The Long-descriptor translation table format introduces a mechanism that entries at one level of translation table lookup can use to set limits on the permitted entries at subsequent levels of lookup. This rule applies to the access permissions, and also to the restrictions on instruction fetching described in [Hierarchical control of instruction fetching, Long-descriptor format on page G4-4611](#).

The restrictions apply only to subsequent levels of lookup at the same stage of translation. The APTable[1:0] field restricts the access permissions, as [Table G4-8](#) shows.

However, in an implementation that includes ARMv8.2-AA32HPD, when hierarchical control of data access permissions is disabled for a translation regime, the information in this subsection does not apply. See [Memory attribute fields in the VMSAv8-32 Long-descriptor translation table format descriptors on page G4-4589](#).

As stated in the table footnote, for the Non-secure PL2 stage 1 translation tables, APTable[0] is reserved, SBZ.

**Table G4-8 Effect of APTable[1:0] on subsequent levels of lookup**

APTable[1:0]	Effect
00	No effect on permissions in subsequent levels of lookup.
01 <sup>a</sup>	Access at PL0 not permitted, regardless of permissions in subsequent levels of lookup.
10	Write access not permitted, at any Exception level, regardless of permissions in subsequent levels of lookup.
11 <sup>a</sup>	Regardless of permissions in subsequent levels of lookup: <ul style="list-style-type: none"> <li>Write access not permitted, at any Exception level.</li> <li>Read access not permitted at PL0.</li> </ul>

a. Not valid for the Non-secure PL2 stage 1 translation tables. In those tables, APTable[0] is SBZ.

**Note**

The APTable[1:0] settings are combined with the translation table access permissions in the translation tables descriptors accessed in subsequent levels of lookup. They do not restrict or change the values entered in those descriptors.

The Long-descriptor format provides APTable[1:0] control only for the stage 1 translations. The corresponding bits are SBZ in the stage 2 translation table descriptors.

The effect of APTable applies to later entries in the translation table walk, and so its effects can be held in one or more TLB entries. Therefore, a change to APTable requires coarse-grained invalidation of the TLB to ensure that the effect of the change is visible to subsequent memory transactions.

**AP[2:0] access permissions control, Short-descriptor format only**

This access permissions model applies when using the Short-descriptor translation tables format, and the SCTLRAFE bit is set to 0. ARM deprecates any use of this access permissions model.

When SCTLRAFE is set to 0, ensuring that the AP[0] bit is always set to 1 effectively changes the access model to the simpler model described in [AP\[2:1\] access permissions model on page G4-4606](#).

Table G4-9 shows the full AP[2:0] access permissions model:

**Table G4-9 VMSAv8-32 MMU access permissions**

AP[2]	AP[1:0]	PL1 access	Unprivileged access	Description
0	00	No access	No access	All accesses generate Permission faults
	01	Read/write	No access	Access only at PL1
	10	Read/write	Read-only	Writes at PL0 generate Permission faults
	11	Read/write	Read/write	Full access
1	00	-	-	Reserved
	01	Read-only	No access	Read-only, only at PL1
	10	Read-only	Read-only	Read-only at any Exception level, deprecated <sup>a</sup>
	11	Read-only	Read-only	Read-only at any Exception level <sup>b</sup>

a. From VMSAv7, ARM strongly recommends use of the 0b11 encoding for Read-only at any Exception level.

b. This mapping was introduced in VMSAv7, and is reserved in earlier versions of the VMSA.

#### **Note**

- VMSAv8-32 supports the full set of access permissions shown in Table G4-9 only when **SCTLR.AFE** is set to 0. When **SCTLR.AFE** is set to 1, the only supported access permissions are those described in [AP\[2:1\] access permissions model on page G4-4606](#).
- Some old documentation describes the AP[2] bit in the translation table entries as the APX bit.

## **G4.6.2 About the PAN bit**

When the value of **PSTATE.PAN** is 1, any privileged data access from PL1 or EL2 to a virtual memory address that is accessible at EL0 generates a Permission fault.

When the value of **PSTATE.PAN** is 0, the translation system is the same as in ARMv8.0.

A corresponding PAN bit is added to **CPSR** and **SPSR** for exception returns, and **DSPSR** for entry to and exit from Debug state.

A new SPAN bit is added to **SCTLR** that controls whether the PAN state bit is set on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

**CPSR.PAN** bit can be written using an MSR instruction at PL1 or higher. Data writes to **CPSR.PAN** using an MSR instruction at EL0 are ignored. The value that is returned for an MRS instruction of **CPSR** from EL0 is UNKNOWN. In keeping with all other writes to the **CPSR**, other than for instruction fetches, the effect of the PAN state bit does not need to be explicitly synchronized.

The PAN state bit has no effect on:

- Data Cache instructions.
- Address translation instructions, other than ATS1CPRP and ATS1CPWP when [ARMv8.2-ATS1E1](#) is implemented.
- Unprivileged instructions, LDRBT, LDRHT, LDRT, LDRSBT, LDRSHT, STRBT, STRHT, STRT, STRSBT, and STRSHT, unless **HCR\_EL2.{E2H, TGE} = {1, 0}**.
- Instruction accesses.
- Manager domains.

If access is disabled, then the access will give rise to a stage 1 Permission fault.

On an exception taken from AArch32:

- **CPSR**.PAN is copied to **SPSR**\_ELx.PAN, when the target Exception level is AArch64.
- **CPSR**.PAN is copied to **SPSR**.PAN, when the target Exception level is AArch32.

On an exception return from AArch32 to AArch32, **SPSR**.PAN is copied to **CPSR**.PAN.

On entry to Debug state, **CPSR**.PAN is copied to **DSPSR**.PAN.

On exit from Debug state, **DSPSR**.PAN is copied to **CPSR**.PAN.

The **CPSR**.PAN bit is not an Execution state bit.

---

**Note**

A debugger can use the DRPS instruction to modify the PAN state bit.

---

### G4.6.3 Access permissions for instruction execution

Execute-never controls provide an additional level of control on memory accesses permitted by the access permissions settings. These controls are:

#### **XN, Execute-never**

Descriptor bit[54], defined as XN for:

- Stage 1 of any translation regime.
- Stage 2 of the Non-secure PL1&0 translation regime when **ARMv8.2-TTS2UXN** is not implemented.

---

**Note**

**XN[1:0], Execute-never, for stage 2 control describes the stage 2 control when ARMv8.2-TTS2UXN is implemented.**

---

A value of 0 indicates that this control permits execution.

#### **PXN, Privileged execute-never**

Descriptor bit[53], used only for stage 1 of any translation regime that applies to EL0 and a higher Exception level:

- For stage 1 of a translation regime that applies to only a single Exception level the descriptors define a PXN field that is RES0, meaning it is ignored by hardware.

---

**Note**

**For stage 2 of the Non-secure PL1&0 translation regime when ARMv8.2-TTS2UXN is not implemented, descriptor bit[53] is RES0, meaning it is ignored by hardware.**

---

A value of 0 indicates that this control permits execution.

#### **XN[1:0], Execute-never, for stage 2 control**

Descriptor bits[54:53], defined as XN[1:0] for:

- Stage 2 of the PL1&0 translation regime in an implementation where **ARMv8.2-TTS2UXN** is supported.

Table G4-10 on page G4-4610 shows the operation of this control.

---

**Note**

**Because the stage 2 controls apply only in Non-secure state, PL1 always corresponds to EL1 and the controls are described in terms of instruction execution at EL1 and EL0.**

---

**Table G4-10 XN[1:0] stage 2 access permissions model**

XN[1]	XN[0]	Access
0	0	The stage 2 control permits execution at EL1 and EL0 if read access is permitted
0	1	The stage 2 control does not permit execution at EL1, but permits execution at EL0 if read access is permitted
1	0	The stage 2 control does not permit execution at EL1 or at EL0
1	1	The stage 2 control permits execution at EL1 if read access is permitted, but does not permit execution at EL0

Executing an instruction at PLx generates a Permission fault unless all of the follow are true for the instruction address:

- The stage 1 execute-never control that applies to execution at PLx permits execution.
- For PL0 or PL1, the stage 2 execute-never control that applies to execution at PLx permits execution.
- Read access is permitted.

However, when using the Short-descriptor translation table format, the Permission fault is generated only if the access is to memory in the Client domain, see [Domains, Short-descriptor format only on page G4-4612](#).

See also [Hyp mode control of Non-secure access permissions on page G4-4614](#).

In addition, System register controls can enforce execute-never restrictions, regardless of the settings in the translation table XN and PXN fields, see:

- [Restriction on Secure instruction fetch on page G4-4612](#).
- [Preventing execution from writeable locations on page G4-4612](#).

The execute-never controls apply also to speculative instruction fetching. This means a speculative instruction fetch from a memory region that is execute-never at the current level of privilege is prohibited.

The execute-never controls means that, when the stage of address translation is enabled, the PE can fetch, or speculatively fetch, an instruction from a memory location only if all of the following apply:

- If using the Short-descriptor translation table format, the translation table descriptor for the location does not indicate that it is in a No access domain.
- If using the Long-descriptor translation table format, or using the Short descriptor format and the descriptor indicates that the location is in a Client domain, in the descriptor for the location the following apply:
  - The stage 1 execute-never control for the Exception level at which the instruction is executed permits execution.
  - For a translation regime with two stages of address translation, the stage 2 execute-never control that applies to the Exception level at which the instruction is executed permits execution.
  - The access permissions permit a read access from the current PE mode.
- No other Prefetch Abort condition exists.

#### **Note**

- The PXN control applies to the PE privilege when it attempts to execute the instruction. In an implementation that fetches instructions speculatively, this might not be the privilege when the instruction was prefetched. Therefore, the architecture does not require the PXN control to prevent instruction fetching.
- Although the XN control applies to speculative fetching, on a speculative instruction fetch from an XN location, no Permission fault is generated unless the PE attempts to execute the instruction that would have been fetched from that location. This means that, if a speculative fetch from an XN location is attempted, but there is no attempt to execute the corresponding instruction, a Permission fault is not generated.

- The software that defines a translation table must mark any region of memory that is read-sensitive as XN, to avoid the possibility of a speculative fetch accessing the memory region. This means it must mark any memory region that corresponds to a read-sensitive peripheral as XN. Hardware does not prevent speculative accesses to a region of any Device memory type unless that region is also marked as execute-never for all Exception levels from which it can be accessed.
- When using the Short-descriptor translation table format, the XN attribute is not checked for domains marked as Manager. Therefore, the system must not include read-sensitive memory in domains marked as Manager, because the XN field does not prevent speculative fetches from a Manager domain.

---

When no stage of address translation for the translation regime is enabled, memory regions cannot have XN or PXN attributes assigned. *Behavior of instruction fetches when all associated address translations are disabled* on page G4-4569 describes how disabling all MMUs affects instruction fetching.

### Hierarchical control of instruction fetching, Long-descriptor format

The Long-descriptor translation table format introduces a mechanism that means entries at one level of translation tables lookup can set limits on the permitted entries at subsequent levels of lookup. This rule applies to the restrictions on instruction fetching, and also to the access permissions described in *Hierarchical control of access permissions, Long-descriptor format* on page G4-4607.

---

#### Note

Similar hierarchical controls apply to data accesses, see *Hierarchical control of access permissions, Long-descriptor format* on page G4-4607.

---

However, in an implementation that includes ARMv8.2-HPD, when hierarchical control of instruction fetching is disabled for a translation regime, the information in this subsection does not apply. See *Memory attribute fields in the VMSAv8-32 Long-descriptor translation table format descriptors* on page G4-4589.

The restrictions apply only to subsequent levels of lookup at the same stage of translation, and:

- **XNTable** restricts the **XN** control:
  - When **XNTable** is set to 1, the **XN** field is treated as 1 in all subsequent levels of lookup, regardless of the actual value of the field.
  - When **XNTable** is set to 0 it has no effect.
- **PXNTable** restricts the **PXN** control:
  - When **PXNTable** is set to 1, the **PXN** field is treated as 1 in all subsequent levels of lookup, regardless of the actual value of the field.
  - When **PXNTable** is set to 0 it has no effect.

---

#### Note

The **XNTable** and **PXNTable** settings are combined with the **XN** and **PXN** fields in the translation table descriptors accessed at subsequent levels of lookup. They do not restrict or change the values entered in those descriptors.

---

The **XNTable** and **PXNTable** controls are provided only in the Long-descriptor translation table format, and only for stage 1 translations. The corresponding bits are SBZ in the stage 2 translation table descriptors.

The effect of **XNTable** or **PXNTable** applies to later entries in the translation table walk, and so its effects can be held in one or more TLB entries. Therefore, a change to **XNTable** or **PXNTable** requires coarse-grained invalidation of the TLB to ensure that the effect of the change is visible to subsequent memory transactions.

## Preventing execution from writeable locations

ARMv8 provides control bits that, when the corresponding stage 1 address translation is enabled, force writeable memory to be treated as **XN** or **PXN**, regardless of the value of the **XN** or **PXN** field. When the translation stages are controlled by an Exception level that is using AArch32:

- For PL1&0 stage 1 translations, when **SCTLR.WXN** is set to 1, all regions that are writeable at stage 1 of the address translation are treated as XN.
- For PL1&0 stage 1 translations, when **SCTLR.UWXN** is set to 1, an instruction fetch is treated as accessing a PXN region if it accesses a region that software executing at PL0 can write to.
- For Non-secure PL2 stage 1 translations, when **HSCTLR.WXN** is set to 1, all regions that are writeable at stage 1 of the address translation are treated as XN.

### Note

- The **SCTLR.WXN** controls are intended to be used in systems with very high security requirements.
- Setting a **WXN** or **UWXN** bit to 1 changes the interpretation of the translation table entry, overriding a zero value of an **XN** or **PXN** field. It does not cause any change to the translation table entry.

For any given virtual machine, ARM expects **WXN** and **UWXN** to remain static in normal operation. In particular, it is IMPLEMENTATION DEFINED whether TLB entries associated with a particular VMID reflect the effect of the values of these fields. A generic sequence to ensure synchronization of a change to these fields, when that change is made without a corresponding change of VMID, is:

```
Change the WXN or UWXN bit
ISB                               ; This ensures synchronization of the change
Invalidate entire TLB of associated entries
DSB                               ; This completes the TLB Invalidation
ISB                               ; This ensures instruction synchronization
```

As with all Permission fault checking, if the stage 1 translation is using the Short-descriptor translation table format, the permission checks are performed only for Client domains. For more information, see [About access permissions on page G4-4605](#).

For more information about address translation, see [About address translation for VMSAv8-32 on page G4-4562](#).

## Restriction on Secure instruction fetch

EL3 provides a Secure instruction fetch bit, **SCR.SIF**. When this bit is to 1, any attempt in Secure state to execute an instruction fetched from Non-secure physical memory causes a Permission fault. As with all Permission fault checking, when using the Short-descriptor format translation tables the check applies only to Client domains, see [About access permissions on page G4-4605](#).

ARM expects **SCR.SIF** to be static during normal operation. In particular, whether the TLB holds the effect of the **SIF** bit is IMPLEMENTATION DEFINED. The generic sequence to ensure visibility of a change to the **SIF** bit is:

```
Change the SCR.SIF bit
ISB                               ; This ensures synchronization of the change
Invalidate entire TLB
DSB                               ; This completes the TLB Invalidation
ISB                               ; This ensures instruction synchronization
```

### G4.6.4 Domains, Short-descriptor format only

A domain is a collection of memory regions. The Short-descriptor translation table format supports 16 domains, and requires the software that defines a translation table to assign each VMSAv8-32 memory region to a domain. When using the Short-descriptor format:

- Level 1 translation table entries for Page tables and Sections include a domain field.

- Translation table entries for Supersections do not include a domain field. The Short-descriptor format defines Supersections as being in domain 0.
- Level 2 translation table entries inherit a domain setting from the parent level 1 Page table descriptor.
- Each TLB entry includes a domain field.

The domain field specifies which of the 16 domains the entry is in, and a two-bit field in the [DACR](#) defines the permitted access for each domain. The possible settings for each domain are:

<b>No access</b>	Any access using the translation table descriptor generates a Domain fault.
<b>Clients</b>	On an access using the translation table descriptor, the access permission attributes are checked. Therefore, the access might generate a Permission fault.
<b>Managers</b>	On an access using the translation table descriptor, the access permission attributes are not checked. Therefore, the access cannot generate a Permission fault.

See [The MMU fault-checking sequence on page G4-4652](#) for more information about how, when using the Short-descriptor translation table format, the Domain attribute affects the checking of the other attributes in the translation table descriptor.

———— **Note** ————

A single program might:

- Be a Client of some domains.
- Be a Manager of some other domains.
- Have no access to the remaining domains.

The Long-descriptor translation table format does not support domains. When a stage of translation is using this format, all memory is treated as being in a Client domain, and the settings in the [DACR](#) are ignored.

## G4.6.5 The Access flag

The Access flag indicates when a page or section of memory is accessed for the first time since the Access flag in the corresponding translation table descriptor was set to 0:

- If address translation is using the Short-descriptor translation table format, it must set [SCTLR.AFE](#) to 1 to enable use of the Access flag. Setting this bit to 1 redefines the AP[0] bit in the translation table descriptors as an Access flag, and limits the access permissions information in the translation table descriptors to AP[2:1], as described in [AP\[2:1\] access permissions model on page G4-4606](#).
- The Long-descriptor format always supports an Access flag bit in the translation table descriptors, and address translation using this format behaves as if [SCTLR.AFE](#) is set to 1, regardless of the value of that bit.

In ARMv8.0, the Access flag is managed by software as described in [Software management of the Access flag](#).

———— **Note** ————

Previous version of the ARM architecture optionally supported hardware management of the Access flag. ARMv8.0 obsoletes this option.

### Software management of the Access flag

ARMv8.0 requires that software manages the Access flag. This means an Access flag fault is generated whenever an attempt is made to read into the TLB a translation table descriptor entry for which the value of the Access flag is 0.

---

**Note**

When using the Short-descriptor translation table format, Access flag faults are generated only if [SCTLR.AFE](#) is set to 1, to enable use of a translation table descriptor bit as an Access flag.

The Access flag mechanism expects that, when an Access flag fault occurs, software resets the Access flag to 1 in the translation table entry that caused the fault. This prevents the fault occurring the next time that memory location is accessed. Entries with the Access flag set to 0 are never held in the TLB, meaning software does not have to flush the entry from the TLB after setting the flag.

---

**Note**

If a system incorporates components that can autonomously update translation table entries that are shared with the ARM PE, then the software must be aware of the possibility that such components can update the access flag autonomously.

In such a system, system software should perform any changes of translation table entries with an Access flag of 0, other than changes to the Access flag value, by using an Load-Exclusive/Store-Exclusive loop, to allow for the possibility of simultaneous updates.

## G4.6.6 Hyp mode control of Non-secure access permissions

When EL2 is using AArch32, Non-secure software executing in Hyp mode controls two sets of translation tables, both of which use the Long-descriptor translation table format:

- The translation tables that control the Non-secure PL2 stage 1 translations. These map VAs to PAs, for memory accesses made when executing in Non-secure state in Hyp mode, and are indicated and controlled by the [HTTBR](#) and [HTCR](#).

These translations have similar access controls to other Non-secure stage 1 translations using the Long-descriptor translation table format, as described in:

- [AP\[2:1\] access permissions model on page G4-4606](#).
- [Access permissions for instruction execution on page G4-4609](#).

The differences from the Non-secure stage 1 translations are that:

- The APTable[0], PXNTable, and PXN bits are reserved, SBZ.
- AP[1] is reserved, SBO.

- The translation tables that control the Non-secure PL1&0 stage 2 translations. These map the IPAs from the stage 1 translation onto PAs, for memory accesses made when executing in Non-secure state at PL1 or PL0, and are indicated and controlled by the [VTTBR](#) and [VTCR](#).

The descriptors in the virtualization translation tables define stage 2 access permissions, that are combined with the permissions defined in the stage 1 translation. This section describes this combining of access permissions.

---

**Note**

The level 2 access permissions mean a hypervisor can define additional access restrictions to those defined by a Guest OS in the stage 1 translation tables. For a particular access, the actual access permission is the more restrictive of the permissions defined by:

- The Guest OS, in the stage 1 translation tables.
- The hypervisor, in the stage 2 translation tables.

The stage 2 access controls defined from Hyp mode:

- Affect only the Non-secure stage 1 access permissions settings.
- Take no account of whether the accesses are from a Non-secure PL1 mode or a Non-secure PL0 mode.
- Permit software executing in Hyp mode to assign a write-only attribute to a memory region.

The S2AP field in the stage 2 descriptors define the stage 2 access permissions, as [Table G4-11](#) shows:

**Table G4-11 Stage 2 control of access permissions**

S2AP	Access permission
00	No access permitted
01	Read-only. Writes to the region are not permitted, regardless of the stage 1 permissions.
10	Write-only. Reads from the region are not permitted, regardless of the stage 1 permissions.
11	Read/write. The stage 1 permissions determine the access permissions for the region.

For more information about the S2AP field see [Attribute fields in VMSAv8-32 Long-descriptor stage 2 Block and Page descriptors on page G4-4592](#).

If the stage 2 permissions cause a Permission fault, this is a stage 2 MMU fault. Stage 2 MMU faults are taken to Hyp mode, and reported in the [HSR](#) using an EC code of 0x20 or 0x24. For more information, see [Use of the HSR on page G4-4677](#).

———— **Note** ————

In the [HSR](#), the combination of the EC code and the DFSC or IFSC value in the ISS indicate that the fault is a stage 2 MMU fault.

The stage 2 permissions include an XN attribute. If this is set to 1, execution from the region is not permitted, regardless of the value of the XN attribute in the stage 1 translation. If a Permission fault is generated because the stage 2 XN bit is set to 1, this is reported as a stage 2 MMU fault.

[AArch32 state prioritization of synchronous aborts from a single stage of address translation on page G4-4660](#) describes the abort prioritization if both stages of a translation generate a fault.

## G4.7 Memory region attributes

In addition to an output address, a translation table entry that refers to a page or region of memory includes fields that define properties of that target memory region. [Information returned by a translation table lookup on page G4-4572](#) describes the classification of those fields as address map control, access control, and memory attribute fields. The memory region attribute fields control the memory type, Cacheability, and Shareability of the region.

The following sections describe the assignment of memory region attributes for stage 1 translations:

- [Overview of memory region attributes for stage 1 translations.](#)
- [Short-descriptor format memory region attributes, without TEX remap on page G4-4617.](#)
- [Short-descriptor format memory region attributes, with TEX remap on page G4-4619.](#)
- [VMSAv8-32 Long-descriptor format memory region attributes on page G4-4622.](#)

For an implementation that is operating in Secure state, or in Hyp mode, these assignments define the memory attributes of the accessed region.

For an implementation that is operating in a Non-secure PL1 or PL0 mode, the Non-secure PL1&0 stage 2 translation can modify the memory attributes assigned by the stage 1 translation. [EL2 control of Non-secure memory region attributes on page G4-4624](#) describes these stage 2 assignments.

### G4.7.1 Overview of memory region attributes for stage 1 translations

The description of the memory region attributes in a translation descriptor divides into:

#### Memory type and attributes

These are described either:

- Directly, by bits in the translation table descriptor.
- Indirectly, by registers referenced by bits in the table descriptor. This is described as *remapping* the memory type and attribute description.

The Short-descriptor translation table format can use either of these approaches, selected by the [SCTLR.TRE](#) bit:

**TRE == 0** Remap disabled. The TEX[2:0], C, and B bits in the translation table descriptor define the memory region attributes. [Short-descriptor format memory region attributes, without TEX remap on page G4-4617](#) describes this encoding.

#### ————— Note —————

With the Short-descriptor format, remapping is called *TEX remap*, and the [SCTLR.TRE](#) bit is the *TEX remap enabled* bit.

The description of the TRE == 0 encoding includes information about the encoding in previous versions of the architecture.

**TRE == 1** Remap enabled. The TEX[0], C, and B bits in the translation table descriptor are index bits to the remap registers, that define the memory region attributes:

- The Primary Region Remap Register, [PRRR](#).
- The Normal Memory Remap Register, [NMRR](#).

[Short-descriptor format memory region attributes, with TEX remap on page G4-4619](#) describes this encoding scheme.

This scheme reassigns translation table descriptor bits TEX[2:1] for use as bits managed by the operating system.

The Long-descriptor translation table format always uses remapping. This means that when the value of [TTBCR.EAE](#) is 1, enabling use of the Long-descriptor translation table format, [SCTLR.TRE](#) is RES1.

[VMSAv8-32 Long-descriptor format memory region attributes on page G4-4622](#) describes this encoding.

**Shareability** In the Short-descriptor translation table format, the S bit in the translation table descriptor is used in determining the Shareability of the region. How the S bit is interpreted depends on whether TEX remap is enabled, see:

- [Shareability and the S bit, without TEX remap on page G4-4618.](#)
- [Determining the Shareability, with TEX remap on page G4-4620.](#)

In the Long-descriptor translation table format, the SH[1:0] field in the translation table descriptor encodes the Shareability of the region, see [Shareability, Long-descriptor format on page G4-4622.](#)

———— **Note** ————

Shareability is one of Non-shareable, Inner Shareable, and Outer Shareable. However, when using the Short-descriptor translation table format without TEX remap, VMSAv8-32 does not support any distinction between Inner Shareable and Outer Shareable memory, and a memory region is either Non-shareable or Outer Shareable.

## G4.7.2 Short-descriptor format memory region attributes, without TEX remap

When using the Short-descriptor translation table formats, TEX remap is disabled when the value of [SCTLR.TRE](#) is 0.

———— **Note** ————

- The Short-descriptor format scheme without TEX remap is the scheme used in VMSAv6.
- The B (Bufferable), C (Cacheable), and TEX (Type extension) bit names are inherited from earlier versions of the architecture. These names no longer adequately describe the function of the B, C, and TEX bits.

[Table G4-12](#) shows the C, B, and TEX[2:0] encodings when TEX remap is disabled. In the [Page Shareability](#) column, an entry of *S bit* indicates that the S bit in the translation table descriptor determines the Shareability, see [Shareability and the S bit, without TEX remap on page G4-4618.](#)

**Table G4-12 TEX, C, and B encodings when TRE == 0**

TEX[2:0]	C	B	Description	Memory type	Page Shareability
000	0	0	Device-nGnRnE	Device-nGnRnE	Outer Shareable
		1	Device-nGnRE <sup>a</sup>	Device-nGnRE	Outer Shareable <sup>a</sup>
	1	0	Outer and Inner Write-Through, Read-Allocate No Write-Allocate	Normal	S bit
		1	Outer and Inner Write-Back, Read-Allocate No Write-Allocate	Normal	S bit
001	0	0	Outer and Inner Non-cacheable	Normal	Outer Shareable <sup>b</sup>
		1	Reserved	-	-
	1	0	IMPLEMENTATION DEFINED	IMPLEMENTATION DEFINED	IMPLEMENTATION DEFINED
		1	Outer and Inner Write-Back, Read-Allocate Write-Allocate	Normal	S bit
010	0	0	Device-nGnRE <sup>a</sup>	Device-nGnRE	Outer Shareable <sup>a</sup>
		1	Reserved	-	-
	1	x	Reserved	-	-

**Table G4-12 TEX, C, and B encodings when TRE == 0 (continued)**

TEX[2:0]	C	B	Description	Memory type	Page Shareability
011	x	x	Reserved	-	-
1BB	A	A	Cacheable memory: AA = Inner attribute <sup>c</sup> BB = Outer attribute	Normal	S bit

- In ARMv8, all Device memory types are Outer Shareable. For the Device-nGnRE memory type this is a change from previous versions of the architecture. This is why Device-nGnRE memory has two entries in this table. For compatibility with ARMv7 software should use the {TEX, C, B} values {000, 0, 1}.
- In ARMv8, Normal Inner Non-cacheable, Outer Non-cacheable memory is always Outer Shareable. This is a change from previous versions of the architecture, where the S bit determined the Shareability. For compatibility with ARMv7 software should set S to 1.
- For more information, see [Cacheability attributes, without TEX remap](#).

See [Memory types and attributes on page E2-2782](#) for an explanation of Normal memory, and the types of Device memory, and of the Shareability attribute.

### Cacheability attributes, without TEX remap

When the value of TEX[2] is 0, the same Cacheability attribute applies to Inner Cacheable and Outer Cacheable memory regions, and the {TEX[1:0], C, B} values identify this attribute, as [Table G4-12 on page G4-4617](#) shows.

When the value of TEX[2] is 1, the memory described by the translation table entry is cacheable, and the rest of the encoding defines the Inner Cacheability and Outer Cacheability attributes:

**TEX[1:0]** Define the Outer Cacheability attribute.  
**C, B** Define the Inner Cacheability attribute.

The translation table entries use the same encoding for the Outer and Inner Cacheability attributes, as [Table G4-13](#) shows.

**Table G4-13 Inner and Outer Cacheability attribute encoding**

Encoding	Cacheability attribute
00	Non-cacheable
01	Write-Back, Read-Allocate Write-Allocate
10	Write-Through, Read Allocate No Write-Allocate
11	Write-Back, Read Allocate No Write-Allocate

### Shareability and the S bit, without TEX remap

The Short-descriptor format translation table entries include an S bit. This bit:

- Is ignored if the entry refers to any type of Device memory, or to Normal memory that is Inner Non-cacheable, Outer Non-cacheable.
- For Normal memory that is not Inner Non-cacheable, Outer Non-cacheable, determines whether the memory region is Outer Shareable or Non-shareable:  
S == 0 Normal memory region is Non-shareable.  
S == 1 Normal memory region is Outer Shareable.

Without TEX remapping there is no distinction between Inner Shareable and Outer Shareable memory, meaning the S bit determines whether the region is Non-shareable or Outer Shareable.

**G4.7.3 Short-descriptor format memory region attributes, with TEX remap**

When using the Short-descriptor translation table formats, TEX remap is enabled when the value of [SCTLR.TRE](#) is 1. In this configuration:

- The software that defines the translation tables must program the [PRRR](#) and [NMRR](#) to define seven possible memory region attributes.
- The TEX[0], C, and B bits of the translation table descriptors define the memory region attributes, by indexing [PRRR](#) and [NMRR](#).
- Hardware makes no use of TEX[2:1], see *The OS managed translation table bits* on page G4-4621.

When TEX remap is enabled:

- For seven of the eight possible combinations of the TEX[0], C and B bits, fields in the [PRRR](#) and [NMRR](#) define the region attributes, as described in this section.
- The meaning of the eighth combination for the TEX[0], C and B bits is IMPLEMENTATION DEFINED.
- If the TEX[0], C and B bits determine that the region is a Device memory type, or is Normal Inner Non-cacheable, Outer Non-cacheable, then the region is Outer Shareable. Otherwise, the Shareability is determined by the combination of:
  - The S bit from the translation table descriptor.
  - The value of the [PRRR.NS0](#) or [PRRR.NS1](#) bit.
  - The value of the appropriate [PRRR.NOS<sub>n</sub>](#) bit, as shown in [Table G4-14](#).

For more information, see *Determining the Shareability, with TEX remap* on page G4-4620.

For each of the possible encodings of the TEX[0], C, and B bits in a translation table entry, [Table G4-14](#) shows which fields of the [PRRR](#) and [NMRR](#) registers describe the memory region attributes.

**Table G4-14 TEX, C, and B encodings when TRE == 1**

Encoding			Cache attributes <sup>a, b:</sup>			
TEX[0]	C	B	Memory type <sup>a</sup>	Inner cacheability	Outer cacheability	Outer Shareable attribute <sup>a, c</sup>
0	0	0	<a href="#">PRRR.TR0</a>	<a href="#">NMRR.IR0</a>	<a href="#">NMRR.OR0</a>	NOT( <a href="#">PRRR.NOS0</a> )
		1	<a href="#">PRRR.TR1</a>	<a href="#">NMRR.IR1</a>	<a href="#">NMRR.OR1</a>	NOT( <a href="#">PRRR.NOS1</a> )
	1	0	<a href="#">PRRR.TR2</a>	<a href="#">NMRR.IR2</a>	<a href="#">NMRR.OR2</a>	NOT( <a href="#">PRRR.NOS2</a> )
		1	<a href="#">PRRR.TR3</a>	<a href="#">NMRR.IR3</a>	<a href="#">NMRR.OR3</a>	NOT( <a href="#">PRRR.NOS3</a> )
1	0	0	<a href="#">PRRR.TR4</a>	<a href="#">NMRR.IR4</a>	<a href="#">NMRR.OR4</a>	NOT( <a href="#">PRRR.NOS4</a> )
		1	<a href="#">PRRR.TR5</a>	<a href="#">NMRR.IR5</a>	<a href="#">NMRR.OR5</a>	NOT( <a href="#">PRRR.NOS5</a> )
	1	0	IMPLEMENTATION DEFINED			
		1	<a href="#">PRRR.TR7</a>	<a href="#">NMRR.IR7</a>	<a href="#">NMRR.OR7</a>	NOT( <a href="#">PRRR.NOS7</a> )

a. For details of the *Memory type* and *Outer Shareable* encodings see the description of the [PRRR](#). For details of the *Cache attributes* encodings the description of the [NMRR](#).

b. Applies only if the memory type for the region is mapped as Normal memory.

c. Applies only if both of the following apply:

- The memory type for the region is mapped as Normal memory that is not Inner Non-cacheable and Outer Non-cacheable.
- The region is not Non-shareable.

See *Determining the Shareability, with TEX remap* on page G4-4620.

As [Table G4-14 on page G4-4619](#) shows, when TEX remap is enabled, for a given set of {TEX[0], C, B} bits from a translation table descriptor:

1. The primary mapping, to memory type, is given by the [PRRR.TR<sub>n</sub>](#) field as shown in the [Memory type](#) column.
2. For any region that the [PRRR.TR<sub>n</sub>](#) maps as Normal memory, [NMRR.IR<sub>n</sub>](#) determines the Inner cacheability attribute, and [NMRR.OR<sub>n</sub>](#) determines the Outer cacheability attribute.
3. For a region that [PRRR.TR<sub>n</sub>](#) maps as Normal memory, if [NMRR.{IR<sub>n</sub>, OR<sub>n</sub>}](#) do not map the region as Inner Non-cacheable, Outer Non-cacheable, [PRRR.{NS0, NS1}](#) and [PRRR.NOS<sub>n</sub>](#) are used to determine the Shareability of the region, see [Determining the Shareability, with TEX remap](#).

The TEX remap registers and the [SCTLR.TRE](#) bit are Banked between the Secure and Non-secure Security states. For more information, see [The effect of EL3 on TEX remap on page G4-4622](#).

The TEX remap registers must be static during normal operation. In particular, when the remap registers are changed:

- It is IMPLEMENTATION DEFINED when the changes take effect.
- It is CONSTRAINED UNPREDICTABLE whether the TLB caches the effect of the TEX remap on translation tables, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6101](#).

The software sequence to ensure the synchronization of changes to the TEX remap registers is:

1. Execute a DSB instruction. This ensures any memory accesses using the old mapping have completed.
2. Write the TEX remap registers or [SCTLR.TRE](#) bit.
3. Execute an ISB instruction. This ensures synchronization of the register updates.
4. Invalidate the entire TLB.
5. Execute a DSB instruction. This ensures completion of the entire TLB operation.
6. Clean and invalidate all caches. This removes any cached information associated with the old mapping.
7. Execute a DSB instruction. This ensures completion of the cache maintenance.
8. Execute an ISB instruction. This ensures instruction synchronization.

This extends the standard rules for the synchronization of changes to System registers described in [Synchronization of changes to AArch32 System registers on page G6-4768](#), and provides implementation freedom as to whether or not the effect of the TEX remap is cached.

### Determining the Shareability, with TEX remap

The memory type of a region, as indicated in the [Memory type](#) column of [Table G4-14 on page G4-4619](#), provides the first level of control of the Shareability of the region:

- If the memory is any type of Device memory, then the region is Outer Shareable, and any Shareability attributes in the translation table descriptor and [PRRR](#) for that region are ignored.  
This rule applies also to a Normal memory region that the [NMRR](#) attributes identify as Inner Non-cacheable and Outer Non-cacheable,
- If using the Short descriptor translation table format then the Shareability of the region is determined using the value of the S bit in the translation table descriptor to index one of the [PRRR.{NS1, NS0}](#) bits, as described in this section.

[Table G4-15](#) shows how the translation table S bit indexes into the [PRRR](#):

**Table G4-15 Determining the Shareability attribute, with TEX remap**

Memory type	Remapping when S == 0	Remapping when S == 1
Device or Normal Inner Non-cacheable, Outer Non-cacheable	Outer Shareable	Outer Shareable
Normal, not Inner Non-cacheable, Outer Non-cacheable	<a href="#">PRRR.NS0</a>	<a href="#">PRRR.NS1</a>

For a Normal memory region that is not Inner Non-cacheable, Outer Non-cacheable, the appropriate bit of the **PRRR** indicates whether the region is Non-shareable, as follows:

- PRRR.NSn==0** Non-shareable.  
**PRRR**.{NOS7:NOS0} are ignored.
- PRRR.NSn==1** The appropriate **PRRR.NOSm** field, as shown in Table G4-14 on page G4-4619, indicates whether the region is Inner Shareable or Outer Shareable:
- PRRR.NOSm==0** Region is Outer Shareable.  
**PRRR.NOSm==1** Region is Inner Shareable.

#### ———— Note ————

This means that TEX remapping can map a translation table entry with S == 0 as shareable memory.

### SCTLR.TRE, SCTLR.M, and the effect of the TEX remap registers

When TEX remap is disabled, because the value of the **SCTLR.TRE** bit is 0:

- The effect of the **PRRR** and **NMRR** registers can be IMPLEMENTATION DEFINED.
- The interpretation of the fields of the **PRRR** and **NMRR** registers can differ from the description given earlier in this section. One implication of this is that the implementation can provide an IMPLEMENTATION DEFINED mechanism to interpret the **PRRR**.{NOS7:NOS0} fields.

VMSAv8-32 requires that the effect of these registers is limited to remapping the attributes of memory locations. These registers must not change whether any cache hardware or stages of address translation are enabled. The mechanism by which the TEX remap registers have an effect when the value of the **SCTLR.TRE** bit is 0 is IMPLEMENTATION DEFINED. The AArch32 architecture requires that from reset, if the IMPLEMENTATION DEFINED mechanism has not been invoked:

- If the PL1&0 stage 1 address translation is enabled and is using the Short-descriptor format translation tables, the architecturally-defined behavior of the TEX[2:0], C, and B bits must apply, without reference to the TEX remap functionality. In other words, memory attribute assignment must comply with the scheme described in *Short-descriptor format memory region attributes, without TEX remap* on page G4-4617.
- If the PL1&0 stage 1 address translation is disabled, then the architecturally-defined behavior of VMSAv8-32 with address translation disabled must apply, without reference to the TEX remap functionality. See *The effects of disabling address translation stages on VMSAv8-32 behavior* on page G4-4567.

Possible mechanisms for enabling the IMPLEMENTATION DEFINED effect of the TEX remap registers when the value of **SCTLR.TRE** is 0 include:

- A control bit in the **ACTLR**, or in an IMPLEMENTATION DEFINED System register.
- Changing the behavior when the **PRRR** and **NMRR** registers are changed from their IMPLEMENTATION DEFINED reset values.

In addition, if the stage of address translation is disabled and the value of the **SCTLR.TRE** bit is 1, the architecturally-defined behavior of the VMSAv8-32 with the stage of address translation disabled must apply without reference to the TEX remap functionality.

In an implementation that includes EL3, the IMPLEMENTATION DEFINED effect of these registers must only take effect in the Security state of the registers. See also *The effect of EL3 on TEX remap* on page G4-4622.

### The OS managed translation table bits

When TEX remap is enabled, the TEX[2:1] bits in the translation table descriptors are available as two bits that can be managed by the operating system. In VMSAv8-32, as long as the **SCTLR.TRE** bit is set to 1, the values of the TEX[2:1] bits are IGNORED by the PE. Software can write any value to these bits in the translation tables.

## The effect of EL3 on TEX remap

In an implementation that includes EL3, when EL3 is using AArch32, the TEX remap registers are Banked between the Secure and Non-secure Security states. When EL3 is using AArch32, write accesses to the Secure register for the current Security state apply to all PL1&0 stage 1 translation table lookups in that state. The **SCTLR.TRE** bit is Banked in the Secure and Non-secure copies of the register, and the appropriate version of this bit determines whether TEX remap is applied to translation table lookups in the current Security state.

Write accesses to the Secure copies of the TEX remap registers are disabled when the **CP15SDISABLE** input is asserted HIGH, meaning the MCR operations to access these registers are UNDEFINED. For more information, see [The CP15SDISABLE input signal on page G4-4699](#).

## G4.7.4 VMSAv8-32 Long-descriptor format memory region attributes

When a PE is using the VMSAv8-32 Long-descriptor translation table format, the **AttrIdx[2:0]** field in a block or page translation table descriptor for a stage 1 translation indicates the 8-bit field, in the appropriate MAIR register, that specifies the attributes for the corresponding memory region, as follows:

- **AttrIdx[2]** indicates the MAIR register to be used:  
**AttrIdx[2] == 0**      Use **MAIR0**.  
**AttrIdx[2] == 1**      Use **MAIR1**.
- **AttrIdx[2:0]** indicates the required Attr field, **Attr<sub>n</sub>**, where  $n = \text{AttrIdx}[2:0]$ .

Each **AttrIdx** field defines, for the corresponding memory region:

- The memory type, Normal or a type of Device memory.
- For Normal memory:
  - The Inner cacheability and Outer cacheability attributes, each of which is one of Non-cacheable, Write-Through Cacheable, or Write-Back Cacheable.
  - For Write-Through Cacheable and Write-Back Cacheable regions, the Read-Allocate and Write-Allocate policy hints, each of which is *Allocate* or *No allocate*.

For more information about the **AttrIdx[2:0]** descriptor field, see [Attribute fields in VMSAv8-32 Long-descriptor stage 1 Block and Page descriptors on page G4-4590](#).

## Shareability, Long-descriptor format

When a PE is using the Long-descriptor translation table format, the **SH[1:0]** field in a block or page translation table descriptor specifies the Shareability attributes of the corresponding memory region, if the MAIR entry for that region identifies it as Normal memory that is not both Inner Non-cacheable and Outer Non-cacheable. [Table G4-16](#) shows the encoding of this field.

**Table G4-16 SH[1:0] field encoding for Normal memory, Long-descriptor format**

SH[1:0]	Normal memory
00	Non-shareable
01	Reserved, CONSTRAINED UNPREDICTABLE, see <a href="#">Reserved values in System and memory-mapped registers and translation table entries on page K1-6117</a> for the permitted behavior.
10	Outer Shareable
11	Inner Shareable

See [Combining the Shareability attribute on page G4-4627](#) for constraints on the Shareability attributes of a Normal memory region that is Inner Non-cacheable, Outer Non-cacheable.

For any type of Device memory, and for Normal Inner Non-cacheable, Outer Non-cacheable memory, the value of the SH[1:0] field of the translation table descriptor is ignored.

## Other fields in the Long-descriptor translation table format descriptors

The following subsections describe the other fields in the translation table block and page descriptors when a PE is using the Long-descriptor translation table format:

- [Contiguous bit](#)
- [IGNORED fields](#).
- [Field reserved for software use](#)

### Contiguous bit

The Long-descriptor translation table format descriptors contain a Contiguous bit. Setting this bit to 1 indicates that 16 adjacent translation table entries point to a *contiguous output address range*. These 16 entries must be aligned in the translation table so that the top five bits of their input addresses, that index their position in the translation table, are the same. For example, to use this bit for a block of 16 entries in the level 3 translation table, bits[20:16] of the input addresses for the 16 entries must be the same.

The contiguous output address range must be aligned to size of 16 translation table entries at the same translation table level.

Use of this bit means that the TLB can cache a single entry to cover the 16 translation table entries.

This bit acts as a hint. The architecture does not require a PE to cache TLB entries in this way. To avoid TLB coherency issues, any TLB maintenance by address must not assume any optimization of the TLB tables that might result from use of this bit.

#### ————— Note —————

The use of the contiguous bit is similar to the approach used, in the Short-descriptor translation table format, for optimized caching of Large Pages and Supersections in the TLB. However, an important difference in the contiguous bit capability is that TLB maintenance must be performed based on the size of the underlying translation table entries, to avoid TLB coherency issues. That is, any use of the contiguous bit has no effect on the minimum size of entry that must be invalidated from the TLB.

### IGNORED fields

For stage 1 and stage 2 Block and Page descriptors, the architecture defines bits[63:59] and bits[58:55] as IGNORED fields, meaning the architecture guarantees that a PE makes no use of these fields. In addition:

- Bits[58:55] are reserved for software use, see [Field reserved for software use](#).
- In the stage 2 Block and Page descriptors, bits[63:60] are reserved for use by a System MMU.

#### ————— Note —————

The definition of IGNORED means there is no need to invalidate the TLB if these bits are changed.

### Field reserved for software use

The architecture reserves a 4-bit field in the Block and Page table descriptors, bits[58:55], for software use. In considering migration from using the Short-descriptor format to the Long-descriptor format, this field is an extension of the Short-descriptor field described in [The OS managed translation table bits on page G4-4621](#).

#### ————— Note —————

The definition of IGNORED means there is no need to invalidate the TLB if these bits are changed.

G4.7.5 EL2 control of Non-secure memory region attributes

Software executing at EL2 controls two sets of translation tables, both of which use the Long-descriptor translation table format. These are:

- The translation tables that control Non-secure PL2 stage 1 translations. These map VAs to PAs, and when EL2 is using AArch32 they are indicated and controlled by the [HTTBR](#) and [HTCR](#).  
These translations have exactly the same memory region attribute controls as any other stage 1 translations, as described in [VMSAv8-32 Long-descriptor format memory region attributes on page G4-4622](#).
- The translation tables that control Non-secure PL1&0 stage 2 translations. These map the IPAs from the stage 1 translation onto PAs, and are indicated and when EL2 is using AArch32 they are controlled by the [VTTBR](#) and [VTCR](#).  
The descriptors in the virtualization translation tables define level 2 memory region attributes, that are combined with the attributes defined in the stage 1 translation. This section describes this combining of attributes.

[VMSAv8-32 Long-descriptor translation table format descriptors on page G4-4586](#) describes the format of the entries in these tables.

———— **Note** —————

In a virtualization implementation, a hypervisor might usefully:

- Reduce the permitted Cacheability of a region.
- Increase the required Shareability of a region.

The combining of attributes from stage 1 and stage 2 translations supports both of these options.

In the stage 2 translation table descriptors for memory regions and pages, the MemAttr[3:0] and SH[1:0] fields describe the stage 2 memory region attributes:

- The definition of the stage 2 SH[1:0] field is identical to the same field for a stage 1 translation, see [Shareability, Long-descriptor format on page G4-4622](#).
- MemAttr[3:2] give a top-level definition of the memory type, and of the cacheability of a Normal memory region, as [Table G4-17](#) shows:

**Table G4-17 Long-descriptor MemAttr[3:2] encoding, stage 2 translation**

MemAttr[3:2]	Memory type	Cacheability
00	Device, of type determined by MemAttr[1:0]	Not applicable
01	Normal, Inner cacheability determined by MemAttr[1:0]	Outer Non-cacheable
10		Outer Write-Through Cacheable
11		Outer Write-Back Cacheable

The encoding of MemAttr[1:0] depends on the Memory type indicated by MemAttr[3:2]:

- When MemAttr[3:2] == 0b00, indicating a type of Device memory, [Table G4-18](#) shows the encoding of MemAttr[1:0]:

**Table G4-18 MemAttr[1:0] encoding for the types of Device memory**

MemAttr[1:0]	Meaning when MemAttr[3:2] == 0b00
00	Region is Device-nGnRnE memory
01	Region is Device-nGnRE memory
10	Region is Device-nGRE memory
11	Region is Device-GRE memory

- When MemAttr[3:2] != 0b00, indicating Normal memory, [Table G4-19](#) shows the encoding of MemAttr[1:0]:

**Table G4-19 MemAttr[1:0] encoding for Normal memory**

MemAttr[1:0]	Meaning when MemAttr[3:2] != 0b00
00	Reserved, CONSTRAINED UNPREDICTABLE, See <a href="#">Reserved values in System and memory-mapped registers and translation table entries on page K1-6117</a> for the permitted behavior.
01	Inner Non-cacheable
10	Inner Write-Through Cacheable
11	Inner Write-Back Cacheable

———— **Note** ————

The stage 2 translation does not assign any allocation hints.

The following sections describe how the memory type attributes assigned at stage 2 of the translation are combined with those assigned at stage 1:

- [Combining the memory type attribute on page G4-4626.](#)
- [Combining the Cacheability attribute on page G4-4626.](#)
- [Combining the Shareability attribute on page G4-4627.](#)

———— **Note** ————

- The following stage 2 translation table attribute settings leave the stage 1 settings unchanged:
  - MemAttr[3:2] == 0b11, Normal memory, Outer Write-Back Cacheable.
  - MemAttr[1:0] == 0b11, Inner Write-Back Cacheable.
- In addition to the attribute combinations described in this section, [Access permissions for instruction execution on page G4-4609](#) describes how the stage 1 and stage 1 XN permission fields are combined, so that a region is execute-never if the value of the XN field is 1 in at least one stage of translation.

## Combining the memory type attribute

Table G4-20 shows how the stage 1 and stage 2 memory type assignments are combined:

**Table G4-20 Combining the stage 1 and stage 2 memory type assignments**

Assignment in stage 1	Assignment in stage 2	Resultant type
Device-nGnRnE	Any	Device-nGnRnE
Device-nGnRE	Device-nGnRnE	Device-nGnRnE
	Not Device-nGnRnE	Device-nGnRE
Device-nGRE	Device-nGnRnE	Device-nGnRnE
	Device-nGnRE	Device-nGnRE
	Not (Device-nGnRnE or Device-nGnRE)	Device-nGRE
Device-GRE	Device-nGnRnE	Device-nGnRnE
	Device-nGnRE	Device-nGnRE
	Device-nGRE	Device-nGRE
	Device-GRE or Normal	Device-GRE
Normal	Any type of Device	Device type assigned at stage 2
	Normal	Normal

See [Combining the Shareability attribute on page G4-4627](#) for information about the Shareability of:

- A region for which the resultant type is any Device type.
- A region with a resultant type of Normal for which the resultant cacheability, described in [Combining the Cacheability attribute](#), is Inner Non-cacheable, Outer Non-cacheable.

The combining of the memory type attribute means a translation table walk for a stage 1 translation can be made to a type of Device memory. If this occurs, then:

- If the value of [HCR.PTW](#) is 0, then the translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be done speculatively.
- If the value of [HCR.PTW](#) is 1, then the memory access generates a stage 2 Permission fault.

## Combining the Cacheability attribute

For a Normal memory region, [Table G4-21](#) shows how the stage 1 and stage 2 Cacheability assignments are combined. This combination applies, independently, for the Inner Cacheability and Outer Cacheability attributes:

**Table G4-21 Combining the stage 1 and stage 2 cacheability assignments**

Assignment in stage 1	Assignment in stage 2	Resultant cacheability
Non-cacheable	Any	Non-cacheable
Any	Non-cacheable	Non-cacheable

**Table G4-21 Combining the stage 1 and stage 2 cacheability assignments (continued)**

Assignment in stage 1	Assignment in stage 2	Resultant cacheability
Write-Through Cacheable	Write-Through or Write-Back Cacheable	Write-Through Cacheable
Write-Through or Write-Back Cacheable	Write-Through Cacheable	Write-Through Cacheable
Write-Back Cacheable	Write-Back Cacheable	Write-Back Cacheable

**Note**

Only Normal memory has a Cacheability attribute.

**Combining the Shareability attribute**

In the following cases, a memory region is treated as Outer Shareable, regardless of any shareability assignments at either stage of translation:

- The resultant memory type attribute, described in [Combining the memory type attribute on page G4-4626](#), is any type of Device memory.
- The resultant memory type attribute is Normal memory, and the resultant Cacheability, described in [Combining the Cacheability attribute on page G4-4626](#), is Inner Non-cacheable Outer Non-cacheable.

For a memory region with a resultant memory type attribute of Normal that is not Inner Non-cacheable Outer Non-cacheable, [Table G4-22](#) shows how the stage 1 and stage 2 shareability assignments are combined:

**Table G4-22 Combining the stage 1 and stage 2 Shareability assignments**

Assignment in stage 1	Assignment in stage 2	Resultant Shareability
Outer Shareable	Any	Outer Shareable
Inner Shareable	Outer Shareable	Outer Shareable
Inner Shareable	Inner Shareable	Inner Shareable
Inner Shareable	Non-shareable	Inner Shareable
Non-shareable	Outer Shareable	Outer Shareable
Non-shareable	Inner Shareable	Inner Shareable
Non-shareable	Non-shareable	Non-shareable

## G4.8 Translation Lookaside Buffers (TLBs)

*Translation Lookaside Buffers* (TLBs) are an implementation technique that caches translations or translation table entries. TLBs avoid the requirement to perform a translation table walk in memory for every memory access. The ARM architecture does not specify the exact form of the TLB structures for any design. In a similar way to the requirements for caches, the architecture only defines certain principles for TLBs:

- The architecture has a concept of an entry locked down in the TLB. The method by which lockdown is achieved is IMPLEMENTATION DEFINED, and an implementation might not support lockdown.
- The architecture does not guarantee that an unlocked TLB entry remains in the TLB.
- The architecture guarantees that a locked TLB entry remains in the TLB. However, a locked TLB entry might be updated by subsequent updates to the translation tables. Therefore, when a change is made to the translation tables, the architecture does not guarantee that a locked TLB entry remains incoherent with an entry in the translation table.
- The architecture guarantees that a translation table entry that generates a Translation fault, an Address size fault, or an Access flag fault is not held in the TLB. However a translation table entry that generates a Domain fault or a Permission fault might be held in the TLB.
- When address translation is enabled, any translation table entry that does not generate a Translation fault, an Address size fault, or an Access flag fault and is not from a translation regime for an Exception level that is lower than the current Exception level can be allocated to a TLB at any time. The only translation table entries guaranteed not to be held in the TLB are those that generate a Translation fault, an Address size fault, or an Access flag fault.

### ———— Note ————

A TLB can hold translation table entries that do not generate a Translation fault but point to subsequent tables in the translation table walk. This can be referred to as *intermediate caching* of TLB entries.

- Software can rely on the fact that between disabling and re-enabling a stage of address translation, entries in the TLB relating to that stage of translation have not been corrupted to give incorrect translations.

The following sections give more information about TLB implementation:

- [Global and process-specific translation table entries](#).
- [TLB matching on page G4-4629](#).
- [TLB behavior at reset on page G4-4629](#).
- [TLB lockdown on page G4-4630](#).
- [TLB conflict aborts on page G4-4630](#).

See also [TLB maintenance requirements on page G4-4632](#).

### G4.8.1 Global and process-specific translation table entries

For VMSAv8-32, system software can divide a virtual memory map used by memory accesses at PL1 and PL0 into global and non-global regions, indicated by the nG bit in the translation table descriptors:

**nG == 0**      The translation is global, meaning the region is available for all processes.

**nG == 1**      The translation is non-global, or process-specific, meaning it relates to the current ASID, as defined by:

- [TTBR0.ASID](#) or [TTBR1.ASID](#), if using the Long-descriptor translation table format. In this case, [TTBCR.A1](#) selects which ASID is current.
- [CONTEXTIDR.ASID](#), if using the Short-descriptor translation table format.

Each non-global region has an associated ASID. These identifiers mean different translation table mappings can co-exist in a caching structure such as a TLB. This means that software can create a new mapping of a non-global memory region without removing previous mappings.

For a symmetric multiprocessor cluster where a single operating system is running on the set of PEs, the architecture requires all ASID values to be assigned uniquely within any single Inner Shareable domain. In other words, each ASID value must have the same meaning to all PEs in the system.

The translation regime used for accesses made at PL2 does not support ASIDs, and all pages are treated as global.

When a PE is using the Long-descriptor translation table format, and is in Secure state, a translation must be treated as non-global, regardless of the value of the nG bit, if NSTable is set to 1 at any level of the translation table walk.

For more information see [Control of Secure or Non-secure memory access, VMSAv8-32 Long-descriptor format on page G4-4593](#).

## G4.8.2 TLB matching

A TLB is a hardware caching structure for translation table information. Like other hardware caching structures, it is mostly invisible to software. However, there are some situations where it can become visible. These are associated with coherency problems caused by an update to the translation table that has not been reflected in the TLB. Use of the TLB maintenance instructions described in [TLB maintenance requirements on page G4-4632](#) can prevent any TLB incoherency becoming a problem.

A particular case where the presence of the TLB can become visible is if the translation table entries that are in use under a particular ASID and VMID are changed without suitable invalidation of the TLB. This can occur only if the architecturally-required break-before-make sequence described in [Using break-before-make when updating translation table entries on page G4-4633](#) is not used. If the break-before make sequence is not used, the TLB can hold two mappings for the same address, and this:

- Might generate an exception that is reported using the TLB Conflict fault code, see [TLB conflict aborts on page G4-4630](#).
- Might lead to CONSTRAINED UNPREDICTABLE behavior. In this case, behavior will be consistent with one of the mappings held in the TLB, or with some amalgamation of the values held in the TLB, but cannot give access to regions of memory with permissions or attributes that could not be assigned by valid translation table entries in the translation regime being used for the access. See [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6101](#).

## G4.8.3 TLB behavior at reset

The ARM architecture does not require a reset to invalidate the TLBs, and recognizes that an implementation might require caches, including TLBs, to maintain context over a system reset. Possible reasons for doing so include power management and debug requirements.

Therefore, for ARMv8:

- All TLBs reset to an IMPLEMENTATION DEFINED state that might be UNKNOWN.
- All TLBs are disabled from reset. All stages of address translation that are used from the PE state entered on coming out of reset are disabled from reset, and the contents of the TLBs have no effect on address translation. For more information see [Enabling stages of address translation on page G4-4569](#).
- An implementation can require the use of a specific TLB invalidation routine, to invalidate the TLB arrays before they are enabled after a reset. The exact form of this routine is IMPLEMENTATION DEFINED, but if an invalidation routine is required it must be documented clearly as part of the documentation of the device.

ARM recommends that if an invalidation routine is required for this purpose, and the PE resets into AArch32 state, the routine is based on the AArch32 TLB maintenance instructions described in [The scope of TLB maintenance instructions on page G4-4641](#).

Similar rules apply:

- To cache behavior, see [Behavior of caches at reset on page G3-4531](#).
- To branch predictor behavior, see [Behavior of the branch predictors at reset on page G3-4539](#).

#### G4.8.4 TLB lockdown

The ARM architecture recognizes that any TLB lockdown scheme is heavily dependent on the microarchitecture, making it inappropriate to define a common mechanism across all implementations. This means that:

- The architecture does not require TLB lockdown support.
- If TLB lockdown support is implemented, the lockdown mechanism is IMPLEMENTATION DEFINED. However, key properties of the interaction of lockdown with the architecture must be documented as part of the implementation documentation.

This means that:

- The TLB Type Register, [TLBTR](#), does not define the lockdown scheme in use.
- In AArch32 state, a region of the {coproc==0b1111, CRn==c10} encodings is reserved for IMPLEMENTATION DEFINED TLB functions, such as TLB lockdown functions. The reserved encodings are those with:
  - <CRm> == {c0, c1, c4, c8}.
  - All values of <opc2> and <opc1>.

An implementation might use some of the {coproc==0b1111, CRn==c10} encodings that are reserved for IMPLEMENTATION DEFINED TLB functions to implement additional TLB control functions. These functions might include:

- Unlock all locked TLB entries.
- Preload into a specific level of TLB. This is beyond the scope of the PLI and PLD hint instructions.

The inclusion of EL2 in an implementation does not affect the TLB lockdown requirements. However, in an implementation that includes EL2, exceptions generated as a result of TLB lockdown when executing in a Non-secure PL1 mode or in Non-secure User mode can be routed to either:

- Non-secure Abort mode, using the Non-secure Data Abort exception vector.
- Hyp mode, using the Hyp Trap exception vector.

For more information, see [Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations on page G1-4433](#).

#### G4.8.5 TLB conflict aborts

If an address matches multiple entries in the TLB, it is IMPLEMENTATION DEFINED whether a TLB conflict abort is generated.

An implementation can generate TLB conflict aborts on either or both instruction fetches and data accesses. A TLB conflict abort is classified as an MMU fault, see [MMU faults in AArch32 state on page G4-4657](#). This means:

- A TLB conflict abort on an instruction fetch is reported as a Prefetch Abort exception,
- A TLB conflict abort on a data access is reported as a Data Abort exception,

Fault status codes for TLB conflict aborts are defined for both the Short-descriptor and Long-descriptor translation table formats, see:

- [PL1 fault reporting with the Short-descriptor translation table format on page G4-4668](#)
- [PL1 fault reporting with the Long-descriptor translation table format on page G4-4670](#).

On a TLB conflict abort, the fault address register returns the address that generated the fault. That is, it returns the address that was being looked up in the TLB.

It is IMPLEMENTATION DEFINED whether a TLB conflict abort is a stage 1 abort or a stage 2 abort.

##### ———— Note ————

- An address can hit multiple entries in the TLB if the TLB has been invalidated inappropriately, for example if TLB invalidation required by this manual has not been performed.
- A stage 2 abort cannot be generated if the Non-secure PL1&0 stage 2 address translation is disabled.

The priority of the TLB conflict abort is IMPLEMENTATION DEFINED, because it depends on the form of any TLB that can generate the abort. However, the TLB conflict abort must have higher priority than any abort that depends on a value held in the TLB.

If an address matches multiple entries in the TLB and no TLB conflict abort not generated, the resulting behavior is CONSTRAINED UNPREDICTABLE, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6101](#). The CONSTRAINED UNPREDICTABLE behavior must not permit access to regions of memory with permissions or attributes that mean they cannot be accessed in the current Security state at the current Privilege level.

## G4.9 TLB maintenance requirements

[Translation Lookaside Buffers \(TLBs\) on page G4-4628](#) describes the ARM architectural provision for TLBs. Although the ARM architecture does not specify the form of any TLB structures, it does define the mechanisms by which TLBs can be maintained. The following sections describe the VMSAv8-32 TLB maintenance instructions:

- [General TLB maintenance requirements.](#)
- [Maintenance requirements on changing System register values on page G4-4637.](#)
- [Atomicity of register changes on changing virtual machine on page G4-4638.](#)
- [Synchronization of changes of ASID and TTBR on page G4-4639.](#)
- [The scope of TLB maintenance instructions on page G4-4641.](#)

### G4.9.1 General TLB maintenance requirements

TLB maintenance instructions provide a mechanism to invalidate entries from a TLB. As [Translation Lookaside Buffers \(TLBs\) on page G4-4628](#) describes, when address translation is enabled translation table entries can be allocated to a TLB at any time. This means that software must perform TLB maintenance between updating translation table entries that apply in a particular context and accessing memory locations whose translation is determined by those entries in that context.

#### ———— Note ————

This requirement applies to any translation table entry at any level of the translation tables, including an entry that points to further levels of the tables, provided that the entry in that level of the tables does not cause a Translation fault, an Address size fault, or an Access flag fault.

In addition to any TLB maintenance requirement, when changing the cacheability attributes of an area of memory, software must ensure that any cached copies of affected locations are removed from the caches. For more information see [Cache maintenance requirement created by changing translation table attributes on page G4-4648](#).

Because a TLB never holds any translation table entry that generates a Translation fault, an Address size fault, or an Access flag fault, a change from a translation table entry that causes a Translation, Address size, or Access flag fault to one that does not fault, does not require any TLB or branch predictor invalidation.

Special considerations apply to translation table updates that change the memory type, cacheability, or output address of an entry, see [Using break-before-make when updating translation table entries on page G4-4633](#).

In addition, software must perform TLB maintenance after updating the System registers if the update means that the TLB might hold information that applies to a current translation context, but is no longer valid for that context. [Maintenance requirements on changing System register values on page G4-4637](#) gives more information about this maintenance requirement.

Each of the translation regimes defined in [Figure G4-1 on page G4-4560](#) is a different context, and:

- For the Non-secure PL1&0 regime, a change in the VMID or ASID value changes the context.
- For the Secure PL1&0 regime, a change in the ASID value changes the context.

For operation in Non-secure PL1 or PL0 modes, a change of [HCR.VM](#), unless made at the same time as a change of VMID, requires the invalidation of all TLB entries for the Non-secure PL1&0 translation regime that apply to the current VMID. Otherwise, there is no guarantee that the effect of the change of [HCR.VM](#) is visible to software executing in the Non-secure PL1 and PL0 modes.

Any TLB maintenance instruction can affect any other TLB entries that are not locked down.

AArch32 state defines {coproc==0b1111, CRn==c8} System instructions for TLB maintenance instructions, and supports the following operations:

- Invalidate all unlocked entries in the TLB.
- Invalidate a single TLB entry, by VA, or VA and ASID for a non-global entry.
- Invalidate all TLB entries that match a specified ASID.
- Invalidate all TLB entries that match a specified VA, regardless of the ASID.
- Operations that apply across multiprocessors in the same Inner Shareable domain.

---

**Note**

---

An address-based TLB maintenance instruction that applies to the Inner Shareable domain does so regardless of the Shareability attributes of the address supplied as an argument to the instruction.

---

A TLB maintenance instruction that specifies a virtual address that would generate any MMU fault, including a virtual address that is not in the range of virtual addresses that can be translated, does not generate an abort.

EL2 provides additional TLB maintenance instructions for use in AArch32 state at PL2, and has some implications for the effect of the other TLB maintenance instructions, see [The scope of TLB maintenance instructions on page G4-4641](#).

In an implementation that includes EL3, the TLB maintenance instructions take account of the current Security state, as part of the address translation required for the TLB maintenance instruction.

Some TLB maintenance instructions are defined as operating only on instruction TLBs, or only on data TLBs. ARMv8 AArch32 state includes these instructions for backwards compatibility. However, more recent TLB maintenance instructions do not support this distinction. From the introduction of ARMv7, ARM deprecates any use of Instruction TLB maintenance instructions, or of Data TLB maintenance instructions, and developers must not rely on this distinction being maintained in future revisions of the ARM architecture.

The ARM architecture does not dictate the form in which the TLB stores translation table entries. However, for TLB invalidate instructions, the minimum size of the table entry that is invalidated from the TLB must be at least the size that appears in the translation table entry.

[The scope of TLB maintenance instructions on page G4-4641](#) describes the TLB maintenance instructions. The following subsections give more information about the general requirements for TLB maintenance:

- [Using break-before-make when updating translation table entries.](#)
- [The interaction of TLB lockdown with TLB maintenance instructions on page G4-4634.](#)
- [Ordering and completion of TLB maintenance instructions on page G4-4635.](#)
- [Use of ASIDs and VMIDs to reduce TLB maintenance requirements on page G4-4636.](#)

### Using break-before-make when updating translation table entries

To avoid possibly creating multiple TLB entries for the same address, and to avoid the effects of TLB caching possibly breaking coherency, ordering guarantees or uniprocessor semantics, or possibly failing to clear the Exclusives monitors, the architecture requires the use of a break-before-make sequence when changing translation table entries whenever multiple threads of execution can use the same translation tables and the change to the translation table entries involves any of:

- A change of the memory type.
- A change of the cacheability attributes.
- A change of the output address (OA), if the OA of at least one of the old translation table entries and the new translation table entry is writeable.
- A change to the size of block used by the translation system. This rule applies both:
  - When changing from a smaller size to a larger size, for example by replacing a table mapping with a block mapping in a stage 2 translation table.
  - When changing from a larger size to a smaller size, for example by replacing a block mapping with a table mapping in a stage 2 translation table.
- Creating a global entry when there might be non-global entries in a TLB that overlap with that global entry.

A break-before-make sequence on changing from an old translation table entry to a new translation table entry requires the following steps:

1. Replace the old translation table entry with an invalid entry, and execute a DSB instruction.
2. Invalidate the translation table entry with a broadcast TLB invalidation instruction, and execute a DSB instruction to ensure the completion of that invalidation.
3. Write the new translation table entry, and execute a DSB instruction to ensure that the new entry is visible.

This sequence ensures that at no time are both the old and new entries simultaneously visible to different threads of execution, and therefore the problems described at the start of this subsection cannot arise.

### The interaction of TLB lockdown with TLB maintenance instructions

The precise interaction of TLB lockdown with the TLB maintenance instructions is IMPLEMENTATION DEFINED. However, the architecturally-defined TLB maintenance instructions must comply with these rules:

- The effect on locked entry of a TLB invalidate all unlocked entries instruction or a TLB invalidate by VA all ASID instruction that would invalidate that entry if the entry was not locked must be one of the following, and it is IMPLEMENTATION DEFINED which behavior applies:
  - The instructions have no effect on entries that are locked down.
  - The instructions generate an IMPLEMENTATION DEFINED Data Abort exception if an entry is locked down, or might be locked down. For an invalidate instruction performed in AArch32 state, the {coproc==0b1111, CRn==c5} fault status register definitions include a Fault status code for cache and TLB lockdown faults, see [Table G4-25 on page G4-4668](#) for the codes used with the Short-descriptor translation table formats, or [Table G4-26 on page G4-4670](#) for the codes used with the Long-descriptor translation table formats.

In an implementation that includes EL2, if EL2 is using AArch32 and the value of HCR.TIDCP is 1, any such exceptions taken from a Non-secure PL1 mode are routed to Hyp mode, see [Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations on page G1-4433](#).
- This permits a usage model for TLB invalidate routines, where the routine invalidates a large range of addresses, without considering whether any entries are locked in the TLB.
- The effect on a locked TLB entry of a TLB invalidate by VA instruction or a TLB invalidate by ASID match instruction that would invalidate that entry if the entry was not locked must be one of the following, and it is IMPLEMENTATION DEFINED which behavior applies:
  - A locked entry is invalidated in the TLB.
  - The instruction has no effect on a locked entry in the TLB. In the case of the Invalidate single entry by VA, this means the PE treats the instruction as a NOP.
  - The instruction generates an IMPLEMENTATION DEFINED Data Abort exception if it operates on an entry that is locked down, or might be locked down. For an invalidate instruction performed in AArch32 state, the {coproc==0b1111, CRn==c5} fault status register definitions include a Fault status code for cache and TLB lockdown faults, see [Table G4-25 on page G4-4668](#) and [Table G4-26 on page G4-4670](#).

#### ————— Note —————

Any implementation that uses an abort mechanism for entries that can be locked down but are not actually locked down must:

- Document the IMPLEMENTATION DEFINED instruction sequences that perform the required invalidation on entries that are not locked down.
- Implement one of the other specified alternatives for the locked entries.

ARM recommends that, when possible, such IMPLEMENTATION DEFINED instruction sequences use the architecturally-defined maintenance instructions. This minimizes the number of customized maintenance operations required.

In addition, an implementation that uses an abort mechanism for handling TLB maintenance instructions on entries that can be locked down but are not actually locked down must also must provide a mechanism that ensures that no TLB entries are locked.

Similar rules apply to cache lockdown, see [The interaction of cache lockdown with cache maintenance instructions on page G3-4546](#).

The architecture does not guarantee that any unlocked entry in the TLB remains in the TLB. This means that, as a side-effect of a TLB maintenance instruction, any unlocked entry in the TLB might be invalidated.

## Ordering and completion of TLB maintenance instructions

The following rules describe the relations between the memory order model and the TLB maintenance instructions:

- A TLB invalidate instruction is complete when all memory accesses using the invalidated TLB entries have been observed by all observers, to the extent that those accesses must be observed. The Shareability and Cacheability of the accessed memory locations determine the extent to which the accesses must be observed.

### ———— Note ————

For a TLB invalidate instruction that affects other PEs, the set of memory accesses that have been observed when the TLB maintenance instruction is complete must include the memory accesses from those processes that used the invalidated TLB entries.

After the TLB invalidate instruction is complete, no new memory accesses using the invalidated TLB entries will be observed by those observers.

### ———— Note ————

This requirement does not mean that speculative memory accesses cannot be performed using those entries if it is impossible to tell that those memory accesses have been observed by the observers.

- A TLB maintenance instruction is only guaranteed to be complete after the execution of a DSB instruction.
- An ISB instruction, or a return from an exception, causes the effect of all completed TLB maintenance instructions that appear in program order before the ISB or return from exception to be visible to all subsequent instructions, including the instruction fetches for those instructions.
- An exception causes all completed TLB maintenance instructions, that appear in the instruction stream before the point where the exception is taken, to be visible to all subsequent instructions, including the instruction fetches for those instructions.
- All TLB maintenance instructions are executed in program order relative to each other.
- The execution of a Data or Unified TLB maintenance instruction is only guaranteed to be visible to a subsequent explicit load or store instruction after both:
  - The execution of a DSB instruction to ensure the completion of the TLB maintenance instruction.
  - Execution of a subsequent [Context synchronization event](#).
- The execution of an Instruction or Unified TLB maintenance instruction is only guaranteed to be visible to a subsequent instruction fetch after both:
  - The execution of a DSB instruction to ensure the completion of the TLB maintenance instruction.
  - Execution of a subsequent [Context synchronization event](#).

In all cases in this section where a DMB or DSB is referred to, it refers to a DMB or DSB whose required access type is both loads and stores. A DSB NSH is sufficient to ensure completion of TLB maintenance instructions that apply to a single PE. A DSB ISH is sufficient to ensure completion of TLB maintenance instructions that apply to PEs in the same Inner Shareable domain.

The following rules apply when writing translation table entries. They ensure that the updated entries are visible to subsequent accesses and cache maintenance instructions.

For TLB maintenance, the translation table walk is treated as a separate observer. This means:

- A write to the translation tables is only guaranteed to be seen by a translation table walk caused by an explicit load or store after the execution of both a DSB and an ISB.

However, the architecture guarantees that any writes to the translation tables are not seen by any explicit memory access that occurs in program order before the write to the translation tables.

- A write to the translation tables is only guaranteed to be seen by a translation table walk caused by the instruction fetch of an instruction that follows the write to the translation tables after both a DSB and an ISB.

Therefore, in a uniprocessor system, an example instruction sequence for writing a translation table entry, covering changes to the instruction or data mappings is:

```
STR rx, [Translation table entry]      ; write new entry to the translation table
DSB                                   ; ensures visibility of the new entry
Invalidate TLB entry by VA (and ASID if non-global) [page address]
Invalidate BTC
DSB                                   ; ensure completion of the Invalidate TLB instruction
ISB                                   ; ensure table changes visible to instruction fetch
```

## Use of ASIDs and VMIDs to reduce TLB maintenance requirements

To reduce the need for TLB maintenance on context switches, the lookups from some translation regimes can be associated with an ASID, or with an ASID and a VMID.

### ————— Note —————

The use of ASIDs and VMIDs in VMSAv8-32 is generally similar to their use in VMSAv8-64, see [Use of ASIDs and VMIDs to reduce TLB maintenance requirements on page D4-2113](#).

For more information about the use of ASIDs in VMSAv8-32 see [Global and process-specific translation table entries on page G4-4628](#).

## Common not private translations in VMSAv8-32

In an implementation that includes ARMv8.2-TTCNP, multiple PEs in the same Inner Shareable domain can use the same translation table entries for a given stage of address translation in a particular translation regime. This sharing is enabled by the TTBR.CnP field for the stage of address translation.

When the value of a TTBR.CnP field is 1, translation table entries pointed to by that TTBR are shared with all other PEs in the Inner Shareable domain for which the following conditions are met:

- The corresponding TTBR.CnP field has the value 1.
- That TTBR is using the Long-descriptor translation table format.
- If an ASID applies to the stage of translation corresponding to that TTBR then the current ASID value must be the same for all of the PEs that are sharing entries.
- If a VMID applies to the stage of translation corresponding to that TTBR then the current VMID value must be the same for all of the PEs that are sharing entries.

### ————— Note —————

In an implementation that includes EL3, the Secure instances of TTBR0 and TTBR1 relate to the Secure PL1&0 translation regime, and the Non-secure instances of TTBR0 and TTBR1 relate to the Non-secure PL1&0 translation regime.

Where a TLB combines information from stage 1 and stage 2 translation table entries into a single entry, this entry can be shared between different PEs only if the value of the TTBR.CnP bit is 1 for both stage 1 and stage 2 of the translation table walk.

The TTBR.CnP bit can be cached in a TLB.

For a given TTBR, if the value of TTBR.CnP is 1 on multiple PEs in the same Inner Shareable domain, and those PEs meet the other conditions for sharing translation table entries as defined in this section, but those TTBRs do not point to the same translation table entries, then the system is misconfigured, and performing an address translation using that TTBR:

- Might generate multiple hits in the TLB, and as a result generate an exception that is reported using the TLB conflict fault code, see *TLB conflict aborts* on page G4-4630.
- Otherwise, has a **CONSTRAINED UNPREDICTABLE** result, as described in *CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values* on page K1-6101.

## G4.9.2 Maintenance requirements on changing System register values

The TLB contents can be influenced by control bits in a number of System registers. This means the TLB must be invalidated after any changes to these bits, unless the changes are accompanied by a change to the VMID or ASID that defines the context to which the bits apply. The general form of the required invalidation sequence is as follows:

```
; Change control bits in System registers
ISB      ; Synchronize changes to the control bits
; Perform TLB invalidation of all entries that might be affected by the changed control bits
```

The System register changes that this applies to are:

- Any change to the **NMRR**, **PRRR**, **MAIR0**, **MAIR1**, **HMAIR0** or **HMAIR1** registers.
- Any change to the **SCTLR**.AFE bit, see *Changing the Access flag enable*.
- Any change to any of the **SCTLR**.{TRE, WXN, UWXN} bits.
- Any change to the Translation table base 0 address in **TTBR0**.
- Any change to the Translation table base 1 address in **TTBR1**.
- Any change to **HTTBR**.BADDR.
- Any change to **VTTBR**.BADDR.
- Changing **TTBCR**.EAE, see *Changing the current Translation table format* on page G4-4638.
- In an implementation that includes EL3, any change to the **SCR**.SIF bit.
- In an implementation that includes EL2:
  - Any change to the **HCR**.VM bit.
  - Any change to **HCR**.PTW bit, see *Changing HCR.PTW* on page G4-4638.
- When using the Short-descriptor translation table format:
  - Any change to the RGN, IRGN, S, or NOS fields in **TTBR0** or **TTBR1**.
  - Any change to the N, EAE, PD0 or PD1 fields in **TTBCR**
- When using the Long-descriptor translation table format:
  - Any change to the EAE, TnSZ, ORGNn, IRGNn, SHn, or EPDn fields in the **TTBCR**, where n is 0 or 1.
  - **Any change to the TTBCR2.**
  - Any change to the T0SZ, ORGN0, IRGN0, or SH0 fields in the **HTCR**.
  - Any change to the T0SZ, ORGN0, IRGN0, or SH0 fields in the **VTCR**.

### Changing the Access flag enable

In a PE that is using the Short-descriptor translation table format, it is **CONSTRAINED UNPREDICTABLE** whether the TLB caches the effect of the **SCTLR**.AFE bit on translation tables. This means that, after changing the **SCTLR**.AFE bit software must invalidate the TLB before it relies on the effect of the new value of the **SCTLR**.AFE bit, otherwise behavior is **CONSTRAINED UNPREDICTABLE**, see *CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values* on page K1-6101.

#### ————— Note —————

There is no enable bit for use of the Access flag when using the Long-descriptor translation table format.

## Changing HCR.PTW

When EL2 is using AArch32 and the value of the Protected table walk bit, [HCR.PTW](#), is 1, a stage 1 translation table access in the Non-secure PL1&0 translation regime, to an address that is mapped to any type of Device memory by its stage 2 translation, generates a stage 2 Permission fault. A TLB associated with a particular VMID might hold entries that depend on the effect of [HCR.PTW](#). Therefore, if the value of [HCR.PTW](#) is changed without a change to the VMID value, all TLB entries associated with the current VMID must be invalidated before executing software in a Non-secure PL1 or PL0 mode. If this is not done, behavior is **CONSTRAINED UNPREDICTABLE**, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6101](#).

## Changing the current Translation table format

The effect of changing [TTBCR.EAE](#) when executing in the translation regime affected by [TTBCR.EAE](#) with any stage of address translation for that translation regime enabled is **CONSTRAINED UNPREDICTABLE**. This means that, when [TTBCR.EAE](#) is changed for a given context, the TLB must be invalidated before resuming execution in that context, otherwise the effect is **CONSTRAINED UNPREDICTABLE**, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6101](#).

### G4.9.3 Atomicity of register changes on changing virtual machine

From the viewpoint of software executing in a Non-secure PL1 or PL0 mode, when there is a switch from one virtual machine to another, the registers that control or affect address translation must be changed atomically. This rule applies to the registers for:

- Non-secure PL1&0 stage 1 address translations. This means that all of the following registers must change atomically:
  - [PRRR](#) and [NMRR](#), if using the Short-descriptor translation table format.
  - [MAIR0](#) and [MAIR1](#), if using the Long-descriptor translation table format.
  - [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), and [CONTEXTIDR](#).
  - The [SCTLR](#).
- Non-secure PL1&0 stage 2 address translations. When EL2 is using AArch32, this means that all of the following registers and register fields must change atomically:
  - [VTTBR](#) and [VTCR](#).
  - [HMAIR0](#) and [HMAIR1](#).
  - The [HSCTLR](#).

#### ————— **Note** —————

Only some bits of [SCTLR](#) affect the stage 1 translation, and only some bits of [HSCTLR](#) affect the stage 2 translation. However, in each case, changing these bits requires a write to the register, and that write must be atomic with the other register updates.

These registers apply to execution in Non-secure PL1&0 modes. However, when updated as part of a switch of virtual machines they are updated by software executing in Hyp mode. This means the registers are *out of context* when they are updated, and no synchronization precautions are required.

#### ————— **Note** —————

By contrast, a translation table change associated with a change of ASID, made by software executing at PL1, can require changes to registers that are *in context*. [Synchronization of changes of ASID and TTBR on page G4-4639](#) describes appropriate precautions for such a change.

Software executing in Hyp mode, or in Secure state, must not use the registers that are associated with the Non-secure PL1&0 translation regime for speculative memory accesses.

## G4.9.4 Synchronization of changes of ASID and TTBR

A common virtual memory management requirement is to change the ASID and **TTBR** together to associate the new ASID with different translation tables, without any change to the current translation regime. When using the Short-descriptor translation table format, different registers hold the ASID and the translation table base address, meaning these two values cannot be updated atomically. Since a PE can perform a speculative memory access at any time, this lack of atomicity is a problem that software must address. Such a change is complicated by:

- The depth of speculative fetch being IMPLEMENTATION DEFINED.
- The use of branch prediction.

When using the Short-descriptor translation table format, the virtual memory management operations must ensure the synchronization of changes of the ContextID and the translation table registers. For example, some or all of the TLBs, branch predictors, and other caching of ASID and translation information might become corrupt with invalid translations. Synchronization is required to avoid either:

- The old ASID being associated with translation table walks from the new translation tables.
- The new ASID being associated with translation table walks from the old translation tables.

There are a number of possible solutions to this problem, and the most appropriate approach depends on the system. [Example G4-3](#), [Example G4-4](#), and [Example G4-5 on page G4-4640](#) describe three possible approaches.

---

### Note

Another instance of the synchronization problem occurs if a branch is encountered between changing the ASID and performing the synchronization. In this case the value in the branch predictor might be associated with the incorrect ASID. Software can address this possibility using any of these approaches, but instead software might be written in a way that avoids such branches.

---

### Example G4-3 Using a reserved ASID to synchronize ASID and TTBR changes

---

In this approach, a particular ASID value is reserved for use by the operating system, and is used only for the synchronization of the ASID and **TTBR**. This example uses the value of 0 for this purpose, but any value could be used.

This approach can be used only when the size of the mapping for any given virtual address is the same in the old and new translation tables.

The maintenance software uses the following sequence, that must be executed from memory marked as global:

```
Change ASID to 0
ISB
Change TTBR
ISB
Change ASID to new value
```

This approach ensures that any non-global pages fetched at a time when it is uncertain whether the old or new translation tables are being accessed are associated with the unused ASID value of 0. Since the ASID value of 0 is not used for any normal operations these entries cannot cause corruption of execution.

---

### Example G4-4 Using translation tables containing only global mappings when changing the ASID

---

A second approach involves switching the translation tables to a set of translation tables that only contain global mappings while switching the ASID.

The maintenance software uses the following sequence, that must be executed from memory marked as global:

```
Change TTBR to the global-only mappings
ISB
```

Change ASID to new value  
ISB  
Change TTBR to new value

This approach ensures that no non-global pages can be fetched at a time when it is uncertain whether the old or new ASID value will be used.

This approach works without the need for TLB invalidations in systems that have caching of intermediate levels of translation tables, as described in [General TLB maintenance requirements on page G4-4632](#), provided that the translation tables containing only global mappings have only level 1 translation table entries of the following kinds:

- Entries that are global.
- Pointers to level 2 tables that hold only global entries, and that are the same level 2 tables that are used for accessing global entries by both:
  - The set of translation tables that were used under the old ASID value.
  - The set of translation tables that will be used with the new ASID value.
- Invalid level 1 entries.

In addition, all sets of translation tables in this example should have the same Shareability and Cacheability attributes, as held in the [TTBR0](#).{ORGN, IRGN} or [TTBR1](#).{ORGN, IRGN} fields.

If these rules are not followed, then the implementation might cache level 1 translation table entries that require explicit invalidation.

---

#### Example G4-5 Disabling non-global mappings when changing the ASID

---

In systems where only the translation tables indexed by [TTBR0](#) hold non-global mappings, maintenance software can use the [TTBCR](#).PD0 field to disable use of [TTBR0](#) during the change of ASID. This means the system does not require a set of global-only mappings.

The maintenance software uses the following sequence, that must be executed from a memory region with a translation that is accessed using the base address in the [TTBR1](#) register, and is marked as global:

Set [TTBCR](#).PD0 = 1  
ISB  
Change ASID to new value  
Change [TTBR](#) to new value  
ISB  
Set [TTBCR](#).PD0 = 0

This approach ensures that no non-global pages can be fetched at a time when it is uncertain whether the old or new ASID value will be used.

---

When using the Long-descriptor translation table format, [TTBCR](#).A1 holds the number, 0 or 1, of the [TTBR](#) that holds the current ASID. This means the current [TTBR](#) can also hold the current ASID, and the current translation table base address and ASID can be updated atomically when:

- [TTBR0](#) is the only [TTBR](#) being used. [TTBCR](#).A1 must be set to 0.
- [TTBR0](#) points to the only translation tables that hold non-global entries, and [TTBCR](#).A1 is set to 0.
- [TTBR1](#) points to the only translation tables that hold non-global entries, and [TTBCR](#).A1 is set to 1.

In these cases, software can update the current translation table base address and ASID atomically, by updating the appropriate [TTBR](#), and does not require a specific routine to ensure synchronization of the change of ASID and base address.

However, in all other cases using the Long-descriptor format, the synchronization requirements are identical to those when using the Short-descriptor formats, and the examples in this section indicate how synchronization might be achieved.

---

**Note**

---

When using the Long-descriptor translation table format, [CONTEXTIDR](#).ASID has no significance for address translation, and is only an extension of the Context ID value.

---

### G4.9.5 The scope of TLB maintenance instructions

TLB maintenance instructions provide a mechanism for invalidating entries from TLB caching structures, to ensure that changes to the translation tables are reflected correctly in the TLB caching structures. To support TLB maintenance in multiprocessor systems, there are maintenance operations that apply to the TLBs of all PEs in the same Inner Shareable domain.

The architecture permits the caching of any translation table entry that has been returned from memory without a fault and that does not, itself, cause a Translation Fault, an Address size fault, or an Access Flag fault. This means the TLB:

- Cannot hold an entry that, when used for a translation table lookup, causes a Translation fault, an Address size fault, or an Access Flag fault.
- Can hold an entry for a translation table lookup for a translation that causes a Translation Fault, an Address size fault, or an Access Flag fault at a subsequent level of translation table lookup. For example, it can hold an entry for the level 1 lookup of a translation that causes a Translation fault, an Address size fault, or an Access Flag fault at level 2 or level 3 of lookup.

This means that entries cached in the TLB can include:

- Translation table entries that point to a subsequent table to be used in the current stage of translation.
- In an implementation that includes EL2:
  - Stage 2 translation table entries that are used as part of a stage 1 translation table walk.
  - Stage 2 translation table entries for translating the output address of a stage 1 translation.

Such entries might be held in intermediate TLB caching structures that are distinct from the data caches, in that they are not required to be invalidated as the result of writes of the data. The architecture makes no restriction on the form of these intermediate TLB caching structures.

The architecture does not intend to restrict the form of TLB caching structures used for holding translation table entries. In particular for translation regimes that involve two stages of translation, it recognizes that such caching structures might contain:

- At any level of the translation table walk, entries containing information from stage 1 translation table entries.
- In an implementation that includes EL2:
  - At any level of the translation table walk, entries containing information from stage 2 translation table entries.
  - At any level of the translation table walk, entries combining information from both stage 1 and stage 2 translation table entries.

---

**Note**

---

For the purpose of TLB maintenance, the term *TLB entry* denotes any structure, including temporary working registers in translation table walk hardware, that holds a translation table entry.

---

For the TLB maintenance instructions:

- If a TLB maintenance instruction is required to apply to stage 1 entries then it must apply to any cached entry in the caching structures that includes any stage 1 information that would be used to translate the address being invalidated, including any entry that combines information from both stage 1 and stage 2 translation table entries.

---

**Note**

---

- Where stage 1 information has been cached in multiple TLB entries, as could occur from splintering a page when caching in the TLB, then the invalidation must apply to each cached entry containing stage 1 information from the page that is used to translate the address being invalidated, regardless of whether or not that cached entry would be used to translate the address being invalidated.
  - As stated in [Global and process-specific translation table entries on page G4-4628](#), translation table entries from levels of translation other than the final level are treated as being non-global. ARM expects that, in at least some implementations, cached copies of levels of the translation table walk other than the last level are tagged with their ASID, regardless of whether the final level is global. This means that TLB invalidations that involve the ASID require the ASID to match such entries to perform the required invalidation.
- 

- If a TLB maintenance instruction is required to apply to stage 2 entries only, then:
  - It is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.
  - It must apply to caching structures that contain information only from stage 2 translation table entries.
- If a TLB maintenance instruction is required to apply to both stage 1 and stage 2 entries, then it must apply to any entry in the caching structures that includes information from either a stage 1 translation table entry or a stage 2 translation table entry, including any entry that combines information from both stage 1 and stage 2 translation table entries.

[Table G4-23 on page G4-4643](#) summarizes the required effect of the AArch32 TLB maintenance instructions, that operate only on TLBs on the PE that executes the instruction. Additional TLB maintenance instructions that:

- Apply across all PEs in the same Inner Shareable domain. Each instruction shown in the table has an Inner Shareable equivalent, identified by an IS suffix. For example, the Inner Shareable equivalent of [TLBIALl](#) is [TLBIALlIS](#). See also [EL2 forced broadcasting of TLB maintenance instructions on page G4-4644](#).
- Can apply to separate Instruction or Data TLBs. These instructions are indicated by a footnote to the table. ARM deprecates any use of these instructions.

---

**Note**

---

- The architecture permits a TLB invalidation instruction to affect any unlocked entry in the TLB. [Table G4-23 on page G4-4643](#) defines only the entries that each instruction must invalidate.
  - All TLB instructions, including those that operate on a VA match, operate as described regardless of the value of [SCTLR.M](#).
- 

When interpreting the table:

**Related operations** Each instruction description applies also to any equivalent instruction that either:

- Applies to all PEs in the same Inner Shareable domain.
- Applies only to a data TLB, or only to an instruction TLB.

So, for example, the [TLBIALl](#) instruction description applies also to [TLBIALlIS](#), [ITLBIALl](#), and [DTLBIALl](#).

[TLB maintenance instructions, functional group on page G4-4735](#) lists all of the TLB maintenance instructions.

**Matches the VA** Means the VA argument for the instruction must match the VA value in the TLB entry.

**Matches the ASID** Means the ASID argument for the instruction must match the ASID in use when the TLB entry was assigned.

**Matches the current VMID**

Means the current VMID must match the VMID in use when the TLB entry was assigned.

The dependency on the VMID applies even when the value of [HCR.VM](#) is 0, including situations where there is no use of virtualization. However, [VTTBR.VMID](#) resets to zero, meaning there is a valid VMID from reset.

**Execution at PL2** Descriptions of operations at PL2 apply only to implementations that include EL2.

For the definitions of the translation regimes referred to in the table see [About VMSAv8-32 on page G4-4558](#).

**Table G4-23 Effect of the TLB maintenance instructions**

Instruction	Executed from		Effect, must invalidate any entry that matches all stated conditions
	State	Mode	
<a href="#">TLBIALL</a> <sup>a</sup>	Secure	PL1	All entries for the Secure PL1&0 translation regime. That is, all entries that were allocated in Secure state.
	Non-secure	PL1	All entries for stage 1 of the Non-secure PL1&0 translation regime that match the current VMID.
		Hyp	All entries for stage 1 or stage 2 of the Non-secure PL1&0 translation regime that match the current VMID.
<a href="#">TLBIMVA</a> <sup>a</sup>	Secure	PL1	Any entry for the Secure PL1&0 translation regime that both: <ul style="list-style-type: none"> <li>Matches the VA argument.</li> <li>Matches the ASID argument, or is global.</li> </ul>
	Non-secure	PL1 or Hyp	Any entry for stage 1 of the Non-secure PL1&0 translation regime to which all of the following apply. The entry: <ul style="list-style-type: none"> <li>Matches the VA argument.</li> <li>Matches the ASID argument, or is global.</li> <li>Matches the current VMID.</li> </ul>
<a href="#">TLBIASID</a> <sup>a</sup>	Secure	PL1	Any entry for the Secure PL1&0 translation regime that matches the specified ASID and either: <ul style="list-style-type: none"> <li>Is from a level of lookup above the final level.</li> <li>Is a non-global entry from the final level of lookup.</li> </ul>
	Non-secure	PL1 or Hyp	Any entry for stage 1 of the Non-secure PL1&0 translation regime that both: <ul style="list-style-type: none"> <li>Matches the specified ASID and either: <ul style="list-style-type: none"> <li>Is from a level of lookup above the final level.</li> <li>Is a non-global entry from the final level of lookup.</li> </ul> </li> <li>Matches the current VMID.</li> </ul>
<a href="#">TLBIMVAA</a>	Secure	PL1	Any entry for the Secure PL1&0 translation regime that matches the VA argument.
	Non-secure	PL1 or Hyp	Any entry for stage 1 of the Non-secure PL1&0 translation regime that both: <ul style="list-style-type: none"> <li>Matches the VA argument.</li> <li>Matches the current VMID.</li> </ul>
<a href="#">TLBIALLNSNH</a> <sup>b</sup>	Secure	Monitor	All entries for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.
	Non-secure	Hyp	
<a href="#">TLBIALLH</a> <sup>b</sup>	Secure	Monitor	All entries for the Non-secure PL2 translation regime. That is, any entry that was allocated in Non-secure state from Hyp mode.
	Non-secure	Hyp	

**Table G4-23 Effect of the TLB maintenance instructions (continued)**

Instruction	Executed from		Effect, must invalidate any entry that matches all stated conditions
	State	Mode	
TLBIMVAL	Secure	PL1	Any entry for stage 1 of the Secure PL1&0 translation regime that is from the last level of the translation table walk and both: <ul style="list-style-type: none"> <li>Matches the VA argument.</li> <li>Matches the ASID argument, or is global.</li> </ul>
	Non-secure	PL1 or Hyp	Any entry for stage 1 of the Non-secure PL1&0 translation regime that is from the last level of the translation table walk and to which all of the following apply. The entry: <ul style="list-style-type: none"> <li>Matches the VA argument.</li> <li>Matches the ASID argument, or is global.</li> <li>Matches the current VMID.</li> </ul>
TLBIMVAAL	Secure	PL1	Any entry for stage 1 of the Secure PL1&0 translation regime that is from the last level of the translation table walk and matches the VA argument.
	Non-secure	PL1 or Hyp	Any entry for stage 1 of the Non-secure PL1&0 translation regime that is from the last level of the translation table walk and both: <ul style="list-style-type: none"> <li>Matches the VA argument.</li> <li>Matches the current VMID.</li> </ul>
TLBIMVAH <sup>b</sup>	Secure	Monitor	Any entry for the Non-secure PL2 translation regime that matches the VA argument.
	Non-secure	Hyp	
TLBIMVALH <sup>b</sup>	Secure	Monitor	Any entry for the Non-secure PL2 translation regime that is from the last level of the translation table walk and matches the VA argument.
	Non-secure	Hyp	
TLBIIPAS2 <sup>b, c</sup>	Secure	Monitor <sup>d</sup>	Any entry for stage 2 of the PL1&0 translation regime that both: <ul style="list-style-type: none"> <li>Matches the IPA argument.</li> <li>Matches the current VMID.</li> </ul>
	Non-secure	Hyp	
TLBIIPAS2L <sup>b, c</sup>	Secure	Monitor <sup>d</sup>	Any entry for stage 2 of the PL1&0 translation regime that is from the last level of translation and both: <ul style="list-style-type: none"> <li>Matches the IPA argument.</li> <li>Matches the current VMID.</li> </ul>
	Non-secure	Hyp	

- a. The architecture defines variants of these instructions that apply only to instruction TLBs, and only to data TLBs. ARM deprecates any use of these variants. For more information, see the referenced description of the operation.
- b. Available only in an implementation that includes EL2. See also [EL2 forced broadcasting of TLB maintenance instructions](#).
- c. This instruction is CONSTRAINED UNPREDICTABLE if executed in any AArch32 Secure privileged mode, see [Hyp mode TLB maintenance instructions on page K1-6116](#).
- d. This instruction executes as a NOP when SCR.NS == 0.

### EL2 forced broadcasting of TLB maintenance instructions

In an implementation that includes EL2, when the value of [HCR.FB](#) is 1, the TLB maintenance instructions that are not broadcast across the Inner Shareable domain are forced to operate across the Inner Shareable domain when executed in a Non-secure PL1 mode. For example, when the value of [HCR.FB](#) is 1, a [TLBIMVA](#) instruction executed in a Non-secure PL1 mode performs the same invalidation as the invalidation performed by a [TLBIMVAIS](#) instruction.

### **TLB maintenance with different translation granule sizes**

If a TLB maintenance instruction specifying a virtual address affecting the PL2 translation regime is broadcast from a PE using AArch32 to a PE using AArch64 using a translation granule size that is different from the AArch32 translation granule size for that same translation regime, the TLB maintenance instruction is not required to perform any invalidation on the recipient PE.

If a TLB maintenance instruction specifying a virtual address affecting the PL1 translation regime is broadcast from a PE using AArch32 using one translation granule size for that translation regime for a particular ASID, VMID (if applicable), and Security state, to a PE using AArch64 where EL1 for the same ASID, VMID (if applicable), and Security state, is using a translation granule size that is different from the AArch32 translation granule size, the TLB maintenance instruction is not required to perform any invalidation on the recipient PE.

## G4.10 Caches in VMSAv8-32

The ARM architecture describes the required behavior of an implementation of the architecture. As far as possible it does not restrict the implemented microarchitecture, or the implementation techniques that might achieve the required behavior.

Maintaining this level of abstraction is difficult when describing the relationship between memory address translation and caches, especially regarding the indexing and tagging policy of caches. This section:

- Summarizes the architectural requirements for the interaction between caches and memory translation.
- Gives some information about the likely implementation impact of the required behavior.

The following sections give this information:

- [Data and unified caches](#).
- [Instruction caches on page G4-4647](#).

In addition [Cache maintenance requirement created by changing translation table attributes on page G4-4648](#) describes the cache maintenance required after updating the translation tables to change the attributes of an area of memory.

For more information about cache maintenance see:

- [AArch32 cache and branch predictor support on page G3-4525](#). This section describes the ARM cache maintenance instructions.
- [Cache maintenance instructions, functional group on page G4-4734](#). This section summarizes the System register encodings used for these operations when executing in AArch32 state.

### G4.10.1 Data and unified caches

For data and unified caches, the use of memory address translation is entirely transparent to any data access other than as described in [Mismatched memory attributes on page E2-2792](#).

This means that the behavior of accesses from the same observer to different VAs, that are translated to the same PA with the same memory attributes, is fully coherent. This means these accesses behave as follows, regardless of which VA is accessed:

- Two writes to the same PA occur in program order.
- A read of a PA returns the value of the last successful write to that PA.
- A write to a PA that occurs, in program order, after a read of that PA, has no effect on the value returned by that read.

The memory system behaves in this way without any requirement to use barrier or cache maintenance instructions.

In addition, if cache maintenance is performed on a memory location, the effect of that cache maintenance is visible to all aliases of that physical memory location.

These properties are consistent with implementing all caches that can handle data accesses as *Physically-indexed, physically-tagged* (PIPT) caches.

## G4.10.2 Instruction caches

In the ARM architecture, an instruction cache is a cache that is accessed only as a result of an instruction fetch. Therefore, an instruction cache is never written to by any load or store instruction executed by the PE.

The ARM architecture permits different behaviors for instruction caches. These are identified by descriptions of the associated expected implementation. The following subsections describe the behavior associated with these cache types, including any occasions where explicit cache maintenance is required to make the use of memory address translation transparent to the instruction cache:

- *PIPT (Physically-indexed, physically-tagged) instruction caches.*
- *VPIPT (VMID-aware PIPT) instruction caches.*
- *VIPT (Virtually-indexed, physically-tagged) instruction caches on page G4-4648.*
- *The IVIPT architecture Extension on page G4-4648.*

In AArch32 state, the `CTR.LIIP` field identifies the form of the instruction caches.

### ———— Note ————

For software to be portable between implementations that might use any of PIPT instruction caches, **VPIPT instruction caches**, or VIPT instruction caches, software must invalidate the instruction cache whenever any condition occurs that would require instruction cache maintenance for at least one of the instruction cache types.

### PIPT (*Physically-indexed, physically-tagged*) instruction caches

For a PIPT instruction cache:

- The use of memory address translation is entirely transparent to all instruction fetches other than as described in *Mismatched memory attributes* on page E2-2792.
- If cache maintenance is performed on a memory location, the effect of that cache maintenance is visible to all aliases of that physical memory location.

An implementation that provides PIPT instruction caches implements the IVIPT Extension, see *The IVIPT architecture Extension* on page G4-4648.

### VPIPT (*VMID-aware PIPT*) instruction caches

An implementation that includes ARMv8.2-VPIPT can implement VPIPT instruction caches.

For a VPIPT instruction cache:

- Instruction fetches from Non-secure EL1 and Non-secure EL0 are only permitted to hit in the cache if the instruction fetch is made using the VMID that was used when the entry in the instruction cache was fetched.
- An instruction cache maintenance instruction executed at Non-secure EL0 or at Non-secure EL1 is required to have an effect on entries in the instruction cache only if those entries were fetched using the VMID that is current when the cache maintenance instruction is executed.

All other requirements for the use of cache maintenance instructions are the same as for *PIPT (Physically-indexed, physically-tagged) instruction caches*.

An implementation that provides VPIPT instruction caches implements the IVIPT Extension, see *The IVIPT architecture Extension* on page G4-4648.

### VIPT (*Virtually-indexed, physically-tagged*) instruction caches

For a VIPT instruction cache:

- The use of memory address translation is transparent to all instruction fetches other than for the effect of memory address translation on instruction cache invalidate by address operations or as described in [Mismatched memory attributes on page E2-2792](#).

---

**Note**

---

Cache invalidation is the only cache maintenance instruction that can be performed on an instruction cache.

- If instruction cache invalidation by address is performed on a memory location, the effect of that invalidation is visible only to the virtual address supplied with the operation. The effect of the invalidation might not be visible to any other virtual address aliases of that physical memory location.

The only architecturally-guaranteed way to invalidate all aliases of a physical address from a VIPT instruction cache is to invalidate the entire instruction cache.

An implementation that provides VIPT instruction caches implements the IVIPT Extension, see [The IVIPT architecture Extension](#).

### The IVIPT architecture Extension

In ARMv8, any permitted instruction cache implementation can be described as implementing the *IVIPT Extension* to the ARM architecture.

The formal definition of the ARM IVIPT Extension is that it reduces the instruction cache maintenance requirement to the following condition:

- Instruction cache maintenance is required only after writing new data to a physical address that holds an instruction.

---

**Note**

---

Previous versions of the ARM architecture have permitted an instruction cache option that does not implement the ARM IVIPT Extension.

## G4.10.3 Cache maintenance requirement created by changing translation table attributes

Any change to the translation tables to change the attributes of an area of memory can require maintenance of the translation tables, as described in [General TLB maintenance requirements on page G4-4632](#). If the change affects the cacheability attributes of the area of memory, including any change between Write-Through and Write-Back attributes, software must ensure that any cached copies of affected locations are removed from the caches, typically by cleaning and invalidating the locations from the levels of cache that might hold copies of the locations affected by the attribute change. Any of the following changes to the inner cacheability or outer cacheability attribute creates this maintenance requirement:

- Write-Back to Write-Through.
- Write-Back to Non-cacheable.
- Write-Through to Non-cacheable.
- Write-Through to Write-Back.

The cache clean and invalidate avoids any possible coherency errors caused by mismatched memory attributes.

Similarly, to avoid possible coherency errors caused by mismatched memory attributes, the following sequence must be followed when changing the Shareability attributes of a cacheable memory location:

1. Make the memory location Non-cacheable, Outer Shareable.
2. Clean and invalidate the location from them cache.
3. Change the Shareability attributes to the required new values.

## G4.11 VMSAv8-32 memory aborts

In a VMSAv8-32 implementation, the following mechanisms cause a PE to take an exception on a failed memory access:

<b>Debug exception</b>	An exception caused by the debug configuration, see <a href="#">Chapter G2 AArch32 Self-hosted Debug</a> .
<b>Alignment fault</b>	An Alignment fault is generated if the address used for a memory access does not have the required alignment for the operation. For more information see <a href="#">Unaligned data access on page E2-2777</a> and <a href="#">Alignment faults on page G4-4656</a> .
<b>MMU fault</b>	An MMU fault is a fault generated by the fault checking sequence for the current translation regime. See <a href="#">MMU faults in AArch32 state on page G4-4657</a> .
<b>External abort</b>	Any memory system fault other than a Debug exception, an Alignment fault, or an MMU fault.

Collectively, these mechanisms are called *aborts*. [Chapter G2 AArch32 Self-hosted Debug](#) and [Chapter H3 Halting Debug Events](#) describe Debug exceptions, and the remainder of this section describes Alignment faults, MMU faults, and External aborts.

The exception generated on a synchronous memory abort:

- On an instruction fetch is called the Prefetch Abort exception.
- On a data access is called the Data Abort exception.

### ———— Note ————

The Prefetch Abort exception applies to any synchronous memory abort on an instruction fetch. It is not restricted to speculative instruction fetches.

In AArch32 state, asynchronous memory aborts are a type of External abort, and are treated as a type of Data Abort exception.

The following sections describe the abort mechanisms:

- [Routing of aborts taken to AArch32 state](#).
- [VMSAv8-32 MMU fault terminology on page G4-4652](#).
- [The MMU fault-checking sequence on page G4-4652](#).
- [Alignment faults on page G4-4656](#).
- [MMU faults in AArch32 state on page G4-4657](#).
- [External abort on a translation table walk on page G4-4659](#).
- [AArch32 state prioritization of synchronous aborts from a single stage of address translation on page G4-4660](#).

An access that causes an abort is said to be aborted. On an abort, System registers are used to record context information. For more information see [Exception reporting in a VMSAv8-32 implementation on page G4-4663](#).

### G4.11.1 Routing of aborts taken to AArch32 state

A memory abort is either a Data Abort exception or a Prefetch Abort exception. When executing in AArch32 state, depending on the cause of the abort, and possibly on configuration settings, an abort is taken either:

- To the Exception level of the PE mode from which the abort is taken. In this case the abort is taken to AArch32 state.
- To a higher Exception level. In this case the Exception level to which the abort is taken is either:
  - Using AArch32. In this case, this chapter describes how the abort is handled.
  - Using AArch64. In this case, [Chapter D4 The AArch64 Virtual Memory System Architecture](#) describes how the abort is handled.

For an abort taken to an Exception level that is using AArch32, the mode to which a memory abort is taken depends on the reason for the exception, the mode the PE is in when it takes the exception, and configuration settings, as follows:

#### Memory aborts taken to Monitor mode

If an implementation includes EL3, when the value of [SCR.EA](#) is 1, all External aborts are taken to EL3, and if EL3 is using AArch32 they are taken to Monitor mode. This rule applies to aborts taken from Secure modes and from Non-secure modes. For more information see [Asynchronous exception routing controls on page G1-4367](#).

---

##### Note

- Although the referenced section mostly describes the routing of asynchronous exceptions, it includes the [SCR.EA](#) control that applies to both synchronous external aborts and SError interrupts.
- The [SCR](#) is implemented only as part of EL3.

#### Memory aborts taken to Secure Abort mode

If an implementation includes EL3, when the PE is executing in Secure state, all memory aborts that are not routed to EL3 are taken to Secure Abort mode.

---

##### Note

The only memory aborts that can be routed to Monitor mode are External aborts.

#### Memory aborts taken to Hyp mode

If an implementation includes EL2, when the PE is executing in Non-secure state, the following aborts are taken to EL2. If EL2 is using AArch32 this means they are taken to Hyp mode:

- Alignment faults taken:
  - When the PE is in Hyp mode.
  - When the PE is in a Non-secure PL1 or PL0 mode and the exception is generated because the Non-secure PL1&0 stage 2 translation identifies the target of an unaligned access as any type of Device memory.
  - When the PE is in Non-secure User mode and [HCR.TGE](#) is set to 1. For more information see [Abort exceptions, when the value of HCR.TGE is 1 on page G1-4357](#).
- When the PE is using the Non-secure PL1&0 translation regime:
  - MMU faults from stage 2 translations, for which the stage 1 translation did not cause an MMU fault.
  - Any abort taken during the stage 2 translation of an address accessed in a stage 1 translation table walk that is not routed to Secure Monitor mode, see [Stage 2 fault on a stage 1 translation table walk on page G4-4656](#).
- When the PE is using the Non-secure PL2 translation regime, MMU faults from stage 1 translations.

---

##### Note

The Non-secure PL2 translation regime has only one stage of translation.

- External aborts, if **SCR.EA** is set to 0 and any of the following applies:
  - The PE was executing in Hyp mode when it took the exception.
  - The PE was executing in a Non-secure PL0 or PL1 mode when it took the exception, the abort is asynchronous, and **HCR.AMO** is set to 1. For more information see [Asynchronous exception routing controls on page G1-4367](#).
  - The PE was executing in the Non-secure User mode when it took the exception, the abort is synchronous, and **HCR.TGE** is set to 1. For more information see [Abort exceptions, when the value of HCR.TGE is 1 on page G1-4357](#).
  - The abort occurred on a stage 2 translation table walk.
- Debug exceptions, if **HDCR.TDE** is set to 1. For more information, see [Routing debug exceptions to EL2 using AArch32 on page G1-4358](#).

#### Memory aborts taken to Non-secure Abort mode

In an implementation that does not include EL3, all memory aborts that are taken to an Exception level that is using AArch32 are taken to Abort mode.

Otherwise, when the PE is executing in Non-secure state, the following aborts are taken to Non-secure Abort mode:

- When the PE is in a Non-secure PL1 or PL0 mode, Alignment faults taken for any of the following reasons:
  - **SCTLR.A** is set to 1.
  - An instruction that does not support unaligned accesses is committed for execution, and the instruction accesses an unaligned address.
  - The PL1&0 stage 1 translation identifies the target of an unaligned access as any type of Device memory.

#### Note

In an implementation that does not include EL2, this case results in a **CONSTRAINED UNPREDICTABLE** memory access, see [Cases where unaligned accesses are CONSTRAINED UNPREDICTABLE on page E2-2778](#) and [Loads and Stores to unaligned locations on page K1-6098](#).

If an implementation includes EL2 and the PE is in Non-secure User mode, these exceptions are taken to Abort mode only if the value of **HCR.TGE** is 0.

- When the PE is using the Non-secure PL1&0 translation regime, an MMU fault from a stage 1 translation.
- External aborts, if all of the following apply:
  - The abort is not on a stage 2 translation table walk.
  - The PE is not in Hyp mode.
  - The value of **SCR.EA** is 0.
  - The abort is asynchronous, and **HCR.AMO** is set to 0.
  - The abort is synchronous, and **HCR.TGE** is set to 0.
- Virtual Aborts, see [Virtual exceptions when an implementation includes EL2 on page G1-4365](#).
- When the value of **HDCR.TDE** is 0, Debug exceptions. For more information, see [Routing debug exceptions to EL2 using AArch32 on page G1-4358](#).

#### Note

If EL0 is using AArch32 and EL1 is using AArch64 then any of these memory aborts taken from User mode are taken to EL1 as described in [Chapter D4 The AArch64 Virtual Memory System Architecture](#).

### Memory aborts with IMPLEMENTATION DEFINED behavior

In addition, a PE can generate an abort for an IMPLEMENTATION DEFINED reason associated with lockdown. In an implementation that includes EL2, whether such an abort is taken to Non-secure Abort mode or is taken to EL2 is IMPLEMENTATION DEFINED, and an implementation might include a mechanism to select whether the abort is routed to Non-secure Abort mode or to EL2.

When the PE is in a Non-secure mode other than Hyp mode, if multiple factors cause an Alignment fault, the abort is taken to Non-secure Abort mode if any of the factors require the abort to be taken to Abort mode. For example, if the **SCTLR.A** bit is set to 1, and the access is an unaligned access to an address that the stage 2 translation tables mark as Device-nGnRnE, then the abort is taken to Non-secure Abort mode.

For more information see [Handling exceptions that are taken to an Exception level using AArch32 on page G1-4340](#).

## G4.11.2 VMSAv8-32 MMU fault terminology

The ARMv7 Large Physical Address Extension introduced new terminology for faults on a stage of address translation, to provide consistent terminology across all implementations. [Table G4-24](#) shows the terminology used in this manual for an MMU faults, compared with older ARM documentation. The current terms are the same for faults that occur with the Short-descriptor translation table format and with the Long-descriptor format, and also apply to faults in a level 3 lookup when using the Long-descriptor translation table format.

**Table G4-24 MMU fault terminology**

Current term	Old term	Note
Level 1 Translation fault	Section Translation fault	-
Level 2 Translation fault	Page Translation fault	-
Level 3 Translation fault	-	Long-descriptor translation table format only.
Level 1 Access flag fault	Section Access flag fault	-
Level 2 Access flag fault	Page Access flag fault	-
Level 3 Access flag fault	-	Long-descriptor translation table format only.
Level 1 Domain fault	Section Domain fault	Short-descriptor translation table format only, except for reporting faults on address translation instructions in the 64-bit <b>PAR</b> , see <a href="#">Determining the PAR format on page G4-4686</a> . Cannot occur at level 3.
Level 2 Domain fault	Page Domain fault	
Level 1 Permission fault	Section Permission fault	-
Level 2 Permission fault	Page Permission fault	-
Level 3 Permission fault	-	Long-descriptor translation table format only.

In an implementation that includes EL2, MMU faults are also classified by the translation stage at which the fault is generated. This means that a memory access from a Non-secure PL1 or PL0 mode can generate:

- A stage 1 MMU fault, for example, a stage 1 Translation fault.
- A stage 2 MMU fault, for example, a stage 2 Translation fault.

## G4.11.3 The MMU fault-checking sequence

This section describes the MMU checks made for the memory accesses required for instruction fetches and for explicit memory accesses:

- If an instruction fetch faults, it generates a Prefetch Abort exception.
- If an data memory access faults, it generates a Data Abort exception.

For more information about Prefetch Abort exceptions and Data Abort exceptions see [Handling exceptions that are taken to an Exception level using AArch32](#) on page G1-4340.

In VMSAv8-32, all memory accesses require VA to PA translation. Therefore, when a corresponding stage of address translation is enabled, each access requires a lookup of the translation table descriptor for the accessed VA. For more information, see [Translation tables on page G4-4571](#) and subsequent sections of this chapter. MMU fault checking is performed for each level of translation table lookup. If an implementation includes EL2 and is operating in Non-secure state, MMU fault checking is performed for each stage of address translation.

---

**Note**

In an implementation that includes EL2, if a PE is executing in Non-secure state, the operating system or similar Non-secure system software defines the stage 1 translation tables in the IPA address map, and typically is unaware of the stage 2 translation from IPA to PA. However, each Non-secure stage 1 translation table access is subject to stage 2 address translation, and might be faulted at that stage.

---

The MMU fault checking sequence is largely independent of the translation table format, as the figures in this section show. The differences are:

**When using the Short-descriptor format**

- There are one or two levels of lookup.
- Lookup always starts at level 1.
- The final level of lookup checks the Domain field of the descriptor and:
  - Faults if there is no access to the Domain.
  - Checks the access permissions only for Client domains.

**When using the Long-descriptor format**

- There are one, two, or three levels of lookup.
- Lookup starts at either level 1 or level 2.
- Domains are not supported. All accesses are treated as Client domain accesses.

The fault-checking sequence shows a translation from an Input address to an Output address. For more information about this terminology, see [About address translation for VMSAv8-32](#) on page G4-4562.

---

**Note**

The descriptions in this section do not include the possibility that the attempted address translation generates a TLB conflict abort, as described in [TLB conflict aborts on page G4-4630](#).

---

[MMU faults in AArch32 state on page G4-4657](#) describes the faults that an MMU fault-checking sequence can report.

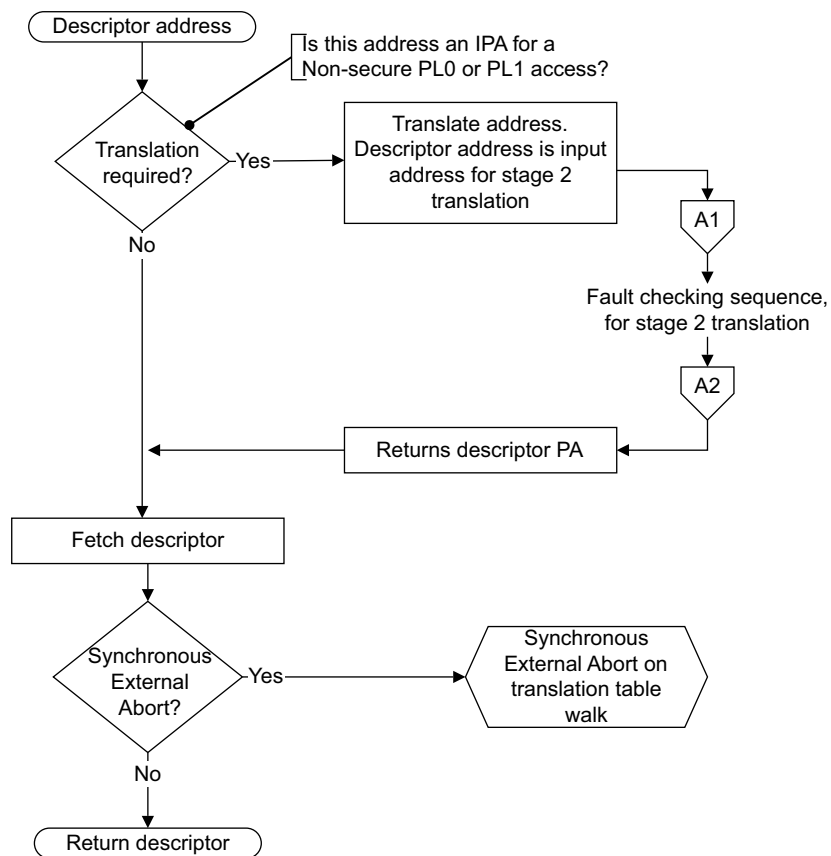

[Figure G4-15 on page G4-4654](#) shows the process of fetching a descriptor from the translation table. For the top-level fetch for any translation, the descriptor is fetched only if the input address passes any required alignment check. As the figure shows, in an implementation that includes EL2, if the translation is stage 1 of the Non-secure PL1&0 translation regime, then the descriptor address is in the IPA address map, and is subject to a stage 2 translation to obtain the required PA. This stage 2 translation requires a recursive entry to the fault checking sequence.

---

**Note**

[Figure G4-15 on page G4-4654](#) and [Figure G4-16 on page G4-4655](#) give an overview of the fault checking performed by the MMU. See [AArch32 state prioritization of synchronous aborts from a single stage of address translation on page G4-4660](#) for the complete set of possible faults and their prioritization.

---

**Figure G4-15 Fetching the descriptor in a VMSAv8-32 translation table walk**

Figure G4-16 shows the full VMSAv8-32 fault checking sequence, including the alignment check on the initial access.

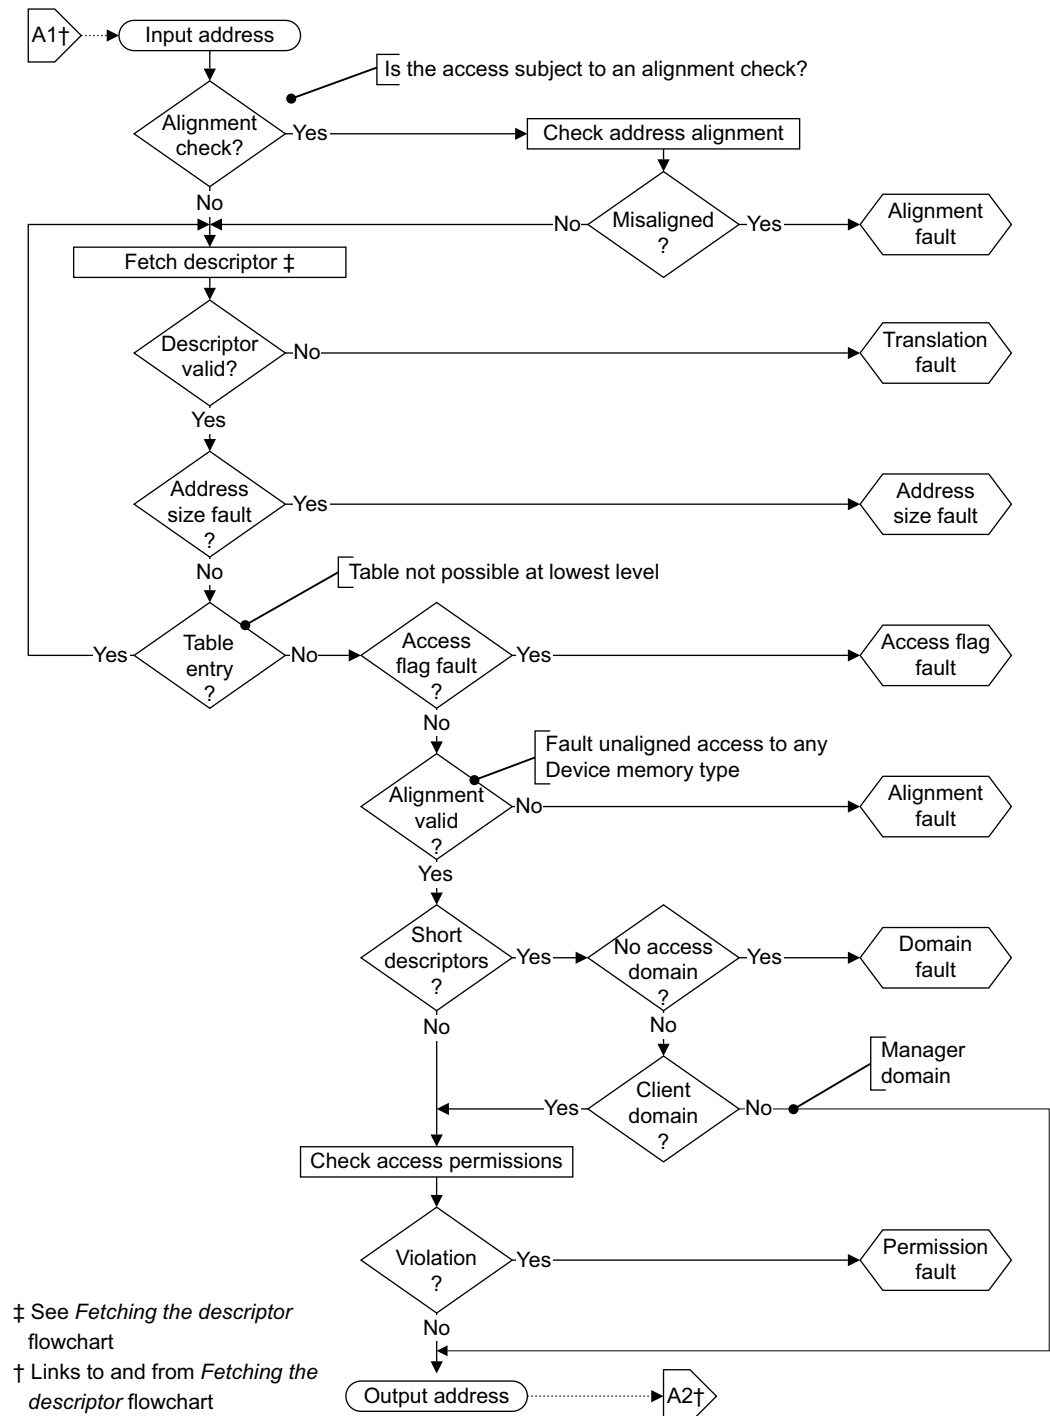

Figure G4-16 VMSAv8-32 fault checking sequence

## Stage 2 fault on a stage 1 translation table walk

When an implementation that includes EL2 is operating in a Non-secure PL1 or PL0 mode, any memory access goes through two stages of translation:

- Stage 1, from VA to IPA.
- Stage 2, from IPA to PA.

---

### Note

In a virtualized system that is using AArch32, typically, a Guest OS operating in a Non-secure PL1 mode defines the translation tables and translation table register entries controlling the Non-secure PL1&0 stage 1 translations. A Guest OS has no awareness of the stage 2 address translation, and therefore believes it is specifying translation table addresses in the physical address map. However, it actually specifies these addresses in its IPA map. Therefore, to support virtualization, translation table addresses for the Non-secure PL1&0 stage 1 translations are always defined in the IPA address map.

On performing a translation table walk for the stage 1 translations, the descriptor addresses must be translated from IPA to PA, using a stage 2 translation. This means that a memory access made as part of a stage 1 translation table lookup might generate, on a stage 2 translation:

- A Translation fault, Access flag fault, or Permission fault.
- A synchronous external abort on the memory access.

If **SCR.EA** is set to 1, a synchronous external abort is taken to EL3, and if EL3 is using AArch32 it is taken to Secure Monitor mode. Otherwise, these faults are reported as stage 2 memory aborts. When EL2 is using AArch32, **HSR.ISS[7]** is set to 1, to indicate a stage 2 fault during a stage 1 translation table walk, and the part of the ISS field that might contain details of the instruction is invalid. For more information see [Use of the HSR on page G4-4677](#).

Alternatively, a memory access made as part of a stage 1 translation table lookup might target an area of memory with the any type of Device memory attribute assigned on the stage 2 translation of the address accessed. When the value of the **HCR.PTW** bit is 1, such an access generates a stage 2 Permission fault.

---

### Note

- On most systems, such a mapping to a Device memory type on the stage 2 translation is likely to indicate a Guest OS error, where the stage 1 translation table is corrupted. Therefore, it is appropriate to trap this access to the hypervisor.

A TLB might hold entries that depend on the effect of **HCR.PTW**. Therefore, if **HCR.PTW** is changed without changing the current VMID, the TLBs must be invalidated before executing in a Non-secure PL1 or PL0 mode. For more information see [Changing HCR.PTW on page G4-4638](#).

A cache maintenance instruction executed at Non-secure PL1 can cause a stage 1 translation table walk that might generate a stage 2 Permission fault, as described in this section. This is an exception to the general rule that a cache maintenance instruction cannot generate a Permission fault. If the Point of Coherency is before any level of cache, it is IMPLEMENTATION DEFINED whether a cache maintenance by VA instruction can generate a Permission fault in this way.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether a data or unified cache clean by VA to the Point of Unification instruction can generate a Permission fault in this way.

## G4.11.4 Alignment faults

The ARM memory architecture requires support for strict alignment checking. This checking is controlled by **SCTLR.A**. In addition, some instructions do not support unaligned accesses, regardless of the value of **SCTLR.A**. [Unaligned data access on page E2-2777](#) defines when Alignment faults are generated, for both values of **SCTLR.A**.

An Alignment fault can occur on an access for which the stage of address translation is disabled.

Any unaligned access to memory region with any Device memory type attribute generates an Alignment fault.

[Routing of aborts taken to AArch32 state on page G4-4649](#) defines the mode to which an Alignment fault is taken.

The prioritization of Alignment faults depends on whether the fault was generated because of an access to a Device memory type, or for another reason. For more information see [AArch32 state prioritization of synchronous aborts from a single stage of address translation on page G4-4660](#).

## G4.11.5 MMU faults in AArch32 state

This section describes the faults that might be detected during one of the fault-checking sequences described in [The MMU fault-checking sequence on page G4-4652](#). Unless indicated otherwise, information in this section applies to the fault checking sequences for both the Short-descriptor translation table format and the Long-descriptor translation table format.

MMU faults are always synchronous.

When an MMU fault generates an abort for a region of memory, no memory access is made if that region is or could be marked as any type of Device memory.

The following subsections describe the MMU faults that might be detected during a fault checking sequence:

- [Permission fault](#).
- [Translation fault on page G4-4658](#).
- [Address size fault on page G4-4658](#).
- [Access flag fault on page G4-4659](#).
- [Domain fault, Short-descriptor format translation tables only on page G4-4659](#).
- [TLB conflict aborts on page G4-4630](#).

See also [External abort on a translation table walk on page G4-4659](#).

---

### Note

- Although the TLB conflict abort is classified as an MMU fault, it is described in the section [Translation Lookaside Buffers \(TLBs\) on page G4-4628](#).
  - In VMSAv8-64 an external abort on a translation table walk is classified as an MMU fault. However, in VMSAv8-32, for consistency with earlier versions of the architecture these aborts are not classified as MMU faults.
- 

## Permission fault

A Permission fault can be generated at any level of lookup, and the reported fault code identifies the lookup level. See [About access permissions on page G4-4605](#) for information about conditions that cause a Permission fault.

---

### Note

When using the Short-descriptor translation table format, the translation table descriptors are checked for Permission faults only for accesses to memory regions in Client domains.

---

A TLB might hold a translation table entry that cause a Permission fault. Therefore, if the handling of a Permission fault results in an update to the associated translation tables, the software that updates the translation tables must invalidate the appropriate TLB entry, to prevent the stale information in the TLB being used on a subsequent memory access. For more information, see the translation table entry update examples in [Ordering and completion of TLB maintenance instructions on page G4-4635](#).

---

### Note

In an implementation that includes EL2, this maintenance requirement applies to Permission faults in both stage 1 and stage 2 translations.

---

Cache or branch predictor maintenance operations cannot cause a Permission fault, except that:

- A stage 1 translation table walk performed as part of a cache or branch predictor maintenance operation can generate a stage 2 Permission fault as described in [Stage 2 fault on a stage 1 translation table walk on page G4-4656](#).
- A DCIMVAC issued in Non-secure state that attempts to update a location for which it does not have stage 2 write access can generate a stage 2 Permission fault, as described in [AArch32 data cache maintenance instructions \(DC\\*\) on page G3-4537](#).

## Translation fault

A Translation fault can be generated at any level of lookup, and the reported fault code identifies the lookup level. A Translation fault is generated if bits[1:0] of a translation table descriptor identify the descriptor as either a Fault encoding or a reserved encoding. For more information see:

- [VMSAv8-32 Short-descriptor translation table format descriptors on page G4-4577](#).
- [VMSAv8-32 Long-descriptor translation table format descriptors on page G4-4586](#).

In addition, a Translation fault is generated if the input address for a translation either does not map onto an address range of a TTBR, or the TTBR range that it maps onto is disabled. In these cases the fault is reported as a level 1 Translation fault on the translation stage at which the mapping to a region described by a TTBR failed.

The architecture guarantees that any translation table entry that causes a Translation fault is not cached, meaning the TLB never holds such an entry. Therefore, when a Translation fault occurs, the fault handler does not have to perform any TLB maintenance instructions to remove the faulting entry.

A data or unified cache maintenance instruction by VA can generate a Translation fault. It is IMPLEMENTATION DEFINED whether an instruction cache invalidate by VA operation can generate a Translation fault.

A data or unified cache maintenance by VA instruction can generate a Translation fault. If the Point of Coherency is before any level of cache, it is IMPLEMENTATION DEFINED whether a data or unified cache maintenance by VA instruction can generate a Translation fault. It is IMPLEMENTATION DEFINED whether an instruction cache invalidate by VA operation can generate a Translation fault.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether a data or unified cache clean by VA to the Point of Unification instruction can generate a Translation fault.

It is IMPLEMENTATION DEFINED whether a branch predictor maintenance operation can generate a Translation fault.

## Address size fault

An Address size fault can be generated at any level of lookup, and the reported fault code identifies the lookup level.

An Address size fault is generated if the translation table entries or the TTBR for the stage of translation have nonzero address bits above the most significant bit of the maximum output address size. Because VMSAv8-32 supports a maximum PA and IPA size of 40 bits, this means any case where a translation table entry or the TTBR holds an address for which A[47:40] is nonzero generates an Address size fault.

A data or unified cache maintenance by VA instruction can generate an Address size fault. If the Point of Coherency is before any level of cache, it is IMPLEMENTATION DEFINED whether a data or unified cache maintenance by VA instruction can generate an Address size fault. It is IMPLEMENTATION DEFINED whether an instruction cache invalidate by VA operation can generate an Address size fault.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether a data or unified cache clean by VA to the Point of Unification instruction can generate an Address size fault.

It is IMPLEMENTATION DEFINED whether a branch predictor maintenance operation can generate an Address size fault.

The architecture guarantees that any translation table entry that causes an Address size fault is not cached, meaning the TLB never holds such an entry. Therefore, when an Address size fault occurs, the fault handler does not have to perform any TLB maintenance instructions to remove the faulting entry.

## Access flag fault

An Access flag fault can be generated at any level of lookup, and the reported fault code identifies the lookup level. An Access flag fault is generated only if all of the following apply:

- The translation tables support an Access flag bit:
  - The Short-descriptor format supports an Access flag only when [SCTLR.AFE](#) is set to 1.
  - The Long-descriptor format always supports an Access flag.
- A translation table descriptor with the Access flag bit set to 0 is loaded.

For more information about the Access flag bit see:

- [VMSAv8-32 Short-descriptor translation table format descriptors on page G4-4577](#)
- [VMSAv8-32 Long-descriptor translation table format descriptors on page G4-4586](#).

The architecture guarantees that any translation table entry that causes an Access flag fault is not cached, meaning the TLB never holds such an entry. Therefore, when an Access flag fault occurs, the fault handler does not have to perform any TLB maintenance instructions to remove the faulting entry.

Whether any cache maintenance instruction by VA can generate Access flag faults is IMPLEMENTATION DEFINED.

Whether branch predictor invalidate by VA operations can generate Access flag faults is IMPLEMENTATION DEFINED.

For more information, see [The Access flag on page G4-4613](#).

## Domain fault, Short-descriptor format translation tables only

When using the Short-descriptor translation table format, a Domain fault can be generated at level 1 or level 2 of lookup. The reported fault code identifies the lookup level. The conditions for generating a Domain fault are:

- |                |   |
|----------------|---|
| <b>Level 1</b> | When a level 1 descriptor fetch returns a valid Section level 1 descriptor, the domain field of that descriptor is checked against the <a href="#">DACR</a> . A level 1 Domain fault is generated if this check fails.                                    |
| <b>Level 2</b> | When a level 2 descriptor fetch returns a valid level 2 descriptor, the domain field of the level 1 descriptor that required the level 2 fetch is checked against the <a href="#">DACR</a> , and a level 2 Domain fault is generated if this check fails. |

For more information, see [Domains, Short-descriptor format only on page G4-4612](#).

Domain faults cannot occur on cache or branch predictor maintenance operations.

A TLB might hold a translation table entry that cause a Domain fault. Therefore, if the handling of a Domain fault results in an update to the associated translation tables, the software that updates the translation tables must invalidate the appropriate TLB entry, to prevent the stale information in the TLB being used on a subsequent memory access. For more information, see the translation table entry update examples in [Ordering and completion of TLB maintenance instructions on page G4-4635](#).

Any change to the [DACR](#) must be synchronized by a [Context synchronization event](#). For more information see [Synchronization of changes to AArch32 System registers on page G6-4768](#).

## G4.11.6 External abort on a translation table walk

An external abort on a translation table walk can be either synchronous or asynchronous. For more information on external aborts, see [External aborts on page G3-4550](#).

An external abort on a translation table walk is reported:

- If the external abort is synchronous, using:
  - A synchronous Prefetch Abort exception if the translation table walk is for an instruction fetch.
  - A synchronous Data Abort exception if the translation table walk is for a data access.
- If the external abort is asynchronous, using an SError interrupt, which is taken as an asynchronous Data Abort exception.

If an implementation reports the error in the translation table walk asynchronously from executing the instruction whose instruction fetch or memory access caused the translation table walk, these aborts behave essentially as interrupts. The aborts are masked when `PSTATE.A` is set to 1, otherwise they are reported using the Data Abort exception.

### Behavior of external aborts on a translation table walk caused by address translation instructions

The address translation instructions summarized in [Address translation instructions, functional group on page G4-4737](#) require translation table walks. An external abort can occur in the translation table walk. The abort generates a Data Abort exception, and can be synchronous or asynchronous. For more information, see [Handling of faults and aborts during an address translation instruction on page G4-4686](#).

#### G4.11.7 AArch32 state prioritization of synchronous aborts from a single stage of address translation

[Exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) describes the prioritization of exceptions taken from an Exception level that is using AArch32. This section gives additional information about the prioritization of MMU faults from VMSAv8-32 translation regimes.

If a single instruction generates aborts on more than one memory access, the architecture does not define any prioritization between those aborts.

In general, the ARM architecture does not define when asynchronous events are taken, and therefore the prioritization of asynchronous events is IMPLEMENTATION DEFINED.

#### ———— Note ————

The priority numbering in this list only shows the relative priorities of aborts from a single stage of address translation in a VMSAv8-32 translation regime. This numbering has no global significance and, for example, does not correlate with the equivalent AArch64 list in [AArch64 state prioritization of synchronous aborts from a single stage of address translation on page D4-2110](#).

For a single stage of translation in a VMSAv8-32 translation regime, the following numbered list shows the priority of the possible memory management faults on a memory access. In this list:

- For memory accesses that undergo two stages of translation, the *italic entries show where the faults from the stage 2 translation can occur*. A stage 2 fault within a stage 1 translation table walk follows the same prioritization of faults.
- For synchronous external aborts from translation table walks see also [Synchronous external abort errors from address translation caching structures on page G4-4661](#).

The priority order, from highest priority to lowest priority, is:

1. Alignment fault not caused by memory type. This is possible for a stage 1 translation only.
2. Translation fault due to the input address being out of the address range to be translated or requiring an AArch32 `TTBR` that is disabled. This includes `VTCR.SL0` being inconsistent with `VTCR.T0SZ` or programmed to a reserved value.
3. Address size fault on an AArch32 `TTBR` caused by the physical address being out of the range implemented.
4. *Second stage abort on a level 1 lookup of a stage 1 table walk. When stage 2 address translation is enabled this includes an Address size fault caused by the physical address being out of the range implemented.* This is second stage abort during a first stage translation table walk.
5. Synchronous parity or ECC error on a level 1 lookup of a translation table walk.
6. Synchronous external abort on a level 1 lookup level of a translation table walk.
7. Translation fault on a level 1 translation table entry.

8. Address size fault on a level 1 lookup translation table entry caused by the output address being out of the range implemented.
9. *Second stage abort on a level 2 lookup of a stage 1 table walk. When stage 2 address translation is enabled this includes an Address size fault caused by the physical address being out of the range implemented. This is second stage abort during a first stage translation table walk.*
10. Synchronous parity or ECC error on a level 2 lookup of a translation table walk.
11. Synchronous external abort on a level 2 lookup level of a translation table walk.
12. Translation fault on a level 2 translation table entry.
13. Address size fault on a level 2 lookup translation table entry caused by the output address being out of the range implemented.
14. *Second stage abort on a level 3 lookup of a stage 1 table walk. When stage 2 address translation is enabled this includes an Address size fault caused by the physical address being out of the range implemented. This is second stage abort during a first stage translation table walk.*
15. Synchronous parity or ECC error on a level 3 lookup of a translation table walk.
16. Synchronous external abort on a level 3 lookup level of a translation table walk.
17. Translation fault on a level 3 translation table entry.
18. Address size fault on a level 3 lookup translation table entry caused by the output address being out of the range implemented.
19. Access Flag fault.
20. Alignment fault caused by the memory type.
21. Domain fault.

**Note**

Domain faults are possible only when using the VMSAv8-32 Short-descriptor translation table format, see [Domain fault, Short-descriptor format translation tables only on page G4-4659](#).

22. Permission fault.
23. *A fault from the stage 2 translation of the memory access. When stage 2 address translation is enabled this includes an Address size fault caused by the physical address being out of the range implemented.*
24. Synchronous parity or ECC error on the memory access.
25. Synchronous External Abort on the memory access.

**Note**

- The prioritization of TLB Conflict aborts is IMPLEMENTATION DEFINED, as the exact cause of these aborts depends on the form of TLBs implemented. However, the TLB conflict abort must have higher priority than any abort that depends on a value held in the TLB.
- The prioritization of IMPLEMENTATION DEFINED MMU faults for a Load-Exclusive or Store-Exclusive to an unsupported memory type is IMPLEMENTATION DEFINED.

See also [The MMU fault-checking sequence on page G4-4652](#).

### Synchronous external abort errors from address translation caching structures

A caching structure used for caching translation table walks might support:

- An arbitrary number of levels of translation table lookup.

- One or more stages of translation, that might not correspond to the stages of an address translation lookup.

This might mean that, on a synchronous external abort arising from the caching structure, such as from a parity or ECC error, the PE cannot precisely determine one or both of the translation stage and level of lookup at which the error occurred. In this case:

- If the PE cannot determine precisely the translation stage at which the error occurred, it is reported and prioritized as a stage 1 error.
- If the PE cannot determine precisely the lookup level at which the error occurred, the level is reported and prioritized as either:
  - The lowest-numbered level that could have given rise to the error.
  - Level 1 if it the PE cannot determine any information about the level.

## G4.12 Exception reporting in a VMSAv8-32 implementation

This section describes exception reporting, in AArch32 state, in a VMSAv8-32 implementation. That is, it describes only the reporting of exceptions that are taken to an Exception level that is using AArch32. EL2 provides an enhanced reporting mechanism for exceptions taken to the Non-secure EL2 mode, Hyp mode. This means that, for VMSAv8-32, the exception reporting depends on the mode to which the exception is taken.

---

### Note

The enhanced reporting mechanism for exceptions that are taken to Hyp mode is generally similar to the reporting of exceptions that are taken to an Exception level that is using AArch64.

---

*About exception reporting* introduces the general approach to exception reporting, and the following sections then describe exception reporting at different privilege levels:

- *Reporting exceptions taken to PL1 modes on page G4-4664.*
- *Fault reporting in PL1 modes on page G4-4667.*
- *Summary of register updates on faults taken to PL1 modes on page G4-4671.*
- *Reporting exceptions taken to Hyp mode on page G4-4673.*
- *Use of the HSR on page G4-4677.*
- *Summary of register updates on exceptions taken to Hyp mode on page G4-4680.*

---

### Note

The registers used for exception reporting also report information about debug exceptions. For more information see:

- *Data Abort exceptions, taken to a PL1 mode on page G4-4665.*
  - *Prefetch Abort exceptions, taken to a PL1 mode on page G4-4667.*
  - *Reporting exceptions taken to Hyp mode on page G4-4673.*
- 

### G4.12.1 About exception reporting

In an implementation that includes EL2 and EL3, exceptions can be taken to:

- Monitor mode, if EL3 is using AArch32.
- Hyp mode, if EL2 is using AArch32.
- A Secure or Non-secure PL1 mode.

Monitor mode is a PL1 mode, but:

- It is accessible only when EL3 is using AArch32.
- It is present only in Secure state.
- When EL3 is using AArch32, System register controls route some exceptions from Non-secure state to Monitor mode. These are the only cases where taking an exception to an Exception level that is using AArch32 changes the Security state of the PE.

Exception reporting in Hyp mode differs significantly from that in the other modes, but in general, exception reporting returns:

- Information about the exception:
  - On taking an exception to Hyp mode, the *Hyp Syndrome Register*, [HSR](#), returns syndrome information.
  - On taking an exception to any other mode, a *Fault Status Register* (FSR) returns status information.
- For synchronous exceptions, one or more addresses associated with the exceptions, returned in *Fault Address Registers* (FARs). For a permitted exception to this requirement see *Fault address reporting on synchronous external aborts on page G4-4664*.

In all modes, additional IMPLEMENTATION DEFINED registers can provide additional information about exceptions.

---

**Note**

- [PE mode for taking exceptions on page G1-4350](#) describes how the mode to which an exception is taken is determined.
- EL2 provides:
  - Specific exception types, that can only be taken from Non-secure PL1 and PL0 modes, and are always taken to Hyp mode.
  - Routing controls that can route some exceptions from Non-secure PL1 and PL0 modes to Hyp mode. These exceptions are reported using the same mechanism as the Hyp mode reporting of VMSAv8-32 memory aborts, as described in this section.

---

Memory system faults generate either a Data Abort exception or a Prefetch Abort exception, as summarized in:

- [Reporting exceptions taken to PL1 modes.](#)
- [Memory fault reporting in Hyp mode on page G4-4675.](#)

On an access that might have multiple aborts, the MMU fault checking sequence and the prioritization of aborts determine which abort occurs. For more information, see [The MMU fault-checking sequence on page G4-4652](#) and [AArch32 state prioritization of synchronous aborts from a single stage of address translation on page G4-4660](#).

### Fault address reporting on synchronous external aborts

The general architectural requirement is that, on a synchronous abort, the faulting address is recorded in a *Fault Address Register* (FAR). This requirement is relaxed for the case of a synchronous external abort that is not a synchronous external abort on a translation table walk. In this case only:

- It is IMPLEMENTATION DEFINED whether the faulting address is recorded in a FAR.
- A bit in a fault reporting register, the FnV bit, indicates whether a valid address is recorded.

For exceptions taken to an Exception level that is using AArch32, the details of this reporting depend on whether the exception is taken to:

- A PL1 mode, as described in [Reporting exceptions taken to PL1 modes.](#)
- Hyp mode, as described in [Reporting exceptions taken to Hyp mode on page G4-4673.](#)

## G4.12.2 Reporting exceptions taken to PL1 modes

The following sections give general information about the reporting of exceptions when they are taken to a Secure or Non-secure PL1 mode:

- [Registers used for reporting exceptions taken to PL1 modes on page G4-4665.](#)
- [Data Abort exceptions, taken to a PL1 mode on page G4-4665.](#)
- [Prefetch Abort exceptions, taken to a PL1 mode on page G4-4667.](#)

[Fault reporting in PL1 modes on page G4-4667](#) then describes the fault reporting in these modes, including the encodings used for reporting the faults.

---

**Note**

[Security state, Exception levels, and AArch32 execution privilege on page G1-4318](#) describes how the Secure and Non-secure PL1 modes map onto the Exception levels.

---

## Registers used for reporting exceptions taken to PL1 modes

AArch32 state defines the following registers, and register encodings, for exceptions taken to PL1 modes:

- The **DFSR** holds information about a Data Abort exception.
- The **DFAR** holds the faulting address for some synchronous Data Abort exceptions.
- The **IFSR** holds information about a Prefetch Abort exception.
- The **IFAR** holds the faulting address for some synchronous Prefetch Abort exceptions.

In addition, if implemented, the optional ADFSR and AIFSR can provide additional fault information, see [Auxiliary Fault Status Registers](#).

### Auxiliary Fault Status Registers

AArch32 state defines the following Auxiliary Fault Status Registers:

- The Auxiliary Data Fault Status Register, **ADFSR**.
- The Auxiliary Instruction Fault Status Register, **AIFSR**.

The position of these registers is architecturally-defined, but the content and use of the registers is IMPLEMENTATION DEFINED. An implementation can use these registers to return additional fault status information. An example use of these registers is to return more information for diagnosing parity or ECC errors.

An implementation that does not need to report additional fault information must implement these registers as UNK/SBZP. This ensures that an attempt to access these registers from software executing at PL1 does not cause an Undefined Instruction exception.

## Data Abort exceptions, taken to a PL1 mode

On taking a Data Abort exception to a PL1 mode:

- If the exception is on an instruction cache or branch predictor maintenance operation by VA, its reporting depends on the value of **TTBCR.EAE**. For more information about the registers used when reporting the exception, see [Data Abort on an instruction cache or branch predictor maintenance instruction by VA on page G4-4666](#).
- Otherwise, the **DFSR** is updated with details of the fault, including the appropriate Fault status code. If the Data Abort exception is synchronous, **DFSR.WnR** is updated to indicate whether the faulted instruction was a read or a write. However, if the fault is on a cache maintenance instruction, or on an address translation instruction, **WnR** is set to 1, to indicate a fault on a write instruction, and the **CM** bit is set to 1.

See the register description for more information about the returned fault information. See also [Data Abort on a Watchpoint exception on page G4-4666](#).

If the Data Abort exception is

- Synchronous, the **DFAR** is updated with the VA that caused the exception, but see [Fault address reporting on synchronous external aborts on page G4-4664](#) for a permitted exception to this requirement.
- Asynchronous, the **DFAR** becomes UNKNOWN.

**DFSR.WnR** and **DFSR.CM** are UNKNOWN on an asynchronous Data Abort exception.

For all Data Abort exceptions, if the implementation includes EL3, the Security state of the PE in the mode to which the Data Abort exception is taken determines whether the Secure or Non-secure **DFSR** and **DFAR** are updated.

### Data Abort on an instruction cache or branch predictor maintenance instruction by VA

If an instruction cache invalidation by VA or branch predictor invalidation by VA operation generates a Data Abort exception that is taken to a PL1 mode, the **DFAR** is updated to hold the faulting VA. However, the reporting of the fault depends on the value of **TTBCR.EAE**:

#### **TTBCR.EAE == 0**

When the value of **TTBCR.EAE** is 0, it is IMPLEMENTATION DEFINED which of the following is used when reporting the fault:

- The **DFSR** indicates an Instruction cache maintenance instruction fault, and the **IFSR** is valid and indicates the cause of the fault, a Translation fault or Access flag fault.
- The **DFSR** indicates the cause of the fault, a Translation fault or Access flag fault. The **IFSR** is UNKNOWN.

In either case:

- **DFSR.WnR** is set to 1.
- **DFSR.CM** is set to 1, to indicate a fault on a cache maintenance instruction.

#### **TTBCR.EAE == 1**

When the value of **TTBCR.EAE** is 1:

- **DFSR.CM** is set to 1, to indicate a fault on a cache maintenance instruction.
- **DFSR.STATUS** indicates the cause of the fault, a Translation or Access flag fault.
- **DFSR.WnR** is set to 1.
- The **IFSR** is UNKNOWN.

### Data Abort on a Watchpoint exception

On taking a Data Abort exception caused by a watchpoint:

- **DFSR.FS** is updated to indicate a debug exception.
- **DFSR**.{WnR, Domain} are UNKNOWN.
- **DFAR** is set to the address that generated the watchpoint

#### ————— **Note** —————

- **LR\_abt** indicates the address of the instruction that triggered the watchpoint.
- In some ARMv7 AArch32 implementations, the **DBGWFAR** is set to the address of the instruction that triggered the watchpoint. In ARMv8 this register is **RES0**.

A watchpointed address can be any byte-aligned address. The address reported in **DFAR** might not be the watchpointed address, and:

- For a watchpoint due to an operation other than a Data Cache maintenance instruction, can be any address between and including:
  - The lowest address accessed by the instruction that triggered the watchpoint.
  - The highest watchpointed address accessed by that instruction.

If multiple watchpoints are set in this range, there is no guarantee of which watchpoint is generated.

The address must also be within a naturally-aligned block of memory of an IMPLEMENTATION DEFINED power-of-two size, containing a watchpoint address accessed by that location.

#### ————— **Note** —————

- In particular, there is no guarantee of generating the watchpoint with the lowest address in the range.
- The IMPLEMENTATION DEFINED power-of-two size must be no larger than the block size of the AArch64 **DC ZVA** operation.

- For a watchpoint due to a Data Cache operation, the address is the address passed to the instruction. This might be an address that is above the watchpointed location.

### Prefetch Abort exceptions, taken to a PL1 mode

For a Prefetch Abort exception generated by an instruction fetch, the Prefetch Abort exception is taken synchronously with the instruction that the abort is reported on. This means:

- If the PE attempts to execute the instruction a Prefetch Abort exception is generated.
- If an instruction fetch is issued but the PE does not attempt to execute the prefetched instruction, no Prefetch Abort exception is generated for that instruction. For example, if the execution flow branches round a prefetched instruction, no Prefetch Abort exception is generated.

In addition, Breakpoint Instruction, Breakpoint, and Vector Catch exceptions, generate a Prefetch Abort exception, see the following for more information:

- [Exception syndrome information and preferred return address for a BKPT instruction on page G2-4468.](#)
- [Exception syndrome information and preferred return address for a Breakpoint exception on page G2-4493.](#)
- [Exception syndrome information and preferred return address for a Vector Catch exception on page G2-4516.](#)

#### Note

Usually, the term *exception syndrome* is used only for exceptions taken to Hyp mode, or to AArch64 state. The referenced sections use the term more generally, to include exception information reported in the [IFSR](#).

On taking a Prefetch Abort exception to a PL1 mode:

- The [IFSR](#) is updated with details of the fault, including the appropriate fault code. If appropriate, the fault code indicates that the exception was generated by a debug exception.  
See the register description for more information about the returned fault information.
- For a Prefetch Abort exception generated by an instruction fetch, the [IFAR](#) is updated with the VA that caused the exception, but see [Fault address reporting on synchronous external aborts on page G4-4664](#) for a permitted exception to this requirement.
- For a Prefetch Abort exception generated by a debug exception, the [IFAR](#) is UNKNOWN.

If the implementation includes EL3, the Security state of the PE in the mode to which it takes the Prefetch Abort exception determines whether the exception updates the Secure or Non-secure [IFSR](#) and [IFAR](#).

## G4.12.3 Fault reporting in PL1 modes

The FSRs provide fault information, including an indication of the fault that occurred. The following subsections describe fault reporting in PL1 modes for each of the translation table formats:

- [PL1 fault reporting with the Short-descriptor translation table format on page G4-4668.](#)
- [PL1 fault reporting with the Long-descriptor translation table format on page G4-4670.](#)

[Reserved encoding in the IFSR and DFSR encodings tables on page G4-4671](#) gives some additional information about the encodings for both formats.

[Summary of register updates on faults taken to PL1 modes on page G4-4671](#) shows which registers are updated on each of the reported faults.

[Reporting of External aborts taken from Non-secure state to Monitor mode on page G4-4668](#) describes how the fault status register format is determined for those aborts. For all other aborts, the current translation table format determines the format of the fault status registers.

## Reporting of External aborts taken from Non-secure state to Monitor mode

When an External abort is taken from Non-secure state to Monitor mode:

- For a Data Abort exception, the Secure [DFSR](#) and [DFAR](#) hold information about the abort.
- For a Prefetch Abort exception, the Secure [IFSR](#) and [IFAR](#) hold information about the abort.
- The abort does not affect the contents of the Non-secure copies of the fault reporting registers.

Normally, the current translation table format determines the format of the [DFSR](#) and [IFSR](#). However, when [SCR.EA](#) is set to 1, to route external aborts to Monitor mode, and an external abort is taken from Non-secure state, this section defines the [DFSR](#) and [IFSR](#) format.

For an External abort taken from Non-secure state to Monitor mode, the [DFSR](#) or [IFSR](#) uses the format associated with the Long-descriptor translation table format, as described in [PL1 fault reporting with the Long-descriptor translation table format on page G4-4670](#), if any of the following applies:

- The Secure [TTBCR.EAE](#) bit is set to 1.
- The External abort is synchronous and either:
  - It is taken from Hyp mode.
  - It is taken from a Non-secure PL1 or PL0 mode, and the Non-secure [TTBCR.EAE](#) bit is set to 1.

Otherwise, the [DFSR](#) or [IFSR](#) uses the format associated with the Short-descriptor translation table format, as described in [PL1 fault reporting with the Short-descriptor translation table format](#).

## PL1 fault reporting with the Short-descriptor translation table format

This subsection describes the fault reporting for a fault taken to a PL1 when address translation is using the Short-descriptor translation table format.

On taking an exception, bit[9] of the FSR is RAZ, or set to 0, if the PE is using this FSR format.

An FSR encodes the fault in a 5-bit FS field, that comprises FSR[10, 3:0]. [Table G4-25](#) shows the encoding of that field. [Summary of register updates on faults taken to PL1 modes on page G4-4671](#) shows:

- Whether the corresponding FAR is updated on the fault. That is:
  - For a fault reported in the [IFSR](#), whether the [IFAR](#) holds a valid address.
  - For a fault reported in the [DFSR](#), whether the [DFAR](#) holds a valid address.
- For faults that update [DFSR](#), whether [DFSR.Domain](#) is valid

When reading [Table G4-25](#):

- FS values not shown in the table are reserved.
- FS values shown as [DFSR](#) only are reserved for the [IFSR](#).

**Table G4-25 FSR encodings when using the Short-description translation table format**

FS	Source	Notes
00001	Alignment fault	<a href="#">DFSR</a> only. Fault on initial lookup
00100	Fault on instruction cache maintenance	<a href="#">DFSR</a> only
01100 01110	Synchronous external abort on translation table walk <sup>a</sup>	Level 1 Level 2 -
11100 11110	Synchronous parity or ECC error on translation table walk <sup>a</sup>	Level 1 Level 2 -
00101 00111	Translation fault <sup>a</sup>	Level 1 Level 2 MMU fault

**Table G4-25 FSR encodings when using the Short-description translation table format (continued)**

FS	Source	Notes
00011 <sup>b</sup> 00110	Access flag fault <sup>a</sup>	Level 1 Level 2 MMU fault
01001 01011	Domain fault <sup>a</sup>	Level 1 Level 2 MMU fault
01101 01111	Permission fault <sup>a</sup>	Level 1 Level 2 MMU fault
00010	Debug exception	See <a href="#">Chapter G2 AArch32 Self-hosted Debug</a>
01000	Synchronous external abort	-
10000	TLB conflict abort	See <a href="#">TLB conflict aborts on page G4-4630</a>
10100	IMPLEMENTATION DEFINED	Lockdown
10101	IMPLEMENTATION DEFINED	Unsupported Exclusive access
11001	Synchronous parity or ECC error on memory access	-
10110	SError interrupt <sup>c</sup>	DFSR only
11000	SError interrupt <sup>c</sup> from a parity or ECC error on memory access	DFSR only

a. See [The level associated with MMU faults on a Short-descriptor translation table lookup](#).

b. Previously, this encoding was a deprecated encoding for Alignment fault. The extensive changes in the memory model in VMSAv8-32 mean there should be no possibility of confusing the new use of this encoding with its previous use

c. Including asynchronous external abort on a data access, a translation table walk, or an instruction fetch.

### ***The level associated with MMU faults on a Short-descriptor translation table lookup***

The lookup level associated with a fault is:

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
- For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a level 1 fault.
- For an Access flag fault, Permission fault, or Domain fault, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Supersection, Section, or Page descriptor.

Also see [Synchronous external abort errors from address translation caching structures on page G4-4661](#).

### ***The Domain field in the DFSR***

The DFSR includes a Domain field. This is inherited from previous versions of the VMSA. The IFSR does not include a Domain field. [Summary of register updates on faults taken to PL1 modes on page G4-4671](#) describes when DFSR.Domain is valid.

ARM deprecates any use of the Domain field in the DFSR. The Long-descriptor translation table format does not support a Domain field, and future versions of the ARM architecture might not support a Domain field in the Short-descriptor translation table format. ARM strongly recommends that new software does not use this field.

For both Data Abort exceptions and Prefetch Abort exceptions, software can find the domain information by performing a translation table read for the faulting address and extracting the Domain field from the translation table entry.

## PL1 fault reporting with the Long-descriptor translation table format

This subsection describes the fault reporting for a fault taken to a PL1 mode when address translation is using the Long-descriptor translation table format.

When the PE takes an exception, bit[9] of the FSR is set to 1 if the PE is using this FSR format.

The FSRs encode the fault in a 6-bit STATUS field, that comprises FSR[5:0]. [Table G4-26](#) shows the encoding of that field. In addition:

- For a fault taken to a PL1 mode, [Summary of register updates on faults taken to PL1 modes on page G4-4671](#) shows whether the corresponding FAR is updated on the fault. That is:
  - For a fault reported in the [IFSR](#), whether the [IFAR](#) holds a valid address.
  - For a fault reported in the [DFSR](#), whether the [DFAR](#) holds a valid address.
- For a fault taken to the Hyp mode, [Summary of register updates on exceptions taken to Hyp mode on page G4-4680](#) shows what registers are updated on the fault.

**Table G4-26 FSR encodings when using the Long-descriptor translation table format**

STATUS <sup>a</sup>	Source	Notes
0000LL	Address size fault. LL bits indicate level <sup>b</sup> .	MMU fault
0001LL	Translation fault. LL bits indicate level <sup>b</sup> .	MMU fault
0010LL	Access flag fault. LL bits indicate level <sup>b</sup> .	MMU fault
0011LL	Permission fault. LL bits indicate level <sup>b</sup> .	MMU fault
010000	Synchronous external abort.	-
011000	Synchronous parity or ECC error on memory access.	-
010001	SError interrupt <sup>c</sup> .	<a href="#">DFSR</a> only
011001	SError interrupt <sup>c</sup> from a parity or ECC error on memory access.	<a href="#">DFSR</a> only
0101LL	Synchronous external abort on translation table walk. LL bits indicate level <sup>b</sup> .	-
0111LL	Synchronous parity or ECC error on memory access on translation table walk. LL bits indicate level <sup>b</sup> .	-
100001	Alignment fault.	Fault on initial lookup
100010	Debug exception.	See <a href="#">Chapter G2 AArch32 Self-hosted Debug</a>
110000	TLB conflict abort.	See <a href="#">TLB conflict aborts on page G4-4630</a>
110100	IMPLEMENTATION DEFINED.	Lockdown, <a href="#">DFSR</a> only
110101	IMPLEMENTATION DEFINED.	Unsupported Exclusive access
1111LL	Domain fault. LL bits indicate level <sup>b</sup> .	MMU fault. 64-bit <a href="#">PAR</a> only, level 1 or level 2 only. Never used in <a href="#">DFSR</a> , <a href="#">IFSR</a> , or <a href="#">HSR</a> <sup>d</sup>

a. STATUS values not shown in this table are reserved. STATUS values not supported in the [IFSR](#) or [DFSR](#) are reserved for the register or registers in which they are not supported.

b. See [The level associated with MMU faults on a Long-descriptor translation table lookup on page G4-4671](#).

c. Including asynchronous external abort on a data access, a translation table walk, or an instruction fetch.

d. A Domain fault can be reported using the Long-descriptor STATUS encodings only as a result of a fault on an address translation instruction. For more information see [MMU fault on an address translation instruction on page G4-4686](#).

### The level associated with MMU faults on a Long-descriptor translation table lookup

For MMU faults, [Table G4-27](#) shows how the LL bits in the xFSR.STATUS field encode the lookup level associated with the fault.

**Table G4-27 Use of LL bits to encode the lookup level at which the fault occurred**

LL bits	Meaning
00	<b>Address size fault</b> Address size fault in <a href="#">TTBR0</a> or <a href="#">TTBR1</a> . <b>All other faults</b> Reserved.
01	Level 1.
10	Level 2.
11	Level 3. When xFSR.STATUS indicates a Domain fault, this value is reserved.

The lookup level associated with a fault is:

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
- For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a level 1 fault.
- For an Access flag fault, the lookup level of the translation table that gave the fault.
- For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

Also see [Synchronous external abort errors from address translation caching structures](#) on page G4-4661.

### Reserved encoding in the IFSR and DFSR encodings tables

With both the Short-descriptor and the Long-descriptor FSR format, the fault encodings reserve a single encoding for Cache and TLB lockdown faults. The details of these faults and any associated subsidiary registers are IMPLEMENTATION DEFINED.

## G4.12.4 Summary of register updates on faults taken to PL1 modes

For faults that generate exceptions that are taken to a PL1 mode, [Table G4-28 on page G4-4672](#) shows the registers affected by each fault. In this table:

- Yes indicates that the register is updated.
- UNK indicates that the fault makes the register value UNKNOWN.
- A null entry, -, indicates that the fault does not affect the register.

For faults that update the [DFSR](#) using the Short-descriptor format FSR encodings, [Table G4-29 on page G4-4673](#) shows whether [DFSR.Domain](#) is valid.

**Table G4-28 Effect of a fault taken to a PL1 mode on the reporting registers**

Fault		IFSR	IFAR	DFSR	DFAR
Faults reported as Prefetch Abort exceptions:					
MMU fault, always synchronous		Yes	Yes	-	-
Synchronous external abort on translation table walk		Yes	Yes	-	-
Synchronous parity or ECC error on translation table walk		Yes	Yes	-	-
Synchronous external abort		Yes	IMP DEF <sup>a</sup>	-	-
Synchronous parity or ECC error on memory access		Yes	Yes	-	-
TLB conflict abort		Yes	Yes	-	-
Fault reported as Data Abort exception:					
Alignment fault, always synchronous		-	-	Yes	Yes
MMU fault, always synchronous		-	-	Yes	Yes
Fault on instruction cache maintenance, when using Long-descriptor translation table format <sup>b</sup>		UNK	-	Yes	Yes
Fault on instruction cache maintenance, when using Short descriptor translation table format <sup>c</sup>	<i>either</i>	Yes	-	Yes	Yes
	<i>or</i>	UNK	-	Yes	Yes
Synchronous external abort on translation table walk		-	-	Yes	Yes
Synchronous parity or ECC error on translation table walk		-	-	Yes	Yes
Synchronous external abort		-	-	Yes	IMP DEF <sup>a</sup>
Synchronous parity or ECC error on memory access		-	-	Yes	Yes
SError interrupt		-	-	Yes	UNK
SError interrupt from a parity or ECC error on memory access		-	-	Yes	UNK
TLB conflict abort		-	-	Yes	Yes
Debug exceptions:					
Breakpoint, Breakpoint Instruction, or Vector Catch <sup>d</sup>		Yes	UNK	-	-
Watchpoint <sup>e</sup>		-	-	Yes	Yes

a. IMPLEMENTATION DEFINED. The [IFSR.FnV](#) or [DFSR.FnV](#) bit indicates whether the register holds a valid address. See [Fault address reporting on synchronous external aborts on page G4-4664](#).

b. When using the Long-descriptor translation table format, there is not a specific fault code for a fault on an instruction cache maintenance instruction. For more information see [Data Abort on an instruction cache or branch predictor maintenance instruction by VA on page G4-4666](#).

c. The two lines of this entry show the alternative ways of reporting the fault when using the Short-descriptor translation table format. It is IMPLEMENTATION DEFINED which methods is used, see [Data Abort on an instruction cache or branch predictor maintenance instruction by VA on page G4-4666](#).

d. Generates a Prefetch Abort exception.

e. Generates a Data Abort exception.

For those faults for which [Table G4-28 on page G4-4672](#) shows that the **DFSR** is updated, if the fault is reported using the Short-descriptor FSR encodings, [Table G4-29](#) shows whether **DFSR.Domain** is valid. In this table, UNK indicates that the fault makes **DFSR.Domain** UNKNOWN.

**Table G4-29 Validity of Domain field on faults that update the **DFSR** when using the Short-descriptor encodings**

<b>DFSR.FS</b>	<b>Source</b>		<b>DFSR.Domain</b>	<b>Notes</b>
00001	Alignment fault		UNK	-
00100	Fault on instruction cache maintenance instruction		UNK	-
01100	Synchronous external abort on translation table walk	Level 1	UNK	-
01110		Level 2	Valid	
11100	Synchronous parity or ECC error on translation table walk	Level 1	UNK	-
11110		Level 2	Valid	
00101	Translation fault	Level 1	UNK	MMU fault
00111		Level 2	Valid	
00011 <sup>a</sup>	Access flag fault	Level 1	UNK	MMU fault
00110		Level 2	Valid	
01001	Domain fault	Level 1	Valid	MMU fault
01011		Level 2	Valid	
01101	Permission fault	Level 1	UNK	MMU fault
01111		Level 2	UNK	
01000	Synchronous external abort		UNK	-
10000	TLB conflict abort		UNK	-
11001	Synchronous parity or ECC error on memory access		UNK	-
10110	SError interrupt <sup>b</sup>		UNK	-
11000	SError interrupt <sup>b</sup> from a parity or ECC error on memory access		UNK	-
00010	Watchpoint		UNK	

a. Previously, this encoding was a deprecated encoding for Alignment fault. The extensive changes in the memory model in VMSAv8-32 mean there should be no possibility of confusing the new use of this encoding with its previous use

b. Including asynchronous external abort on a data access, a translation table walk, or an instruction fetch.

### G4.12.5 Reporting exceptions taken to Hyp mode

Hyp mode is the Non-secure EL2 mode. It is entered by taking an exception to Hyp mode.

#### ————— **Note** —————

Software executing in Monitor mode, or at EL3 when EL3 is using AArch64, can perform an exception return to Hyp mode. This means Hyp mode can be entered either by taking an exception, or by a permitted exception return.

When EL2 is using AArch32, the following exceptions are taken to Hyp mode:

- SError interrupt exceptions, IRQ exceptions, and FIQ exceptions, from Non-secure PL0 and PL1 modes, if not routed to Secure Monitor mode, and if configured by the AMO, FMO or IMO bits. For more information see [Asynchronous exception routing controls on page G1-4367](#).
- When **HCR.TGE** is set to 1, all exceptions that would be routed to Non-secure PL1 modes.

For more information, see [Routing exceptions from Non-secure EL0 to EL2 on page G1-4356](#).

- When `HDCR.TDE` is set to 1, any debug exception that would otherwise be taken to a Non-secure PL1 mode, see [Routing debug exceptions to EL2 using AArch32 on page G1-4358](#).
- The privilege rules for taking exceptions mean that any exception taken from Hyp mode, if not routed to EL3, must be taken to Hyp mode.
- Hypervisor Call exceptions, and Hyp Trap exceptions, are always taken to Hyp mode. These exceptions are supported only as part of EL2.

When EL2 is implemented, various operations from Non-secure PL0 and PL1 modes can be *trapped* to Hyp mode, using the Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-4427](#).

These exceptions include any memory system fault that occurs:

- On a memory access from Hyp mode.
- On memory access from a Non-secure PL0 or PL1 mode:
  - On a stage 2 translation, from IPA to PA.
  - On the stage 2 translation of an address accessed in performing a stage 1 translation table walk.

[Memory fault reporting in Hyp mode on page G4-4675](#) gives more information about these faults.

The following exceptions provide *syndrome* information in the `HSR`:

- Any synchronous exception taken to Hyp mode.
- Some exceptions taken from Debug state that would be taken to Hyp mode if the PE was in Non-debug state, see [Exceptions in Debug state on page H2-5465](#).

———— **Note** —————

- In Debug state, the PE does not change mode on taking an exception.
- As [Exceptions in Debug state on page H2-5465](#) describes, some other exceptions taken from Debug state make the `HSR` UNKNOWN.

The syndrome information in the `HSR` includes the Fault status code otherwise provided by the fault status register, and extends the fault reporting compared to that available for an exception taken to a PL1 mode. For more information, see [Use of the HSR on page G4-4677](#).

In addition, for a Debug exception taken to Hyp mode, `DBGDSCRint.MOE` or `DBGDTRRExt.MOE` shows what caused the Debug exception. This bit is valid regardless of whether the Debug exception was taken from Hyp mode or from another Non-secure mode.

[Registers used for reporting exceptions taken to Hyp mode](#) lists all of the registers used for exception reporting in Hyp mode.

## Registers used for reporting exceptions taken to Hyp mode

The following registers are used for reporting exceptions taken to Hyp mode:

- The `HSR` holds syndrome information for the exception.
- The `HDFAR` holds the VA associated with a Data Abort exception.
- The `HIFAR` holds the VA associated with a Prefetch Abort exception.
- The `HPFAR` holds bits[39:12] of the IPA associated with some aborts on stage 2 address translations.

In addition, if implemented, the optional `HADFSR` and `HAIFSR` can provide additional fault information, see [Hyp Auxiliary Fault Syndrome Registers](#).

## Hyp Auxiliary Fault Syndrome Registers

EL2 also defines encodings for the following Hyp Auxiliary Fault Syndrome Registers:

- The Hyp Auxiliary Data Fault Syndrome Register, `HADFSR`.
- The Hyp Auxiliary Instruction Fault Syndrome Register, `HAIFSR`.

An implementation can use these registers to return additional fault status information for aborts taken to Hyp mode. They are the Hyp mode equivalents of the registers described in [Auxiliary Fault Status Registers on page G4-4665](#). An example use of these registers is to return more information for diagnosing parity or ECC errors.

The architectural requirements for the [HADFSR](#) and [HAIFSR](#) are:

- The position of these registers is architecturally-defined, but the content and use of the registers is IMPLEMENTATION DEFINED.
- An implementation with no requirement for additional fault reporting can implement these registers as UNK/SBZP, but the architecture does not require it to do so.

## Memory fault reporting in Hyp mode

Prefetch Abort and Data Abort exceptions taken to Hyp mode report memory faults. For these aborts, the [HSR](#) contains the following fault status information:

- The [HSR.EC](#) field indicates the type of abort, as [Table G4-30](#) shows.
- The [HSR.ISS](#) field holds more information about the abort. In particular:
  - Bits[5:0] of this field hold the STATUS field for the abort, using the encodings defined in [PL1 fault reporting with the Long-descriptor translation table format on page G4-4670](#).
  - Other subfields of the ISS give more information about the exception, equivalent to the information returned in the FSR for a memory fault reported at PL1.

See the descriptions of the ISS fields for the memory faults, referenced from the *Syndrome description* column of [Table G4-30](#), for information about the returned fault information.

**Table G4-30 HSR.EC encodings for aborts taken to Hyp mode**

HSR.EC	Abort	Syndrome description
0x20	Prefetch Abort taken from Non-secure PL0 or PL1 mode	<a href="#">ISS encoding for an exception from a Prefetch Abort on page G6-4958</a>
0x21	Prefetch Abort taken from Hyp mode	
0x24	Data Abort taken from Non-secure PL0 or PL1 mode	<a href="#">ISS encoding for an exception from a Data Abort on page G6-4960</a>
0x25	Data Abort taken from Hyp mode	

For more information, see [Use of the HSR on page G4-4677](#).

A Prefetch Abort exception is taken synchronously with the instruction that the abort is reported on. This means:

- If the PE attempts to execute the instruction a Prefetch Abort exception is generated.
- If an instruction fetch is issued but the PE does not attempt to execute the prefetched instruction, no Prefetch Abort exception is generated for that instruction. For example, if the execution flow branches round a prefetched instruction that would abort if the PE attempted to execute it, no Prefetch Abort exception is generated.

## Register updates on exception reporting in Hyp mode

The use of the [HSR](#), and of the other registers listed in [Registers used for reporting exceptions taken to Hyp mode on page G4-4674](#), depends on the cause of the Abort. In reporting these faults, in general:

- If the fault generates a synchronous Data Abort exception, the [HDFAR](#) holds the associated VA, but see [Fault address reporting on synchronous external aborts on page G4-4664](#) for a permitted exception to this requirement.
- If the fault generates a Prefetch Abort exception, the [HIFAR](#) holds the associated VA, but see [Fault address reporting on synchronous external aborts on page G4-4664](#) for a permitted exception to this requirement.

- In the following cases, the **HPFAR** holds the faulting IPA:
  - A Translation or Access flag fault on a stage 2 translation.
  - A Translation, Access flag, or Permission fault on the stage 2 translation of an address accessed in a stage 1 translation table walk.
  - A stage 2 Address size fault.

In all other cases, the **HPFAR** is UNKNOWN.

- On a Data Abort exception that is taken to Hyp mode, the **HIFAR** is UNKNOWN.
- On a Prefetch Abort exception that is taken to Hyp mode, the **HDFAR** is UNKNOWN.

In addition, the reporting of particular aborts is as follows:

#### **Abort on the stage 1 translation for a memory access from Hyp mode**

The **HDFAR** or **HIFAR** holds the VA that caused the fault. The STATUS subfield of **HSR.ISS** indicates the type of fault, Translation, Address size, Access flag, or Permission. The **HPFAR** is UNKNOWN.

#### **Abort on the stage 2 translation for a memory access from a Non-secure PL1 or PL0 mode**

This includes aborts on the stage 2 translation of a memory access made as part of a translation table walk for a stage 1 translation. The **HDFAR** or **HIFAR** holds the VA that caused the fault. The STATUS subfield of **HSR.ISS** indicates the type of fault, Translation, Address size, Access flag, or Permission.

For any Access flag fault or Translation fault, and also for any Permission fault on the stage 2 translation of a memory access made as part of a translation table walk for a stage 1 translation, the **HPFAR** holds the IPA that caused the fault. Otherwise, the **HPFAR** is UNKNOWN.

#### **Abort caused by a synchronous external abort, or synchronous parity or ECC error, and taken to Hyp mode**

The **HDFAR** or **HIFAR** holds the VA that caused the fault, but see [Fault address reporting on synchronous external aborts on page G4-4664](#) for a permitted exception to this requirement. The **HPFAR** is UNKNOWN.

#### **Data Abort caused by a Watchpoint exception and routed to Hyp mode because HDCR.TDE is set to 1**

When **HDCR.TDE** is set to 1, a Watchpoint exception generated in a Non-secure PL1 or PL0 mode, that would otherwise generate a Data Abort exception, is routed to Hyp mode and generates a Hyp Trap exception.

**HDFAR** is set to the address that generated the watchpoint.

#### **Note**

**ELR\_hyp** indicates the address of the instruction that triggered the watchpoint.

A watchpointed address can be any byte-aligned address. The address reported in **HDFAR** might not be the watchpointed address, and, for a watchpoint due to an operation other than a Data Cache maintenance instruction, can be any address between and including:

- The lowest address accessed by the instruction that triggered the watchpoint.
- The highest watchpointed address accessed by that instruction.

If multiple watchpoints are set in this range, there is no guarantee of which watchpoint is generated.

#### **Note**

In particular, there is no guarantee of generating the watchpoint with the lowest address in the range.

The address must also be within a naturally-aligned block of memory of an IMPLEMENTATION DEFINED power-of-two size, containing a watchpoint address accessed by that location.

---

**Note**

---

The IMPLEMENTATION DEFINED power-of-two size must be no larger than the block size of the AArch64 [DC ZVA](#) operation.

---

See also [Watchpoint exceptions](#) on page G2-4496.

In all cases, [HPFAR](#) is UNKNOWN.

**Prefetch Abort caused by a Breakpoint Instruction exception and taken to Hyp mode**

This abort is generated if a BKPT instruction is executed in Hyp mode. The abort leaves the [HIFAR](#) and [HPFAR](#) UNKNOWN.

See also [Breakpoint Instruction exceptions](#) on page G2-4467.

**Prefetch Abort caused by a Breakpoint Instruction, Breakpoint, or Vector Catch exception, and routed to Hyp mode because HDCR.TDE is set to 1**

When [HDCR.TDE](#) is set to 1, a debug exception, generated in a Non-secure PL1 or PL0 mode, that would otherwise generate a Prefetch Abort exception, is routed to Hyp mode and generates a Hyp Trap exception.

The abort leaves the [HIFAR](#) and [HPFAR](#) UNKNOWN. This is identical to the reporting of a Prefetch Abort exception caused by a Debug exception on a BKPT instruction that is executed in Hyp mode.

---

**Note**

---

The difference between these two cases is:

- The Debug exception on a BKPT instruction executed in Hyp mode generates a Prefetch Abort exception, taken to Hyp mode, and reported in the [HSR](#) using EC value 0x21.
  - Aborts generated because [HDCR.TDE](#) is set to 1 generate a Hyp Trap exception, and are reported in the [HSR](#) using EC value 0x20.
- 

**Use of the HSR**

The [HSR](#) holds syndrome information for any synchronous exception taken to Hyp mode. Compared with the reporting of exceptions taken to PL1 modes, the [HSR](#):

- Always provides details of the fault. The [DFSR](#) and [IFSR](#) are not used.
- Provides more extensive information, for a wider range of exceptions.

---

**Note**

---

IRQ and FIQ exceptions taken to Hyp mode do not report any syndrome information in the [HSR](#).

---

[HSR, Hyp Syndrome Register](#) on page G6-4945 describes the [HSR](#), this section summarizes the general form of the register, to show how it encodes exception syndrome information. The register comprises:

- A 6-bit Exception class field, EC, that indicates the cause of the exception.
- An instruction length bit, IL. When an exception is caused by trapping an instruction to Hyp mode, this bit indicates the length of the trapped instruction, as follows:
 

<b>0</b>	16-bit instruction trapped.
<b>1</b>	32-bit instruction trapped.

In other cases the IL field is not valid and is RES1.
- An instruction specific syndrome field, ISS. Architecturally, this field could be defined independently for each defined Exception class (EC), but in practice several ISS formats are common to more than one [EC](#).

The format of the HSR depends on the value of the EC field, as follows:

**0b000000 < EC ≤ 0b001100**

The ISS part of the returned value includes the CV and COND fields described in [Encoding of ISS\[24:20\] when 0b000000 < EC ≤ 0b001100](#). Figure G4-17 shows the HSR format in this case.

**Figure G4-17 HSR format when the ISS includes CV and COND fields**

**EC == 0b000000 or EC 0b001110** There are no generic fields within the ISS. Figure G4-18 shows the HSR format in this case.

**Figure G4-18 HSR format when the ISS does not include a COND field**

#### **Encoding of ISS[24:20] when 0b000000 < EC ≤ 0b001100**

For EC values that are nonzero and less than or equal to 0b001100, ISS[24:20] provides the Condition code field for the trapped instruction, together with a valid flag for this field. The encoding of this part of the ISS field is:

**CV, ISS[24]** Condition code valid. Possible values of this bit are:

- 0** The COND field is not valid.
- 1** The COND field is valid

#### **COND, ISS[23:20]**

The Condition code for the trapped instruction. This field is valid only when CV is set to 1.

If CV is set to 0, this field is UNK/SBZP.

The full descriptions of the [HSR.ISS](#) formats give more information about the CV field.

#### **———— Note ————**

In some circumstances, it is IMPLEMENTATION DEFINED whether a conditional instruction that fails its Condition code check generates an Undefined Instruction exception, see [Conditional execution of undefined instructions on page G1-4378](#).

### HSR exception classes

Table G4-31 shows the encoding of the HSR exception class field, EC. Values of EC not shown in the table are reserved. For each EC value, the table references a subsection of the description of the HSR that describes the associated ISS format and gives information about the cause of the exception, for example the configuration required to enable the associated trap.

**Table G4-31 HSR.EC field encoding**

EC	Exception class	ISS description, or notes
0b000000	Unknown reason	<i>ISS encoding for exceptions with an unknown reason on page G6-4947.</i>
0b000001	Trapped WFI or WFE instruction	<i>ISS encoding for an exception from a WFI or WFE instruction on page G6-4948.</i>
0b000011	Trapped MCR or MRC access with (coproc==0b1111)	<i>ISS encoding for an exception from an MCR or MRC access on page G6-4949.</i>
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111)	<i>ISS encoding for an exception from an MCRR or MRRC access on page G6-4951.</i>
0b000101	Trapped MCR or MRC access with (coproc==0b1110)	<i>ISS encoding for an exception from an MCR or MRC access on page G6-4949.</i>
0b000110	Trapped LDC or STC access	<i>ISS encoding for an exception from an LDC or STC instruction on page G6-4953.</i>
0b000111	Advanced SIMD or floating-point functionality trapped by a HCPTR. {TASE, TCP10} control	<i>ISS encoding for an exception from an access to SIMD or floating-point functionality, resulting from HCPTR on page G6-4955.</i>
0b001000	Trapped VMRS access, from ID group traps, that is not reported using EC 0b000111	<i>ISS encoding for an exception from an MCR or MRC access on page G6-4949.</i> This trap is not taken if the HCPTR settings trap the access.
0b001100	Trapped MRRC access with (coproc==0b1110)	<i>ISS encoding for an exception from an MCRR or MRRC access on page G6-4951.</i>
0b001110	Illegal exception return to AArch32 state	<i>ISS encoding for an exception from an Illegal state or PC alignment fault on page G6-4959.</i>
0b010001	Exception on SVC execution in AArch32 state routed to EL2	<i>ISS encoding for an exception from HVC or SVC instruction execution on page G6-4956.</i>
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled	
0b010011	Trapped execution of SMC instruction in AArch32 state	<i>ISS encoding for an exception from SMC instruction execution on page G6-4957.</i>
0b100000	Prefetch Abort from a lower Exception level	<i>ISS encoding for an exception from a Prefetch Abort on page G6-4958.</i>
0b100001	Prefetch Abort taken without a change in Exception level	
0b100010	PC alignment exception.	<i>ISS encoding for an exception from an Illegal state or PC alignment fault on page G6-4959.</i>
0b100100	Data Abort from a lower Exception level	<i>ISS encoding for an exception from a Data Abort on page G6-4960.</i>
0b100101	Data Abort taken without a change in Exception level	

All EC encodings not shown in Table G4-30 on page G4-4675 are reserved by ARM.

## G4.12.6 Summary of register updates on exceptions taken to Hyp mode

For memory system faults that generate exceptions that are taken to Hyp mode, [Table G4-32](#) shows the registers affected by each fault. In this table:

- Yes indicates that the register is updated.
- UNK indicates that the fault makes the register value UNKNOWN.
- A null entry, -, indicates that the fault does not affect the register.

### ————— **Note** —————

For a list of the MMU faults see [MMU faults in AArch32 state on page G4-4657](#).

**Table G4-32 Effect of an exception taken to Hyp mode on the reporting registers**

Fault	HSR	HIFAR	HDFAR	HPFAR
Faults reported as Prefetch Abort exceptions:				
MMU fault <sup>a</sup> at stage 1.	Yes	Yes	UNK	UNK
Translation or Access flag MMU fault <sup>a</sup> at stage 2.	Yes	Yes	UNK	Yes
Other <sup>b</sup> MMU fault <sup>a</sup> at stage 2.	Yes	Yes	UNK	UNK
Stage 2 MMU fault <sup>a</sup> on a stage 1 translation.	Yes	Yes	UNK	Yes
Synchronous external abort on translation table walk.	Yes	Yes	UNK	UNK
Synchronous parity or ECC error on translation table walk.	Yes	Yes	UNK	UNK
Synchronous external abort.	Yes	IMP DEF <sup>c</sup>	UNK	UNK
Synchronous parity or ECC error on memory access.	Yes	Yes	UNK	UNK
Fault reported as Data Abort exception:				
MMU fault <sup>a</sup> at stage 1.	Yes	UNK	Yes	UNK
Translation or Access flag MMU fault <sup>a</sup> at stage 2.	Yes	UNK	Yes	Yes
Other <sup>b</sup> MMU fault <sup>a</sup> at stage 2.	Yes	UNK	Yes	UNK
Stage 2 MMU fault <sup>a</sup> on a stage 1 translation.	Yes	UNK	Yes	Yes
Synchronous external abort on translation table walk.	Yes	UNK	Yes	UNK
Synchronous parity or ECC error on translation table walk.	Yes	UNK	Yes	UNK
Synchronous external abort.	Yes	UNK	IMP DEF <sup>c</sup>	UNK
Synchronous parity or ECC error on memory access.	Yes	UNK	Yes	UNK
SError interrupt	Yes	UNK	UNK	UNK
SError interrupt from a parity or ECC error on memory access.	Yes	UNK	UNK	UNK
Debug exception:				
Breakpoint Instruction <sup>d</sup> , generates a Prefetch Abort exception.	Yes	UNK	-	UNK

**Table G4-32 Effect of an exception taken to Hyp mode on the reporting registers (continued)**

Fault	HSR	HIFAR	HDFAR	HPFAR
Debug exception routed to Hyp mode because <a href="#">HDCR.TDE</a> is set to 1. Generates a Hyp Trap exception.				
Breakpoint Breakpoint Instruction or Vector Catch	Yes	UNK	-	UNK
Watchpoint	Yes	-	Yes	UNK

- For more information see [Classification of MMU faults taken to Hyp mode](#)
- MMU fault other than a Translation fault or an Access flag fault.
- IMPLEMENTATION DEFINED. The FnV bit in the HSR.ISS field indicates whether the register holds a valid address. See [Fault address reporting on synchronous external aborts on page G4-4664](#).
- All other debug exceptions are not permitted in Hyp mode.

#### ———— Note ————

Unlike [Table G4-28 on page G4-4672](#), the Hyp mode fault reporting table does not include an entry for a fault on an instruction cache maintenance instruction. That is because, when the fault is taken to Hyp mode, the reporting indicates the cause of the fault, for example a Translation fault, and ISS.CM is set to 1 to indicate that the fault was on a cache maintenance instruction, see [ISS encoding for an exception from a Data Abort on page G6-4960](#).

## Classification of MMU faults taken to Hyp mode

This subsection gives more information about the MMU faults shown in [Table G4-32 on page G4-4680](#).

#### ———— Note ————

All MMU faults are synchronous.

The table uses the following descriptions for MMU faults taken to Hyp mode:

#### MMU fault at stage 1

This is an MMU fault generated on a stage 1 translation performed in the Non-secure PL2 translation regime.

#### MMU fault at stage 2

This is an MMU fault generated on a stage 2 translation performed in the Non-secure PL1&0 translation regime.

As the table shows, for the faults in this group:

- Translation and Access flag faults update the [HPFAR](#)
- Permission faults leave the [HPFAR](#) UNKNOWN.

#### MMU stage 2 fault on a stage 1 translation

This is an MMU fault generated on the stage 2 translation of an address accessed in a stage 1 translation table walk performed in the Non-secure PL1&0 translation regime. For more information about these faults see [Stage 2 fault on a stage 1 translation table walk on page G4-4656](#).

[Figure G4-1 on page G4-4560](#) shows the different translation regimes and associated stages of translation.

## G4.13 Address translation instructions

The System register encoding space includes encodings for instructions that either:

- Translate a *virtual address* (VA) to a *physical address* (PA).
- Translate a *virtual address* (VA) to an *intermediate physical address* (IPA).

[Address translation instructions, functional group on page G4-4737](#) summarizes these instructions.

When using the Short-descriptor translation table format, all translations performed by these instructions take account of TEX remap when this is enabled, see [Short-descriptor format memory region attributes, with TEX remap on page G4-4619](#).

An address translation instruction that executes successfully returns the output address, a PA or an IPA, in the [PAR](#). This is a 64-bit register, that can hold addresses of up to 40 bits.

It is IMPLEMENTATION DEFINED whether the address translation instructions return the values held in a TLB or the result of a translation table walk. Therefore, ARM recommends that these instructions are not used at a time when the TLB entries might be different from the underlying translation tables held in memory.

The following sections give more information about these instructions:

- [Address translation instruction naming and operation summary](#).
- [Encoding and availability of the address translation instructions on page G4-4684](#).
- [Determining the PAR format on page G4-4686](#).
- [Handling of faults and aborts during an address translation instruction on page G4-4686](#).

### G4.13.1 Address translation instruction naming and operation summary

Some older documentation uses the original names for the address translation instructions that were included in the original ARMv7 documentation. [Table G4-33](#) summarizes the instructions that are available in AArch32 state, and relates the old instruction names to the current names.

**Table G4-33 Naming of address translation instructions**

Name	Old name	Description
<a href="#">ATS1CPR</a> , <a href="#">ATS1CPW</a> , <a href="#">ATS1CUR</a> , <a href="#">ATS1CUW</a>	V2PCWPR, V2PCWPW, V2PCWUR, V2PCWUW	See <a href="#">ATS1C**</a> , <a href="#">Address translation stage 1, current Security state on page G4-4683</a>
<a href="#">ATS12NSOPR</a> , <a href="#">ATS12NSOPW</a> , <a href="#">ATS12NSOUR</a> , <a href="#">ATS12NSOUW</a>	V2POWPR, V2POWPW, V2POWUR, V2POWUW	See <a href="#">ATS12NSO**</a> , <a href="#">Address translation stages 1 and 2, Non-secure state only on page G4-4683</a>
<a href="#">ATS1HR</a> , <a href="#">ATS1HW</a>	Not applicable <sup>a</sup>	See <a href="#">ATS1H*</a> , <a href="#">Address translation stage 1, Hyp mode on page G4-4684</a>

a. Instructions are part of EL2 and have no equivalent in the older descriptions.

In an implementation that does not include EL2, there is no distinction between stage 1 translations and stage 1 and 2 combined translations.

For the *stage 1 current state* and *stages 1 and 2 Non-secure state only* instructions, the meanings of the last two letters of the names are:

<b>PR</b>	PL1 mode, read operation.
<b>PW</b>	PL1 mode, write operation.
<b>UR</b>	User mode, read operation.
<b>UW</b>	User mode, write operation.

#### ———— Note ————

User mode can be described as the unprivileged mode. It is the only PL0 mode.

For the *stage 1 Hyp mode* instructions, the last letter of the instruction name is **R** for the read operation and **W** for the write operation.

See also [Encoding and availability of the address translation instructions on page G4-4684](#).

### ATS1C\*\*, Address translation stage 1, current Security state

Any VMSAv8-32 implementation supports the ATS1C\*\* instructions. They can be executed by any software executing at PL1 or higher, in either Security state.

The ATS1C\*\* instructions are [ATS1CPR](#), [ATS1CPW](#), [ATS1CUR](#), and [ATS1CUW](#) and, when ARMv8.2-ATS1E1 is implemented, [ATS1CPRP](#) and [ATS1CPWP](#). These instructions perform the address translations of the PL1&0 translation regime.

In an implementation that includes EL2, when executed in Non-secure state, these instructions return the IPA that is the output address of the stage 1 translation. [Figure G4-1 on page G4-4560](#) shows the different translation regimes.

#### ————— Note —————

The Non-secure PL1 and PL0 modes have no visibility of the stage 2 address translations, that can be defined only at PL2, and translate IPAs to be PAs.

See [Determining the PAR format on page G4-4686](#) for the format used when returning the result of these instructions.

### ATS12NSO\*\*, Address translation stages 1 and 2, Non-secure state only

A VMSAv8-32 implementation supports the ATS12NSO\*\* instructions only if it includes EL2. In an implementation that includes EL2, in AArch32 state, they can be executed:

- By software executing in Non-secure state at EL2. This means by software executing in Hyp mode.
- If the implementation includes EL3, when EL3 is using AArch32, by software executing in Secure state at PL1.

The ATS12NSO\*\* instructions are [ATS12NSOPR](#), [ATS12NSOPW](#), [ATS12NSOUR](#), and [ATS12NSOUW](#).

In an implementation that includes EL3, when EL3 is using AArch64 and EL1 is using AArch32, any execution of an ATS12NSO\*\* instruction at Secure EL1 is trapped as an exception that is taken to EL3.

In an implementation that does not include EL2, but includes EL3, when EL3 is using AArch32 these instructions are not UNDEFINED but each instruction behaves in the same way as the equivalent [ATS1C\\*\\*](#) instruction.

If an implementation does not include EL2 and does not include EL3 then these instructions are CONSTRAINED UNPREDICTABLE, with the permitted behavior that the instructions are UNDEFINED, see [Unallocated System register access instructions on page K1-6100](#).

ARM deprecates use of these instructions from any Secure PL1 mode other than Monitor mode.

In Secure state and in Non-secure Hyp mode these instructions perform the translations made by the Non-secure PL1&0 translation regime.

These instructions always return the PA and final attributes generated by the translation. That is, for an implementation that includes EL2, they return:

- The result of the two stages of address translation for the specified Non-secure input address.
- The memory attributes obtained by the combination of the stage 1 and stage 2 attributes.

———— **Note** ————

From Hyp mode, the [ATS1C\\*\\*](#) and [ATS12NSO\\*\\*](#) instructions both return the results of address translations that would be performed in the Non-secure modes other than Hyp mode. The difference is:

- The [ATS1C\\*\\*](#) instructions return the Non-secure PL1 view of the associated address translation. That is, they return the IPA output address corresponding to the VA input address.
- The [ATS12NSO\\*\\*](#) instructions return the EL2, or Hyp mode, view of the associated address translation. That is, they return the PA output address corresponding to the VA input address, generated by two stages of translation.

See [Determining the PAR format on page G4-4686](#) for the format used when returning the result of these instructions.

**ATS1H\*, Address translation stage 1, Hyp mode**

A VMSAv8-32 implementation supports the [ATS1H\\*](#) instructions only if it includes EL2. They can be executed by:

- Software executing in Non-secure state at PL2. This means by software executing in Hyp mode.
- Software executing in Secure state in Monitor mode.

The [ATS1H\\*](#) instructions are [ATS1HR](#) and [ATS1HW](#). In an implementation that includes EL3, these instructions are **CONSTRAINED UNPREDICTABLE** if executed in a Secure PL1 mode other than Monitor mode, see [Hyp mode VA to PA address translation instructions on page K1-6116](#).

If an implementation does not include EL2 then these instructions are **CONSTRAINED UNPREDICTABLE**, with the permitted behavior that the instructions are **UNDEFINED**, see [Unallocated System register access instructions on page K1-6100](#).

These instructions perform the translations made by the Non-secure EL2 translation regime. The instruction takes a VA input address and returns a PA output address.

These instructions always return a result in a 64-bit format [PAR](#).

**G4.13.2 Encoding and availability of the address translation instructions**

Software executing at PL0 never has any visibility of the address translation instructions, but software executing at PL1 or higher can use the unprivileged address translation instructions to find the address translations used for memory accesses by software executing at PL0 and PL1.

———— **Note** ————

For information about translations when the stage of address translation is disabled see [The effects of disabling address translation stages on VMSAv8-32 behavior on page G4-4567](#).

[Table G4-34](#) shows the encodings for the address translation instructions, and their availability in different implementations in different PE modes and states.

**Table G4-34 Address translation instructions in AArch32 state**

opc1	CRm	opc2	Name	Type	Description
All VMSAv8-32 implementations, in all modes, at PL1 or higher, see <a href="#">ATS1C**</a> , <a href="#">Address translation stage 1</a> , <a href="#">current Security state on page G4-4683</a>					

Table G4-34 Address translation instructions in AArch32 state (continued)

opc1	CRm	opc2	Name	Type	Description
0	c8	0	<a href="#">ATS1CPR</a>	WO	PL1 stage 1 read translation, current state
		1	<a href="#">ATS1CPW</a>	WO	PL1 stage 1 write translation, current state
		2	<a href="#">ATS1CUR</a>	WO	Unprivileged stage 1 read translation, current state
		3	<a href="#">ATS1CUW</a>	WO	Unprivileged stage 1 write translation, current state
	c9	0	<a href="#">ATS1CPRP<sup>a</sup></a>	WO	PL1 stage 1 read translation, current state, PSTATE.PAN <sup>a</sup>
		1	<a href="#">ATS1CPWP<sup>a</sup></a>	WO	PL1 stage 1 write translation, current state, PSTATE.PAN <sup>a</sup>
Implementation includes EL2, in Non-secure Hyp mode and Secure PL1 modes, see <a href="#">ATS12NSO**</a> , <a href="#">Address translation stages 1 and 2, Non-secure state only on page G4-4683</a>					
0	c8	4	<a href="#">ATS12NSOPR</a>	WO	Non-secure PL1 stage 1 and 2 read translation
		5	<a href="#">ATS12NSOPW</a>	WO	Non-secure PL1 stage 1 and 2 write translation
		6	<a href="#">ATS12NSOUR</a>	WO	Non-secure unprivileged stage 1 and 2 read translation
		7	<a href="#">ATS12NSOUW</a>	WO	Non-secure unprivileged stage 1 and 2 write translation
Implementation includes EL2, in Non-secure Hyp mode and Secure Monitor mode, see <a href="#">ATS1H*</a> , <a href="#">Address translation stage 1, Hyp mode on page G4-4684</a>					
4	c8	0	<a href="#">ATS1HR</a>	WO	Hyp mode stage 1 read translation
		1	<a href="#">ATS1HW</a>	WO	Hyp mode stage 1 write translation

a. Instruction only supported when ARMv8.2-ATS1E1 is implemented.

The result of an instruction is always returned in the [PAR](#). The [PAR](#) is a RW register and:

- In all implementations, the 32-bit format [PAR](#) is accessed using an MCR or MRC instruction with CRn set to c7, CRm set to c4, and opc1 and opc2 both set to 0.
- The 64-bit format [PAR](#) is accessed using an MCRR or MRRC instruction with CRm set to c7, and opc1 set to 0.

Address translation instructions that are not available in a particular implementation are reserved and CONSTRAINED UNPREDICTABLE. For example:

- In an implementation that does not include EL2, the encodings with an opc1 value of 4 are reserved and CONSTRAINED UNPREDICTABLE. These are the [ATS1H\\*](#) instructions.
- In an implementation that does not include either EL2 or EL3, the encodings with opc2 values of 4-7 are reserved and CONSTRAINED UNPREDICTABLE. These are the [ATS12NSO\\*\\*](#) instructions.

The CONSTRAINED UNPREDICTABLE behavior of these encodings is that they are UNDEFINED, see [Unallocated System register access instructions on page K1-6100](#).

### G4.13.3 Determining the PAR format

The **PAR** is a 64-bit register, that supports both 32-bit and 64-bit **PAR** formats. This section describes how the **PAR** format is determined, for returning a result from each of the groups of address translation instructions. The returned result might be the translated address, or might indicate a fault on the translation, see *Handling of faults and aborts during an address translation instruction*.

#### **ATS1C\*\* instructions**

Address translations for the current state. From modes other than Hyp mode:

- **TTBCR**.EAE determines whether the result is returned using the 32-bit or the 64-bit **PAR** format.
- If the implementation includes EL3, the translation performed is for the current Security state and, depending on that state:
  - The Secure or Non-secure **TTBCR**.EAE determines the **PAR** format.
  - The result is returned to the Secure or Non-secure instance of the **PAR**

Instructions executed in Hyp mode always return a result to the Non-secure **PAR**, using the 64-bit format.

#### **ATS12NSO\*\* instructions**

Address translations for the Non-secure PL1 and PL0 modes. These instructions return a result using the 64-bit **PAR** format if at least one of the following is true:

- The Non-secure **TTBCR**.EAE bit is set to 1.
- The implementation includes EL2, and the value of **HCR**.VM is 1.

Otherwise, the instruction returns a result using the 32-bit **PAR** format.

Instructions executed in a Secure PL1 mode return a result to the Secure **PAR**. Instructions executed in Hyp mode return a result to the Non-secure **PAR**.

#### **ATS1H\* instructions**

Address translations from Hyp mode. These instructions always return a result using the 64-bit **PAR** format.

Instructions executed in Secure Monitor mode return a result to the Secure **PAR**. Instructions executed in Non-secure Hyp mode return a result to the Non-secure **PAR**.

### G4.13.4 Handling of faults and aborts during an address translation instruction

When a stage of address translation is enabled, any corresponding address translation instruction requires a translation table lookup, and this might require a translation table walk. However, the input address for the translation might be a faulting address, either because:

- The translation table entries used for the translation indicate a fault.
- A stage 2 fault or an external abort occurs on the required translation table walk.

*VMSAv8-32 memory aborts on page G4-4649* describes the faults that might occur on a translation table walk in AArch32 state.

How the fault is handled, and whether it generates an exception, depends on the cause of the fault, as described in:

- *MMU fault on an address translation instruction*.
- *External abort during an address translation instruction on page G4-4687*.
- *Stage 2 fault on a current state address translation instruction on page G4-4688*.

#### **MMU fault on an address translation instruction**

In the following cases, an MMU fault on an address translation is reported in the **PAR**, and no abort is taken. This rule applies:

- To a faulting address translation instruction executed in Hyp mode, or in a Secure PL1 mode.

- To a faulting address translation instruction executed in a Non-secure PL1 mode, for cases where the fault would generate a stage 1 abort if it occurred on the equivalent load or store operation.

*Using the PAR to report a fault on an address translation instruction* gives more information about how these faults are reported.

---

**Note**

- The Domain fault encodings shown in [Table G4-26 on page G4-4670](#) are used only for reporting a fault on an address translation instruction that uses the 64-bit PAR format. That is, they are used only in an implementation that includes EL2, and are used for reporting a Domain fault on either:
    - An **ATS1C\*\*** instruction executed in Hyp mode.
    - An **ATS12NSO\*\*** instruction executed when the value of **HCR.VM** is 1.
 These encodings are never used for fault reporting in the **DFSR**, **IFSR**, or **HSR**.
  - For an address translation instruction executed in a Non-secure PL1 mode, for a fault that would generate a stage 2 abort if it occurred on the equivalent load or store operation, the stage 2 abort is generated as described in *Stage 2 fault on a current state address translation instruction* on page G4-4688.
- 

**Using the PAR to report a fault on an address translation instruction**

For a fault on an address translation instruction for which no abort is taken, the PAR is updated with the following information, to indicate the fault:

- The fault code, that would normally be written to the Fault status register. The code used depends on the current translation table format, as described in either:
  - *PL1 fault reporting with the Short-descriptor translation table format* on page G4-4668.
  - *PL1 fault reporting with the Long-descriptor translation table format* on page G4-4670.
 See also the Note at the start of *Determining the PAR format* on page G4-4686 about the Domain fault encodings shown in [Table G4-26 on page G4-4670](#).
- A status bit, that indicates that the translation operation failed.

The fault does not update any Fault Address Register.

**External abort during an address translation instruction**

As stated in *External abort on a translation table walk* on page G4-4659, an external abort on a translation table walk generates a Data Abort exception. The abort can be synchronous or asynchronous, and behaves as follows:

**Synchronous external abort on a translation table walk**

The fault status and fault address registers of the Security state to which the abort is taken are updated. The fault status register indicates the appropriate external abort on a Translation fault, and the fault address register indicates the input address for the translation.

The PAR is UNKNOWN.

**Asynchronous external abort on a translation table walk**

The fault status register of the Security state to which the abort is taken is updated, to indicate the asynchronous external abort. No fault address registers are updated.

The PAR is UNKNOWN.

### Stage 2 fault on a current state address translation instruction

If the PE is in a Non-secure PL1 mode and executes one of the [ATS1C\\*\\*](#) instructions, then a fault in the stage 2 translation of an address accessed in a stage 1 translation table lookup generates an exception. This is equivalent to the case described in [Stage 2 fault on a stage 1 translation table walk on page G4-4656](#). When this fault occurs on an [ATS1C\\*\\*](#) address translation instruction:

- A Hyp Trap exception is taken to Hyp mode.
- The [PAR](#) is UNKNOWN.
- The [HSR](#) indicates that:
  - The fault occurred on a translation table walk.
  - The operation that faulted was a cache maintenance instruction.
- The [HPFAR](#) holds the IPA that faulted.
- The [HDFAR](#) holds the VA that the executing software supplied to the address translation instruction.

## G4.14 About the System registers for VMSAv8-32

The System registers and System instructions that are accessible in AArch32 state are almost all in the encoding space described in [The AArch32 System register interface on page G1-4408](#). This section gives general information about these registers, which comprise:

- Registers in the (coproc==0b1111) encoding space, that provide control and status information for the PE in Non-debug state.
- Registers in the (coproc==0b1110) encoding space, including:
  - Debug registers.
  - Trace registers.
  - Legacy execution environment registers.

[VMSAv8-32 organization of registers in the \(coproc==0b1110\) encoding space on page G4-4704](#) summarizes the registers in the (coproc==0b1110) encoding space, and indicates where these registers are described, either in this manual or in other architecture specifications.

[VMSAv8-32 organization of registers in the \(coproc==0b1111\) encoding space on page G4-4707](#) summarizes the registers in the (coproc==0b1111) encoding space, and indicates where in this manual these registers are described.

This section gives general information about the AArch32 System registers, and the conventions used in describing these registers.

### ———— Note ————

Many implementations include other interfaces to some System registers, for example a memory-mapped interface to some debug System registers. These are described in the appropriate sections of this manual.

This section is organized as follows:

- [About AArch32 System register accesses.](#)
- [Classification of System registers on page G4-4692.](#)
- [Synchronization of changes to AArch32 System registers on page G6-4768.](#)
- [Fixed values in register diagrams on page G4-4701.](#)
- [Principles of the ID scheme for fields in ID registers on page G4-4701.](#)

### G4.14.1 About AArch32 System register accesses

The following subsections give more information about accesses to the AArch32 System registers:

- [Ordering of reads of System registers.](#)
- [Accessing 32-bit System registers on page G4-4690.](#)
- [Accessing 64-bit System registers on page G4-4691.](#)

#### Ordering of reads of System registers

Reads of the System registers can occur out of order with respect to earlier instructions executed on the same PE, provided that both:

- Any data dependencies between the instructions, as specified in [Synchronization of changes to AArch32 System registers on page G6-4768](#), including read-after-read dependencies, are respected.
- The reads to the register do not occur earlier than the most recent [Context synchronization event](#) to its architectural position in the instruction stream.

### ———— Note ————

In particular, the values read from System registers that hold self-incrementing counts, such as the Performance Monitors counters or the Generic Timer counter or timers, could be accessed from any time after the previous [Context synchronization event](#). For example, where a memory access is used to communicate a read of such

counters, an ISB must be inserted between the read of the memory location that is known to have returned its data, either as a result of a condition on that data or of the write being completed, and the read of the Generic Timer counter, if it is necessary that the Generic Timer counter returns a count value after the memory communication.

## Accessing 32-bit System registers

Software accesses most 32-bit System registers using the generic MCR and MRC System register access instructions, specifying some or all of the parameters {coproc, CRn, opc1, CRm, opc2}, where:

coproc	Identifies the primary region of the System register encoding space. Takes one of the values:
	p14 Encoded as 0b1110.
	p15 Encoded as 0b1111.
CRn	Takes a value in the range c0-c15, encoded the corresponding 4-bit binary value, 0b0000-0b1111.
	In the (coproc==0b1110) encoding space, the opc1 value identifies the System register functional group, and CRn is the most significant identifier for the required register within that group.
	In the (coproc==0b1111) encoding space, CRn is the most significant identifier for the required register.
opc1	Takes a value in the range 0-7, encoded as its 3-bit binary value.
	In the (coproc==0b1110) encoding space, the opc1 value identifies the System register functional group, and can take the following values:
	0 Debug System registers.
	1 Trace System registers.
	7 Legacy Jazelle System registers.
	In the (coproc==0b1111) encoding space, opc1 can take any value in the range 0-7.
CRm	Takes a value in the range c0-c15, encoded the corresponding 4-bit binary value, 0b0000-0b1111.
opc2	Takes a value in the range 0-7, encoded as its 3-bit binary value.
	opc2 is optional in the MCR and MRC instruction syntax, and if no value is specified the encoding defaults to 0b000.
Rt	A general-purpose register to hold a 32-bit value to transfer to or from the System register. Takes a value in the range R0-R14, encoded as the corresponding 4-bit binary value, 0b0000-0b1110.

This means an MCR or MRC access to a specific 32-bit System register uses:

- A unique combination of coproc, CRn, opc1, CRm, and opc2, to specify the required System register.
- A general-purpose register, Rt, for the transferred 32-bit value.

See also:

- [MCR on page F5-3249.](#)
- [MRC on page F5-3271.](#)

A small number of AArch32 debug System registers are accessed using LDC or STC instructions. In these cases, the register to be accessed is identified in the instruction syntax by the use of p14, c5 where:

p14	Identifies that the access is to the (coproc==0b1110) encoding space.
c5	Identifies the target debug System register.

See the instruction descriptions:

- [LDC \(immediate\) on page F5-3140.](#)
- [LDC \(literal\) on page F5-3142.](#)
- [STC on page F5-3478.](#)

The only uses of LDC and STC permitted in ARMv8-A are:

- An LDC access to load data from memory to **DBGDTRTXint**, see [LDC \(immediate\) on page F5-3140](#) and [LDC \(literal\) on page F5-3142](#).
- An STC access to store data to memory from **DBGDTRRXint**, see [STC on page F5-3478](#).

A small number of AArch32 System registers are accessed using MRS, MSR, VMRS, or VMSR instructions, see the appropriate register and instruction description for more information, see:

- [MRS on page F5-3275](#).
- [MSR \(immediate\) on page F5-3285](#),
- [MSR \(register\) on page F5-3287](#).
- [VMRS on page F6-4017](#).
- [VMSR on page F6-4020](#).

---

**Note**

- For example:
    - The [APSR](#), [CPSR](#), and [SPSR](#) are accessed using MRS or MSR instructions.
    - The [MVFR0](#), [MVFR1](#), and [MVFR2](#) are accessed using VMRS or VMSR instructions.
  - In addition, the banked register forms of the MRS and MSR instructions can be used to access some System registers that are associated with PE modes other than the mode in which the PE is currently executing, see [MRS \(Banked register\) on page F5-3277](#) and [MSR \(Banked register\) on page F5-3281](#).
- 

## Accessing 64-bit System registers

Software accesses a 64-bit System register using the generic MCRR and MRRC System register access instructions, specifying the parameters {coproc, CRm, opc1}, where:

coproc	Identifies the primary region of the System register encoding space. Takes one of the values:
	p14 Encoded as 0b1110.
	p15 Encoded as 0b1111.
CRm	Takes a value in the range c0-c15, encoded the corresponding 4-bit binary value, 0b0000-0b1111.
	In the (coproc==0b1110) encoding space, the opc1 value identifies the System register functional group, and CRm is the most significant identifier for the required register within that group.
	In the (coproc==0b1111) encoding space, CRm is the most significant identifier for the required register.
opc1	Takes a value in the range 0-15, encoded as its 3-bit binary value.
	In the (coproc==0b1110) encoding space, the opc1 value identifies the System register functional group, and can take the following values:
	0 Debug System registers.
	1 Trace System registers.
	In the (coproc==0b1111) encoding space, opc1 can take any value in the range 0-15.
Rt	A general-purpose register to hold bits[31:0] of the value to transfer to or from the System register. Takes a value in the range R0-R14, encoded as the corresponding 4-bit binary value, 0b0000-0b1110.
Rt2	A general-purpose register to hold bits[63:32] of the value to transfer to or from the System register. Takes a value in the range R0-R14, encoded as the corresponding 4-bit binary value, 0b0000-0b1110.

This means an MCRR or MRRC access to a specific 64-bit System register uses:

- A unique combination of coproc, CRm and opc1, to specify the required 64-bit System register.
- Two general-purpose registers, each holding 32 bits of the value to transfer.

This means a PE can access a 64-bit System register using:

- An MCRR instruction to write to a System register, see [MCRR on page F5-3251](#).
- An MRRC instruction to read a System register, see [MRRC on page F5-3251](#).

When using an MCRR or MRRC instruction the System register access is 64-bit atomic.

Some 64-bit registers also have an MCR and MRC encoding. The MCR and MRC encodings for these registers access the least significant 32 bits of the register. For example, to access the [PAR](#), software can:

- Use the following instructions to access all 64 bits of the register:
 

MRRC p15, 0, <Rt>, <Rt2>, c7 ; Read 64-bit PAR into Rt (low word) and Rt2 (high word)  
 MCRR p15, 0, <Rt>, <Rt2>, c7 ; Write Rt (low word) and Rt2 (high word) to 64-bit PAR

- Use the following instructions to access the least significant 32 bits of the register:  
MRC p15, 0, <Rt>, c7, c4, 0 ; Read PAR[31:0] into Rt  
MCR p15, 0, <Rt>, c7, c4, 0 ; Write Rt to PAR[31:0]

## G4.14.2 Classification of System registers

Features provided by EL3 and EL2 integrate with many features of the architecture. Therefore, the descriptions of the individual System registers include information about how these Exception levels affect the register. This section:

- Summarizes how EL3 and EL2 affect the implementation of the System registers, and the classification of those registers.
- Summarizes how EL3 controls access to the System registers.
- Describes an EL3 signal that can control access to some registers in the (coproc==0b1111) encoding space.

It contains the following subsections:

- [Banked System registers](#).
- [Restricted access System registers](#) on page G4-4694.
- [Configurable access System registers](#) on page G4-4694.
- [EL2-mode System registers](#) on page G4-4695.
- [Common System registers](#) on page G4-4698.
- [The CP15SDISABLE input signal](#) on page G4-4699.
- [Access to registers from Monitor mode](#) on page G4-4700.

### ———— Note ————

EL3 defines the register classifications of Banked, Restricted access, Configurable, and Common. EL2 defines the EL2-mode classification.

It is IMPLEMENTATION DEFINED whether each IMPLEMENTATION DEFINED register is Banked, Restricted access, Configurable, EL2-mode, or Common.

## Banked System registers

In an implementation that includes EL3 using AArch32, some System registers are Banked. Banked System registers have two copies, one Secure and one Non-secure. The SCR.NS bit selects the Secure or Non-secure instance of the register. [Table G4-35](#) shows which registers in the (coproc==0b1111) encoding space are Banked in this way, and the permitted access to each register. No registers in the (coproc==0b1110) encoding space are Banked.

**Table G4-35 Banked (coproc==0b1110) System registers**

Banked register	Permitted accesses <sup>a</sup>
<a href="#">ACTLR</a> , Auxiliary Control Register	Read/write only at PL1 or higher
<a href="#">ACTLR2</a> , Auxiliary Control Register 2	Read/write only at PL1 or higher.
<a href="#">ADFSR</a> , Auxiliary Data Fault Status Register	Read/write only at PL1 or higher
<a href="#">AIFSR</a> , Auxiliary Instruction Fault Status Register	Read/write only at PL1 or higher
<a href="#">AMAIRO</a> , Auxiliary Memory Attribute Indirection Register 0	Read/write only at PL1 or higher
<a href="#">AMAIRO1</a> , Auxiliary Memory Attribute Indirection Register 1	Read/write only at PL1 or higher
<a href="#">CNTP_CTL</a> , Counter-timer Physical Timer Control register	Read/write only at PL0 or higher <sup>b</sup>
<a href="#">CNTP_CVAL</a> , Counter-timer Physical Timer CompareValue register	Read/write at PL0 or higher <sup>b</sup>
<a href="#">CNTP_TVAL</a> , Counter-timer Physical Timer TimerValue register	Read/write at PL0 or higher <sup>b</sup>

**Table G4-35 Banked (coproc==0b1110) System registers (continued)**

Banked register	Permitted accesses <sup>a</sup>
<a href="#">CONTEXTIDR</a> , Context ID Register	Read/write only at PL1 or higher
<a href="#">CSSELR</a> , Cache Size Selection Register	Read/write only at PL1 or higher
<a href="#">DACR</a> , Domain Access Control Register	Read/write only at PL1 or higher
<a href="#">DFAR</a> , Data Fault Address Register	Read/write only at PL1 or higher
<a href="#">DFSR</a> , Data Fault Status Register	Read/write only at PL1 or higher
<a href="#">IFAR</a> , Instruction Fault Address Register	Read/write only at PL1 or higher
<a href="#">IFSR</a> , Instruction Fault Status Register	Read/write only at PL1 or higher
<a href="#">MAIR0</a> , Memory Attribute Indirection Register 0	Read/write only at PL1 or higher
<a href="#">MAIR1</a> , Memory Attribute Indirection Register 1	Read/write only at PL1 or higher
<a href="#">NMRR</a> , Normal Memory Remap Register	Read/write only at PL1 or higher
<a href="#">PAR</a> , Physical Address Register	Read/write only at PL1 or higher
<a href="#">PRRR</a> , Primary Region Remap Register	Read/write only at PL1 or higher
<a href="#">SCTLR</a> , System Control Register <sup>c</sup>	Read/write only at PL1 or higher
<a href="#">TPIDRPRW</a> , EL1 only Thread ID	Read/write only at PL1 or higher
<a href="#">TPIDRURO</a> , User Read-only Thread ID	Read-only at PL0 Read/write at PL1 or higher
<a href="#">TPIDRURW</a> , User Read/Write Thread ID	Read/write at PL0 or higher
<a href="#">TTBCR</a> , Translation Table Base Control	Read/write only at PL1 or higher
<a href="#">TTBCR2</a> , Translation Table Base Control 2	Read/write only at PL1 or higher
<a href="#">TTBR0</a> , Translation Table Base 0	Read/write only at PL1 or higher
<a href="#">TTBR1</a> , Translation Table Base 1	Read/write only at PL1 or higher
<a href="#">VBAR</a> , Vector Base Address Register	Read/write only at PL1 or higher

- a. Any attempt to execute an access that is not permitted results in an Undefined Instruction exception.  
b. PL0 access is configurable, see the register description for more information.  
c. Some bits are common to the Secure and the Non-secure copies of the register, see [SCTLR, System Control Register](#) on page G6-5106.

A Banked System register can contain a mixture of:

- Fields that are Banked.
- Fields that are read-only in Non-secure PL1 or PL2 modes but read/write in the Secure state.

The System Control Register [SCTLR](#) is an example of a register of that contains this mixture of fields.

The Secure copies of the Banked System registers are sometimes referred to as the Secure Banked System registers. The Non-secure copies of the Banked System registers are sometimes referred to as the Non-secure Banked System registers.

## Restricted access System registers

In an implementation that includes EL3, some System registers are present only in Secure state. These are called *Restricted access* registers, and their read/write access permissions are:

- In Non-secure state, software cannot modify Restricted access registers.
- For the **NSACR**, in Non-secure state:
  - Software running at PL1 or higher can read the register.
  - Unprivileged software, meaning software running at PL0, cannot read the register.

This means that Non-secure software running at PL1 or higher can read the access permissions for System registers that have Configurable access.

If EL3 is using AArch64 then any read of the **NSACR** from Non-secure EL2 using AArch32, or Non-secure EL1 using AArch32, returns the value 0x00000C00.
- For all other Restricted access registers, Non-secure software cannot read the register.

In an implementation that does not include EL3:

- **SDER** is implemented only in Secure state.
- Any read of the **NSACR** returns the value 0x00000C00.
- All other accesses to Restricted access System registers are UNDEFINED.

**Table G4-36** shows the Restricted access System registers in the (coproc==0b1111) encoding space. There are no Restricted access registers in the (coproc==0b1110) encoding space.

**Table G4-36 Restricted access (coproc==0b1111) System registers**

Register	Permitted accesses <sup>a</sup>
<b>SCR</b> , Secure Configuration	Read/write in Secure PL1 modes
<b>SDCR</b> , Secure Debug Configuration Register	Read/write in Secure PL1 modes
<b>SDER</b> , Secure Debug Enable	Read/write in Secure PL1 modes
<b>NSACR</b> , Non-Secure Access Control	Read/write in Secure PL1 modes Read-only in Non-secure PL1 and PL2 modes
<b>MVBAR</b> , Monitor Vector Base Address	Read/write in Secure PL1 modes

a. Any attempt to execute an access that is not permitted results in an Undefined Instruction exception.

## Configurable access System registers

Secure software can configure the access to some System registers. These registers are called Configurable access registers, and the control can be:

- A bit in the control register determines whether the register is:
  - Accessible from Secure state only.
  - Accessible from both Secure and Non-secure states.
- A bit in the control register changes the accessibility of a register bit or field. For example, setting a bit in the control register might mean that a RW field behaves as RAZ/WI when accessed from Non-secure state.

Bits in the **NSACR** control access.

In an AArch32 implementation that includes EL3:

- There are no Configurable access System registers in the (coproc==0b1110) encoding space.
- The only required Configurable access register in the (coproc==0b1111) encoding space is the **CPACR**.
- The following Advanced SIMD and floating point System registers are Configurable access:
  - Floating-point Status and Control Register, **FPSCR**

- Floating-point Exception register, [FPEXC](#).
- Floating-point System ID register, [FPSID](#).
- Media and VFP Feature Register 0, [MVFR0](#).
- Media and VFP Feature Register 1, [MVFR1](#).
- Media and VFP Feature Register 2, [MVFR2](#).

## EL2-mode System registers

In an implementation that includes EL2, if EL2 can use AArch32, the implementation provides a number of registers for use in the EL2 mode, Hyp mode. As with other System register encodings, some of these register encodings provide write-only operations. When the implementation includes EL3 and EL3 is using AArch32, these registers are also accessible from Monitor mode when the value of [SCR.NS](#) is 1.

The following subsections describe the EL2-mode registers:

- [Hyp mode read/write registers in the \(coproc==0b1111\) encoding space.](#)
- [Hyp mode encodings for shared \(coproc==0b1111\) System registers on page G4-4696.](#)
- [Hyp mode \(coproc==0b1111\) write-only System instructions on page G4-4697.](#)

There are no EL2-mode registers in the (coproc==0b1110) encoding space.

### **Hyp mode read/write registers in the (coproc==0b1111) encoding space**

These registers are implemented only in Non-secure state, and in Non-secure state they are accessible only from Hyp mode.

Except for accesses to [CNTVOFF](#) in an implementation that includes EL3 but not EL2, the behavior of accesses to these registers is as follows:

- In Secure state, the registers can be accessed from EL3 when [SCR.NS](#) is set to 1, see [Access to registers from Monitor mode on page G4-4700](#).
- The following accesses are UNDEFINED:
  - Accesses from Non-secure PL1 modes.
  - Accesses in Secure state when [SCR.NS](#) is set to 0.

In an implementation that includes EL3 but not EL2, the behavior of accesses to [CNTVOFF](#) is as follows:

- Any access from Secure Monitor mode is CONSTRAINED UNPREDICTABLE, regardless of the value of [SCR.NS](#). The CONSTRAINED UNPREDICTABLE behavior is that the access is UNDEFINED, see [Unallocated System register access instructions on page K1-6100](#).
- All other accesses are UNDEFINED.

### **————— Note —————**

Except for [CNTVOFF](#), the Hyp mode registers are part of EL2, meaning they are implemented only if the implementation includes EL2. However, conceptually, [CNTVOFF](#) is part of any implementation of the Generic Timer, see [Status of the CNTVOFF register on page G5-4757](#). This means the behavior of [CNTVOFF](#) in an implementation that does not include EL2 is not covered by the general definition of the behavior of the Hyp mode (coproc==0b1111) read/write registers.

Table G4-37 shows the Hyp mode read/write System registers, in the (coproc==0b1111) encoding space:

**Table G4-37 Hyp mode (coproc==0b1111) read/write System registers**

Register	Width	Permitted accesses <sup>a</sup>
VPIDR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
VMPIDR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HSCTLR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HACTLR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HACTLR2	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode.
HCR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HDCCR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HCPTR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HSTR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HACR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HTCR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
VTCTCR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HTTBR	64-bit	Read/write. In Non-secure state, accessible only from Hyp mode
VTTBR	64-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HADFSR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HAIFSR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HSR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HPFAR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HMAIR0	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HMAIR1	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HAMAIR0	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HAMAIR1	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HVBAR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
HTPIDR	32-bit	Read/write. In Non-secure state, accessible only from Hyp mode
CNTVOFF <sup>b</sup>	64-bit	Read/write. In Non-secure state, accessible only from Hyp mode

a. Any attempt to execute an access that is not permitted results in an Undefined Instruction exception.

b. Implemented in any implementation of the Generic Timer. See, also, the Note earlier in this section.

#### **Hyp mode encodings for shared (coproc==0b1111) System registers**

Some Hyp mode registers share the Secure instance of an existing Banked register. In this case the implementation includes an encoding for the register that is accessible only in Hyp mode, or in Monitor mode when **SCR.NS** is set to 1.

For these registers, the following accesses are UNDEFINED:

- Accesses from Non-secure PL1 modes.
- Accesses in Secure state when [SCR.NS](#) is set to 0.

[Table G4-38](#) lists the Hyp mode encodings for shared registers.

**Table G4-38 Hyp mode (coproc==0b1111) System register encodings for shared registers**

Register	Permitted accesses <sup>a</sup>	Shared register
<a href="#">HDFAR</a>	Read/write. Accessible from Hyp mode, or from Monitor mode when <a href="#">SCR.NS</a> is set to 1.	Secure <a href="#">DFAR</a>
<a href="#">HIFAR</a>	Read/write. Accessible from Hyp mode, or from Monitor mode when <a href="#">SCR.NS</a> is set to 1.	Secure <a href="#">IFAR</a>

- a. Any attempt to execute an access that is not permitted results in an Undefined Instruction exception.

In Monitor mode, the Secure copies of these registers can be accessed either:

- Using the [DFAR](#) or [IFAR](#) encoding with [SCR.NS](#) set to 0.
- Using the [HDFAR](#) or [HIFAR](#) encoding with [SCR.NS](#) set to 1.

However, between accessing a register using one alias and accessing the register using the other alias, a [Context synchronization event](#) is required to ensure the ordering of the accesses.

#### **Hyp mode (coproc==0b1111) write-only System instructions**

Architecturally, these encodings are an extension of the Banked register encodings described in [Banked System registers on page G4-4692](#), where:

- The implementation does not implement the operation in Secure state.
- In Non-secure state, the operation is accessible only at EL2, that is, only from Hyp mode.

In Secure state:

- These instructions can be accessed from Monitor mode regardless of the value of [SCR.NS](#), see [Access to registers from Monitor mode on page G4-4700](#).
- Accesses to these instructions are CONSTRAINED UNPREDICTABLE if executed in a Secure mode other than Monitor mode, see [Hyp mode TLB maintenance instructions on page K1-6116](#) and [Hyp mode VA to PA address translation instructions on page K1-6116](#).

Accesses to these instructions are UNDEFINED if accessed from a Non-secure PL1 mode.

[Table G4-39](#) shows the EL2-mode write-only instructions in the (coproc==0b1111) encoding space:

**Table G4-39 Hyp mode (coproc==0b1111) write-only System instructions**

Register	Width	Permitted accesses <sup>a</sup>
<a href="#">ATS1HR</a>	32-bit	Write-only. Accessible only from Hyp mode and Monitor mode
<a href="#">ATS1HW</a>	32-bit	Write-only. Accessible only from Hyp mode and Monitor mode
<a href="#">TLBIALLHIS</a>	32-bit	Write-only. Accessible only from Hyp mode and Monitor mode
<a href="#">TLBIMVAHIS</a>	32-bit	Write-only. Accessible only from Hyp mode and Monitor mode
<a href="#">TLBIALLNSNHIS</a>	32-bit	Write-only. Accessible only from Hyp mode and Monitor mode
<a href="#">TLBIALLH</a>	32-bit	Write-only. Accessible only from Hyp mode and Monitor mode
<a href="#">TLBIMVAH</a>	32-bit	Write-only. Accessible only from Hyp mode and Monitor mode
<a href="#">TLBIALLNSNH</a>	32-bit	Write-only. Accessible only from Hyp mode and Monitor mode

- a. This section describes the behavior of write accesses that are not permitted. See also [Read-only and write-only register encodings](#) on page G6-4766.

## Common System registers

Some System registers and operations are common to the Secure and Non-secure Security states. These are described as the *Common access* registers, or simply as the *Common* registers. These registers include:

- Read-only registers that hold configuration information.
- Register encodings used for various memory system operations, rather than to access registers.
- The [ISR](#).
- All System registers in the (coproc==0b1110) encoding space.

[Table G4-40](#) shows the Common System registers in the (coproc==0b1111) encoding space. These registers are not affected by whether EL3 is implemented.

**Table G4-40 Common (coproc==0b1111) System registers**

Register	Permitted accesses <sup>a</sup>
<a href="#">MIDR</a> , Main ID Register	Read-only, only at EL1 or higher
<a href="#">CTR</a> , Cache Type Register	Read-only, only at EL1 or higher
<a href="#">TCMTR</a> , TCM Type Register <sup>b</sup>	Read-only, only at EL1 or higher
<a href="#">TLBTR</a> , TLB Type Register <sup>b</sup>	Read-only, only at EL1 or higher
<a href="#">MPIDR</a> , Multiprocessor Affinity Register	Read-only, only at EL1 or higher
<a href="#">REVIDR</a> , Revision ID	Read-only, only at EL1 or higher
<a href="#">ID_PFR0</a> , <a href="#">ID_PFR1</a> , Processor Feature Registers	Read-only, only at EL1 or higher
<a href="#">ID_DFR0</a> , Debug Feature Register 0	Read-only, only at EL1 or higher
<a href="#">ID_AFR0</a> , Auxiliary Feature Register 0	Read-only, only at EL1 or higher
<a href="#">ID_MMFR0</a> - <a href="#">ID_MMFR4</a> , Memory Model Feature Registers	Read-only, only at EL1 or higher
<a href="#">ID_ISAR0</a> - <a href="#">ID_ISAR5</a> , Instruction Set Attribute Registers	Read-only, only at EL1 or higher
<a href="#">CCSIDR</a> , Cache Size ID Register	Read-only, only at EL1 or higher
<a href="#">CLIDR</a> , Cache Level ID Register	Read-only, only at EL1 or higher
<a href="#">AIDR</a> , Auxiliary ID Register <sup>b</sup>	Read-only, only at EL1 or higher
<a href="#">FCSEIDR</a> , FCSE PID Register	Read/write, only at EL1 or higher
Cache and branch predictor maintenance instruction	See <a href="#">Cache maintenance instructions, functional group</a> on page G4-4734
Address translation instructions	See <a href="#">Address translation instructions, functional group</a> on page G4-4737
<a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , <a href="#">CP15ISB</a> memory barrier operations <sup>c</sup>	Write-only at all privilege levels, including EL0
TLB maintenance instructions	Write-only, only at EL1 or higher, see <a href="#">TLB maintenance instructions, functional group</a> on page G4-4735
Performance monitors	See <a href="#">Access permissions</a> on page D5-2176
<a href="#">ISR</a> , Interrupt Status Register	Read-only, only at EL1 or higher

- Any attempt to execute an access that is not permitted results in an Undefined Instruction exception.
- Register or operation details are IMPLEMENTATION DEFINED.
- For performance reasons, ARM deprecates any use of these memory barrier operations.

### Secure System registers for the (coproc==0b1111) encoding space

The Secure System registers in the (coproc==0b1111) encoding space comprise:

- The Secure copies of the Banked System registers in the (coproc==0b1111) encoding space.
- The Restricted access System registers in the (coproc==0b1111) encoding space.
- The Configurable access System registers in the (coproc==0b1111) encoding space that are configured to be accessible only from Secure state.

In an implementation that includes EL3, the Non-secure System registers are the System registers other than the Secure System registers.

### The CP15SDISABLE input signal

When EL3 is using AArch32, it provides an input signal, **CP15SDISABLE**, that disables write access to some of the Secure registers when asserted HIGH. The **CP15SDISABLE** signal has no effect on:

- Register accesses from AArch64 state.
- Register accesses from Secure EL1 when EL3 is using AArch64 and EL1 is using AArch32.

#### ———— Note ————

When EL3 is using AArch32, the interaction between **CP15SDISABLE** and any IMPLEMENTATION DEFINED register is IMPLEMENTATION DEFINED.

Table G4-41 shows the registers and operations affected.

**Table G4-41 Secure registers affected by CP15SDISABLE**

Register name	Affected operation
<a href="#">SCTLR</a> , System Control Register	MCR p15, 0, <Rt>, c1, c0, 0
<a href="#">TTBR0</a> , Translation Table Base Register 0	MCR p15, 0, <Rt>, c2, c0, 0
<a href="#">TTBCR</a> , Translation Table Base Control Register	MCR p15, 0, <Rt>, c2, c0, 2
<a href="#">TTBCR2</a> , Translation Table Base Control Register 2	MCR p15, 0, <Rt>, c2, c0, 3
<a href="#">DACR</a> , Domain Access Control Register	MCR p15, 0, <Rt>, c3, c0, 0
<a href="#">PRRR</a> , Primary Region Remap Register	MCR p15, 0, <Rt>, c10, c2, 0
<a href="#">NMRR</a> , Normal Memory Remap Register	MCR p15, 0, <Rt>, c10, c2, 1
<a href="#">AMAIR0</a> , Auxiliary Memory Attribute Indirection Register 0	MCR p15, 0, <Rt>, c10, c3, 0
<a href="#">AMAIR1</a> , Auxiliary Memory Attribute Indirection Register 1	MCR p15, 0, <Rt>, c10, c3, 1
<a href="#">VBAR</a> , Vector Base Address Register	MCR p15, 0, <Rt>, c12, c0, 0
<a href="#">MVBAR</a> , Monitor Vector Base Address Register	MCR p15, 0, <Rt>, c12, c0, 1

On a reset by the external system that resets the PE into EL3 using AArch32, the **CP15SDISABLE** input signal must be taken LOW. This permits the Reset code to set up the configuration of EL3 features. When the input is asserted HIGH, any attempt to write to the Secure registers shown in [Table G4-41 on page G4-4699](#) results in an Undefined Instruction exception.

The **CP15SDISABLE** input does not affect reading Secure registers, or reading or writing Non-secure registers. It is IMPLEMENTATION DEFINED how the input is changed and when changes to this input are reflected in the PE, and an implementation might not provide any mechanism for driving the **CP15SDISABLE** input HIGH. However, in an implementation in which the **CP15SDISABLE** input can be driven HIGH, changes in the state of **CP15SDISABLE** must be reflected as quickly as possible. Any change must occur before completion of an Instruction Synchronization Barrier operation, issued after the change, is visible to the PE with respect to instruction execution boundaries. Software must perform an Instruction Synchronization Barrier operation meeting the above conditions to ensure all subsequent instructions are affected by the change to **CP15SDISABLE**.

When EL3 is using AArch32, use of **CP15SDISABLE** means key Secure features that are accessible only at PL1 can be locked in a known state. This provides an additional level of overall system security. ARM expects control of **CP15SDISABLE** to reside in the system, in a block dedicated to security.

## Access to registers from Monitor mode

When the PE is in Monitor mode, the PE is in Secure state regardless of the value of the **SCR.NS** bit. In Monitor mode, the **SCR.NS** bit determines whether, for System registers in the (coproc==0b1111) encoding space, valid uses of the MRC, MCR, MRRC and MCRR instructions access the Secure Banked System registers or the Non-secure Banked System registers. That is, when:

**NS == 0** Common, Restricted access, and Secure Banked System registers are accessed by MRC, MCR, MRRC and MCRR instructions that target the (coproc==0b1111) encoding space.

If the implementation includes EL2, the registers listed in [Hyp mode read/write registers in the \(coproc==0b1111\) encoding space on page G4-4695](#) and [Hyp mode encodings for shared \(coproc==0b1111\) System registers on page G4-4696](#) are not accessible, and any attempt to access them generates an Undefined Instruction exception.

### ————— Note —————

The operations listed in [Hyp mode \(coproc==0b1111\) write-only System instructions on page G4-4697](#) are accessible in Monitor mode regardless of the value of **SCR.NS**.

System instructions in the (coproc==0b1111) encoding space use the Security state to determine all resources used, that is, all operations performed by these instructions are performed in Secure state.

**NS == 1** Common, Restricted access and Non-secure Banked System registers are accessed by MRC, MCR, MRRC and MCRR instructions that target the (coproc==0b1111) encoding space.

If the implementation includes EL2, all the registers and operations listed in the subsections of [EL2-mode System registers on page G4-4695](#) are accessible, using the MRC, MCR, MRRC, or MCRR instructions required to access them from Hyp mode.

System instructions in the (coproc==0b1111) encoding space use the Security state to determine all resources used, that is, all operations by these instructions are performed in Secure state.

The Security state determines whether the Secure or Non-secure Banked registers determine the control state.

### ————— Note —————

Where the contents of a register select the value accessed by an MRC or MCR access to a different register, then the register that is used for selection is being used as control state. For example, **CSSELR** selects the current **CCSIDR**, and therefore **CSSELR** is used as control state. Therefore, in Monitor mode:

- **SCR.NS** determines whether the Secure or Non-secure **CSSELR** is accessible.
- Because the PE is in Secure state, the Secure **CSSELR** selects the current **CCSIDR**.

### G4.14.3 Fixed values in register diagrams

In register diagrams, a fixed bit can be indicated by one of 0, (0), 1, or (1), with the following meanings:

- 0** In any implementation:
  - The bit must read as 0.
  - Writes to the bit must be ignored.
  - Software:
    - Can rely on the bit reading as 0.
    - Must use an SBZP policy to write to the bit.
- (0)** The bit should-be-zero. In AArch32 state there are a small number of cases where a bit is (0) in some contexts, and has a different defined behavior in other contexts. See [RES0](#).
- 1** In any implementation:
  - The bit must read as 1.
  - Writes to the bit must be ignored.
  - Software:
    - Can rely on the bit reading as 1.
    - Must use an SBOP policy to write to the bit.
- (1)** The bit is should-be-one. In AArch32 state there are a small number of cases where a bit is (1) in some contexts, and has a different defined behavior in other contexts. See [RES1](#).

#### ———— Note ————

In register diagrams, (0) is a synonym for RES0, and (1) is a synonym for RES1, where RES0 and RES1 are defined in the [Glossary](#). However, when used in an instruction encoding diagram, (0) and (1) have the narrower definition that behavior is UNPREDICTABLE or CONSTRAINED UNPREDICTABLE if either:

- A bit marked as (0) has the value 1.
- A bit marked as (1) has the value 0.

### G4.14.4 Principles of the ID scheme for fields in ID registers

The ARM architecture specifies a number of *ID registers* that are characterized as comprising a set of 4-bit *ID fields*. Each ID field identifies the presence, and possibly the level of support for, a particular feature in an implementation of the architecture. These fields follow an architectural model that aids their use by software and provides future compatibility. This section describes that model. [AArch32 ID registers to which this scheme applies on page G4-4702](#) identifies the set of ID registers that are accessible from AArch32 state.

#### ———— Note ————

These fields are distinct from register fields that enumerate the number of resources, such as the number of breakpoints, watchpoints, or performance monitors, or the amount of memory.

#### ———— Note ————

The presence of an ID register field for a feature does not imply that the feature is optional.

To provide forward compatibility, software can rely on the features of these fields that are described in this section.

The ID fields, which are either signed or unsigned, use increasing numerical values to indicate increases in functionality. Therefore, if a value of 0x1 indicates the presence of some instructions, then the value 0x2 will indicate the presence of those instructions plus some additional instructions or functionality. This means software can be written in the form:

```
if (value >= number) {
    // do something that relies on the value of the feature
}
```

For ID fields where the value 0x0 defines that a feature is not present, the field holds an unsigned value. This covers the vast majority of such fields.

In a few cases, the architecture has been changed to permit implementations to exclude a feature that has previously been required and for which no ID field has been defined. In these cases, a new ID field is defined and:

- The field holds a signed value.
- The field value 0xF indicates that the feature is not implemented.
- The field value 0x0 indicates that the feature is implemented.
- Software that depends on the feature can use the test:

```
if value >= 0 {  
    // Software features that depend on the presence of the hardware feature  
}
```

In some cases, it has been decided retrospectively that the increase in functionality between two consecutive numerical values is too great, and it is desirable to permit an intermediate degree of functionality, and the means to discover this. This is done by the introduction of a *fractional* field that both:

- Is referred to in the definition of the original field.
- Applies only when the original field is at the lower value of the step.

In principle a fractional field can be used for two different fractional steps, with different meanings associated with each of these steps. For this reason, a fractional field must be interpreted in the context of the field to which it relates and the value of that field. [Example G4-6](#) shows the use of such a field.

#### Example G4-6 Example of the use of a fractional field

---

For a field describing some class of functionality:

- The value 0x1 was defined as indicating that item A is present.
- The value 0x2 was defined as indicating that items B and C are present, in addition to item A.

Subsequently, it might be necessary to introduce a second ID field to indicate that A and B only are present. This new field is a fractional field, and might be defined as having the value 0x1 when A and B only are present. This fractional field is valid only when the original ID field has the value 0x1.

This approach means that:

- Software that depends on the test if (value >= 0x2) can rely on features A, B, and C being present,
- Software that depends on the test if (value >= 0x1) can rely on feature A being present.
- If new software needs to check only that features A and B are present then it can test:

```
if (value >= 0x2 || (value == 0x1 && fractional_value >= 0x1)) {  
    // Software features that depend on A and B only  
}
```

---

A fractional field uses the same approach of increasing numerical values indicating increasing functionality, and the fractional approach can also be applied recursively to fractional fields.

Unused ID fields, and fractional fields that are not applicable, are RES0 to allow their future use when features, or fractional implementation options, are added.

#### AArch32 ID registers to which this scheme applies

This scheme applies to the following AArch32 system registers:

- The Auxiliary Feature register [ID\\_AFR0](#).
- The Processor Feature registers [ID\\_PFR0](#) and [ID\\_PFR1](#).
- The Debug Feature register [ID\\_DFR0](#).
- The Memory Model Feature registers [ID\\_MMFR0](#), [ID\\_MMFR1](#), [ID\\_MMFR2](#), [ID\\_MMFR3](#), and [ID\\_MMFR4](#).

- The Instruction Set Attribute registers [ID\\_ISAR0](#), [ID\\_ISAR1](#), [ID\\_ISAR2](#), [ID\\_ISAR3](#), [ID\\_ISAR4](#), and [ID\\_ISAR5](#).
- The Media and VFP Feature registers [MVFR0](#), [MVFR1](#), and [MVFR2](#).

---

**Note**

*Principles of the ID scheme for fields in ID registers on page D7-2195* includes information about the AArch64 System registers and the memory-mapped registers to which this scheme applies.

---

## G4.15 VMSAv8-32 organization of registers in the (coproc==0b1110) encoding space

The System registers in the (coproc==0b1110) encoding space provide a number of distinct control functions, covering:

- Debug.
- Trace.
- Execution environment control, for identification of the trivial Jazelle implementation.

Because these functions are distinct, the descriptions of these registers are distributed, as follows:

- In this manual [Debug registers on page G6-5239](#) describes the Debug registers.
- The *Embedded Trace Macrocell Architecture Specification* describes the Trace registers.

This section summarizes the allocation of the System registers in the (coproc==0b1110) encoding space between these different functions, and the register encodings in this space that are reserved.

The 32-bit System register encodings are classified by the {opc1, CRn, opc2, CRm} values required to access them using an MCR or an MRC instruction. The 64-bit System register encodings are classified by the {opc1, CRm} values required to access them using an MCRR or an MRRC instruction. For the registers in the (coproc==0b1110) encoding space, the opc1 value determines the primary allocation of these registers, as follows:

**opc1==0** Debug registers.

**opc1==1** Trace registers.

**opc1==7** Jazelle registers. Jazelle registers are implemented as required for a trivial Jazelle implementation.

**Other opc1 values**

Reserved.

---

### Note

Primary allocation of (coproc==0b1110) register function by opc1 value differs from the allocation of (coproc==0b1111) registers, where primary allocation is by CRn value for 32-bit register accesses, or CRm value for 64-bit register accesses.

---

For the Debug and Jazelle registers, [Table G4-42 on page G4-4705](#) defines:

- The {opc1, CRn, opc2, CRm} values used for accessing the 32-bit registers using the MRC and MCR instructions.
- The {opc1, CRm} values used for accessing the 64-bit register using the MRRC instruction.

Some Debug registers can also be accessed using the LDC and STC instructions. [Table G4-43 on page G4-4706](#) defines the CRn values used for accessing the registers using these instructions.

---

### Note

The only permitted uses of the LDC and STC instructions are:

- An LDC access to load data from memory to [DBGDTRTXint](#).
- An STC access to store data to memory from [DBGDTRRXint](#).

In the LDC and STC syntax descriptions in this Manual, the required coproc value of p14 and CRn value of c5 are given explicitly.

---

#### G4.15.1 Register access instruction arguments, (coproc==0b1110) registers

Table G4-42 shows the MCR, MRC, and MRRC instruction arguments required for accesses to each register that can be visible in the System register interface in the (coproc==0b1110) encoding.

**Table G4-42 Mapping of (coproc==0b1110) MCR, MRC, and MRRC instruction arguments to System registers**

opc1	CRn	opc2	CRm	Name	Width	Description
0	c0	0	c0	DBGDIDR	32-bit	Debug ID, or unallocated <sup>a</sup>

	-	-	c2		64-bit	
	c4	0-3	c0-15	-		IMPLEMENTATION DEFINED

**Table G4-42 Mapping of (coproc==0b1110) MCR, MRC, and MRRC instruction arguments to System registers (continued)**

opc1	CRn	opc2	CRm	Name	Width	Description
0	c7	6	c8	<a href="#">DBGCLAIMSET</a>	32-bit	Debug CLAIM Tag Set register
			c9	<a href="#">DBGCLAIMCLR</a>	32-bit	Debug CLAIM Tag Clear register
			c14	<a href="#">DBGAUTHSTATUS</a>	32-bit	Debug Authentication Status register
	7		c0	<a href="#">DBGDEVID2</a>	32-bit	Debug Device ID register 2
			c1	<a href="#">DBGDEVID1</a>	32-bit	Debug Device ID register 1
			c2	<a href="#">DBGDEVID</a>	32-bit	Debug Device ID register
1	c0-c7	0-7	c0-c15	-	32-bit	Reserved for OPTIONAL Trace extension
7	c0	0	c0	<a href="#">JIDR</a>	32-bit	Jazelle ID Register <sup>c</sup>
	c1	0	c0	<a href="#">JOSCR</a>	32-bit	Jazelle OS Control Register <sup>c</sup>
	c2	0	c0	<a href="#">JMCR</a>	32-bit	Jazelle Main Configuration Register <sup>c</sup>
All other encodings				-	32-bit	Unallocated

a. If EL1 cannot use AArch32 this register is OPTIONAL and deprecated. See the register description for details.

b. Not implemented breakpoint and watchpoint register access instructions are unallocated. If EL2 is not implemented or breakpoint *n* is not context-aware, [DBGBXR<n>](#) is unallocated. CRm encodes <*n*>, the breakpoint or watchpoint number.

c. Legacy register, see [Legacy feature registers, functional group on page G4-4744](#).

[Table G4-43](#) shows the LDC and STC instruction arguments required for accesses to the Debug registers that can be accessed using these instructions.

**Table G4-43 Mapping of LDC and STC instruction arguments to System registers**

CRn	Instruction	Name	Width	Description
c5	LDC	<a href="#">DBGDTRTXint</a>	32-bit	Debug Data Transfer Register, Transmit, Internal View
c5	STC	<a href="#">DBGDTRRXint</a>	32-bit	Debug Data Transfer Register, Receive, Internal View

#### ————— Note —————

In the instruction syntax descriptions for the LDC and STC instructions, the required coproc and CRn values are given explicitly as coproc==p14, CRn==c5.

## G4.16 VMSAv8-32 organization of registers in the (coproc==0b1111) encoding space

For 32-bit accesses to the System registers in the (coproc==0b1111) encoding space, the ordered set of parameters {CRn, opc1, CRm, opc2} determine the register order. Within this ordering, the CRn value originally provided a functional grouping of these registers. As the number of System registers has increased this ordering has become less appropriate.

This document now:

- Groups the ARMv8.0 System registers in the (coproc==0b1111) encoding space by functional group, see [Functional grouping of VMSAv8-32 System registers on page G4-4726](#).
- Describes all of the ARMv8.0 System registers for VMSAv8-32, in [Chapter G6 AArch32 System Register Descriptions](#).
- Gives additional information about the organization of the VMSAv8-32 System registers in the (coproc==0b1111) encoding space, in the remainder of this section.

---

### Note

Not all System registers introduced by architectural extensions to ARMv8.0 are described in [Chapter G6 AArch32 System Register Descriptions](#). For information about the System registers introduced by architectural extensions to ARMv8.0, see [ARMv8 architecture extensions on page A1-55](#).

This section presents information as follows:

#### Register ordering by {CRn, opc1, CRm, opc2}

See:

- [System register summary for \(coproc==0b1111\) encodings by CRn value on page G4-4708](#).
- [Full list of VMSAv8-32 System registers in the \(coproc==0b1111\) encoding space on page G4-4710](#).

---

### Note

The ordered listing of (coproc==0b1111) registers by the {CRn, opc1, CRm, opc2} encoding of the 32-bit registers is most likely to be useful to those implementing AArch32 state, and to those validating such implementations. However, otherwise, the grouping of registers by function is more logical.

#### Views of the registers, that depend on the current state of the PE

See [AArch32 views of the System registers in the \(coproc==0b1111\) encoding space on page G4-4723](#).

---

### Note

The different register views are particularly significant in implementations that include EL2.

In addition, the indexes in [Appendix K11 Registers Index](#) include all of the System registers.

#### G4.16.1 System register summary for (coproc==0b1111) encodings by CRn value

Figure G4-19 summarizes the grouping of the System registers in the (coproc==0b1111) encoding space, for a VMSAv8-32 implementation, by the value of CRn used for a 32-bit access to the register.

CRn	opc1	CRm	opc2		
c0	{0-2, 4}	{c0-c2}	{0-7}	☐	ID registers
c1	{0, 4}	{c0, c1}	{0-7}	▨	System control registers
c2	{0, 4}	{c0, c1}	{0-2}	▨	Memory system control registers

☐ Read-only    ▨ Read/Write    ▨ Write-only    ☐ Access depends on the implementation  
\* If implemented

**Figure G4-19 System register groupings for (coproc==0b1111), for 32-bit registers**

##### Note

For the System registers in the (coproc==0b1111) encoding space, Figure G4-19 gives only an overview of the assigned encodings for 32-bit registers for each of the CRn values c0-c15. For more information, see:

- The full list of registers in the (coproc==0b1111) encoding space, in [Full list of VMSAv8-32 System registers in the \(coproc==0b1111\) encoding space on page G4-4710](#), for the definition of the assigned and unassigned encodings for that register.
- The register definitions in [Chapter G6 AArch32 System Register Descriptions](#) for any dependencies on the implemented Exception levels.

In general, System register accesses using an unallocated set of {CRn, opc1, CRm, opc2} values are UNDEFINED.

[Behavior of VMSAv8-32 32-bit System registers with \(coproc==0b1111, CRn==c0\) on page G4-4709](#) described the only exceptions to this rule.

The 32-bit System registers with (coproc==0b1111, CRn==c15), and the corresponding 64-bit System registers, are reserved for implementation defined registers. For more information see [Reserved encodings in the VMSAv8-32 System register \(coproc==0b1111\) space on page G4-4709](#).

#### The HSTR.Tn trap on (coproc==0b1111) System registers

As [General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the \(coproc==0b1111\) encoding space on page G1-4440](#) describes, when the value of HSTR.Tn is 1, Non-secure PL1 accesses to System registers in the (coproc==0b1111) encoding space using a CRn or CRm value that corresponds to the value of Tn are trapped to PL2, even if the encoding is UNDEFINED when the value of HSTR.Tn is 0. This rule applies:

- For 32 bit register accesses when the value of Rn in the MCR or MRC instruction corresponds to Tn.
- For 64 bit register accesses when the value of Rm in the MCRR or MRRC instruction corresponds to Tn.

If there are matching System register encodings that are accessible from Non-secure PL0 then those accesses are also trapped to PL2 when the value of HSTR.Tn is 1.

## Behavior of VMSAv8-32 32-bit System registers with (coproc==0b1111, CRn==c0)

In the (coproc==0b1111) encoding space, the 32-bit System registers with (CRn==c0) provide device and feature identification. That is, they provide registers in the functional group described in [Identification registers, functional group](#) on page G4-4727.

Table G4-44 on page G4-4711 shows all of the architecturally required System registers with {coproc==0b1111, CRn==c0}. The behavior of 32-bit System register encodings in this group that are not shown in the table, and encodings that are part of an unimplemented Exception level, depends on the value of opc1, and possibly on the value of CRm and opc2, as follows:

- opc1 == 0      All write accesses to the encodings are UNDEFINED.  
For read accesses:
- The following encodings return an UNKNOWN value:
    - CRm==3, opc2=={0, 1, 2}.
    - CRm=={4, 6, 7}, opc2=={0, 1}.
    - CRm==5, opc2=={0, 1, 4, 5}.
  - All other encodings are RES0.
- opc1 > 0      All accesses to the encodings are UNDEFINED.

See also [Accesses to unallocated encodings in the \(coproc==0b111x\) encoding space](#) on page G6-4765.

### ————— Note —————

Some of these registers were previously described as being part of the CPUID identification scheme, see [The CPUID identification scheme](#) on page G4-4728.

## Reserved encodings in the VMSAv8-32 System register (coproc==0b1111) space

AArch32 state reserves a number of regions in the (coproc==0b1111) encoding space for IMPLEMENTATION DEFINED System registers. These reservations are defined in terms of the encoding of 32-bit accesses to the System register encoding space. That is, they are defined by the reserved 32-bit {CRn, opc1, CRm, opc2} encodings.

In ARMv8, reserved encodings that do not have an IMPLEMENTATION DEFINED function are UNDEFINED.

The following subsections give more information about these reserved encodings:

- [Reserved 32-bit encodings with {coproc==0b1111, CRn==c9}](#).
- [Reserved 32-bit encodings with {coproc==0b1111, CRn==c10}](#) on page G4-4710.
- [Reserved 32-bit encodings with {coproc==0b1111, CRn==c11}](#) on page G4-4710.
- [Reserved 32-bit encodings with {coproc==0b1111, CRn==c15}](#) on page G4-4710.

### Reserved 32-bit encodings with {coproc==0b1111, CRn==c9}

In the AArch32 encoding space, for 32-bit encodings with {coproc==0b1111, CRn==c9}, the following encodings are reserved for IMPLEMENTATION DEFINED purposes:

- Encodings with {coproc==0b1111, CRn==c9, opc=={0-7}, CRm=={c0-c2, c5-c8}} are reserved for IMPLEMENTATION DEFINED branch predictor, cache, and TCM operations.
- Encodings with {coproc==0b1111, CRn==c9, opc=={0-7}, CRm==c15} are reserved for IMPLEMENTATION DEFINED performance monitors.

### ————— Note —————

These are distinct from the OPTIONAL ARM Performance Monitors Extension, the registers for which use the encoding space {coproc==0b1111, CRn==c9, opc=={0-7}, CRm=={c12-c14}}.

**Reserved 32-bit encodings with {coproc==0b1111, CRn==c10}**

In the AArch32 encoding space, for 32-bit encodings with {coproc==0b1111, CRn==c10}, the following encodings are reserved for IMPLEMENTATION DEFINED purposes:

- Encodings with {coproc==0b1111, CRn==c10, opc=={0-7}, CRm=={c0, c1, c4, c8}} are reserved for IMPLEMENTATION DEFINED TLB lockdown operations.

**Reserved 32-bit encodings with {coproc==0b1111, CRn==c11}**

In the AArch32 encoding space, for 32-bit encodings with {coproc==0b1111, CRn==c11}, the following encodings are reserved for IMPLEMENTATION DEFINED purposes:

- Encodings with {coproc==0b1111, CRn==c11, opc=={0-7}, CRm=={c0-c8, c15}} are reserved for IMPLEMENTATION DEFINED DMA operations for TCM access.

In ARMv8, the remainder of the AArch32 {coproc==0b1111, CRn==c11} encoding space is UNDEFINED.

**Reserved 32-bit encodings with {coproc==0b1111, CRn==c15}**

ARMv8 reserves the AArch32 System register encodings with (coproc==0b1111, CRn==c15) for IMPLEMENTATION DEFINED purposes, and does not impose any restrictions on the use of these encodings. The documentation of the ARM implementation must describe fully any registers implemented in the {coproc==0b1111, CRn==c15} encoding space. Normally, for processor implementations by ARM, this information is included in the *Technical Reference Manual* for the processor.

Typically, an implementation uses the {coproc==0b1111, CRn==c15} encodings to provide test features, and any required configuration options that are not covered by this Manual.

This reservation means that the AArch32 64-bit encodings with {coproc==0b1111, CRm==c15} are also reserved for IMPLEMENTATION DEFINED purposes, without any restrictions on the use of these encodings.

**G4.16.2 Full list of VMSAv8-32 System registers in the (coproc==0b1111) encoding space**

Table G4-44 on page G4-4711 shows the System registers in the (coproc==0b1111) encoding space in VMSAv8-32, in the order of the {CRn, opc1, CRm, opc2} parameter values used in MCR or MRC accesses to the 32-bit registers:

- For MCR or MRC accesses to the 32-bit registers, CRn is the primary identifier of the target System register for the access. This rule applies, also, to MCR or MRC instructions that provide 32-bit accesses to a single word of a 64-bit System register.
- For MCRR or MRRC accesses to the 64-bit registers, CRm is the primary identifier of the target System register for the access. Table G4-44 on page G4-4711 orders the 64-bit registers with the 32-bit registers accessed using the same primary register identifier. For example, the 64-bit encoding of TTBR0, that is accessed with (CRm==c2), is listed with the 32-bit registers that are accessed with (CRn==c2).

**Table G4-44 VMSAv8-32 (coproc==0b1111) register summary, in MCR/MRC parameter order**

c15	0-7	c0-c15	0-7	-	32-bit	See <a href="#">Reserved 32-bit encodings with {coproc==0b1111, CRn==c15}</a> on page G4-4710

- a. [REVIDR](#) is an optional register. If it is not implemented, the encoding with opc2 set to 6 is an alias of [MIDR](#).
- b. Implemented only as part of EL2, when EL2 is using AArch32. Otherwise, encoding is unallocated and CONSTRAINED UNPREDICTABLE, see [Accesses to unallocated encodings in the \(coproc==0b111x\) encoding space on page G6-4765](#).
- c. Implemented only as part of the EL3, when EL3 is using AArch32. Otherwise, as described in [Accesses to unallocated encodings in the \(coproc==0b111x\) encoding space on page G6-4765](#), encoding is unallocated and:
- UNDEFINED, for the registers accessed using CRn set to c12.
  - CONSTRAINED UNPREDICTABLE, for the register accessed using CRn values other than c12.
- d. Introduced in ARMv8.
- e. Introduced in ARMv8. Implemented only if the implementation includes the GIC System registers. For information see [Generic Interrupt Controller System registers, functional groups on page G4-4740](#). As that subsection describes, each ICV\_\* register uses the same encoding as the corresponding ICC\_\* register
- f. This register is only accessible in Debug state.
- g. [RAS System registers, see The Reliability, Availability, and Serviceability \(RAS\) Extension on page A1-63](#).

- h. For performance reasons, ARM deprecates any use of these memory barrier operations.
- i. When an implementation is using the Long descriptor translation table format these encodings access the [MAIR0](#) and [MAIR1](#) registers. Otherwise, they access the [PRRR](#) and [NMRR](#).
- j. Introduced in ARMv8. Only one of [RMR](#) and [HRMR](#) is implemented, corresponding to the highest implemented Exception level, and the register is implemented only if that Exception level is using AArch32.
- k. Implemented as part of the Generic Timer.
- l. Implemented as RW as part of the Generic Timer on an implementation that includes EL2 and when EL2 is using AArch32. For more information see [Status of the CNTVOFF register on page G5-4757](#).

### G4.16.3 AArch32 views of the System registers in the (coproc==0b1111) encoding space

The following sections summarize the different software views of the System registers in the (coproc==0b1111) encoding space, for VMSAv8-32:

- [PL0 views of the System registers in the \(coproc==0b1111\) encoding space.](#)
- [PL1 views of the System registers in the in the \(coproc==0b1111\) encoding space on page G4-4725.](#)
- [Non-secure PL2 view of the System registers in the \(coproc==0b1111\) encoding space on page G4-4725.](#)

#### ————— Note —————

In previous versions of the ARM architecture, the behavior of accesses to the System registers in the (coproc==0b1111) encoding space were described in relation to the PE modes. In Secure state, the Exception level of the privileged PE modes depends on whether EL3 is using AArch32, or is using AArch64. This means it is simpler to describe the views of the registers in terms of *privilege levels*, PL0-PL2, rather than the *Exception levels* EL1-EL3. This is because each AArch32 PE mode is associated with a particular privilege level, but in Secure state its Exception level can depend on the EL3 Execution state. For more information see [Security state, Exception levels, and AArch32 execution privilege on page G1-4318](#).

### PL0 views of the System registers in the (coproc==0b1111) encoding space

Software executing at PL0, unprivileged, can access only a small subset of the System registers in the (coproc==0b1111) encoding space, as [Table G4-45](#) shows. This table excludes possible PL0 access to the following registers:

- The Performance Monitors Extension, see [Possible PL0 access to the Performance Monitors Extension System registers on page G4-4724](#).
- The Generic Timer registers, see [Possible PL0 access to the Generic Timer System registers on page G4-4724](#).

**Table G4-45 System registers in the (coproc==0b1111) encoding space accessible from PL0**

Name	Access	Description	Note
CP15ISB	WO	<a href="#">Memory barriers on page E2-2768</a>	ARM deprecates use of these operations
CP15DSB	WO		
CP15DMB	WO		
TPIDRURW	RW	<a href="#">TPIDRURW, PL0 Read/Write Software Thread ID Register on page G6-5201</a>	-
TPIDRURO	RO	<a href="#">TPIDRURO, PL0 Read-Only Software Thread ID Register on page G6-5199</a>	RW at PL1

### Possible PL0 access to the Performance Monitors Extension System registers

In a VMSAv8-32 implementation that includes the Performance Monitors Extension, when using the System register interface to the Performance Monitors:

- The **PMUSERENR** is RO from PL0.
  - When:
    - The value of **PMUSERENR.EN** is 1, **PMCNTENSET**, **PMCNTENCLR**, **PMOVSr**, **PMSWINC**, **PMSELR**, **PMCEID0**, **PMCEID1**, **PMCCNTR**, **PMXEVTYPER**, **PMXEVCNTR**, **PMUSERENR**, **PMOVSSET**, **PMEVCNTR<n>**, **PMEVTYPER<n>**, and **PMCCFILTR** are accessible by reads and writes from PL0.
    - The value of **PMUSERENR.ER** is 1, **PMXEVCNTR** and **PMEVCNTR<n>** are accessible by reads and from PL0, and **PMSELR** is accessible by reads and writes from PL0.
    - The value of **PMUSERENR.CR** is 1, **PMCCNTR** is accessible by reads from PL0.
    - The value of **PMUSERENR.SW** is 1, **PMSWINC** is accessible by writes from PL0.
- In general, when the value of a **PMUSERENR**.{EN, ER, CR, SW} bit is 1, the enabled registers have the same access permissions from PL0 as they do from PL1.

For more information, see:

- [Traps to EL1 of EL0 accesses to Performance Monitors registers on page D1-1850.](#)
- [Chapter D5 The Performance Monitors Extension](#), in particular [Access permissions on page D5-2176.](#)

### Possible PL0 access to the Generic Timer System registers

In a VMSAv8-32 implementation, when using the System register interface to the Generic Timer registers:

- If **CNTKCTL.PL0PCTEN** is set to 1, then if the physical counter register **CNTPCT** is accessible from PL1 it is also accessible from PL0. For more information see [Accessing the physical counter on page D6-2184.](#)
- If **CNTKCTL.PL0PVTEN** is set to 1, the virtual counter register **CNTVCT** is accessible from PL0. For more information, see [Accessing the virtual counter on page D6-2185.](#)
- If at least one of **CNTKCTL**.{**PL0PCTEN**, **PL0PVTEN**} is set to 1, the **CNTFRQ** register is RO from PL0.
- If:
  - **CNTKCTL.PL0PTEN** is set to 1, the physical timer registers **CNTP\_CTL**, **CNTP\_CVAL**, and **CNTP\_TVAL** are accessible from PL0.
  - **CNTKCTL.PL0VTEN** is set to 1, the virtual timer registers **CNTV\_CTL**, **CNTV\_CVAL**, and **CNTV\_TVAL**, are accessible from PL0.

For more information, see [Accessing the timer registers on page G5-4759.](#)

## PL1 views of the System registers in the in the (coproc==0b1111) encoding space

Software executing at PL1 can access all System registers in the (coproc==0b1111) encoding space, with the following exceptions:

### Non-secure PL1 software

EL3 restricts or prevents access to some registers by Non-secure PL1 software. In particular:

- The Restricted access System registers are either not accessible to Non-secure PL1 software, or are read-only to Non-secure PL1 software, see [Restricted access System registers on page G4-4694](#).
- Configuration settings determine whether Non-secure PL1 software can access the Configurable access System registers, see [Configurable access System registers on page G4-4694](#).

The individual register descriptions identify these access restrictions.

In an implementation that includes EL2, Non-secure PL1 software has no visibility of the PL2-mode registers summarized in [Hyp mode read/write registers in the \(coproc==0b1111\) encoding space on page G4-4695](#). The individual register descriptions identify these registers as EL2-mode registers.

### Secure PL1 software

In general, Secure PL1 software has access to all System registers. However:

- When EL3 is using AArch32, the **CP15SDISABLE** signal disables write access to a number of Secure registers, see [The CP15SDISABLE input signal on page G4-4699](#).
- The PL2-mode registers are accessible from Secure state only if EL3 is using AArch32. When this is the case, Secure PL1 software can access these registers by moving into Monitor mode, and setting **SCR.NS** to 1.  
[Hyp mode read/write registers in the \(coproc==0b1111\) encoding space on page G4-4695](#) summarizes these registers.

The individual register descriptions identify:

- The registers affected by the **CP15SDISABLE** signal.
- The PL2-mode registers.

## Non-secure PL2 view of the System registers in the (coproc==0b1111) encoding space

Non-secure software executing at PL2 can access:

- The registers that are accessible to Non-secure software executing at PL1, as defined in [PL1 views of the System registers in the in the \(coproc==0b1111\) encoding space](#). Access permissions for these registers are identical to those for Non-secure software executing at EL1.
- The PL2-mode registers summarized in [Hyp mode read/write registers in the \(coproc==0b1111\) encoding space on page G4-4695](#), and described in [Virtualization registers, functional group on page G4-4730](#).

## G4.17 Functional grouping of VMSAv8-32 System registers

This section describes how the System registers in an VMSAv8-32 implementation divide into functional groups.

[Chapter G6 AArch32 System Register Descriptions](#) describes each of these registers.

---

### Note

- [Table G4-44 on page G4-4711](#) lists all of the VMSAv8-32 System registers in the (coproc==0b1111) encoding space, ordered by:
  1. The CRn primary register used when using a 32-bit access to the register.  
For 64-bit register accesses using an MCRR or MRRC instruction, the instruction arguments that identify the target register are {coproc, Rm, opc1}. The value of Rm determines where these registers appear in [Table G4-44 on page G4-4711](#), so that these registers appear with the 32-bit registers accessed using that value for CRn. So, for example, the 64-bit access to [TTBR0](#), that uses (CRn==c2), appears with the 32-bit access to [TTBR0](#), that uses (CRn==c2).
  2. The opc1 value used when accessing the register.
  3. For 32-bit registers, the {CRm, opc2} values used when accessing the register.
- The functional groups defined in this section mainly consist of the VMSAv8-32 System registers, but include some additional System registers.
- Some registers belong to more than one functional group.

---

For other related information see:

- [The AArch32 System register interface on page G1-4408](#) for general information about the access to the AArch32 System registers, including the main register access instructions MRC and MCR.
- [About the System registers for VMSAv8-32 on page G4-4689](#).
- [VMSAv8-32 organization of registers in the \(coproc==0b1110\) encoding space on page G4-4704](#).
- [VMSAv8-32 organization of registers in the \(coproc==0b1111\) encoding space on page G4-4707](#).
- [About the AArch32 System registers on page G6-4764](#).

The remainder of this chapter, and the register descriptions in [Chapter G6 AArch32 System Register Descriptions](#), assume you are familiar with these sections, and use conventions and other information from them without any explanation.

Each of the following sections summarizes a functional group of VMSAv8-32 System registers:

- [Identification registers, functional group on page G4-4727](#).
- [General system control registers, functional group on page G4-4728](#).
- [Virtual memory control registers, functional group on page G4-4729](#).
- [Virtualization registers, functional group on page G4-4730](#).
- [Security registers, functional group on page G4-4732](#).
- [Exception and fault handling registers, functional group on page G4-4733](#).
- [Reset management registers, functional group on page G4-4734](#).
- [Thread and process ID registers, functional group on page G4-4734](#).
- [Cache maintenance instructions, functional group on page G4-4734](#).
- [TLB maintenance instructions, functional group on page G4-4735](#).

REVIDR	c0	0	c0	6	32-bit	RO	Revision ID Register
TCMTR	c0	0	c0	2	32-bit	RO	TCM Type Register

**Table G4-46 Identification registers, VMSAv8-32 (continued)**

Name	CRn	opc1	CRm	opc2	Width	Type	Description
<a href="#">TLBTR</a>	c0	0	c0	3	32-bit	RO	TLB Type Register
<a href="#">VMPIDR</a>	c0	4	c0	5	32-bit	RW	Virtualization Multiprocessor ID Register
<a href="#">VPIDR</a>	c0	4	c0	5	32-bit	RW	Virtualization Processor ID Register

a. CPUID register, see [The CPUID identification scheme](#).

The other registers in this group are the [FPSID](#), [MVFR0](#), [MVFR1](#), and [MVFR2](#).

The [JIDR](#) holds legacy identification information.

### The CPUID identification scheme

The ID\_\* registers were originally called the CPUID identification scheme registers. A footnote to [Table G4-46 on page G4-4727](#) identifies these registers. However, functionally, there is no value in separating these registers from the slightly larger Identification registers functional group.

## G4.17.2 General system control registers, functional group

[Table G4-47](#) shows the VMSAv8-32 System registers in the (coproc==0b1111) encoding space that are in the General system control registers functional group.

**Table G4-47 General system control registers, VMSAv8-32**

Name	CRn	opc1	CRm	opc2	Width	Type	Description
<a href="#">ACTLR</a>	c1	0	c0	1	32-bit	RW	Auxiliary Control Register
<a href="#">ACTLR2</a>	c1	0	c0	3	32-bit	RW	Auxiliary Control Register 2
<a href="#">CPACR</a>	c1	0	c0	2	32-bit	RW	Architectural Feature Access Control Register
<a href="#">HACTLR</a>	c1	4	c0	0	32-bit	RW	Hyp Auxiliary System Control Register
<a href="#">HACTLR2</a>	c1	4	c0	3	32-bit	RW	Hyp Auxiliary System Control Register 2
<a href="#">HSCTLR</a>	c1	4	c0	0	32-bit	RW	Hyp System Control Register
<a href="#">SCTLR</a>	c1	0	c0	0	32-bit	RW	System Control Register

The following sections summarize the System registers added by the corresponding Exception levels:

- [Security registers, functional group on page G4-4732](#).
- [Virtualization registers, functional group on page G4-4730](#).

### G4.17.3 Virtual memory control registers, functional group

Table G4-48 shows the VMSAv8-32 System registers in the (coproc==0b1111) encoding space that are in the Virtual memory control registers functional group.

**Table G4-48 Virtual memory control registers**

Name	CRn	opc1	CRm	opc2	Width	Type	Description
AMAIRO	c10	0	c3	0	32-bit	RW	Auxiliary Memory Attribute Indirection Register 0
AMAIR1	c10	0	c3	1	32-bit	RW	Auxiliary Memory Attribute Indirection Register 1
CONTEXTIDR	c13	0	c0	1	32-bit	RW	Context ID Register
DACR	c3	0	c0	0	32-bit	RW	Domain Access Control Register
HAMAIRO	c10	4	c3	0	32-bit	RW	Hyp Auxiliary Memory Attribute Indirection Register 0
HAMAIR1	c10	4	c3	1	32-bit	RW	Hyp Auxiliary Memory Attribute Indirection Register 1
HMAIRO	c10	4	c2	0	32-bit	RW	Hyp Memory Attribute Indirection Register 0
HMAIR1	c10	4	c2	1	32-bit	RW	Hyp Memory Attribute Indirection Register 1
HTCR	c2	4	c0	2	32-bit	RW	Hyp Translation Control Register
HTTBR	-	4	c2	-	64-bit	RW	Hyp Translation Table Base Register
MAIRO	c10	0	c2	0	32-bit	RW	Memory Attribute Indirection Register 0
MAIR1	c10	0	c2	1	32-bit	RW	Memory Attribute Indirection Register 1
NMRR	c10	0	c2	1	32-bit	RW	Normal Memory Remap Register
PRRR	c10	0	c2	0	32-bit	RW	Primary Region Remap Register
SCTLR	c1	0	c0	0	32-bit	RW	System Control Register
TTBCR	c2	0	c0	2	32-bit	RW	Translation Table Base Control Register
TTBCR2	c2	0	c0	3	32-bit	RW	Translation Table Base Control Register 2
TTBR0	c2	0	c0	0	32-bit	RW	Translation Table Base Register 0
TTBR0	-	0	c2	-	64-bit	RW	Translation Table Base Register 0
TTBR1	c2	0	c0	1	32-bit	RW	Translation Table Base Register 1
TTBR1	-	1	c2	-	64-bit	RW	Translation Table Base Register 1
VTCT	c2	4	c1	2	32-bit	RW	Virtualization Translation Control Register
VTTBR	-	6	c2	-	64-bit	RW	Virtualization Translation Table Base Register

The ACTLR and, if implemented, ACTLR2, might provide additional virtual memory control.

#### G4.17.4 Virtualization registers, functional group

Table G4-49 shows the VMSAv8-32 System registers in the (coproc==0b1111) encoding space that are in the Virtualization registers functional group, excluding the System instructions in this group.

**Table G4-49 Virtualization registers, excluding System instructions**

Name	CRn	opc1	CRm	opc2	Width	Type	Description
CNTHCTL	c14	4	c1	0	32-bit	RW	Counter-timer Hyp Control register

<a href="#">ICC_MSRE</a> <sup>a</sup>	c12	6	c12	5	32-bit	RW	Interrupt Controller Monitor System Register Enable register
<a href="#">MVBAR</a>	c12	0	c0	1	32-bit	RW	Monitor Vector Base Address Register

**Table G4-51 Security registers (continued)**

Name	CRn	opc1	CRm	opc2	Width	Type	Description
<a href="#">NSACR</a>	c1	0	c1	2	32-bit	RW	Non-Secure Access Control Register
<a href="#">RMR</a>	c12	0	c0	2	32-bit	RW	Reset Management Register
<a href="#">SCR</a>	c1	0	c1	0	32-bit	RW	Secure Configuration Register
<a href="#">SDER</a>	c1	0	c1	1	32-bit	RW	Secure Debug Enable Register

- a. For information about these registers see the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0*.

All the encodings shown in [Table G4-51 on page G4-4732](#) are unallocated and CONSTRAINED UNPREDICTABLE on an implementation that does not include EL3, see [Accesses to unallocated encodings in the \(coproc == 0b111x\) encoding space on page G6-4765](#).

#### G4.17.6 Exception and fault handling registers, functional group

[Table G4-52](#) shows the VMSAv8-32 System registers in the (coproc == 0b1111) encoding space that are in the Exception and fault handling registers functional group.

**Table G4-52 Exception and fault handling registers**

Name	CRn	opc1	CRm	opc2	Width	Type	Description
<a href="#">ADFSR</a>	c5	0	c1	0	32-bit	RW	Auxiliary Data Fault Status Register
<a href="#">AIFSR</a>	c5	0	c1	1	32-bit	RW	Auxiliary Instruction Fault Status Register
<a href="#">DFAR</a>	c6	0	c0	0	32-bit	RW	Data Fault Address Register
<a href="#">DFSR</a>	c5	0	c0	0	32-bit	RW	Data Fault Status Register
<a href="#">HADFSR</a>	c5	4	c1	0	32-bit	RW	Hyp Auxiliary Data Fault Status Register
<a href="#">HAIFSR</a>	c5	4	c1	1	32-bit	RW	Hyp Auxiliary Instruction Fault Status Register
<a href="#">HDFAR</a>	c6	4	c0	0	32-bit	RW	Hyp Data Fault Address Register
<a href="#">HIFAR</a>	c6	4	c0	2	32-bit	RW	Hyp Instruction Fault Address Register
<a href="#">HPFAR</a>	c6	4	c0	4	32-bit	RW	Hyp IPA Fault Address Register
<a href="#">HSR</a>	c5	4	c2	0	32-bit	RW	Hyp Syndrome Register
<a href="#">HVBAR</a>	c12	4	c0	1	32-bit	RW	Hyp Vector Base Address Register
<a href="#">IFAR</a>	c6	0	c0	2	32-bit	RW	Instruction Fault Address Register
<a href="#">IFSR</a>	c5	0	c0	1	32-bit	RW	Instruction Fault Status Register
<a href="#">ISR</a>	c12	0	c1	0	32-bit	RO	Interrupt Status Register
<a href="#">MVBAR</a>	c12	0	c0	1	32-bit	RW	Monitor Vector Base Address Register
<a href="#">RVBAR</a>	c12	0	c0	1	32-bit	RW	Reset Vector Base Address Register
<a href="#">VBAR</a>	c12	0	c0	0	32-bit	RW	Vector Base Address Register

The PE returns fault information using the fault status registers and the fault address registers. For details of how these registers are used see [Exception reporting in a VMSAv8-32 implementation on page G4-4663](#).

———— **Note** ————

These registers also report information about debug exceptions. For more information see:

- [Data Abort exceptions, taken to a PL1 mode on page G4-4665.](#)
- [Prefetch Abort exceptions, taken to a PL1 mode on page G4-4667.](#)
- [Reporting exceptions taken to Hyp mode on page G4-4673.](#)

#### G4.17.7 Reset management registers, functional group

[Table G4-53](#) shows the VMSAv8-32 System registers in the (coproc==0b1111) encoding space that are in the Reset management registers functional group.

**Table G4-53 Reset management registers**

Name	CRn	opc1	CRm	opc2	Width	Type	Description
<a href="#">HRMR</a>	c12	4	c0	2	32-bit	RW	Hyp Reset Management Register
<a href="#">RMR</a>	c12	0	c0	2	32-bit	RW	Reset Management Register

#### G4.17.8 Thread and process ID registers, functional group

[Table G4-54](#) shows the VMSAv8-32 System registers in the (coproc==0b1111) encoding space that are in the Thread and process ID registers functional group.

**Table G4-54 VMSAv8-32 Thread and process ID registers**

Name	CRn	opc1	CRm	opc2	Width	Type <sup>a</sup>	Description
<a href="#">HTPIDR</a> <sup>b</sup>	c13	4	c0	2	32-bit	RW	Hyp Software Thread ID Register
<a href="#">TPIDRPRW</a>	c13	0	c0	4	32-bit	RW	PL1 Software Thread ID Register
<a href="#">TPIDRURO</a>	c13	0	c0	3	32-bit	RW, PL0	PL0 Read-Only Software Thread ID Register
<a href="#">TPIDRURW</a>	c13	0	c0	2	32-bit	RW, PL0	PL0 Read/Write Software Thread ID Register

- a. PL0 in a Type description indicates that the encoding is accessible by software executing at PL0. See the register description for more information.
- b. Implemented only as part of EL2. Otherwise, encoding is unallocated and CONSTRAINED UNPREDICTABLE, see [Accesses to unallocated encodings in the \(coproc==0b111x\) encoding space on page G6-4765.](#)

#### G4.17.9 Cache maintenance instructions, functional group

[Table G4-55](#) shows the VMSAv8-32 System instructions in the (coproc==0b1111) encoding space that are in the Cache and branch predictor maintenance instructions functional group.

**Table G4-55 Cache and branch predictor maintenance instructions**

Name	CRn	opc1	CRm	opc2	Width	Type	Description	Limits <sup>a</sup>
<a href="#">BPIALL</a> <sup>b</sup>	c7	0	c5	6	32-bit	WO	Branch predictor invalidate all	-
<a href="#">BPIALLIS</a> <sup>b</sup>	c7	0	c1	6	32-bit	WO	Branch predictor invalidate all	IS
<a href="#">BPIMVA</a> <sup>b</sup>	c7	0	c5	7	32-bit	WO	Branch predictor invalidate by VA	-
<a href="#">DCCIMVAC</a> <sup>b</sup>	c7	0	c14	1	32-bit	WO	Data cache clean and invalidate by VA	PoC

**Table G4-55 Cache and branch predictor maintenance instructions (continued)**

Name	CRn	opc1	CRm	opc2	Width	Type	Description	Limits <sup>a</sup>
<a href="#">DCCISW<sup>b</sup></a>	c7	0	c14	2	32-bit	WO	Data cache clean and invalidate by set/way	-
<a href="#">DCCMVAC<sup>b</sup></a>	c7	0	c10	1	32-bit	WO	Data cache clean by VA	PoC
<a href="#">DCCMVAU<sup>b</sup></a>	c7	0	c11	1	32-bit	WO	Data cache clean by VA	PoU
<a href="#">DCCSW<sup>b</sup></a>	c7	0	c10	2	32-bit	WO	Data cache clean by set/way	-
<a href="#">DCIMVAC<sup>b</sup></a>	c7	0	c6	1	32-bit	WO	Data cache invalidate by VA	PoC
<a href="#">DCISW<sup>b</sup></a>	c7	0	c6	2	32-bit	WO	Data cache invalidate by set/way	-
<a href="#">ICIALLU<sup>b</sup></a>	c7	0	c5	0	32-bit	WO	Instruction cache invalidate all	PoU
<a href="#">ICIALLUIS<sup>b</sup></a>	c7	0	c1	0	32-bit	WO	Instruction cache invalidate all	PoU, IS
<a href="#">ICIMVAU<sup>b</sup></a>	c7	0	c5	1	32-bit	WO	Instruction cache invalidate by VA	PoU

a. PoU = to Point of Unification, PoC = to Point of Coherency, IS = Inner Shareable.

b. The links in this column are to a summary of the operation, see [AArch32 cache and branch predictor maintenance instructions](#) on page G3-4535.

#### G4.17.10 TLB maintenance instructions, functional group

Table G4-56 shows the VMSAv8-32 System instructions in the (coproc==0b1111) encoding space that are in the TLB maintenance instructions functional group. [The scope of TLB maintenance instructions](#) on page G4-4641 describes the operations.

**Table G4-56 TLB maintenance instructions**

Name <sup>a</sup>	CRn	opc1	CRm	opc2	Width	Type	Description	Limits <sup>b</sup>
<a href="#">DTLBIALL<sup>c</sup></a>	c8	0	c6	0	32-bit	WO	Invalidate entire data TLB	-
<a href="#">DTLBIASID<sup>c</sup></a>	c8	0	c6	2	32-bit	WO	Invalidate data TLB by ASID	-
<a href="#">DTLBMVA<sup>c</sup></a>	c8	0	c6	1	32-bit	WO	Invalidate data TLB entry by VA	-
<a href="#">ITLBIALL<sup>c</sup></a>	c8	0	c5	0	32-bit	WO	Invalidate entire instruction TLB	-
<a href="#">ITLBIASID<sup>c</sup></a>	c8	0	c5	2	32-bit	WO	Invalidate instruction TLB by ASID	-

<a href="#">TLBIMVAAL</a>	c8	0	c7	7	32-bit	WO	TLB Invalidate entry by MVA, All ASID, Last level	-
<a href="#">TLBIMVAALIS</a>	c8	0	c3	7	32-bit	WO	TLB Invalidate entry by MVA, All ASID, Last level, Inner Shareable	IS
<a href="#">TLBIMVA</a>	c8	0	c7	1	32-bit	WO	Invalidate unified TLB by VA	-
<a href="#">TLBIMVAH</a>	c8	4	c7	1	32-bit	WO	Invalidate Hyp unified TLB by VA	-
<a href="#">TLBIMVAHIS</a>	c8	4	c3	1	32-bit	WO	Invalidate Hyp unified TLB by VA	IS
<a href="#">TLBIMVAIS</a>	c8	0	c3	1	32-bit	WO	Invalidate unified TLB by VA	IS
<a href="#">TLBIMVAL</a>	c8	0	c7	5	32-bit	WO	TLB Invalidate entry by MVA, Last level	-
<a href="#">TLBIMVALH</a>	c8	4	c7	5	32-bit	WO	TLB Invalidate entry by MVA, Last level, Hyp mode	-
<a href="#">TLBIMVALHIS</a>	c8	4	c3	5	32-bit	WO	TLB Invalidate entry by MVA, Last level, Hyp mode, Inner Shareable	IS
<a href="#">TLBIMVALIS</a>	c8	0	c3	5	32-bit	WO	TLB Invalidate entry by MVA, Last level	IS

a. These links are to a summary of the operation, and [The scope of TLB maintenance instructions on page G4-4641](#) describes the operation.

b. IS = Inner Shareable.

c. Deprecated. ARM deprecates use of operations that operate only on an Instruction TLB, or only on a Data TLB.

d. The mnemonics for the operations with CRm==c7, opc2=={0, 1, 2} were previously UTLBIALL, UTLBIMVA and UTLBIMASID.

## G4.17.11 Address translation instructions, functional group

Table G4-57 shows the VMSAv8-32 System instructions in the (coproc==0b1111) encoding space that are in the Address translation instructions functional group.

**Table G4-57 Address translation instructions**

Name	CRn	opc1	CRm	opc2	Width	Type	Description
<a href="#">ATS12NSOPR</a> <sup>a, c</sup>	c7	0	c8	4	32-bit	WO	Stages 1 and 2 Non-secure only EL1 read
<a href="#">ATS12NSOPW</a> <sup>a, c</sup>	c7	0	c8	5	32-bit	WO	Stages 1 and 2 Non-secure only EL1 write
<a href="#">ATS12NSOUR</a> <sup>a, c</sup>	c7	0	c8	6	32-bit	WO	Stages 1 and 2 Non-secure only unprivileged read
<a href="#">ATS12NSOUW</a> <sup>a, c</sup>	c7	0	c8	7	32-bit	WO	Stages 1 and 2 Non-secure only unprivileged write
<a href="#">ATS1CPR</a> <sup>c</sup>	c7	0	c8	0	32-bit	WO	Stage 1 Current state EL1 read
<a href="#">ATS1CPW</a> <sup>c</sup>	c7	0	c8	1	32-bit	WO	Stage 1 Current state EL1 write
<a href="#">ATS1CUR</a> <sup>c</sup>	c7	0	c8	2	32-bit	WO	Stage 1 Current state unprivileged read
<a href="#">ATS1CUW</a> <sup>c</sup>	c7	0	c8	3	32-bit	WO	Stage 1 Current state unprivileged write
<a href="#">ATS1HR</a> <sup>b, c</sup>	c7	4	c8	0	32-bit	WO	Stage 1 Hyp mode read
<a href="#">ATS1HW</a> <sup>b, c</sup>	c7	4	c8	1	32-bit	WO	Stage 1 Hyp mode write
<a href="#">PAR</a>	c7	0	c4	0	32-bit	RW	Physical Address Register
	-	0	c7	-	64-bit	RW	

- a. Implemented only as part of EL3. Otherwise, encoding is unallocated and CONSTRAINED UNPREDICTABLE, see [Accesses to unallocated encodings in the \(coproc==0b111x\) encoding space on page G6-4765](#).
- b. Implemented only as part of EL2. Otherwise, encoding is unallocated and CONSTRAINED UNPREDICTABLE, see [Accesses to unallocated encodings in the \(coproc==0b111x\) encoding space on page G6-4765](#).
- c. These links are to a summary of the operation.

[Address translation instructions on page G4-4682](#) describes these operations.

#### G4.17.12 Lockdown, DMA, and TCM features, functional group

Table G4-58 shows the VMSAv8-32 reserved encodings in the (coproc==0b1111) encoding space that provide the Lockdown, DMA, and TCM features registers functional group.

**Table G4-58 Lockdown, DMA, and TCM features, VMSAv8-32**

Name	CRn	opc1	CRm	Width	opc2	Type	Description
IMPLEMENTATION DEFINED	c9	0-7	c0-c2	32-bit	0-7	a	Reserved for IMPLEMENTATION DEFINED branch predictor, cache, and TCM operations.
			c5-c8	32-bit	0-7	a	
	c10	0-7	c0-c1	32-bit	0-7	a	Reserved for IMPLEMENTATION DEFINED TLB lockdown operations
			c4	32-bit	0-7	a	
			c8	32-bit	0-7	a	
	c11	0-7	c0-c8	32-bit	0-7	a	Reserved for IMPLEMENTATION DEFINED DMA operations to and from TCMs
			c15	32-bit	0-7	a	

a. Access depends on the register or operation, and is IMPLEMENTATION DEFINED.

#### G4.17.13 Performance Monitors Extension registers, functional group

Table G4-59 shows the VMSAv8-32 System registers in the (coproc==0b1111) encoding space that are the Performance Monitors Extension registers functional group. See also *IMPLEMENTATION DEFINED performance monitors* on page G4-4739.

**Table G4-59 Performance Monitors Extension registers**

Name	CRn	opc1	CRm	opc2	Width	Description
<a href="#">PMCCFILTR</a>	c14	0	c15	7	32-bit	Performance Monitors Cycle Count Filter Register

<a href="#">PMEVCNTR&lt;n&gt;</a> , for n==8 to 15	c14	0	c9	0-7	32-bit	Performance Monitors Event Count Registers, 8-15

**Table G4-59 Performance Monitors Extension registers (continued)**

Name	CRn	opc1	CRm	opc2	Width	Description
<a href="#">PMEVTYPER&lt;n&gt;</a> , for n==0 to 7	c14	0	c12	0-7	32-bit	Performance Monitors Event Type Registers, 0-7
<a href="#">PMEVTYPER&lt;n&gt;</a> , for n==16 to 23	c14	0	c14	0-7	32-bit	Performance Monitors Event Type Registers, 16-23
<a href="#">PMEVTYPER&lt;n&gt;</a> , for n==17 to 30	c14	0	c15	0-6	32-bit	Performance Monitors Event Type Registers, 24-30
<a href="#">PMEVTYPER&lt;n&gt;</a> , for n==8 to 15	c14	0	c13	0-7	32-bit	Performance Monitors Event Type Registers, 8-15
<a href="#">PMINTENCLR</a>	c9	0	c14	2	32-bit	Performance Monitors Interrupt Enable Clear register
<a href="#">PMINTENSET</a>	c9	0	c14	1	32-bit	Performance Monitors Interrupt Enable Set register
<a href="#">PMOVSr</a>	c9	0	c12	3	32-bit	Performance Monitors Overflow Flag Status Register
<a href="#">PMOVSSET</a>	c9	0	c14	3	32-bit	Performance Monitors Overflow Flag Status Set register
<a href="#">PMSELR</a>	c9	0	c12	5	32-bit	Performance Monitors Event Counter Selection Register
<a href="#">PMSWINC</a>	c9	0	c12	4	32-bit	Performance Monitors Software Increment register
<a href="#">PMUSERENR</a>	c9	0	c14	0	32-bit	Performance Monitors User Enable Register
<a href="#">PMXEVCNTR</a>	c9	0	c13	2	32-bit	Performance Monitors Event Count Register
<a href="#">PMXEVTYPER</a>	c9	0	c13	1	32-bit	Performance Monitors Event Type Select Register

### IMPLEMENTATION DEFINED performance monitors

VMSAv8-32 reserves some additional System register encodings in the (coproc==0b1111) encoding space for optional additional IMPLEMENTATION DEFINED performance monitors. [Table G4-60](#) shows the allocation of these encodings:

**Table G4-60 Performance Monitors System register encoding allocations**

CRn	opc1	CRm	opc2	Name	Width	Type
c9	0-7	c12-c14	0-7	Performance Monitors Extension registers, see <a href="#">Table G4-59 on page G4-4738</a>	32-bit	RW or RO <sup>a</sup>
		c15	0-7	IMPLEMENTATION DEFINED	32-bit	b

a. The table referenced in the [Name](#) entry shows the type of each of the OPTIONAL Performance Monitors Extension registers.

b. Access depends on the register or operation, and is IMPLEMENTATION DEFINED.

#### G4.17.14 Generic Timer registers, functional group

Table G4-61 shows the VMSAv8-32 System registers in the (coproc==0b1111) encoding space that are the Generic Time registers functional group.

**Table G4-61 Generic Timer registers**

Name	CRn	opc1	CRm	opc2	Width	Type <sup>a</sup>	Description
<a href="#">CNTFRQ</a>	c14	0	c0	0	32-bit	RW	Counter Frequency register
<a href="#">CNTHCTL</a>	c14	4	c1	0	32-bit	RW	Timer EL2 Control register
<a href="#">CNTHP_CTL</a>	c14	4	c2	1	32-bit	RW	EL2 Physical Timer Control register
<a href="#">CNTHP_CVAL</a>	-	6	c14	-	64-bit	RW	EL2 Physical Timer CompareValue register
<a href="#">CNTHP_TVAL</a>	c14	4	c2	0	32-bit	RW	EL2 Physical TimerValue register
<a href="#">CNTKCTL</a>	c14	0	c1	0	32-bit	RW	Timer EL1 Control register
<a href="#">CNTP_CTL</a>	c14	0	c2	1	32-bit	RW	EL1 Physical Timer Control register
<a href="#">CNTP_CVAL</a>	-	2	c14	-	64-bit	RW	EL1 Physical Timer CompareValue register
<a href="#">CNTP_TVAL</a>	c14	0	c2	0	32-bit	RW	EL1 Physical TimerValue register
<a href="#">CNTPCT</a>	-	0	c14	-	64-bit	RW	Physical Count register
<a href="#">CNTV_CTL</a>	c14	0	c3	1	32-bit	RW	Virtual Timer Control register
<a href="#">CNTV_CVAL</a>	-	3	c14	-	64-bit	RW	Virtual Timer CompareValue register
<a href="#">CNTV_TVAL</a>	c14	0	c3	0	32-bit	RW	Virtual TimerValue register
<a href="#">CNTVCT</a>	-	1	c14	-	64-bit	RO	Virtual Count register
<a href="#">CNTVOFF<sup>b</sup></a>	-	4	c14	-	64-bit	RW	Virtual Offset register

a. See the register descriptions for more information. Accessibility can depend on configuration settings as well as on the current Exception level.

b. Implemented as RW as part of the Generic Timer on an implementation that includes EL2 and when EL2 is using AArch32. For more information see [Status of the CNTVOFF register on page G5-4757](#).

#### G4.17.15 Generic Interrupt Controller System registers, functional groups

From version 3.0 of the GIC architecture specification, the specification defines three groups of System registers, identified by the prefix of the register name:

**ICC\_** GIC physical CPU interface System registers.

**ICH\_** GIC virtual interface control System registers.

**ICV\_** GIC Virtual CPU interface System registers.

##### ———— **Note** ————

These registers are in addition to the GIC memory-mapped register groups GICC\_, GICD\_, GICH\_, GICR\_, GICV\_, and GITS\_.

In VMSAv8-32, the GIC System registers are all in the (coproc==0b1111) encoding space with (CRn==c12). The ICV\_\* registers have the same {CRn, opc1, CRm, op2} encodings as the corresponding ICC\_\* registers. For these encodings, GIC register configuration fields determine which register is accessed.

For more information see the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0*.

Table G4-62 shows the functional groups of GIC System registers.

**Table G4-62 Generic Interrupt Controller System registers**

Name	CRn	opc1	CRm	opc2	Width	Type	Description
ICC_AP0R0 <sup>a</sup> ICV_AP0R0 <sup>a</sup>	c12	0	c8	4	32-bit	RW	Interrupt Controller Active Priorities Register (0,0) Interrupt Controller Virtual Active Priorities Register (0,0)

a. As described in this section, these ICC\_\* and ICV\_\* registers use the same encodings.

## G4.17.16 Legacy feature registers, functional group

Table G4-63 shows the VMSAv8-32 System registers in the (coproc==0b1111) encoding space that are in the Legacy features registers functional group.

**Table G4-63 Legacy features System registers in the (coproc==0b1111) encoding space**

Name	CRn	opc1	CRm	opc2	Width	Type <sup>a</sup>	Description
CP15DMB	c7	0	c10	5	32-bit	WO, PL0	<i>Memory barriers on page E2-2768<sup>b</sup></i>
CP15DSB	c7	0	c10	4	32-bit	WO, PL0	
CP15ISB	c7	0	c5	4	32-bit	WO, PL0	
FCSEIDR	c13	0	c0	0	32-bit	RW <sup>c</sup>	FCSE Process ID Register

- a. PL0 in a Type description indicates that the encoding is accessible by software executing at PL0. See the register description for more information.
- b. For performance reasons, ARM deprecates any use of these memory barrier operations.
- c. In ARMv8, the PE does not implement the FCSEIDR, and therefore the register is RAZ/WI. See the register description for more information.

Table G4-64 shows the VMSAv8-32 System registers in the (coproc==0b1110) encoding space that are in the Legacy features registers functional group.

**Table G4-64 Legacy features registers in the (coproc==0b1110) encoding space**

JOSCR	c1	7	c0	0	32-bit	RW	Jazelle OS Control Register

## G4.17.17 IMPLEMENTATION DEFINED registers, functional group

VMSAv8-32 defines some encodings for registers with content that is entirely IMPLEMENTATION DEFINED.

Table G4-65 shows these registers in the (coproc==0b1111) encoding space.

**Table G4-65 Architectural encodings for registers with IMPLEMENTATION DEFINED content**

Name	CRn	opc1	CRm	opc2	Width	Type	Description
ACTLR	c1	0	c0	1	32-bit	RW	Auxiliary Control Register
ACTLR2	c1	0	c0	3	32-bit	RW	Auxiliary Control Register 2
ADFSR	c5	0	c1	0	32-bit	RW	Auxiliary Data Fault Status Register

<a href="#">TCMTR</a>	c0	0	c0	2	32-bit	RO	TCM Type Register

See also [IMPLEMENTATION DEFINED performance monitors on page G4-4739](#).

#### G4.17.18 Advanced SIMD and floating-point registers, functional group

[Table G4-66](#) shows the VMSAv8-32 System registers in the Advanced SIMD and floating-point registers functional group. These registers are accessed using VMRS and VMSR instructions, see the register descriptions for more information.

**Table G4-66 Floating-point registers**

Name	Width	Type	Description
<a href="#">FPEXC</a>	32-bit	RW	Floating-Point Exception Control register
<a href="#">FPSCR</a>	32-bit	RW	Floating-Point Status and Control Register
<a href="#">FPSID</a>	32-bit	RW <sup>a</sup>	Floating-Point System ID register
<a href="#">MVFR0</a>	32-bit	RO	Media and VFP Feature Register 0
<a href="#">MVFR1</a>	32-bit	RO	Media and VFP Feature Register 1
<a href="#">MVFR2</a>	32-bit	RO	Media and VFP Feature Register 2

a. When the [FPSID](#) is accessible, VMSR accesses to the [FPSID](#) are ignored.

#### G4.17.19 Debug registers, functional group

In AArch32 state, most Debug registers that are accessible through the System registers interface use {coproc==0b1110, opc1==0} encodings. [Table G4-67](#) shows these registers.

**Table G4-67 System register {coproc == 0b1110, opc1 == 0} encodings of Debug registers**

## G4.18 Pseudocode description of VMSAv8-32 memory system operations

This section contains a list of pseudocode functions describing VMSAv8-32 memory operations. The following subsections describe the pseudocode functions:

- [Alignment fault.](#)
- [Address translation.](#)
- [Domain checking.](#)
- [TLB operations.](#)
- [Translation table walk.](#)
- [Reporting syndrome information on page G4-4749.](#)
- [Memory access decode when TEX remap is enabled on page G4-4749.](#)

See also the descriptions of pseudocode for general memory system operations in [Pseudocode description of general memory system instructions on page G3-4553](#).

### G4.18.1 Alignment fault

The `AArch32.AlignmentFault()` pseudocode function describes the generation of an Alignment fault Data Abort exception.

See also [Abort exceptions on page G3-4555](#).

### G4.18.2 Address translation

The `AArch32.TranslateAddress()` and `AArch32.FullTranslate()` pseudocode functions describe a VMSAv8-32 address translation.

The `AArch32.FullTranslate()` function calls either:

- The function described in [Address translation when the stage 1 address translation is disabled](#).
- One of the functions described in [Translation table walk](#).

See also [Stage 2 translation table walk on page G4-4749](#).

#### Address translation when the stage 1 address translation is disabled

The `AArch32.TranslateAddressS10ff()` pseudocode function describes the address translation performed when the stage 1 address translation is disabled.

### G4.18.3 Domain checking

The `AArch32.CheckDomain()` pseudocode function describes domain checking.

### G4.18.4 TLB operations

The `TLBRecord` type represents the contents of a TLB entry:

### G4.18.5 Translation table walk

Because of the complexity of a translation table walk, the following sections describe the different cases:

- [Translation table walk using the Short-descriptor translation table format for stage 1.](#)
- [Translation table walk using the Long-descriptor translation table format for stage 1 on page G4-4749.](#)
- [Stage 2 translation table walk on page G4-4749.](#)

#### Translation table walk using the Short-descriptor translation table format for stage 1

The `AArch32.TranslationTableWalkSD()` pseudocode function describes the translation table walk when the stage 1 translation tables use the Short-descriptor format. It calls the function described in [Stage 2 translation table walk on page G4-4749](#) if necessary.

The `ShortConvertAttrHints()` pseudocode function converts the Normal memory cacheability attribute, from the `TTBR` or the translation table `TEX` field, into the separate cacheability attribute and cache allocation hint defined in a Long-descriptor translation table descriptor.

### Translation table walk using the Long-descriptor translation table format for stage 1

The `AArch32.TranslationTableWalkLD()` pseudocode function describes the translation table walk when the stage 1 translation tables use the Long-descriptor format. It calls the function described in *Stage 2 translation table walk* if necessary.

`AArch32.TranslationTableWalkLD()` calls the `ConvertAttrHints()` pseudocode function that is defined in *Translation table walk using the Short-descriptor translation table format for stage 1* on page G4-4748.

The `AArch32.S1AttrDecode()` pseudocode function uses the `MAIR0` and `MAIR1` registers to decode the `Attr[2:0]` value from a stage 1 translation table descriptor.

The `S2AttrDecode()` pseudocode function decodes the `Attr[3:0]` value from a stage 2 translation table descriptor.

### Stage 2 translation table walk

In the Non-secure EL1&0 translation regime, a descriptor address returned by stage 1 lookup is in the IPA address map, and must be mapped to a PA by a stage 2 translation. When EL2 is using AArch32, function `AArch32.SecondStageWalk()` performs this translation, by calling the `AArch32.SecondStageTranslate()` function. When called from `AArch32.SecondStageWalk()`, the `AArch32.SecondStageTranslate()` function performs a second stage translation, from IPA to PA, of the supplied address, including checking that the access has read permission at the second stage. If the access does not have second stage read permission it generates a second stage Permission fault on the first stage translation table walk. The second stage translation might hit in a TLB, or might involve a translation table walk, which will use the algorithm described in this section. Stage 2 translations tables always use the Long-descriptor translation table format.

The `AArch32.CheckPermission()` pseudocode function checks the access permissions for the stage 1 translation.

The `AArch32.CheckS2Permission()` pseudocode function checks the access permissions for the stage 2 translation.

The `CombineS1S2Desc()` pseudocode function combines the stage 1 and stage 2 access descriptors:

## G4.18.6 Reporting syndrome information

The `AArch32.ReportHypEntry()`, `AArch32.ReportDataAbort()`, and `AArch32.ReportPrefetchAbort()` pseudocode functions write syndrome value information to the appropriate registers for the current mode.

## G4.18.7 Memory access decode when TEX remap is enabled

When using the Short-descriptor translation table format, the function `AArch32.RemappedTEXDecode()` decodes the `texcb` and `S` attributes derived from the translation tables when TEX remap is enabled. *Short-descriptor format memory region attributes, with TEX remap* on page G4-4619 shows the interpretation of the arguments.

# Chapter G5

## The Generic Timer in AArch32 state

This chapter describes the implementation of the ARM Generic Timer as an extension to an ARMv8 implementation. It includes an overview of the AArch32 System register interface to an ARM Generic Timer.

It contains the following sections:

- [About the Generic Timer in AArch32 state on page G5-4752.](#)
- [The AArch32 view of the Generic Timer on page G5-4756.](#)

[Chapter D6 The Generic Timer in AArch64 state](#) describes the AArch64 view of the Generic Timer, including an additional timer that can be implemented in AArch64 state, and [Chapter I1 System Level Implementation of the Generic Timer](#) describes the system level implementation of the Generic Timer.

## G5.1 About the Generic Timer in AArch32 state

Figure G5-1 shows an example system-on-chip that uses the Generic Timer as a system timer. In this figure:

- This manual defines the architecture of the individual PEs in the multiprocessor blocks.
- The *ARM Generic Interrupt Controller Architecture Specification* defines a possible architecture for the interrupt controllers.
- Generic Timer functionality is distributed across multiple components.

Figure G5-1 Generic Timer example

The Generic Timer:

- Provides a system counter, that measures the passing of time in real-time.

———— **Note** ————

The Generic Timer can also provide other components at a system level, but Figure G5-1 does not show any such components.

- Supports *virtual counters* that measure the passing of virtual-time. That is, a virtual counter can measure the passing of time on a particular virtual machine.
- Timers, that can trigger events after a period of time has passed. The timers:
  - Can be used as count-up or as count-down timers.
  - Can operate in real-time or in virtual-time.

This chapter describes an instance of the Generic Timer component that Figure G5-1 shows as Timer\_0 or Timer\_1 within the Multiprocessor A or Multiprocessor B block. This component can be accessed from AArch64 state or AArch32 state, and this chapter describes access from AArch32 state. Chapter D6 *The Generic Timer in AArch64 state* describes access to this component from AArch64 state.

———— **Note** ————

The reset requirements of Generic Timer registers are more strict when they are accessed from AArch32 state than when they are accessed from AArch64 state.

A Generic Timer implementation must also include a memory-mapped system component, see [The full set of Generic Timer components](#).

## G5.1.1 The full set of Generic Timer components

Within a system that might include multiple PEs, a full set of Generic Timer components is as follows:

### The system counter

This provides a uniform view of system time, see [The system counter on page G5-4754](#). Because this must be implemented at the system level, it is accessed through [The system level memory-mapped implementation of the Generic Timer](#). However, during initialization, a status register in each implemented timer in the system must be programmed with the frequency of the system counter, so that software can read this frequency.

### PE implementations of the Generic Timer

Each PE implementation of the Generic Timer provides the following components:

- A physical counter, that gives access to the count value of the system counter.
- A virtual counter, that gives access to virtual time. In AArch32 state, the [CNTVOFF](#) register defines the offset between physical time, as defined by the value of the system counter, and virtual time.
- A number of timers. In an implementation where all Exception levels are implemented and can use AArch32 state, the timers that are accessible from AArch64 state are:
  - A Secure PL1 physical timer.
  - A Non-secure EL1 physical timer.
  - An EL2 physical timer.
  - A virtual timer.

#### Note

The Secure PL1 physical timer uses the Secure banked instances of the [CNTP\\_CTL](#), [CNTP\\_CVAL](#), and [CNTP\\_TVAL](#) registers, and the Non-secure EL1 physical timer uses the Non-secure instances of the same registers.

[The AArch32 view of the Generic Timer on page G5-4756](#) describes these components.

### The system level memory-mapped implementation of the Generic Timer

The memory-mapped registers that control the components of the system level implementation of the Generic Timer are grouped into *frames*. The Generic Timer architecture defines the offset of each register within its frame, but the base address of each frame is IMPLEMENTATION DEFINED, and defined by the system.

Each system level component has one or two register frames. The possible system level components are:

#### The memory-mapped counter module, required

This module controls the system counter. It has two frames:

- A control frame, CNTControlBase.
- A status frame, CNTReadBase.

#### The memory-mapped timer control module, required

The system level implementation of the Generic Timer can provide up to eight timers, and the memory-mapped timer control module identifies:

- Which timers are implemented.
- The features of each implemented timer.

This module has a single frame, CNTCTBase.

#### Memory-mapped timers, optional

An implemented memory-mapped timer:

- Must provide a privileged view of the timer, in the CNTBaseN frame.

- Optionally, provides an unprivileged view of the timer in the CNTEL0BaseN frame.

*N* is the timer number, and the corresponding frame number, in the range 0-7.

[Chapter I1 System Level Implementation of the Generic Timer](#) describes these components.

## G5.1.2 The system counter

The Generic Timer provides a system counter with the following specification:

<b>Width</b>	At least 56 bits wide. The value returned by any 64-bit read of the counter is zero-extended to 64 bits.
<b>Frequency</b>	Increments at a fixed frequency, typically in the range 1-50MHz. Can support one or more alternative operating modes in which it increments by larger amounts at a lower frequency, typically for power-saving.
<b>Roll-over</b>	Roll-over time of not less than 40 years.
<b>Accuracy</b>	ARM does not specify a required accuracy, but recommends that the counter does not gain or lose more than ten seconds in a 24-hour period. Use of lower-frequency modes must not affect the implemented accuracy.
<b>Start-up</b>	Starts operating from zero.

The system counter, once configured and running, must provide a uniform view of system time. More precisely, it must be impossible for the following sequence of events to show system time going backwards:

1. Device A reads the time from the system counter.
2. Device A communicates with another agent in the system, Device B.
3. After recognizing the communication from Device A, Device B reads the time from the system counter.

The system counter must be implemented in an always-on power domain.

To support lower-power operating modes, the counter can increment by larger amounts at a lower frequency. For example, a 10MHz system counter might either increment:

- By 1 at 10MHz.
- By 500 at 20kHz, when the system lowers the clock frequency, to reduce power consumption.

In this case, the counter must support transitions between high-frequency, high-precision operation, and lower-frequency, lower-precision operation, without any impact on the required accuracy of the counter.

The **CNTRQ** register is intended to hold a copy of the current clock frequency to allow fast reference to this frequency by software running on the PE. For more information see [Initializing and reading the system counter frequency](#).

The mechanism by which the count from the system counter is distributed to system components is IMPLEMENTATION DEFINED, but each PE with a System register interface to the system counter must have a counter input that can capture each increment of the counter.

### ———— Note ————

So that the system counter can be clocked independently from the PE hardware, the count value might be distributed using a Gray code sequence. [Gray-count scheme for timer distribution scheme on page I1-5736](#) gives more information about this possibility.

## Initializing and reading the system counter frequency

The **CNTRQ** register must be programmed to the clock frequency of the system counter. Typically, this is done only during the system boot process, by using the System register interface to write the system counter frequency to the **CNTRQ** register. Only software executing at the highest implemented Exception level can write to **CNTRQ**.

---

**Note**

---

The [CNTFRQ](#) register is UNKNOWN at reset, and therefore the counter frequency must be set as part of the system boot process.

---

Software can read the [CNTFRQ](#) register, to determine the current system counter frequency, in the following states and modes:

- Hyp mode.
- Secure PL1 modes and Non-secure EL1 modes.
- When [CNTKCTL.PL0PCTEN](#) is set to 1, Secure and Non-secure EL0 modes.

### Memory-mapped controls of the system counter

Some system counter controls are accessible only through the memory-mapped interface to the system counter. These controls are:

- Enabling and disabling the counter.
- Setting the counter value.
- Changing the operating mode, to change the update frequency and increment value.
- Enabling Halt-on-debug, that a debugger can then use to suspend counting.

For descriptions of these controls, see [Chapter I1 System Level Implementation of the Generic Timer](#).

## G5.2 The AArch32 view of the Generic Timer

The following sections describe the components and features of a PE implementation of the Generic Timer, as seen from AArch32 state:

- [The physical counter.](#)
- [The virtual counter.](#)
- [Event streams on page G5-4757.](#)
- [Timers on page G5-4758.](#)

### G5.2.1 The physical counter

The PE includes a physical counter that contains the count value of the system counter. The **CNTPCT** register holds the current physical counter value.

#### Accessing the physical counter

Software with sufficient privilege can read **CNTPCT** using a 64-bit System register read.

**CNTPCT**:

- Is always accessible from Secure PL1 modes and from Non-secure Hyp mode.
- Is accessible from Non-secure EL1 modes when the value of **CNTHCTL**.PL1PCTEN is 1. When the value of **CNTHCTL**.PL1PCTEN is 0, any attempt to access **CNTPCT** from Non-secure EL1 modes is trapped to Hyp mode.
- Is accessible from Secure User mode when the value of **CNTKCTL**.PL0PCTEN is 1. When the value of **CNTKCTL**.PL0PCTEN is 0, any attempt to access **CNTPCT** generates an UNDEFINED exception.
- Is accessible from Non-secure User mode when the value of **CNTHCTL**.PL1PCTEN is 1 and the value of **CNTKCTL**.PL0PCTEN is 1. Otherwise:
  - When the value of **CNTKCTL**.PL0PCTEN is 0, any attempt to access **CNTPCT** from Non-secure User mode generates an UNDEFINED exception.
  - When the value of **CNTKCTL**.PL0PCTEN is 1 and the value of **CNTHCTL**.PL1PCTEN is 0, any attempt to access **CNTPCT** from Non-secure User mode is trapped to Hyp mode.

Reads of **CNTPCT** can occur speculatively and out of order relative to other instructions executed on the same PE.

For example, if a read from memory is used to obtain a signal from another agent that indicates that **CNTPCT** must be read, an ISB is used to ensure that the read of **CNTPCT** occurs after the signal has been read from memory, as shown in the following code sequence:

```
loop          ; polling for some communication to indicate a requirement to read the timer
    LDR R1, [R2]
    CMP R1, #1
    BNE loop
    ISB          ; without this, the CNTPCT could be read before the memory location in [R2]
                ; has had the value 1 written to it
    MRS R1, CNTPCT
```

### G5.2.2 The virtual counter

An implementation of the Generic Timer always includes a virtual counter, that indicates virtual time.

The virtual counter contains the value of the physical counter minus a 64-bit virtual offset. When executing in a Non-secure EL1 or EL0 mode, the virtual offset value relates to the current virtual machine.

The **CNTVOFF** register contains the virtual offset. **CNTVOFF** is only accessible:

- From Hyp mode.
- From Monitor mode only when **SCR**.NS is set to 1.

For more information see [Status of the CNTVOFF register on page G5-4757](#).

The **CNTVCT** register holds the current virtual counter value.

### Accessing the virtual counter

Software with sufficient privilege can read **CNTVCT** using a 64-bit System register read.

**CNTVCT** is always accessible from Secure PL1 modes and from Non-secure EL1 and EL2 modes.

In addition, when **CNTKCTL**.PL0VCTEN is set to 1, **CNTVCT** is accessible from EL0.

When **CNTKCTL**.PL0VCTEN is set to 0, any attempt to access **CNTVCT** from EL0 is UNDEFINED.

Reads of **CNTVCT** can occur speculatively and out of order relative to other instructions executed on the same PE.

For example, if a read from memory is used to obtain a signal from another agent that indicates that **CNTVCT** must be read, an ISB is used to ensure that the read of **CNTVCT** occurs after the signal has been read from memory, as shown in the following code sequence:

```
loop                ; polling for some communication to indicate a requirement to read the timer
    LDR R1, [R2]
    CMP R1, #1
    BNE loop
    ISB              ; without this, the CNTVCT could be read before the memory location in [R2]
                    ; has had the value 1 written to it
    MRS R1, CNTVCT
```

### Status of the CNTVOFF register

All implementations of the Generic Timer include the virtual counter. Therefore, conceptually, all implementations include the **CNTVOFF** register that defines the *virtual offset* between the physical count and the virtual count. **CNTVOFF** is only accessible at EL2 or above. If EL2 is not implemented, the virtual counter uses a fixed virtual offset of zero.

## G5.2.3 Event streams

Any implementation of the Generic Timer can use the system counter to generate one or more *event streams*, to generate periodic wake-up events as part of the mechanism described in [Wait for Event mechanism and Send event on page D1-1879](#).

#### ————— Note —————

An event stream might be used:

- To impose a time-out on a Wait For Event polling loop.
- To safeguard against any programming error that means an expected event is not generated.

An event stream is configured by:

- Selecting which bit, from the bottom 16 bits of a counter, triggers the event. This determines the frequency of the events in the stream.
- Selecting whether the event is generated on each 0 to 1 transition, or each 1 to 0 transition, of the selected counter bit.

The **CNTKCTL**.{EVNTEN, EVNTDIR, EVNTI} fields define an event stream that is generated from the virtual counter.

In all implementations the **CNTHCTL**.{EVNTEN, EVNTDIR, EVNTI} fields define an event stream that is generated from the physical counter.

The operation of an event stream is as follows:

- The pseudocode variables PreviousCNTVCT and PreviousCNTPCT are initialized as:  
// Variables used for generation of the timer event stream.

```
bits(64) PreviousCNTVCT = bits(64) UNKNOWN;
bits(64) PreviousCNTPCT = bits(64) UNKNOWN;
```

- The pseudocode functions TestEventCNTV() and TestEventCNTP() are called on each cycle of the PE clock.
- The TestEventCNTx() pseudocode template defines the functions TestEventCNTV() and TestEventCNTP():

```
// TestEventCNTx()
// =====

// Template for the TestEventCNTV() and TestEventCNTP() functions
// Describes operation when all Exception Levels are using AArch32:
// CNTxCT      is CNTVCT      or CNTPCT      64-bit count value
// CNTx_CTL    is CNTV_CTL    or CNTP_CTL    Control register
// PreviousCNTxCT is PreviousCNTVCT or PreviousCNTPCT

TestEventCNTx()
    if CNTx_CTL.EVNTEN == '1' then
        n = UInt(CNTx_CTL.EVNTI);
        SampleBit = CNTxCT<n>;
        PreviousBit = PreviousCNTxCT<n>;

        if CNTx_CTL.EVNTDIR == '0' then
            if PreviousBit == '0' && SampleBit == '1' then EventRegisterSet();
        else
            if PreviousBit == '1' && SampleBit == '0' then EventRegisterSet();

    PreviousCNTxCT = CNTxCT;

    return;
```

## G5.2.4 Timers

In an implementation that includes EL3, in any implementation of the Generic Timer, the following timers are accessible from AArch32 state, provided the appropriate Exception level can use AArch32:

- A Non-secure EL1 physical timer. A Non-secure EL1 control determines whether this register is accessible from Non-secure EL0.
- A Secure PL1 physical timer. This timer:
  - Is accessible from Secure EL1 using AArch32 when EL3 is using AArch64.
  - Is accessible from Secure EL3 when EL3 is using AArch32.
 A Secure PL1 control determines whether this register is accessible from Secure EL0.
- A Non-secure EL2 physical timer.
- A virtual timer.

The output of each implemented timer:

- Provides an output signal to the system.
- If the PE interfaces to a *Generic Interrupt Controller* (GIC), signals a *Private Peripheral Interrupt* (PPI) to that GIC. In a multiprocessor implementation, each PE must use the same interrupt number for each timer.

Each timer:

- Is based around a 64-bit CompareValue that provides a 64-bit unsigned upcounter.
- Provides an alternative view of the CompareValue, called the TimerValue, that appears to operate as a 32-bit downcounter.
- Has, in addition, a 32-bit Control register.

In all implementations, the AArch32 System registers for the EL1 (or PL1) physical timer are Banked, to provide the Secure and Non-secure implementations of the timer. [Table G5-1](#) shows the Timer registers.

**Table G5-1 Timer registers summary for the Generic Timer**

Timer register	Secure PL1 or Non-secure EL1 physical timer	EL2 physical timer	Virtual timer
CompareValue register	<a href="#">CNTP_CVAL</a> <sup>a</sup>	<a href="#">CNTHP_CVAL</a>	<a href="#">CNTV_CVAL</a>
TimerValue register	<a href="#">CNTP_TVAL</a> <sup>a</sup>	<a href="#">CNTHP_TVAL</a>	<a href="#">CNTV_TVAL</a>
Control register	<a href="#">CNTP_CTL</a> <sup>a</sup>	<a href="#">CNTHP_CTL</a>	<a href="#">CNTV_CTL</a>

a. In AArch32 state, these registers are Banked to provide the Non-secure EL1 physical timer and the Secure PL1 physical timer.

The following sections describe:

- [Accessing the timer registers](#)
- [Operation of the CompareValue views of the timers on page G5-4760](#)
- [Operation of the TimerValue views of the timers on page G5-4760.](#)

## Accessing the timer registers

For each timer, all timer registers have the same access permissions, as follows:

### Secure PL1 and Non-secure EL1 physical timer

The Secure PL1 physical timer is accessible from Secure PL1 modes.

Non-secure software executing at EL2 controls access to the Non-secure EL1 physical timer from Non-secure EL1 modes. The Non-secure EL1 physical timer is accessible from Monitor mode when the value of [SCR.NS](#) is 1.

When access from PL1 or EL1 modes is permitted, [CNTKCTL.PLOPTEN](#) determines whether the registers are accessible from EL0. If an access is not permitted because [CNTKCTL.PLOPTEN](#) is set to 0, an attempted access from EL0 is UNDEFINED.

In all implementations:

- Except for accesses from Monitor mode, accesses are to the registers for the current Security state.
- For accesses from Monitor mode, the value of [SCR.NS](#) determines whether accesses are to the Secure or the Non-secure registers.

#### **Note**

Monitor mode is present only when EL3 is using AArch32.

- The Non-secure registers are accessible from Hyp mode.
- [CNTHCTL.PL1PCEN](#) determines whether the Non-secure registers are accessible from Non-secure EL1 modes. If this bit is set to 1, to enable access from Non-secure EL1 modes, [CNTKCTL.PLOPTEN](#) determines whether the registers are accessible from Non-secure EL0.

If an access is not permitted because [CNTHCTL.PL1PCEN](#) is set to 0, an attempted access from a Non-secure EL1 or EL0 mode generates a Hyp Trap exception. However, if [CNTKCTL.PLOPTEN](#) is set to 0, this control takes priority, and an attempted access from EL0 is UNDEFINED.

**EL2 physical timer** Accessible from Hyp mode, and from Secure Monitor mode when [SCR\\_EL3.NS](#) is set to 1.

**Virtual timer** Accessible from Secure PL1 modes and Non-secure EL1 modes, and from Hyp mode.  
[CNTKCTL.PLOVTEN](#) determines whether the registers are accessible from EL0 modes. If an access is not permitted because [CNTKCTL.PLOVTEN](#) is set to 0, an attempted access from EL0 is UNDEFINED.

## Operation of the CompareValue views of the timers

The CompareValue view of a timer operates as a 64-bit upcounter. The timer condition is met when the appropriate counter reaches the value programmed into its CompareValue register. When the timer condition is met an interrupt is generated if the interrupt is not masked in the corresponding timer control register, [CNTP\\_CTL](#), [CNTHP\\_CTL](#), or [CNTV\\_CTL](#). For [CNTP\\_CTL](#), the interrupt is the same as the interrupt asserted by the Non-secure instance of the AArch64 register [CNTP\\_CTL\\_EL0](#).

The operation of this view of a timer is:

$$\text{TimerConditionMet} = (((\text{Counter}[63:0] - \text{Offset}[63:0])[63:0] - \text{CompareValue}[63:0]) \geq 0)$$

Where:

**TimerConditionMet** Is TRUE if the timer condition for this counter is met, and FALSE otherwise.

**Counter** The physical counter value, that can be read from the [CNTPCT](#) register.

### ———— **Note** ————

The virtual counter value, that can be read from the [CNTVCT](#) register, is the value:  
$$(\text{Counter} - \text{Offset})$$

**Offset** For a physical timer it is zero, and for the virtual timer it is the virtual offset, held in the [CNTVOFF](#) register.

**CompareValue** The value of the appropriate CompareValue register, [CNTP\\_CVAL](#), [CNTHP\\_CVAL](#), or [CNTV\\_CVAL](#).

In this view of a timer, Counter, Offset, and CompareValue are all 64-bit unsigned values.

### ———— **Note** ————

This means that a timer with a CompareValue of, or close to, 0xFFFF\_FFFF\_FFFF\_FFFF might never meet its timer condition. However, there is no practical requirement to use values close to the counter wrap value.

## Operation of the TimerValue views of the timers

The TimerValue view of a timer appears to operate as a signed 32-bit downcounter. A TimerValue register is programmed with a count value. This value decrements on each increment of the appropriate counter, and the timer condition is met when the value reaches zero. When the timer condition is met, an interrupt is generated if the interrupt is not masked in the corresponding timer control register, [CNTP\\_CTL](#), [CNTHP\\_CTL](#), or [CNTV\\_CTL](#).

This view of a timer depends on the following behavior of accesses to TimerValue registers:

**Reads**  $\text{TimerValue} = (\text{CompareValue} - (\text{Counter} - \text{Offset}))[31:0]$

**Writes**  $\text{CompareValue} = ((\text{Counter} - \text{Offset})[63:0] + \text{SignExtend}(\text{TimerValue}))[63:0]$

Where the arguments other than TimerValue have the definitions used in [Operation of the CompareValue views of the timers](#), and in addition:

**TimerValue** The value of a TimerValue register, [CNTP\\_TVAL](#), [CNTHP\\_TVAL](#), or [CNTV\\_TVAL](#).

In this view of a timer, values are signed, in standard two's complement form.

A read of a TimerValue register after the timer condition has been met indicates the time since the timer condition was met.

---

**Note**

---

- *Operation of the CompareValue views of the timers on page G5-4760* gives a strict definition of TimerConditionMet. However, provided that the TimerValue is not expected to wrap as a 32-bit signed value when decremented from 0x80000000, the TimerValue view can be used as giving an effect equivalent to:  
$$\text{TimerConditionMet} = (\text{TimerValue} \leq 0)$$
  - Programming TimerValue to a negative number with magnitude greater than (Counter–Offset) can lead to an arithmetic overflow that causes the CompareValue to be an extremely large positive value. This potentially delays meeting the timer condition for an extremely long period of time.
-

# Chapter G6

## **AArch32 System Register Descriptions**

This chapter describes each of the AArch32 System registers.

It contains the following sections:

- *About the AArch32 System registers* on page G6-4764.
- *General system control registers* on page G6-4774.
- *Debug registers* on page G6-5239.
- *Performance Monitors registers* on page G6-5331.
- *Generic Timer registers* on page G6-5383.

## G6.1 About the AArch32 System registers

For general information about the AArch32 System registers, see:

- [About the System registers for VMSAv8-32 on page G4-4689.](#)
- [VMSAv8-32 organization of registers in the \(coproc==0b1110\) encoding space on page G4-4704.](#)
- [VMSAv8-32 organization of registers in the \(coproc==0b1111\) encoding space on page G4-4707.](#)
- [Functional grouping of VMSAv8-32 System registers on page G4-4726.](#)

The remainder of this chapter describes the AArch32 System registers, in the following sections:

- [General system control registers on page G6-4774.](#)
- [Debug registers on page G6-5239.](#)
- [Performance Monitors registers on page G6-5331.](#)
- [Generic Timer registers on page G6-5383.](#)

### G6.1.1 General behavior of System registers

Except where indicated, System registers are 32-bits wide. As stated in [About the System registers for VMSAv8-32 on page G4-4689](#), there are some 64-bit registers, and these include cases where software can access either a 32-bit view or a 64-bit view of a register. The register summaries, and the individual register descriptions, identify the 64-bit registers and how they can be accessed.

The following sections give information about the general behavior of these registers. Unless otherwise indicated, information applies to all AArch32 System registers:

- [Register names.](#)
- [Read-only bits in read/write registers.](#)
- [UNPREDICTABLE, CONSTRAINED UNPREDICTABLE, and UNDEFINED behavior for AArch32 System register accesses.](#)
- [Read-only and write-only register encodings on page G6-4766.](#)
- [Reset behavior of AArch32 System registers on page G6-4767.](#)

See also [About AArch32 System register accesses on page G4-4689](#) and [Fixed values in register diagrams on page G4-4701](#).

#### Register names

The ARM architecture guarantees not to define any register name prefixed with *IMP\_* as part of the standard ARM architecture.

#### ————— Note —————

ARM strongly recommends that any register names created in the IMPLEMENTATION DEFINED register spaces be prefixed with *IMP\_*, where appropriate.

#### Read-only bits in read/write registers

Some read/write registers include bits that are read-only. These bits ignore writes.

An example of this is the [SCTLR.NMFI](#) bit, [SCTLR\[27\]](#).

#### UNPREDICTABLE, CONSTRAINED UNPREDICTABLE, and UNDEFINED behavior for AArch32 System register accesses

This section defines UNPREDICTABLE and UNDEFINED behaviors for accesses to System registers, including those cases where the ARMv8 behavior is CONSTRAINED UNPREDICTABLE.

In AArch32 state the following operations are UNDEFINED:

- All LDC and STC accesses, except for the LDC access to [DBGDTRTXint](#) and the STC access to [DBGDTRRXint](#) specified in [Table G4-43 on page G4-4706](#).
- All MCRR and MRRC operations to the (coproc==0b111x) encoding space, except for those explicitly defined as accessing 64-bit System registers specified in [Table G4-42 on page G4-4705](#) and [Table G4-44 on page G4-4711](#).

Unless otherwise indicated in the individual register descriptions:

- Reserved fields in registers are RES0.
- Assigning a reserved value to a field has a CONSTRAINED UNPREDICTABLE effect, see [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

The following subsections give more information about UNPREDICTABLE, CONSTRAINED UNPREDICTABLE, and UNDEFINED behavior for accesses to the (coproc==0b111x) encoding space:

- [Accesses to unallocated encodings in the \(coproc==0b111x\) encoding space](#).
- [Additional rules for MCR and MRC accesses to System registers](#).
- [Effects of EL3 and EL2 on System register accesses](#).

### **Accesses to unallocated encodings in the (coproc==0b111x) encoding space**

In ARMv8-A, accesses to unallocated register encodings in the (coproc==0b111x) encoding space are UNDEFINED, see [Unallocated System register access instructions on page K1-6100](#).

### **Additional rules for MCR and MRC accesses to System registers**

The following operations are CONSTRAINED UNPREDICTABLE for all encodings in the (coproc==0b111x) encoding space:

- All MCR operations from the PC.
- All MRC operations to APSR\_nzcv, except for the (coproc==0b1110) MRC operation to APSR\_nzcv from [DBGDSCRint](#).

The CONSTRAINED UNPREDICTABLE behavior of these operations is that they are UNDEFINED, see [Unallocated System register access instructions on page K1-6100](#).

For registers and operations that are accessible from a particular Privilege level, any attempt to access those registers from a lower Privilege level is UNDEFINED.

Some individual registers can be made inaccessible by setting configuration bits, possibly including IMPLEMENTATION DEFINED configuration bits, to disable access to the register. The effects of the architecturally-defined configuration bits are defined individually in this manual. Unless explicitly stated otherwise in this manual, setting a configuration bit to disable access to a register results in the register becoming UNDEFINED for MRC and MCR accesses.

See also [Read-only and write-only register encodings on page G6-4766](#).

### **Effects of EL3 and EL2 on System register accesses**

EL2 and EL3 introduce classes of System registers, described in [Classification of System registers on page G4-4692](#). Some of these classes of register are either:

- Accessible only from certain modes or states.
- Accessible from certain modes or states only when configuration settings permit the access.

Accesses to these registers that are not permitted are UNDEFINED, meaning execution of the register access instruction generates an Undefined Instruction exception.

#### **———— Note ————**

This section applies only to registers that are accessible from some modes and states. That is, it applies only to register access instructions using an encoding that, under some circumstances, would perform a valid register access.

The following register classes restrict access in this way:

### Restricted access System registers

This register class is defined in any implementation that includes EL3.

Restricted access registers other than the [NSACR](#) are accessible only from Secure EL3 modes. All other accesses to these registers are UNDEFINED.

The [NSACR](#) is a special case of a Restricted access register and:

- The [NSACR](#) is:
  - Read/write accessible from Secure PL1 modes.
  - Is Read-only accessible from Non-secure PL2 and PL1 modes.
- All other accesses to the [NSACR](#) are UNDEFINED.

For more information, including behavior when EL3 is using AArch64 or is not implemented, see [Restricted access System registers on page G4-4694](#).

### Configurable access System registers

This register class is defined in any implementation that includes EL3.

Most Configurable access registers are accessible from Non-secure state only if control bits in the [NSACR](#) permit Non-secure access to the register. Otherwise, a Non-secure access to the register is UNDEFINED.

For other Configurable access registers, control bits in the [NSACR](#) control the behavior of bits or fields in the register when it is accessed from Non-secure state. That is, Non-secure accesses to the register are permitted, but the [NSACR](#) controls how they behave. The only architecturally-defined register of this type is the [CPACR](#).

For more information, see [Configurable access System registers on page G4-4694](#).

### EL2-mode System registers

This register class is defined only in an implementation that includes EL2.

EL2-mode registers are accessible only from:

- The Non-secure EL2 mode, Hyp mode.
- Secure Monitor mode when [SCR.NS](#) is set to 1.

All other accesses to these registers are UNDEFINED.

For more information, see [Hyp mode read/write registers in the \(coproc == 0b1111\) encoding space on page G4-4695](#) and [Hyp mode encodings for shared \(coproc == 0b1111\) System registers on page G4-4696](#).

### EL2-mode write-only operations

This register class is defined only in an implementation that includes EL2.

EL2-mode write-only operations are accessible only from:

- The Non-secure EL2 mode, Hyp mode.
- Secure Monitor mode, regardless of the value of [SCR.NS](#).

Write accesses to these operations are:

- CONSTRAINED UNPREDICTABLE in Secure EL3 modes other than Monitor mode.
- UNDEFINED in Non-secure modes other than Hyp mode.

For more information, see [Hyp mode \(coproc == 0b1111\) write-only System instructions on page G4-4697](#).

In addition, in any implementation that includes EL3, when EL3 is using AArch32, if write access to a register is disabled by the [CP15SDISABLE](#) signal then any MCR access to that register is UNDEFINED.

### Read-only and write-only register encodings

Some System registers are *read-only* (RO) or *write-only* (WO). For example:

- Most identification registers are read-only.

- Most encodings that perform an operation, such as a cache maintenance instruction, are write-only.

If a particular Privilege level defines a register to be:

- RO, then any attempt to write to that register, at that Privilege level, is UNDEFINED. This means that any access to that register with  $L = 0$  is UNDEFINED.
- WO, then any attempt to read from that register, at that Privilege level, is UNDEFINED. This means that any access to that register with  $L = 1$  is UNDEFINED.

For IMPLEMENTATION DEFINED encoding spaces, the treatment of the encodings is IMPLEMENTATION DEFINED.

---

**Note**

This section applies only to registers that this manual defines as RO or WO. It does not apply to registers for which other access permissions are explicitly defined.

---

## Reset behavior of AArch32 System registers

Reset values apply only to RW registers and fields, however:

- Some RO registers or fields, including feature ID registers and some status registers or register fields, always return a known value.
- Some RW and RO registers or register fields return status information about the PE. Unless the register description indicates that the value is UNKNOWN on reset, a read of the register immediately after a reset returns valid information.
- Some RW and RO registers and fields are aliases of other registers or fields. In these cases, the reset behavior of the aliased register or field determines the value returned by a read of the register immediately after a reset.
- WO registers that only have an effect on writes do not have meaningful reset values. However, an access to a WO register might affect underlying state, and that state might have a defined reset value.
- IMPLEMENTATION DEFINED registers have IMPLEMENTATION DEFINED reset behavior.

After a reset, only a limited subset of the PE state is guaranteed to be set to defined values. Also, for debug and trace System registers, reset requirements must take account of different levels of reset. For more information about the reset behavior of System registers when the PE resets into an Exception level that is using AArch32, see:

- [PE state on reset into AArch32 state on page G1-4400](#).
- The appropriate Trace architecture specification, for the Trace System registers.

When the PE resets into an Exception level that is using AArch64, PE state that relates to execution in AArch32 state, including the System register values, is UNKNOWN. The only exception to this is state that applies to execution in both AArch64 state and AArch32 state and that has a defined reset value on the reset into AArch64 state. An example of such PE state is the [EDPRSR.SR](#) bit.

For a PE reset into an Exception level that is using AArch32, the architecture defines which AArch32 System registers have a defined reset value, and when that defined reset value applies. The register descriptions include this information, and [PE state on reset into AArch32 state on page G1-4400](#) summarizes these architectural requirements. Otherwise, RW registers reset to an architecturally unknown value.

---

**Note**

In an implementation that includes EL3, unless this manual explicitly states otherwise, only the Secure instance of a Banked register is reset to the defined value. This means that software must program the Non-secure instance of the register with the required values. Typically, this programming is part of the PE boot sequence.

---

## Pseudocode description of resetting System registers

The [AArch32.ResetControlRegisters\(\)](#) pseudocode function resets all System registers, and register fields, that have defined reset values, as described in this section and [PE state on reset into AArch32 state on page G1-4400](#).

---

**Note**

For debug and trace System registers, this function resets registers as defined for the appropriate level of reset.

---

## Synchronization of changes to AArch32 System registers

In this section, *this PE* means the PE on which accesses are being synchronized.

---

**Note**

See [Definitions of direct and indirect reads and writes and their side-effects on page G6-4772](#) for definitions of the terms *direct write*, *direct read*, *indirect write*, and *indirect read*.

---

A *direct write* to a System register might become visible at any point after the change to the register, but without a [Context synchronization event](#) there is no guarantee that the change becomes visible.

Any direct write to a System register is guaranteed not to affect any instruction that appears, in program order, before the instruction that performed the direct write, and any direct write to a System register must be synchronized before any instruction that appears after the direct write, in program order, can rely on the effect of that write. The only exceptions to this are:

- All direct writes to the same register, using the same encoding, are guaranteed to occur in program order.
- All direct writes to a register are guaranteed to occur in program order relative to all direct reads of the same register using the same encoding.
- Any System register access that an ARM *Architecture Specification* or equivalent specification defines as not requiring synchronization.
- If an instruction that appears in program order before the direct write performs a memory access, such as a memory-mapped register access, that causes an indirect read or write to a register, that memory access is subject to the memory order model. In this case, if permitted by the memory order model, the instruction that appears in program order before the direct write can be affected by the direct write. For information about the memory order model, see [Definition of the ARMv8 memory model on page E2-2762](#).

These rules mean that an instruction that writes to one of the address translation instructions described in [Address translation instructions on page G4-4682](#) must be explicitly synchronized to guarantee that the result of the address translation instruction is visible in the [PAR](#).

---

**Note**

In this case, the direct write to the encoding of the address translation instruction causes an *indirect write* to the [PAR](#). Without a [Context synchronization event](#) after the direct write, there is no guarantee that the indirect write to the [PAR](#) is visible.

---

Conceptually, the explicit synchronization occurs as the first step of any [Context synchronization event](#). This means that if the operation uses the state that had been changed but not synchronized before the operation occurred, the operation is guaranteed to use the state as if it had been synchronized.

---

**Note**

- This explicit synchronization is applied as the first step of the execution of any instruction that causes the synchronization operation. This means it does not synchronize any effect of changes to the System registers that might affect the fetch and decode of the instructions that cause the operation, such as breakpoints or changes to translation tables.
  - For a synchronous exception, the control state in use at the time the exception is generated determines the exception syndrome information, and this syndrome information is not changed by this synchronization at the start of taking the exception.
-

Except for the register reads listed in *Registers with some architectural guarantee of ordering or observability* on page G6-4771, if no *Context synchronization event* is performed, direct reads of System registers can occur in any order.

Table G6-1 shows the synchronization requirement between two reads or writes that access the same System register. In the column headings, *First* and *Second* refer to:

- Program order, for any read or write caused by the execution of an instruction by this PE, other than a read or write caused by a memory access made by that instruction.
- The order of arrival of asynchronous reads or writes made by this PE relative to the execution of instructions by this PE.

In addition:

- For indirect reads or writes caused by an external agent, such as a debugger, the mechanism that determines the order of the reads or writes is defined by that external agent. The external agent can provide mechanisms that ensure that any read or write it makes arrives at the PE. These indirect reads and writes are asynchronous to software execution on the PE.
- For indirect reads or writes caused by memory-mapped reads or writes made by this PE, the ordering of the memory accesses is subject to the memory order model, including the effect of the memory type of the accessed memory address. This applies, for example, if this PE reads or writes one of its registers in a memory-mapped register interface.

The mechanism for ensuring completion of these memory accesses, including ensuring the arrival of the asynchronous read or write at the PE, is defined by the system.

———— **Note** ————

Such accesses are likely to be given a Device memory attribute, but requiring this is outside the scope of the architecture.

- For indirect reads or writes caused by autonomous asynchronous events that are counted, for example events caused by the passage of time, the events are ordered so that:
  - Counts progress monotonically.
  - The events arrive at the PE in finite time and without undue delay.

**Table G6-1 Synchronization requirements for updates to System registers**

First read or write	Second read or write	<i>Context synchronization event</i> required
Direct read	Direct read	No
	Direct write	No
	Indirect read	No <sup>a</sup>
	Indirect write	No <sup>a</sup> , but see text in this section for exceptions
Direct write	Direct read	No
	Direct write	No
	Indirect read	Yes <sup>a</sup>
	Indirect write	No, but see text in this section for exceptions

**Table G6-1 Synchronization requirements for updates to System registers (continued)**

First read or write	Second read or write	<i>Context synchronization event</i> required
Indirect read	Direct read	No
	Direct write	No
	Indirect read	No
	Indirect write	No
Indirect write	Direct read	Yes, but see text in this section for exceptions
	Direct write	No, but see text in this section for exceptions
	Indirect read	Yes, but see text in this section for exceptions
	Indirect write	No, but see text in this section for exceptions

- a. Although no synchronization is required between a Direct write and a Direct read, or between a Direct read and an Indirect write, this does not imply that a Direct read causes synchronization of a previous Direct write. This means that the sequence Direct write followed by Direct read followed by Indirect read, with no intervening context synchronization, does not guarantee that the Indirect read observes the result of the Direct write.

If the indirect write is to a register that [Registers with some architectural guarantee of ordering or observability on page G6-4771](#) shows as having some guarantee of the visibility of an indirect write, synchronization might not be required.

If a direct read or a direct write to a register is followed by an indirect write to that register that is caused by an external agent, or by an autonomous asynchronous event, or as a result of a memory-mapped write, then synchronization is required to guarantee the ordering of the indirect write relative to the direct read or direct write.

If an indirect write caused by a direct write is followed by an indirect write caused by an external agent, or by an autonomous asynchronous event, or as a result of a memory-mapped write, then synchronization is required to guarantee the ordering of the two indirect writes.

If a direct read causes an indirect write, synchronization is required to guarantee that the indirect write is visible to subsequent direct or indirect reads or writes. This synchronization must be performed after the direct read, before any subsequent direct or indirect read or write.

If a direct write causes an indirect write, synchronization is required to guarantee that the indirect write is visible to subsequent direct or indirect reads or writes. This synchronization must be performed after the direct write, before any subsequent direct or indirect read or write.

#### ———— **Note** ————

Where a register has more than one encoding, a direct write to the register using a particular encoding is not an indirect write to the same register with a different encoding.

Where an indirect write is caused by the action of an external agent, such as a debugger, or by a memory-mapped read or write by the PE, then an indirect write by that agent to a register using a particular access mechanism, followed by an indirect read by that agent to the same register using the same access mechanism and address does not need synchronization.

For information about the additional synchronization requirements for memory-mapped registers, see [Synchronization requirements for AArch64 System registers on page D7-2191](#).

To guarantee the visibility of changes to some registers, additional operations might be required before the [Context synchronization event](#). For such a register, the definition of the register identifies these additional requirements.

In this manual, unless the context indicates otherwise:

- *Accessing* a System register refers to a direct read or write of the register.
- *Using* a System register refers to an indirect read or write of the register.

### Registers with some architectural guarantee of ordering or observability

For the registers for which [Table G6-2](#) shows that the ordering of direct reads is guaranteed, multiple direct reads of a single register, using the same encoding, occur in program order without any explicit ordering.

For the registers for which [Table G6-2](#) shows that some observability of indirect writes is guaranteed, an indirect write to the register caused by an external agent, an autonomous asynchronous event, or as a result of a memory-mapped write, is both:

- Observable to direct reads of the register, in finite time, without explicit synchronization.
- Observable to subsequent indirect reads of the register without explicit synchronization.

These two sets of registers are similar, as [Table G6-2](#) shows:

**Table G6-2 Registers with a guarantee of ordering or observability, VMSAv8-32**

Register	Ordering of direct reads	Observability of indirect writes	Notes
<a href="#">ISR</a>	Guaranteed	Guaranteed	Interrupt Status Register
<a href="#">DBGCLAIMCLR</a>	Guaranteed	Guaranteed	Debug CLAIM registers
<a href="#">DBGCLAIMSET</a>	-	Guaranteed	
<a href="#">DBGDTRRXint</a>	Guaranteed	Guaranteed	Debug Communication Channel registers
<a href="#">DBGDTRTXint</a>	-	Guaranteed	
The DCC flags in <a href="#">DBGDSCRint</a>	Guaranteed	Guaranteed	
<a href="#">CNTPCT</a>	Guaranteed	Guaranteed	Generic Timer registers
<a href="#">CNTP_TVAL</a>	Guaranteed	Guaranteed	
<a href="#">CNTVCT</a>	Guaranteed	Guaranteed	
<a href="#">CNTV_TVAL</a>	Guaranteed	Guaranteed	
<a href="#">CNTHP_TVAL</a>	Guaranteed	Guaranteed	
<a href="#">PMCCNTR</a>	Guaranteed	Guaranteed	Performance Monitors Extension registers, if the implementation includes the extension
<a href="#">PMEVCNTR&lt;n&gt;</a>	Guaranteed	Guaranteed	
<a href="#">PMXVCNTR</a>	Guaranteed	Guaranteed	
<a href="#">PMOVSSET</a>	Guaranteed	Guaranteed	
<a href="#">PMOVSRR</a>	Guaranteed	Guaranteed	
<a href="#">EDSCR</a> .PipeAdv and the DCC flags in <a href="#">EDSCR</a>	-	Guaranteed	Fields of the External Debug Status and Control Register

In addition to the requirements shown in [Table G6-2](#):

- Indirect writes to the following registers as a result of memory-mapped writes, including accesses by external agents, are required to be observable to the indirect read made in determining the response to a subsequent memory-mapped access without explicit synchronization:

- [OSLAR\\_EL1](#). [OSLAR\\_EL1](#) is indirectly read to determine whether the subsequent access is permitted.

———— **Note** —————

[OSLAR\\_EL1](#) maps to the AArch32 System register [DBGOSLAR](#).

- [EDLAR](#), if implemented. [EDLAR](#) is indirectly read to determine whether a subsequent write or side-effect of an access is ignored.

———— **Note** —————

This requirement is stricter than the general requirement for the observability of indirect writes.

- When the PE is in Debug state, there are synchronization requirements for the Debug Communication Channel and Instruction Transfer registers. See [DCC and ITR access in Debug state on page H4-5513](#).

The possibility that direct reads can occur *early*, in the absence of context synchronization, described in [Ordering of reads of System registers on page G4-4689](#), still applies to the registers listed in [Table G6-2 on page G6-4771](#).

**Definitions of direct and indirect reads and writes and their side-effects**

Direct and indirect reads and writes are defined as follows:

**Direct read** Is a read of a register, using an MRC, MRRC, or STC instruction, that the architecture permits for the current PE state.

If a direct read of a register has a side-effect of changing the value of a register, the effect of a direct read on that register is defined to be an *indirect write*, and has the synchronization requirements of an indirect write. This means the indirect write is guaranteed to have occurred, and to be visible to subsequent direct or indirect reads and writes only if synchronization is performed after the direct read.

———— **Note** —————

The indirect write described here can affect either the register written to by the direct write, or some other register. The synchronization requirement is the same in both cases.

**Direct write** Is a write to a register, using an MCR, MCRR, or LDC instruction, that the architecture permits for the current PE state.

In the following cases, the side-effect of the direct write is defined to be an indirect write of the affected register, and has the synchronization requirements of an indirect write:

- If the direct write has a side-effect of changing the value of a register other than the register accessed by the direct write.
- If the direct write has a side-effect of changing the value of the register accessed by the direct write, so that the value in that register might not be the value that the direct write wrote to the register.

In both cases, this means that the indirect write is not guaranteed to be visible to subsequent direct or indirect reads and writes unless synchronization is performed after the direct write.

———— **Note** —————

- As an example of a direct write to a register having an effect that is an indirect write of that register, writing 1 to a [PMCNTENCLR.Px](#) bit is also an indirect write, because if the Px bit had the value 1 before the direct write, the side-effect of the write changes the value of that bit to 0.
- The indirect write described here can affect either the register written to by the direct write, or some other register. The synchronization requirement is the same in both cases.  
For example, writing 1 to a [PMCNTENCLR.Px](#) bit that is set to 1 also changes the corresponding [PMCNTENSET.Px](#) bit from 1 to 0. This means that the direct write to the [PMCNTENCLR](#) defines indirect writes to both itself and to the [PMCNTENSET](#).

**Indirect read** Is a use of the register by an instruction to establish the operating conditions for the instruction. Examples of operating conditions that might be determined by an indirect read are the translation table base address, or whether memory accesses are forced to be Non-cacheable.

Indirect reads include situations where the value of one register determines what value is returned by a second register. This means that any read of the second register is an indirect read of the register that determines what value is returned.

Indirect reads also include:

- Reads of the System registers by external agents, such as debuggers, as described in [Debug registers on page G6-5239](#).
- Memory-mapped reads of the System registers made by the PE on which the System registers are implemented.

Where an indirect read of a register has a side-effect of changing the value of a register, that change is defined to be an indirect write, and has the synchronization requirements of an indirect write.

**Indirect write** Is an update to the value of a register as a consequence of either:

- An exception, operation, or execution of an instruction that is not a direct write to that register.
- The asynchronous operation of an external agent.

This can include:

- The passage of time, as seen in counters or timers, including performance counters.
- The assertion of an interrupt.
- A write from an external agent, such as a debugger.

However, for some registers, the architecture gives some guarantee of visibility without any explicit synchronization, see [Registers with some architectural guarantee of ordering or observability on page G6-4771](#).

---

**Note**

Taking an exception is a context-synchronizing operation. Therefore, any indirect write performed as part of an exception entry does not require additional synchronization. This includes the indirect writes to the registers that report the exception, as described in [Exception reporting in a VMSAv8-32 implementation on page G4-4663](#).

---

## G6.2 General system control registers

This section lists the System registers in AArch32 state that are not part of one of the other listed groups.

## G6.2.1 ACTLR, Auxiliary Control Register

The ACTLR characteristics are:

### Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

### Configurations

AArch32 System register ACTLR is architecturally mapped to AArch64 System register [ACTLR\\_EL1](#)[31:0].

Some bits might define global configuration settings, and be common to the Secure and Non-secure instances of the register.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

ACTLR is a 32-bit register.

### Field descriptions

The ACTLR bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the ACTLR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c0, 1	000	001	0001	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	ACTLR_s
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	ACTLR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	ACTLR_ns
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	ACTLR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	ACTLR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	ACTLR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	ACTLR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	ACTLR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	ACTLR

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TACR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2 using AArch64.
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TACR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2 using AArch64.
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TAC](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.2 ACTLR2, Auxiliary Control Register 2

The ACTLR2 characteristics are:

### Purpose

Provides additional space to the ACTLR register to hold IMPLEMENTATION DEFINED trap functionality for execution at EL1 and EL0.

### Configurations

AArch32 System register ACTLR2 is architecturally mapped to AArch64 System register [ACTLR\\_EL1](#)[63:32].

In ARMv8.0 and ARMv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining [ID\\_MMFR4.AC2](#).

From ARMv8.2 this register must be implemented.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

ACTLR2 is a 32-bit register.

### Field descriptions

The ACTLR2 bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the ACTLR2

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c0, 3	000	011	0001	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	ACTLR2
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	ACTLR2
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	ACTLR2
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	ACTLR2
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	ACTLR2
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	ACTLR2
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	ACTLR2_s
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	ACTLR2_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	ACTLR2_ns

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TACR==1, Non-secure accesses to this register from EL1 are trapped to EL2 using AArch64.
  - If HSTR\_EL2.T1==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TACR==1, Non-secure accesses to this register from EL1 are trapped to EL2 using AArch64.
  - If HSTR\_EL2.T1==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TAC==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T1==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.3 ADFSR, Auxiliary Data Fault Status Register

The ADFSR characteristics are:

### Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for Data Abort exceptions taken to EL1 modes, and EL3 modes when EL3 is implemented and is using AArch32.

### Configurations

AArch32 System register ADFSR is architecturally mapped to AArch64 System register [AFSR0\\_EL1](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

ADFSR is a 32-bit register.

## Field descriptions

The ADFSR bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

## Accessing the ADFSR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c1, 0	000	000	0101	1111	0001

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	ADFSR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	ADFSR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	ADFSR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	ADFSR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	ADFSR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	ADFSR
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	ADFSR_s
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	ADFSR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	ADFSR_ns

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If [HCR.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.4 AIDR, Auxiliary ID Register

The AIDR characteristics are:

### Purpose

Provides IMPLEMENTATION DEFINED identification information.

The value of this register must be used in conjunction with the value of [MIDR](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register AIDR is architecturally mapped to AArch64 System register [AIDR\\_EL1](#).

### Attributes

AIDR is a 32-bit register.

### Field descriptions

The AIDR bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the AIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 1, <Rt>, c0, c0, 7	001	111	0000	1111	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TID1==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.5 AIFSR, Auxiliary Instruction Fault Status Register

The AIFSR characteristics are:

### Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for Prefetch Abort exceptions taken to EL1 modes, and EL3 modes when EL3 is implemented and is using AArch32.

### Configurations

AArch32 System register AIFSR is architecturally mapped to AArch64 System register [AFSR1\\_EL1](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

AIFSR is a 32-bit register.

### Field descriptions

The AIFSR bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the AIFSR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c1, 1	000	001	0101	1111	0001

### Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	AIFSR_s
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	AIFSR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	AIFSR

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	AIFSR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	AIFSR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	AIFSR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	AIFSR
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	AIFSR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	AIFSR_ns

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TVM==1](#), Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM==1](#), Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T5==1](#), Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TVM==1](#), Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM==1](#), Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T5==1](#), Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TVM==1](#), Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If [HCR.TRVM==1](#), Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T5==1](#), Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.6 AMAIR0, Auxiliary Memory Attribute Indirection Register 0

The AMAIR0 characteristics are:

### Purpose

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by [MAIR0](#).

### Configurations

AArch32 System register AMAIR0 is architecturally mapped to AArch64 System register [AMAIR\\_EL1](#)[31:0].

When EL3 is using AArch32, write access to AMAIR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

AMAIR0 is a 32-bit register.

### Field descriptions

The AMAIR0 bit assignments are:

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR0(S) gives the value for memory accesses from Secure state.
- AMAIR0(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by [MAIR0](#) and [MAIR1](#).

In a typical implementation, AMAIR0 and [AMAIR1](#) split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the AMAIR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c10, c3, 0	000	000	1010	1111	0011

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	AMAIRO
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	AMAIRO
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	AMAIRO
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	AMAIRO
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	AMAIRO
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	AMAIRO
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	AMAIRO_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	AMAIRO_ns
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	AMAIRO_s

When EL3 is using AArch32, write access to AMAIRO\_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If HCR.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T10==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.7 AMAIR1, Auxiliary Memory Attribute Indirection Register 1

The AMAIR1 characteristics are:

### Purpose

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by [MAIR1](#).

### Configurations

AArch32 System register AMAIR1 is architecturally mapped to AArch64 System register [AMAIR\\_EL1](#)[63:32].

When EL3 is using AArch32, write access to AMAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

AMAIR1 is a 32-bit register.

### Field descriptions

The AMAIR1 bit assignments are:

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR1(S) gives the value for memory accesses from Secure state.
- AMAIR1(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by [MAIR0](#) and [MAIR1](#).

In a typical implementation, [AMAIRO](#) and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the AMAIR1

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c10, c3, 1	000	001	1010	1111	0011

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	AMAIR1
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	AMAIR1
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	AMAIR1
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	AMAIR1
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	AMAIR1
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	AMAIR1
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	AMAIR1_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	AMAIR1_ns
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	AMAIR1_s

When EL3 is using AArch32, write access to AMAIR1\_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If HCR.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T10==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.8 APSR, Application Program Status Register

The APSR characteristics are:

### Purpose

Hold program status and control information.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

### Attributes

APSR is a 32-bit register.

### Field descriptions

The APSR bit assignments are:

### N, bit [31]

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

### Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

### C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

### V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

### Q, bit [27]

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

### Bits [26:20]

Reserved, RES0.

### GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

### Bits [15:5]

Reserved, RES0.

### Bit [4]

Reserved, RES1.

**Bits [3:0]**

Reserved, RES0.

## G6.2.9 ATS12NSOPR, Address Translate Stages 1 and 2 Non-secure Only PL1 Read

The ATS12NSOPR characteristics are:

### Purpose

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if reading from the given virtual address.

### Configurations

There are no configuration notes.

### Attributes

ATS12NSOPR is a 32-bit System instruction.

### Field descriptions

The ATS12NSOPR input value bit assignments are:

### Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

### Executing the ATS12NSOPR instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c8, 4	000	100	0111	1111	1000

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL3 is implemented and is using AArch64, execution of ATS12NSOPR in Secure EL1 using AArch32 is trapped as an exception to EL3.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.10 ATS12NSOPW, Address Translate Stages 1 and 2 Non-secure Only PL1 Write

The ATS12NSOPW characteristics are:

### Purpose

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if writing to the given virtual address.

### Configurations

There are no configuration notes.

### Attributes

ATS12NSOPW is a 32-bit System instruction.

### Field descriptions

The ATS12NSOPW input value bit assignments are:

### Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

### Executing the ATS12NSOPW instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c8, 5	000	101	0111	1111	1000

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL3 is implemented and is using AArch64, execution of ATS12NSOPW in Secure EL1 using AArch32 is trapped as an exception to EL3.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.11 ATS12NSOUR, Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read

The ATS12NSOUR characteristics are:

### Purpose

Performs stage 1 and 2 address translations as defined for PL0 and the Non-secure state, with permissions as if reading from the given virtual address.

### Configurations

There are no configuration notes.

### Attributes

ATS12NSOUR is a 32-bit System instruction.

### Field descriptions

The ATS12NSOUR input value bit assignments are:

### Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

### Executing the ATS12NSOUR instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c8, 6	000	110	0111	1111	1000

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL3 is implemented and is using AArch64, execution of ATS12NSOUR in Secure EL1 using AArch32 is trapped as an exception to EL3.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.12 ATS12NSOUW, Address Translate Stages 1 and 2 Non-secure Only Unprivileged Write

The ATS12NSOUW characteristics are:

### Purpose

Performs stage 1 and 2 address translations as defined for PL0 and the Non-secure state, with permissions as if writing to the given virtual address.

### Configurations

There are no configuration notes.

### Attributes

ATS12NSOUW is a 32-bit System instruction.

### Field descriptions

The ATS12NSOUW input value bit assignments are:

### Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

### Executing the ATS12NSOUW instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c8, 7	000	111	0111	1111	1000

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL3 is implemented and is using AArch64, execution of ATS12NSOUW in Secure EL1 using AArch32 is trapped as an exception to EL3.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.13 ATS1CPR, Address Translate Stage 1 Current state PL1 Read

The ATS1CPR characteristics are:

### Purpose

Performs stage 1 address translation as defined for PL1 and the current Security state, with permissions as if reading from the given virtual address.

### Configurations

There are no configuration notes.

### Attributes

ATS1CPR is a 32-bit System instruction.

### Field descriptions

The ATS1CPR input value bit assignments are:

### Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. In an implementation that includes EL2, when executed in Non-secure state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

### Executing the ATS1CPR instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c8, 0	000	000	0111	1111	1000

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

#### G6.2.14 ATS1CPRP, Address Translate Stage 1 Current state PL1 Read PAN

The ATS1CPRP characteristics are:

## Purpose

When [ARMv8.2-ATS1E](#) is implemented, performs a stage 1 address translation at PL1 and in the current Security state, where the value of PSTATE.PAN determines if a read from a location will generate a permission fault for a privileged access.

## Configurations

This instruction is introduced in ARMv8.2.

## Attributes

ATS1CPRP is a 32-bit System instruction.

## Field descriptions

The ATS1CPRP input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. In an implementation that includes EL2, when executed in Non-secure state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

### Executing the `ATS1CPRP` instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c9, 0	000	000	0111	1111	1001

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.15 ATS1CPW, Address Translate Stage 1 Current state PL1 Write

The ATS1CPW characteristics are:

### Purpose

Performs stage 1 address translation as defined for PL1 and the current Security state, with permissions as if writing to the given virtual address.

### Configurations

There are no configuration notes.

### Attributes

ATS1CPW is a 32-bit System instruction.

### Field descriptions

The ATS1CPW input value bit assignments are:

### Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. In an implementation that includes EL2, when executed in Non-secure state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

### Executing the ATS1CPW instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c8, 1	000	001	0111	1111	1000

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

### G6.2.16 ATS1CPWP, Address Translate Stage 1 Current state PL1 Write PAN

The ATS1CPWP characteristics are:

## Purpose

When [ARMv8.2-ATS1E](#) is implemented, performs a stage 1 address translation at PL1 and in the current Security state, where the value of PSTATE.PAN determines if a write to the location will generate a permission fault for a privileged access.

## Configurations

This instruction is introduced in ARMv8.2.

## Attributes

ATS1CPWP is a 32-bit System instruction.

## Field descriptions

The ATS1CPWP input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. In an implementation that includes EL2, when executed in Non-secure state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

### Executing the ATS1CPWP instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c9, 1	000	001	0111	1111	1001

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.17 ATS1CUR, Address Translate Stage 1 Current state Unprivileged Read

The ATS1CUR characteristics are:

### Purpose

Performs stage 1 address translation as defined for PL0 and the current Security state, with permissions as if reading from the given virtual address.

### Configurations

There are no configuration notes.

### Attributes

ATS1CUR is a 32-bit System instruction.

### Field descriptions

The ATS1CUR input value bit assignments are:

### Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. In an implementation that includes EL2, when executed in Non-secure state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

### Executing the ATS1CUR instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c8, 2	000	010	0111	1111	1000

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.18 ATS1CUW, Address Translate Stage 1 Current state Unprivileged Write

The ATS1CUW characteristics are:

### Purpose

Performs stage 1 address translation as defined for PL0 and the current Security state, with permissions as if writing to the given virtual address.

### Configurations

There are no configuration notes.

### Attributes

ATS1CUW is a 32-bit System instruction.

### Field descriptions

The ATS1CUW input value bit assignments are:

### Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. In an implementation that includes EL2, when executed in Non-secure state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

### Executing the ATS1CUW instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c8, 3	000	011	0111	1111	1000

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \ \&\& \ (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \ \&\& \ (HCR\_EL2.E2H == 1) \ \&\& \ (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

### G6.2.19 ATS1HR, Address Translate Stage 1 Hyp mode Read

The ATS1HR characteristics are:

## Purpose

Performs stage 1 address translation as defined for PL2 and the Non-secure state, with permissions as if reading from the given virtual address.

## Configurations

There are no configuration notes.

### Attributes

ATS1HR is a 32-bit System instruction.

## Field descriptions

The ATS1HR input value bit assignments are:

**Bits [31:0]**

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. The resulting address is the PA that is the output address of the translation.

### Executing the ATS1HR instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c7, c8, 0	100	000	0111	1111	1000

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.20 ATS1HW, Address Translate Stage 1 Hyp mode Write

The ATS1HW characteristics are:

### Purpose

Performs stage 1 address translation as defined for PL2 and the Non-secure state, with permissions as if writing to the given virtual address.

### Configurations

There are no configuration notes.

### Attributes

ATS1HW is a 32-bit System instruction.

### Field descriptions

The ATS1HW input value bit assignments are:

### Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This instruction takes a VA as input. The resulting address is the PA that is the output address of the translation.

### Executing the ATS1HW instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c7, c8, 1	100	001	0111	1111	1000

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.21 BPIALL, Branch Predictor Invalidate All

The BPIALL characteristics are:

### Purpose

Invalidate all entries from branch predictors.

### Configurations

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

### Attributes

BPIALL is a 32-bit System instruction.

### Field descriptions

BPIALL ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

### Executing the BPIALL instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c5, 6	000	110	0111	1111	0101

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When HCR.FB is 1, at Non-secure EL1 this instruction executes as a BPIALLIS.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.22 BPIALLIS, Branch Predictor Invalidate All, Inner Shareable

The BPIALLIS characteristics are:

### Purpose

Invalidate all entries from branch predictors Inner Shareable.

### Configurations

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

### Attributes

BPIALLIS is a 32-bit System instruction.

### Field descriptions

BPIALLIS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

### Executing the BPIALLIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c1, 6	000	110	0111	1111	0001

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HSTR\_EL2.T7==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If [HSTR\\_EL2.T7](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If [HSTR.T7](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.23 BPIMVA, Branch Predictor Invalidate by VA

The BPIMVA characteristics are:

### Purpose

Invalidate virtual address from branch predictors.

### Configurations

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

### Attributes

BPIMVA is a 32-bit System instruction.

## Field descriptions

The BPIMVA input value bit assignments are:

### Bits [31:0]

Virtual address to use.

## Executing the BPIMVA instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c5, 7	000	111	0111	1111	0101

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.24 CCSIDR, Current Cache Size ID Register

The CCSIDR characteristics are:

### Purpose

Provides information about the architecture of the currently selected cache.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CCSIDR is architecturally mapped to AArch64 System register [CCSIDR\\_EL1](#).

The implementation includes one CCSIDR for each cache that it can access. [CSSELR](#) and the Security state select which Cache Size ID Register is accessible.

### Attributes

CCSIDR is a 32-bit register.

### Field descriptions

The CCSIDR bit assignments are:

31	28	27	13	12	3	2	0
UNKNOWN	NumSets						LineSize

#### UNKNOWN, bits [31:28]

Reserved, UNKNOWN.

#### NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

#### Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

#### LineSize, bits [2:0]

( $\log_2(\text{Number of bytes in cache line})$ ) - 4. For example:

For a line length of 16 bytes:  $\log_2(16) = 4$ , LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes:  $\log_2(32) = 5$ , LineSize entry = 1.

### ————— Note —————

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

## Accessing the CCSIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 1, <Rt>, c0, c0, 0	001	000	0000	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

If [CSSEL](#).Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR read is treated as NOP.
- The CCSIDR read is UNDEFINED.
- The CCSIDR read returns an UNKNOWN value.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID2](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID2](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TID2](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.25 CLIDR, Cache Level ID Register

The CLIDR characteristics are:

### Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CLIDR is architecturally mapped to AArch64 System register [CLIDR\\_EL1](#).

### Attributes

CLIDR is a 32-bit register.

### Field descriptions

The CLIDR bit assignments are:

31	30	29	27	26	24	23	21	20	18	17	15	14	12	11	9	8	6	5	3	2	0
ICB	LoUU	LoC	LoUIS	Ctype7	Ctype6	Ctype5	Ctype4	Ctype3	Ctype2	Ctype1											

#### ICB, bits [31:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

The possible values are:

- 00 Not disclosed by this mechanism.
- 01 L1 cache is the highest Inner Cacheable level.
- 10 L2 cache is the highest Inner Cacheable level.
- 11 L3 cache is the highest Inner Cacheable level.

#### LoUU, bits [29:27]

Level of Unification Uniprocessor for the cache hierarchy.

#### LoC, bits [26:24]

Level of Coherence for the cache hierarchy.

#### LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

#### Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 1 to 7

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

- 000 No cache.
- 001 Instruction cache only.
- 010 Data cache only.
- 011 Separate instruction and data caches.

100 Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

## Accessing the CLIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 1, <Rt>, c0, c0, 1	001	001	0000	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID2==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID2==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TID2==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.26 CONTEXTIDR, Context ID Register

The CONTEXTIDR characteristics are:

### Purpose

Identifies the current Process Identifier and, when using the Short-descriptor translation table format, the Address Space Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

### Configurations

AArch32 System register CONTEXTIDR is architecturally mapped to AArch64 System register [CONTEXTIDR\\_EL1](#).

The register format depends on whether address translation is using the Long-descriptor or the Short-descriptor translation table format.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CONTEXTIDR is a 32-bit register.

### Field descriptions

The CONTEXTIDR bit assignments are:

**When *TTBCR.EAE*==0:**

#### PROCID, bits [31:8]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

#### ASID, bits [7:0]

Address Space Identifier. This field is programmed with the value of the current ASID.

**When *TTBCR.EAE*==1:**

#### PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

### Accessing the CONTEXTIDR

This register can be read using MRC with the following syntax:

MCR <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c0, 1	000	001	1101	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	CONTEXTIDR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	CONTEXTIDR_ns
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	CONTEXTIDR_s
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	CONTEXTIDR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	CONTEXTIDR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	CONTEXTIDR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	CONTEXTIDR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	CONTEXTIDR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	CONTEXTIDR

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TVM==1](#), Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM==1](#), Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T13==1](#), Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TVM==1](#), Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM==1](#), Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T13==1](#), Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TVM==1](#), Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If [HCR.TRVM==1](#), Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

- If `HSTR.T13==1`, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.27 CP15DMB, Data Memory Barrier System instruction

The CP15DMB characteristics are:

### Purpose

Performs a Data Memory Barrier.

ARM deprecates any use of this operation, and strongly recommends that software use the [DMB](#) instruction instead.

### Configurations

There are no configuration notes.

### Attributes

CP15DMB is a 32-bit System instruction.

### Field descriptions

CP15DMB ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

### Executing the CP15DMB instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c10, 5	000	101	0111	1111	1010

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	WO	WO	n/a	WO
x	0	1	WO	WO	WO	WO
x	1	1	WO	n/a	WO	WO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [SCTLR.CP15BEN](#)==0, execution of this instruction at PL0 and PL1 is UNDEFINED.
  - If [SCTLR\\_EL1.CP15BEN](#)==0, execution of this instruction at PL0 is UNDEFINED.
  - If [HSCTLR.CP15BEN](#)==0, execution of this instruction at PL2 is UNDEFINED.

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If [HSTR\\_EL2.T7](#)==1, Non-secure execution of this instruction at EL0 and EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If [HSTR\\_EL2.T7](#)==1, Non-secure execution of this instruction at EL0 and EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If [HSTR.T7](#)==1, Non-secure execution of this instruction at EL0 and EL1 is trapped to Hyp mode.

G6.2.28 CP15DSB, Data Synchronization Barrier System instruction

The CP15DSB characteristics are:

Purpose

Performs a Data Synchronization Barrier.  
ARM deprecates any use of this operation, and strongly recommends that software use the [DSB](#) instruction instead.

Configurations

There are no configuration notes.

Attributes

CP15DSB is a 32-bit System instruction.

Field descriptions

CP15DSB ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

Executing the CP15DSB instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c10, 4	000	100	0111	1111	1010

Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	WO	WO	n/a	WO
x	0	1	WO	WO	WO	WO
x	1	1	WO	n/a	WO	WO

Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [SCTLR.CP15BEN](#)==0, execution of this instruction at PL0 and PL1 is UNDEFINED.
  - If [SCTLR\\_EL1.CP15BEN](#)==0, execution of this instruction at PL0 is UNDEFINED.
  - If [HSCTLR.CP15BEN](#)==0, execution of this instruction at PL2 is UNDEFINED.

- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 0)$ :
  - If [HSTR\\_EL2.T7](#)==1, Non-secure execution of this instruction at EL0 and EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 1) \ \&\& \ (\text{HCR\_EL2.TGE} == 0)$ :
  - If [HSTR\\_EL2.T7](#)==1, Non-secure execution of this instruction at EL0 and EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} == 1$ :
  - If [HSTR.T7](#)==1, Non-secure execution of this instruction at EL0 and EL1 is trapped to Hyp mode.

## G6.2.29 CP15ISB, Instruction Synchronization Barrier System instruction

The CP15ISB characteristics are:

### Purpose

Performs an Instruction Synchronization Barrier.

ARM deprecates any use of this operation, and strongly recommends that software use the [ISB](#) instruction instead.

### Configurations

There are no configuration notes.

### Attributes

CP15ISB is a 32-bit System instruction.

### Field descriptions

CP15ISB ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

### Executing the CP15ISB instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c5, 4	000	100	0111	1111	0101

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	WO	WO	n/a	WO
x	0	1	WO	WO	WO	WO
x	1	1	WO	n/a	WO	WO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [SCTLR.CP15BEN](#)==0, execution of this instruction at PL0 and PL1 is UNDEFINED.
  - If [SCTLR\\_EL1.CP15BEN](#)==0, execution of this instruction at PL0 is UNDEFINED.
  - If [HSCTLR.CP15BEN](#)==0, execution of this instruction at PL2 is UNDEFINED.

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If [HSTR\\_EL2.T7](#)==1, Non-secure execution of this instruction at EL0 and EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If [HSTR\\_EL2.T7](#)==1, Non-secure execution of this instruction at EL0 and EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If [HSTR.T7](#)==1, Non-secure execution of this instruction at EL0 and EL1 is trapped to Hyp mode.

G6.2.30 CPACR, Architectural Feature Access Control Register

The CPACR characteristics are:

Purpose

Controls access to trace, and to Advanced SIMD and floating-point functionality from EL0, EL1, and EL3.

In an implementation that includes EL2, the CPACR has no effect on instructions executed at EL2.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CPACR is architecturally mapped to AArch64 System register [CPACR\\_EL1](#).

Bits in the [NSACR](#) control Non-secure access to the CPACR fields. See the field descriptions for more information.

Note

In the register field descriptions, controls are described as applying at specified Privilege levels. This is because, in Secure state, a PL1 control:

- Applies to execution in a Secure EL3 mode when EL3 is using AArch32.
- Applies to execution in a Secure EL1 mode when EL3 is using AArch64.

See [Security state, Exception levels, and AArch32 execution privilege](#) on page G1-4318.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CPACR is a 32-bit register.

Field descriptions

The CPACR bit assignments are:

ASEDIS, bit [31]

Disables PL0 and PL1 execution of Advanced SIMD instructions.

- 0 This control permits execution of Advanced SIMD instructions at PL0 and PL1.
- 1 All instruction encodings that are Advanced SIMD instruction encodings, but are not also floating-point instruction encodings, are UNDEFINED at PL0 and PL1.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of [NSACR.NSASEDIS](#) is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see [Controls of Advanced SIMD operation that do not apply to floating-point operation on page E1-2746](#).

See the description of CPACR.cp10 for a list of other controls that can disable or trap execution of Advanced SIMD instructions in AArch32 state.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### Bits [30:29]

Reserved, RES0.

#### TRCDIS, bit [28]

Traps PL0 and PL1 System register accesses to all implemented trace registers to Undefined mode.

- |   |  |
|---|--|
| 0 | This control has no effect on PL0 and PL1 System register accesses to trace registers.                 |
| 1 | PL0 and PL1 System register accesses to all implemented trace registers are trapped to Undefined mode. |

If the implementation does not include a trace macrocell, or does not include a System register interface to the trace macrocell registers, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

#### Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the implementation includes an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### Bits [27:24]

Reserved, RES0.

#### cp11, bits [23:22]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the CPACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of NSACR.cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### cp10, bits [21:20]

Defines the access rights for the floating-point and Advanced SIMD functionality. Possible values of the field are:

- |    |   |
|----|---|
| 00 | PL0 and PL1 accesses to floating-point and Advanced SIMD registers or instructions are UNDEFINED. |
|----|---|

- 01 PL0 accesses to floating-point and Advanced SIMD registers or instructions are UNDEFINED.
- 10 Reserved. The effect of programming this field to this value is CONSTRAINED UNPREDICTABLE. See *Reserved values in System and memory-mapped registers and translation table entries* on page K1-6117.
- 11 This control permits full access to the floating-point and Advanced SIMD functionality from PL0 and PL1.

The floating-point and Advanced SIMD features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the [FPSCR](#), [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), or [FPEXC](#) System registers.

#### Note

The [CPACR](#) has no effect on floating-point and Advanced SIMD accesses from PL2. These can be disabled by the [HCPTR](#).TCP10 field.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of [NSACR](#).cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- [CPACR](#).cp10, or, if executing at EL0, [CPACR\\_EL1](#).FPEN.
- [FPEXC](#).EN.
- If executing in Non-secure state:
  - [HCPTR](#).TCP10, or if EL2 is using AArch64, [CPTR\\_EL2](#).TFP.
  - [NSACR](#).cp10, or if EL3 is using AArch64, [CPTR\\_EL3](#).TFP.
- For Advanced SIMD instructions only:
  - [CPACR](#).ASEDIS.
  - If executing in Non-secure state, [HCPTR](#).TASE and [NSACR](#).NSTRCDIS.

See the descriptions of the controls for more information.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### Bits [19:0]

Reserved, RES0.

### Accessing the CPACR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c0, 2	000	010	0001	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If CPTR\_EL2.TCPAC==1, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T1==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If CPTR\_EL2.TCPAC==1, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T1==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCPTR.TCPAC==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T1==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If CPTR\_EL3.TCPAC==1, accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.2.31 CPSR, Current Program Status Register

The CPSR characteristics are:

### Purpose

Holds PE status and control information.

### Configurations

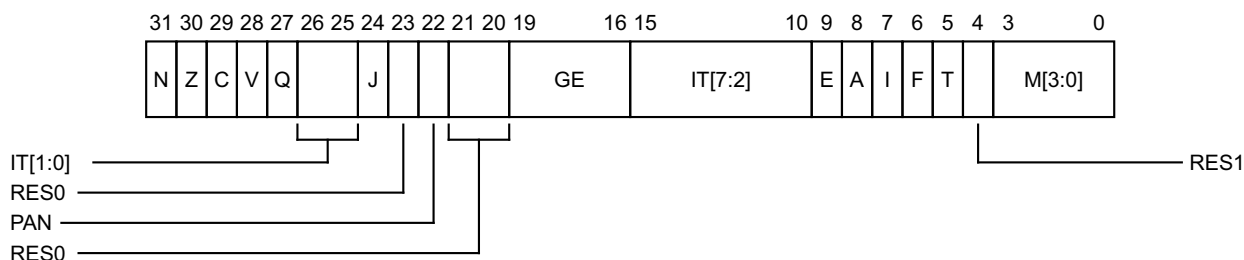

There is one instance of this register that is used in both Secure and Non-secure states.

### Attributes

CPSR is a 32-bit register.

## Field descriptions

The CPSR bit assignments are:

### N, bit [31]

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

### Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

### C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

### V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

### Q, bit [27]

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

### IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

### J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

#### Bit [23]

Reserved, RES0.

#### PAN, bit [22]

##### *In ARMv8.2 and ARMv8.1*

Privileged Access Never. When [ARMv8.1-PAN](#) is implemented, defined values are:

- 0 The translation system is the same as ARMv8.0.
- 1 Disables privileged read and write accesses to addresses accessible at EL0.

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the [SCTLR.SPAN](#) bit for the current Security state is 0, this bit is set to 1.
- When the target of the exception is EL3, from Secure state, and the value of the Secure [SCTLR.SPAN](#) is 0, this bit is set to 1.
- When the target of the exception is EL3, from Non-secure state, this bit is set to 0 regardless of the value of the Secure [SCTLR.SPAN](#) bit.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

##### *In ARMv8.0.*

Reserved, RES0.

#### Bits [21:20]

Reserved, RES0.

#### GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

#### IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

#### E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

- 0 Little-endian operation
- 1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

#### A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

- 0 Exception not masked.

1 Exception masked.

I, bit [7]

IRQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

F, bit [6]

FIQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

T, bit [5]

T32 Instruction set state bit. Indicates the AArch32 instruction set state. Possible values of this bit are:

- 0 A32 state.
- 1 T32 state.

Bit [4]

Reserved, RES1.

M[3:0], bits [3:0]

Current PE mode. Possible values are:

M[3:0]	Mode
0b0000	User
0b0001	FIQ
0b0010	IRQ
0b0011	Supervisor
0b0110	Monitor
0b0111	Abort
0b1010	Hyp
0b1011	Undefined
0b1111	System

Other values are reserved.

### G6.2.32 CSSELR, Cache Size Selection Register

The CSSELR characteristics are:

## Purpose

Selects the current Cache Size ID Register, **CCSIDR**, by specifying the required cache level and the cache type (either instruction or data cache).

## Configurations

AArch32 System register CSSELR is architecturally mapped to AArch64 System register CSSELR\_EL1.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CSSELR is a 32-bit register.

## Field descriptions

The CSSELR bit assignments are:

**Bits [31:4]**

Reserved, RES0.

**Level, bits [3:1]**

Cache level of required cache. Permitted values are:

000	Level 1 cache
001	Level 2 cache
010	Level 3 cache
011	Level 4 cache
100	Level 5 cache
101	Level 6 cache
110	Level 7 cache

All other values are reserved.

If CSSELR.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

**InD, bit [0]**

Instruction not Data bit. Permitted values are:

0	Data or unified cache.
1	Instruction cache.

If CSSELR.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

## Accessing the CSSELR

This register can be read using MRC with the following syntax:

MCR <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 2, <Rt>, c0, c0, 0	010	000	0000	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	CSSELR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	CSSELR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	CSSELR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	CSSELR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	CSSELR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	CSSELR
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	CSSELR_s
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	CSSELR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	CSSELR_ns

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID2](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID2](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TID2](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T0](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.33 CTR, Cache Type Register

The CTR characteristics are:

### Purpose

Provides information about the architecture of the caches.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CTR is architecturally mapped to AArch64 System register [CTR\\_EL0](#).

### Attributes

CTR is a 32-bit register.

### Field descriptions

The CTR bit assignments are:

#### Bit [31]

Reserved, RES1.

#### Bits [30:28]

Reserved, RES0.

#### CWG, bits [27:24]

Cache writeback granule.  $\log_2$  of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of `0b0000` indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than `0b1001` are reserved.

ARM recommends that an implementation that does not support cache write-back implements this field as `0b0001`. This applies, for example, to an implementation that supports only write-through caches.

#### ERG, bits [23:20]

Exclusives reservation granule.  $\log_2$  of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

A value of `0b0000` indicates that this register does not provide Exclusives reservation granule information and the architectural maximum of 512 words (2KB) must be assumed.

Values greater than `0b1001` are reserved.

#### DminLine, bits [19:16]

$\log_2$  of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

### L1Ip, bits [15:14]

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

00	VMID aware Physical Index, Physical tag (VPIPT)
01	ASID-tagged Virtual Index, Virtual Tag (AIVIVT)
10	Virtual Index, Physical Tag (VIPT)
11	Physical Index, Physical Tag (PIPT)

The value 0b01 is reserved in ARMv8.

### Bits [13:4]

Reserved, RES0.

### IminLine, bits [3:0]

Log<sub>2</sub> of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

## Accessing the CTR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c0, 1	000	001	0000	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID2==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \ \&\& \ (HCR\_EL2.E2H == 1) \ \&\& \ (HCR\_EL2.TGE == 0)$ :
  - If [HCR\\_EL2.TID2](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If [HCR.TID2](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.34 DACR, Domain Access Control Register

The DACR characteristics are:

### Purpose

Defines the access permission for each of the sixteen memory domains.

### Configurations

AArch32 System register DACR is architecturally mapped to AArch64 System register [DACR32\\_EL2](#).

When EL3 is using AArch32, write access to DACR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

This register has no function when [TTBCR](#).EAE is set to 1, to select the Long-descriptor translation table format.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

DACR is a 32-bit register.

### Field descriptions

The DACR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0																

### D<n>, bits [2n+1:2n], for n = 0 to 15

Domain n access permission, where n = 0 to 15. Permitted values are:

- 00 No access. Any access to the domain generates a Domain fault.
  - 01 Client. Accesses are checked against the permission bits in the translation tables.
  - 11 Manager. Accesses are not checked against the permission bits in the translation tables.
- The value 10 is reserved.

### Accessing the DACR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c3, c0, 0	000	000	0011	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	DACR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	DACR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	DACR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	DACR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	DACR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	DACR
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	DACR_s
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	DACR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	DACR_ns

When EL3 is using AArch32, write access to DACR\_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T3](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T3](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If [HCR.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T3](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G6.2.35 DCCIMVAC, Data Cache line Clean and Invalidate by VA to PoC

The DCCIMVAC characteristics are:

Purpose

Clean and Invalidate data or unified cache line by virtual address to PoC.

Configurations

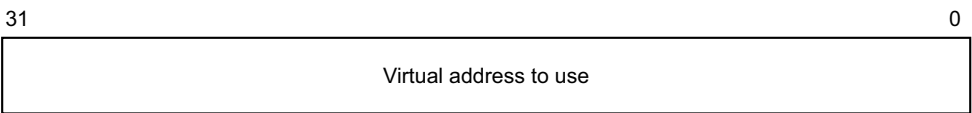

AArch32 System instruction DCCIMVAC performs the same function as AArch64 System instruction [DC CIVAC](#).

Attributes

DCCIMVAC is a 32-bit System instruction.

Field descriptions

The DCCIMVAC input value bit assignments are:

Bits [31:0]

Virtual address to use.

Executing the DCCIMVAC instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c14, 1	000	001	0111	1111	1110

Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TPC==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T7==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TPC==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T7==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TPC==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If HSTR.T7==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

G6.2.36 DCCISW, Data Cache line Clean and Invalidate by Set/Way

The DCCISW characteristics are:

Purpose

Clean and Invalidate data or unified cache line by set/way.

Configurations

AArch32 System instruction DCCISW performs the same function as AArch64 System instruction [DC C1SW](#).

Attributes

DCCISW is a 32-bit System instruction.

Field descriptions

The DCCISW input value bit assignments are:

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$ ,  $L = \text{Log}_2(\text{LINELEN})$ ,  $B = (L + S)$ ,  $S = \text{Log}_2(\text{NSETS})$ .

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DCCISW instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c14, 2	000	010	0111	1111	1110

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TSW==1](#), Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T7==1](#), Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TSW==1](#), Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T7==1](#), Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TSW==1](#), Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T7==1](#), Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

G6.2.37 DCCMVAC, Data Cache line Clean by VA to PoC

The DCCMVAC characteristics are:

Purpose

Clean data or unified cache line by virtual address to PoC.

Configurations

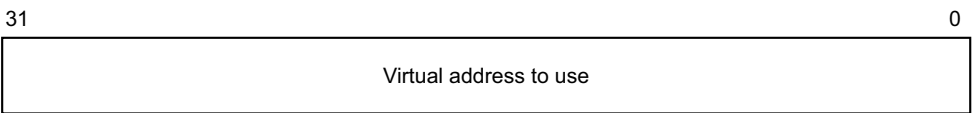

AArch32 System instruction DCCMVAC performs the same function as AArch64 System instruction [DC CVAC](#).

Attributes

DCCMVAC is a 32-bit System instruction.

Field descriptions

The DCCMVAC input value bit assignments are:

Bits [31:0]

Virtual address to use.

Executing the DCCMVAC instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c10, 1	000	001	0111	1111	1010

Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TPC==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T7==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TPC==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T7==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TPC==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If HSTR.T7==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

G6.2.38 DCCMVAU, Data Cache line Clean by VA to PoU

The DCCMVAU characteristics are:

Purpose

Clean data or unified cache line by virtual address to PoU.

Configurations

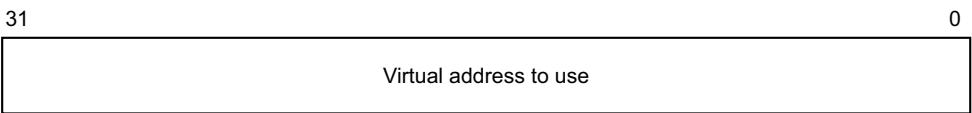

AArch32 System instruction DCCMVAU performs the same function as AArch64 System instruction [DC CVAU](#).

Attributes

DCCMVAU is a 32-bit System instruction.

Field descriptions

The DCCMVAU input value bit assignments are:

Bits [31:0]

Virtual address to use.

Executing the DCCMVAU instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c11, 1	000	001	0111	1111	1011

Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TPU==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T7==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TPU==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T7==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TPU==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If HSTR.T7==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

G6.2.39 DCCSW, Data Cache line Clean by Set/Way

The DCCSW characteristics are:

Purpose

Clean data or unified cache line by set/way.

Configurations

AArch32 System instruction DCCSW performs the same function as AArch64 System instruction [DC CSW](#).

Attributes

DCCSW is a 32-bit System instruction.

Field descriptions

The DCCSW input value bit assignments are:

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$ ,  $L = \text{Log}_2(\text{LINELEN})$ ,  $B = (L + S)$ ,  $S = \text{Log}_2(\text{NSETS})$ .

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DCCSW instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c10, 2	000	010	0111	1111	1010

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TSW==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T7==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TSW==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T7==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TSW==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If HSTR.T7==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

G6.2.40 DCIMVAC, Data Cache line Invalidate by VA to PoC

The DCIMVAC characteristics are:

Purpose

Invalidate data or unified cache line by virtual address to PoC.

Configurations

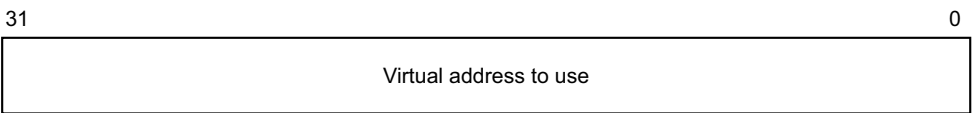

AArch32 System instruction DCIMVAC performs the same function as AArch64 System instruction [DC IVAC](#).

Attributes

DCIMVAC is a 32-bit System instruction.

Field descriptions

The DCIMVAC input value bit assignments are:

Bits [31:0]

Virtual address to use.

Executing the DCIMVAC instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c6, 1	000	001	0111	1111	0110

It is IMPLEMENTATION DEFINED whether, when this instruction is executed, it can generate a watchpoint. If this instruction can generate a watchpoint this is prioritized in the same way as other watchpoints.

Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

At EL1, this instruction performs a cache clean and invalidate, meaning it performs the same invalidation as a [DCCIMVAC](#) instruction, if all of the following apply:

- EL2 is implemented and either:
  - EL2 is using AArch64 and the value of [HCR\\_EL2.VM](#) is 1.
  - EL2 is using AArch32 and the value of [HCR.VM](#) is 1.
- Execution is in Non-secure state, or EL3 is not implemented.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If [HCR\\_EL2.TPC](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T7](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If [HCR\\_EL2.TPC](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T7](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If [HCR.TPC](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T7](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

G6.2.41 DCISW, Data Cache line Invalidate by Set/Way

The DCISW characteristics are:

Purpose

Invalidate data or unified cache line by set/way.

Configurations

AArch32 System instruction DCISW performs the same function as AArch64 System instruction [DC ISW](#).

Attributes

DCISW is a 32-bit System instruction.

Field descriptions

The DCISW input value bit assignments are:

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$ ,  $L = \text{Log}_2(\text{LINELEN})$ ,  $B = (L + S)$ ,  $S = \text{Log}_2(\text{NSETS})$ .

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DCISW instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c6, 2	000	010	0111	1111	0110

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

At EL1, this instruction performs a cache clean and invalidate, meaning it performs the same invalidation as a [DCCISW](#) instruction, if all of the following apply:

- EL2 is implemented and either:
  - EL2 is using AArch64 and the value of [HCR\\_EL2](#).{SWIO, VM} is not {0, 0}.
  - EL2 is using AArch32 and the value of [HCR](#).{SWIO, VM} is not {0, 0}.
- Execution is in Non-secure state, or EL3 is not implemented.

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2](#).TSW==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2](#).T7==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2](#).TSW==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2](#).T7==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR](#).TSW==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR](#).T7==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

G6.2.42 DFAR, Data Fault Address Register

The DFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception.

Configurations

AArch32 System register DFAR(NS) is architecturally mapped to AArch64 System register FAR\_EL1[31:0].

AArch32 System register DFAR(S) is architecturally mapped to AArch32 System register HDFAR when EL2 is implemented.

AArch32 System register DFAR(S) is architecturally mapped to AArch64 System register FAR\_EL2[31:0] when EL2 is implemented.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DFAR is a 32-bit register.

Field descriptions

The DFAR bit assignments are:

Bits [31:0]

VA of faulting address of synchronous Data Abort exception.

Accessing the DFAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c6, c0, 0	000	000	0110	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	DFAR_s
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	DFAR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	DFAR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	DFAR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	DFAR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	DFAR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	DFAR
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	DFAR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	DFAR_ns

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If [HCR.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.43 DFSR, Data Fault Status Register

The DFSR characteristics are:

### Purpose

Holds status information about the last data fault.

### Configurations

AArch32 System register DFSR is architecturally mapped to AArch64 System register [ESR\\_EL1](#).

The current translation table format determines which format of the register is used.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

DFSR is a 32-bit register.

### Field descriptions

The DFSR bit assignments are:

**When *TTBCR.EAE*==0:**

### Bits [31:17]

Reserved, RES0.

### FnV, bit [16]

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

0 [DFAR](#) is valid.

1 [DFAR](#) is not valid, and holds an UNKNOWN value.

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

### AET, bits [15:14]

Asynchronous Error Type. When the RAS Extension is implemented, this field describes the state of the PE after taking an asynchronous Data Abort exception. Possible values are:

00 Uncontainable error (UC) or uncategorized.

01 Unrecoverable error (UEU).

10 Restartable error (UEO) or Corrected error (CE).

11 Recoverable error (UER).

When the RAS Extension is not implemented, or on a synchronous Data Abort, this field is RES0.

---

**Note**

---

ARMv8.2 requires the implementation of the RAS Extension.

---

In the event of multiple errors taken as a single SError interrupt exception, the overall state of the PE is reported.

---

**Note**

---

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

---

**CM, bit [13]**

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

- 0 Abort not caused by execution of a cache maintenance instruction.
- 1 Abort caused by execution of a cache maintenance instruction.

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

**ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.

In an implementation that does not provide any classification of external aborts, this bit is RES0.

For aborts other than external aborts this bit always returns 0.

**WnR, bit [11]**

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

- 0 Abort caused by a read instruction.
- 1 Abort caused by a write instruction.

For faults on the cache maintenance and address translation System instructions in the (coproc==1111) encoding space this bit always returns a value of 1.

**FS[4], bit [10]**

See FS[3:0], bits [3:0] for description of the FS field.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

- 0 Using the Short-descriptor translation table formats.
- 1 Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

**Bit [8]**

Reserved, RES0.

**Domain, bits [7:4]**

The domain of the fault address.

ARM deprecates any use of this field, see [The Domain field in the DFSR on page G4-4669](#).

This field is UNKNOWN for certain faults where the DFSR is updated and reported using the Short-descriptor FSR encodings, see [Table G4-29 on page G4-4673](#).

### FS[3:0], bits [3:0]

Fault status bits. Interpreted with bit [10]. Possible values of FS[4:0] are:

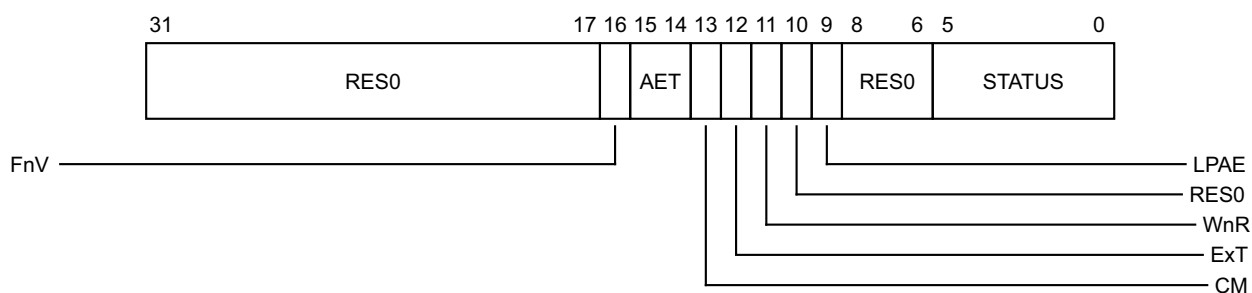

00001	Alignment fault
00010	Debug exception
00011	Access flag fault, level 1
00100	Fault on instruction cache maintenance
00101	Translation fault, level 1
00110	Access flag fault, level 2
00111	Translation fault, level 2
01000	Synchronous external abort, not on translation table walk
01001	Domain fault, level 1
01011	Domain fault, level 2
01100	Synchronous external abort, on translation table walk, level 1
01101	Permission fault, level 1
01110	Synchronous external abort, on translation table walk, level 2
01111	Permission fault, level 2
10000	TLB conflict abort
10100	IMPLEMENTATION DEFINED fault (Lockdown fault)
10101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive access fault)
10110	SError interrupt
11000	SError interrupt, from a parity or ECC error on memory access
11001	Synchronous parity or ECC error on memory access, not on translation table walk
11100	Synchronous parity or ECC error on translation table walk, level 1
11110	Synchronous parity or ECC error on translation table walk, level 2

All other values are reserved.

When the RAS Extension is implemented, 11000, 11001, 11100, and 11110 are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Short-descriptor translation table lookup](#) on page G4-4669.

### When TTBCR.EAE==1:

### Bits [31:17]

Reserved, RES0.

### FnV, bit [16]

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

- 0 DFAR is valid.
- 1 DFAR is not valid, and holds an UNKNOWN value.

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

### AET, bits [15:14]

Asynchronous Error Type. When the RAS Extension is implemented, this field describes the state of the PE after taking an asynchronous Data Abort exception. Possible values are:

- 00 Uncontainable error (UC) or uncategorized.
- 01 Unrecoverable error (UEU).
- 10 Restartable error (UEO) or Corrected error (CE).
- 11 Recoverable error (UER).

When the RAS Extension is not implemented, or on a synchronous Data Abort, this field is RES0.

#### ———— Note ————

ARMv8.2 requires the implementation of the RAS Extension.

In the event of multiple errors taken as a single SError interrupt exception, the overall state of the PE is reported.

#### ———— Note ————

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

### CM, bit [13]

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

- 0 Abort not caused by execution of a cache maintenance instruction.
- 1 Abort caused by execution of a cache maintenance instruction.

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.

In an implementation that does not provide any classification of external aborts, this bit is RES0.

For aborts other than external aborts this bit always returns 0.

### WnR, bit [11]

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

- 0 Abort caused by a read instruction.
- 1 Abort caused by a write instruction.

For faults on the cache maintenance and address translation System instructions in the (coproc==1111) encoding space this bit always returns a value of 1.

#### Bit [10]

Reserved, RES0.

#### LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

- 0 Using the Short-descriptor translation table formats.
- 1 Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

#### Bits [8:6]

Reserved, RES0.

#### STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

- 000000 Address size fault in [TTBR0](#) or [TTBR1](#)
- 000001 Address size fault, level 1
- 000010 Address size fault, level 2
- 000011 Address size fault, level 3
- 000101 Translation fault, level 1
- 000110 Translation fault, level 2
- 000111 Translation fault, level 3
- 001001 Access flag fault, level 1
- 001010 Access flag fault, level 2
- 001011 Access flag fault, level 3
- 001101 Permission fault, level 1
- 001110 Permission fault, level 2
- 001111 Permission fault, level 3
- 010000 Synchronous external abort, not on translation table walk
- 010001 SError interrupt
- 010101 Synchronous external abort, on translation table walk, level 1
- 010110 Synchronous external abort, on translation table walk, level 2
- 010111 Synchronous external abort, on translation table walk, level 3
- 011000 Synchronous parity or ECC error on memory access, not on translation table walk
- 011001 SError interrupt, from a parity or ECC error on memory access
- 011101 Synchronous parity or ECC error on memory access on translation table walk, level 1
- 011110 Synchronous parity or ECC error on memory access on translation table walk, level 2
- 011111 Synchronous parity or ECC error on memory access on translation table walk, level 3
- 100001 Alignment fault
- 100010 Debug exception
- 110000 TLB conflict abort
- 110100 IMPLEMENTATION DEFINED fault (Lockdown fault)
- 110101 IMPLEMENTATION DEFINED fault (Unsupported Exclusive access fault)

All other values are reserved.

When the RAS Extension is implemented, 011000, 011001, 011101, 011110, and 011111 are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Long-descriptor translation table lookup on page G4-4671](#).

## Accessing the DFSR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c0, 0	000	000	0101	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	DFSR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	DFSR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	DFSR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	DFSR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	DFSR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	DFSR
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	DFSR_s
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	DFSR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	DFSR_ns

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T5==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.

- If [HCR\\_EL2](#).TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- If [HSTR\\_EL2](#).T5==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR](#).TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If [HCR](#).TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR](#).T5==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

**G6.2.44 DTLBIALL, Data TLB Invalidate All**

The DTLBIALL characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from data TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at Secure EL1 when EL3 is using AArch64, all entries that would be required for the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at Non-secure EL1, all stage 1 translation table entries that would be required for the Non-secure PL1&0 translation regime and, if EL2 is implemented, they must match the current VMID.
- If executed at EL2, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this instruction.

ARM deprecates the use of this instruction. It is only provided for backwards compatibility with earlier versions of the ARM architecture.

**Configurations**

There are no configuration notes.

**Attributes**

DTLBIALL is a 32-bit System instruction.

**Field descriptions**

DTLBIALL ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

**Executing the DTLBIALL instruction**

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c6, 0	000	000	1000	1111	0110

**Accessibility**

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIALLS](#) operating on data TLBs only.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 0)$ :
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 1) \ \&\& \ (\text{HCR\_EL2.TGE} == 0)$ :
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} == 1$ :
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.45 DTLBIASID, Data TLB Invalidate by ASID match

The DTLBIASID characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

ARM deprecates the use of this instruction. It is only provided for backwards compatibility with earlier versions of the ARM architecture.

### Configurations

There are no configuration notes.

### Attributes

DTLBIASID is a 32-bit System instruction.

### Field descriptions

The DTLBIASID input value bit assignments are:

31	8 7	0
RES0		ASID

#### Bits [31:8]

Reserved, RES0.

#### ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

### Executing the DTLBIASID instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c6, 2	000	010	1000	1111	0110

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIASIDIS](#) operating on data TLBs only.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.46 DTLBIMVA, Data TLB Invalidate by VA

The DTLBIMVA characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

ARM deprecates the use of this instruction. It is only provided for backwards compatibility with earlier versions of the ARM architecture.

### Configurations

There are no configuration notes.

### Attributes

DTLBIMVA is a 32-bit System instruction.

### Field descriptions

The DTLBIMVA input value bit assignments are:

31	12 11	8 7	0
VA	RES0	ASID	

#### VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

#### Bits [11:8]

Reserved, RES0.

#### ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

## Executing the DTLBIMVA instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c6, 1	000	001	1000	1111	0110

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIMVAIS](#) operating on data TLBs only.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.47 ELR\_hyp, Exception Link Register (Hyp mode)

The ELR\_hyp characteristics are:

### Purpose

When taking an exception to Hyp mode, holds the address to return to.

### Configurations

AArch32 System register ELR\_hyp is architecturally mapped to AArch64 System register [ELR\\_EL2](#).

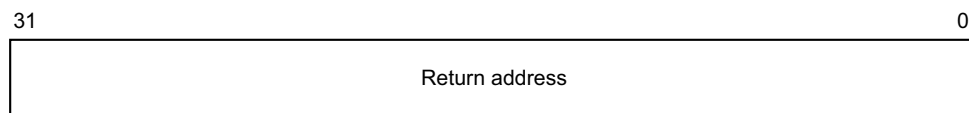

On a reset into an Exception level that is using AArch32 ELR\_hyp is UNKNOWN.

### Attributes

ELR\_hyp is a 32-bit register.

### Field descriptions

The ELR\_hyp bit assignments are:

### Bits [31:0]

Return address.

### Accessing the ELR\_hyp

This register can be read using MRS (banked register) with the following syntax:

MRS <Rd>, <banked\_reg>

This register can be written using MSR (banked register) with the following syntax:

MSR <banked\_reg>, <Rd>

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	R	M	M1
ELR_hyp	0	1	1110

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## G6.2.48 FCSEIDR, FCSE Process ID register

The FCSEIDR characteristics are:

### Purpose

Identifies whether the Fast Context Switch Extension (FCSE) is implemented.

In ARMv8, the FCSE is not implemented, so this register is RAZ/WI. Software can access this register to determine that the implementation does not include the FCSE.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

### Attributes

FCSEIDR is a 32-bit register.

### Field descriptions

The FCSEIDR bit assignments are:

### Bits [31:0]

Reserved, RAZ/WI. Hardware must implement this as RAZ/WI. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

### Accessing the FCSEIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c0, 0	000	000	1101	1111	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T13 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T13 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T13 == 1$ , Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.49 FPEXC, Floating-Point Exception Control register

The FPEXC characteristics are:

### Purpose

Provides a global enable for the implemented Advanced SIMD and floating-point functionality, and reports floating-point status information.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register FPEXC is architecturally mapped to AArch64 System register [FPEXC32\\_EL2](#).

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

FPEXC is a 32-bit register.

### Field descriptions

The FPEXC bit assignments are:

### EX, bit [31]

Exception bit. In ARMv8, this bit is RAZ/WI.

### EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the [FPEXC](#) or [FPSID](#).
- VMRS accesses from the [FPEXC](#), [FPSID](#), [MVFR0](#), [MVFR1](#), or [MVFR2](#).

0 Accesses to the [FPSCR](#), and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.

1 This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- [CPACR](#).cp10, or, if executing at EL0, [CPACR\\_EL1](#).FPEN.

- FPEXC.EN.
- If executing in Non-secure state:
  - [HCPTR.TCP10](#), or if EL2 is using AArch64, [CPTR\\_EL2.TFP](#).
  - [NSACR.cp10](#), or if EL3 is using AArch64, [CPTR\\_EL3.TFP](#).
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, [HCPTR.TASE](#) and [NSACR.NSTRCDIS](#).

See the descriptions of the controls for more information.

———— **Note** —————

When executing at EL0 using AArch32:

- If EL1 is using AArch64 then behavior is as if the value of FPEXC.EN is 1.
  - In Non-secure state, if EL2 is using AArch64 and the value of [HCR\\_EL2](#).{RW, TGE} is {1, 1} then behavior is as if the value of FPEXC.EN is 1.
  - In Non-secure state, if EL2 is using AArch64 and the value of [HCR\\_EL2](#).{RW, TGE} is {0, 1} then it is IMPLEMENTATION DEFINED whether the behavior is:
    - As if the value of FPEXC.EN is 1.
    - Determined by the value of FPEXC.EN, as described in this field description.
- ARM deprecates using the value of FPEXC.EN to determine behavior.

When this register has an architecturally-defined reset value, this field resets to 0.

**DEX, bit [29]**

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function `ExecutingCP10or11Instr()` returning TRUE. This field also indicates whether the FPEXC.TFV field is valid.

The meaning of this bit is:

- |   |   |
|---|---|
| 0 | The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function <code>ExecutingCP10or11Instr()</code> . If FPEXC.TFV is RW then it is invalid and UNKNOWN. If FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN. |
| 1 | The exception was generated during the execution of an unallocated encoding. FPEXC.TFV is valid and indicates the cause of the exception.   |

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the [FPSCR](#).{Stride, Len} fields as RAZ, this bit is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

**FP2V, bit [28]**

FPINST2 instruction valid bit. In ARMv8, this bit is RES0.

**VV, bit [27]**

VECITR valid bit. In ARMv8, this bit is RES0.

### TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

- 0 The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of [FPSCR](#).{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.
- 1 FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements [FPSCR](#).{Stride, Len} as RAZ, this bit is RAO/WI.

### Bits [25:11]

Reserved, RES0.

### VECITR, bits [10:8]

Vector iteration count. In ARMv8, this field is RES1.

### IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while [FPSCR](#).IDE was 1:

- 0 Input denormal exception has not occurred.
- 1 Input denormal exception has occurred.

Input Denormal exceptions can occur only when [FPSCR](#).FZ is 1.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

### Bits [6:5]

Reserved, RES0.

### IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while [FPSCR](#).IXE was 1:

- 0 Inexact exception has not occurred.
- 1 Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

### UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

- 0 Underflow exception has not occurred.
- 1 Underflow exception has occurred.

Underflow trapped exceptions can occur only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

### OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

- 0 Overflow exception has not occurred.
- 1 Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

### DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

- 0 Divide by Zero exception has not occurred.
- 1 Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

### IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while FPSCR.IOE was 1:

- 0 Invalid Operation exception has not occurred.
- 1 Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

## Accessing the FPEXC

This register can be read using VMRS with the following syntax:

```
VMRS <Rt>, <spec_reg>
```

This register can be written using VMSR with the following syntax:

VMSR <spec\_reg>, <Rt>

This syntax is encoded with the following settings in the instruction encoding:

<spec_reg>	reg
FPEXC	1000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} = 0$ :
  - If  $\text{CPACR.cp10} = 00$ , accesses to this register from PL1 are UNDEFINED.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 0)$ :
  - If  $\text{CPTR\_EL2.TFP} = 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If  $\text{CPTR\_EL2.FPEN} = 00$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CPTR\_EL2.FPEN} = 10$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} = 1$ :
  - If  $\text{HCPTR.TCP10} = 1$ , Non-secure accesses to this register from EL1 are trapped to Hyp mode.
  - If  $\text{HCPTR.TCP10} = 1$ , Non-secure accesses to this register from EL2 are UNDEFINED.
- When EL3 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} = 1$ :
  - If  $\text{NSACR.cp10} = 0$ , Non-secure accesses to this register from EL1 and EL2 are UNDEFINED.
- When EL3 is implemented and is using AArch64:
  - If  $\text{CPTR\_EL3.TFP} = 1$ , accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.2.50 FPSCR, Floating-Point Status and Control Register

The FPSCR characteristics are:

### Purpose

Provides floating-point system status information and control.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

The named fields in this register map to the equivalent fields in the AArch64 [FPCR](#) and [FPSR](#).

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

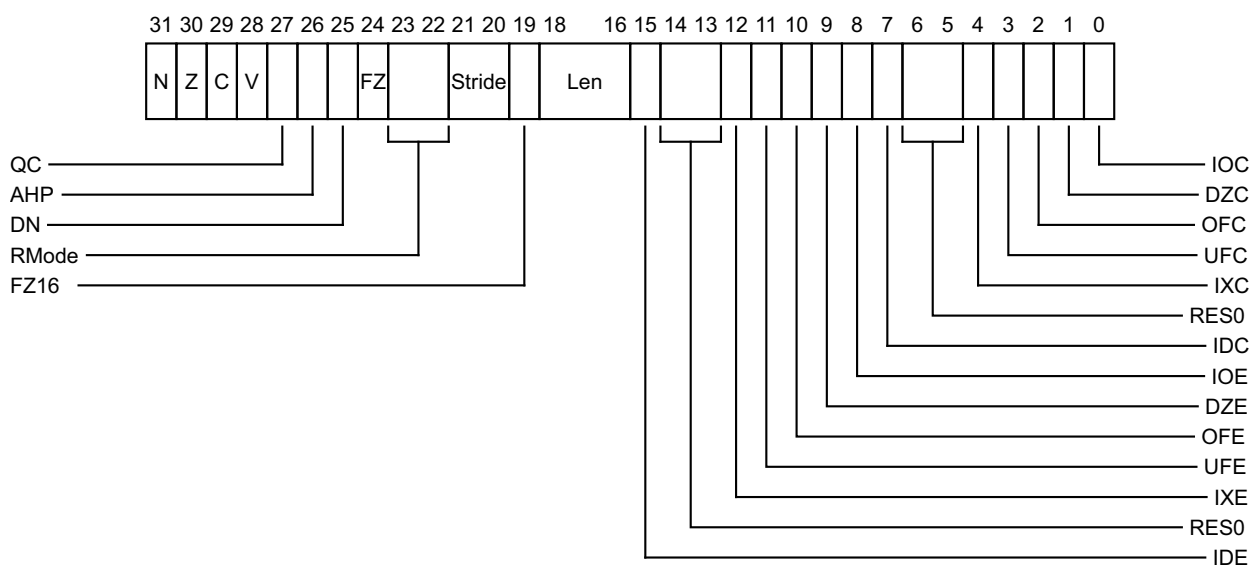

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

FPSCR is a 32-bit register.

### Field descriptions

The FPSCR bit assignments are:

### N, bit [31]

Negative condition flag. This is updated by floating-point comparison operations.

### Z, bit [30]

Zero condition flag. This is updated by floating-point comparison operations.

### C, bit [29]

Carry condition flag. This is updated by floating-point comparison operations.

### V, bit [28]

Overflow condition flag. This is updated by floating-point comparison operations.

#### QC, bit [27]

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

#### AHP, bit [26]

Alternative half-precision control bit:

- 0 IEEE half-precision format selected.
- 1 Alternative half-precision format selected.

This bit is only used for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the [ARMv8.2-FP16](#) extension always use the IEEE half-precision format, and ignore the value of this bit.

#### DN, bit [25]

Default NaN mode control bit:

- 0 NaN operands propagate through to the output of a floating-point operation.
- 1 Any operation involving one or more NaNs returns the Default NaN.

The value of this bit only controls scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Default NaN setting, regardless of the value of the DN bit.

#### FZ, bit [24]

Flush-to-zero mode control bit:

- 0 Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
- 1 Flush-to-zero mode enabled.

The value of this bit only controls scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Flush-to-zero setting, regardless of the value of the FZ bit.

This bit has no effect on half-precision calculations.

#### RMode, bits [23:22]

Rounding Mode control field. The encoding of this field is:

- 00 Round to Nearest (RN) mode
- 01 Round towards Plus Infinity (RP) mode
- 10 Round towards Minus Infinity (RM) mode
- 11 Round towards Zero (RZ) mode.

The specified rounding mode is used by almost all scalar floating-point instructions. Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the RMode bits.

#### Stride, bits [21:20]

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

ARM strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

#### FZ16, bit [19]

*In ARMv8.2*

When [ARMv8.2-FP16](#) is implemented, flush-to-zero mode control bit on half-precision data-processing instructions:

- 0 Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
- 1 Flush-to-zero mode enabled.

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

When [ARMv8.2-FP16](#) is not implemented, this bit is RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

#### Len, bits [18:16]

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

ARM strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

#### IDE, bit [15]

Input Denormal floating-point exception trap enable. Possible values are:

- 0 Untrapped exception handling selected. If the floating-point exception occurs then the IDC bit is set to 1.
- 1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IDC bit. The trap handling software can decide whether to set the IDC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

#### Bits [14:13]

Reserved, RES0.

#### IXE, bit [12]

Inexact floating-point exception trap enable. Possible values are:

- 0 Untrapped exception handling selected. If the floating-point exception occurs then the IXC bit is set to 1.
- 1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IXC bit. The trap handling software can decide whether to set the IXC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

#### UFE, bit [11]

Underflow floating-point exception trap enable. Possible values are:

- 0 Untrapped exception handling selected. If the floating-point exception occurs then the UFC bit is set to 1.
- 1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the UFC bit. The trap handling software can decide whether to set the UFC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

#### OFE, bit [10]

Overflow floating-point exception trap enable. Possible values are:

- 0 Untrapped exception handling selected. If the floating-point exception occurs then the OFC bit is set to 1.
- 1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the OFC bit. The trap handling software can decide whether to set the OFC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

#### DZE, bit [9]

Divide by Zero floating-point exception trap enable. Possible values are:

- 0 Untrapped exception handling selected. If the floating-point exception occurs then the DZC bit is set to 1.
- 1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the DZC bit. The trap handling software can decide whether to set the DZC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

#### IOE, bit [8]

Invalid Operation floating-point exception trap enable. Possible values are:

- 0 Untrapped exception handling selected. If the floating-point exception occurs then the IOC bit is set to 1.
- 1 Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IOC bit. The trap handling software can decide whether to set the IOC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RES0.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

#### IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IDE bit.

Advanced SIMD instructions set this bit if the Input Denormal floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IDE bit.

#### Bits [6:5]

Reserved, RES0.

#### IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IXE bit.

Advanced SIMD instructions set this bit if the Inexact floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IXE bit.

#### UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the UFE bit.

Advanced SIMD instructions set this bit if the Underflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the UFE bit.

#### OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the OFE bit.

Advanced SIMD instructions set this bit if the Overflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the OFE bit.

#### DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the DZE bit.

Advanced SIMD instructions set this bit if the Divide by Zero floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the DZE bit.

#### IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IOE bit.

Advanced SIMD instructions set this bit if the Invalid Operation floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IOE bit.

### Accessing the FPSCR

This register can be read using VMRS with the following syntax:

VMRS <Rt>, <spec\_reg>

This register can be written using VMSR with the following syntax:

VMSR <spec\_reg>, <Rt>

This syntax is encoded with the following settings in the instruction encoding:

<spec_reg>	reg
FPSCR	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When `HCR_EL2.E2H == 0`:
  - If `CPACR.cp10 == 00`, accesses to this register from PL0 and PL1 are UNDEFINED.
  - If `CPACR.cp10 == 01`, accesses to this register from PL0 are UNDEFINED.
  - If `CPACR_EL1.FPEN == 00`, accesses to this register from PL0 are trapped to EL1.
  - If `CPACR_EL1.FPEN == 01`, accesses to this register from PL0 are trapped to EL1.
  - If `CPACR_EL1.FPEN == 10`, accesses to this register from PL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0)`:
  - If `CPTR_EL2.TFP == 1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:
  - If `CPACR_EL1.FPEN == 00`, Non-secure accesses to this register from EL0 are trapped to EL1.
  - If `CPACR_EL1.FPEN == 01`, Non-secure accesses to this register from EL0 are trapped to EL1.
  - If `CPACR_EL1.FPEN == 10`, Non-secure accesses to this register from EL0 are trapped to EL1.
  - If `CPTR_EL2.FPEN == 00`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
  - If `CPTR_EL2.FPEN == 10`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1)`:
  - If `CPTR_EL2.FPEN == 00`, Non-secure accesses to this register from EL0 are trapped to EL2.
  - If `CPTR_EL2.FPEN == 01`, Non-secure accesses to this register from EL0 are trapped to EL2.
  - If `CPTR_EL2.FPEN == 10`, Non-secure accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and `SCR_EL3.NS == 1`:
  - If `HCPTR.TCP10 == 1`, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If `HCPTR.TCP10 == 1`, Non-secure accesses to this register from EL2 are UNDEFINED.
- When EL3 is implemented and is using AArch32 and `SCR_EL3.NS == 1`:
  - If `NSACR.cp10 == 0`, Non-secure accesses to this register from EL0, EL1, and EL2 are UNDEFINED.

- When EL3 is implemented and is using AArch64:
  - If [CPTR\\_EL3.TFP==1](#), accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

G6.2.51 FPSID, Floating-Point System ID register

The FPSID characteristics are:

Purpose

Provides top-level information about the floating-point implementation.  
This register largely duplicates information held in the MIDR. ARM deprecates use of it.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPSID is a 32-bit register.

Field descriptions

The FPSID bit assignments are:

Implementer, bits [31:24]

Implementer codes are the same as those used for the MIDR.  
For an implementation by ARM this field is 0x41, the ASCII code for A.

SW, bit [23]

Software bit. Defined values are:

0	The implementation provides a hardware implementation of the floating-point instructions.
1	The implementation supports only software emulation of the floating-point instructions.

In ARMv8-A the only permitted value is 0.

Subarchitecture, bits [22:16]

Subarchitecture version number. For an implementation by ARM, defined values are:

0000000	VFPv1 architecture with an IMPLEMENTATION DEFINED subarchitecture.
0000001	VFPv2 architecture with Common VFP subarchitecture v1.
0000010	VFPv3 architecture, or later, with Common VFP subarchitecture v2. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.
0000011	VFPv3 architecture, or later, with Null subarchitecture. The entire floating-point implementation is in hardware, and no software support code is required. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers. This value can be used only by an implementation that does not support the trap enable bits in the FPSCR.
0000100	VFPv3 architecture, or later, with Common VFP subarchitecture v3, and support for trap enable bits in FPSCR. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.

For a subarchitecture designed by ARM the most significant bit of this field, register bit[22], is 0. Values with a most significant bit of 0 that are not listed here are reserved.

When the subarchitecture designer is not ARM, the most significant bit of this field, register bit[22], must be 1. Each implementer must maintain its own list of subarchitectures it has designed, starting at subarchitecture version number 0x40.

In ARMv8-A the permitted values are 0000011 and 0000100.

#### PartNum, bits [15:8]

An IMPLEMENTATION DEFINED part number for the floating-point implementation, assigned by the implementer.

#### Variant, bits [7:4]

An IMPLEMENTATION DEFINED variant number. Typically, this field distinguishes between different production variants of a single product.

#### Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the floating-point implementation.

### Accessing the FPSID

This register can be read using VMRS with the following syntax:

VMRS <Rt>, <spec\_reg>

This register can be written using VMSR with the following syntax:

VMSR <spec\_reg>, <Rt>

This syntax is encoded with the following settings in the instruction encoding:

<spec_reg>	reg
FPSID	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

When access to this register is permitted, write accesses are ignored.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} = 0$ :
  - If  $\text{CPACR.cp10} = 0$ , accesses to this register from PL1 are UNDEFINED.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 0)$ :
  - If  $\text{CPTR\_EL2.TFP} = 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $\text{HCR\_EL2.TID0} = 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If  $\text{CPTR\_EL2.FPEN} = 0$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CPTR\_EL2.FPEN} = 10$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $\text{HCR\_EL2.TID0} = 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} = 1$ :
  - If  $\text{HCPTR.TCP10} = 1$ , Non-secure accesses to this register from EL1 are trapped to Hyp mode.
  - If  $\text{HCPTR.TCP10} = 1$ , Non-secure accesses to this register from EL2 are UNDEFINED.
  - If  $\text{HCR.TID0} = 1$ , Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} = 1$ :
  - If  $\text{NSACR.cp10} = 0$ , Non-secure accesses to this register from EL1 and EL2 are UNDEFINED.
- When EL3 is implemented and is using AArch64:
  - If  $\text{CPTR\_EL3.TFP} = 1$ , accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.2.52 HACR, Hyp Auxiliary Configuration Register

The HACR characteristics are:

### Purpose

Controls trapping to Hyp mode of IMPLEMENTATION DEFINED aspects of Non-secure EL1 or EL0 operation.

### Configurations

AArch32 System register HACR is architecturally mapped to AArch64 System register [HACR\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HACR is a 32-bit register.

### Field descriptions

The HACR bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the HACR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c1, 7	100	111	0001	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.53 HACTLR, Hyp Auxiliary Control Register

The HACTLR characteristics are:

### Purpose

Controls IMPLEMENTATION DEFINED features of Hyp mode operation.

### Configurations

AArch32 System register HACTLR is architecturally mapped to AArch64 System register [ACTLR\\_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HACTLR is a 32-bit register.

### Field descriptions

The HACTLR bit assignments are:

31	0
IMPLEMENTATION DEFINED	

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the HACTLR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c0, 1	100	001	0001	1111	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T1 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T1 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T1 == 1$ , Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.54 HACTLR2, Hyp Auxiliary Control Register 2

The HACTLR2 characteristics are:

### Purpose

Provides additional space to the HACTLR register to hold IMPLEMENTATION DEFINED trap functionality.

### Configurations

AArch32 System register HACTLR2 is architecturally mapped to AArch64 System register [ACTLR\\_EL2](#)[63:32].

In ARMv8.0 and ARMv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining [ID\\_MMFR4.AC2](#).

From ARMv8.2 this register must be implemented.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HACTLR2 is a 32-bit register.

### Field descriptions

The HACTLR2 bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the HACTLR2

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c0, 3	100	011	0001	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.55 HADFSR, Hyp Auxiliary Data Fault Status Register

The HADFSR characteristics are:

### Purpose

Provides additional IMPLEMENTATION DEFINED syndrome information for Data Abort exceptions taken to Hyp mode.

### Configurations

AArch32 System register HADFSR is architecturally mapped to AArch64 System register [AFSR0\\_EL2](#).

This is an optional register. An implementation that does not require this register can implement it as RES0.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HADFSR is a 32-bit register.

### Field descriptions

The HADFSR bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the HADFSR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c5, c1, 0	100	000	0101	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):  
— If [HSTR\\_EL2.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):  
— If [HSTR\\_EL2.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:  
— If [HSTR.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.56 HAIFSR, Hyp Auxiliary Instruction Fault Status Register

The HAIFSR characteristics are:

### Purpose

Provides additional IMPLEMENTATION DEFINED syndrome information for Prefetch Abort exceptions taken to Hyp mode.

### Configurations

AArch32 System register HAIFSR is architecturally mapped to AArch64 System register [AFSR1\\_EL2](#).

This is an optional register. An implementation that does not require this register can implement it as RES0.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HAIFSR is a 32-bit register.

### Field descriptions

The HAIFSR bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the HAIFSR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c5, c1, 1	100	001	0101	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):  
— If [HSTR\\_EL2.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):  
— If [HSTR\\_EL2.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:  
— If [HSTR.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.57 HMAIR0, Hyp Auxiliary Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

### Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory attribute encodings defined by [HMAIR0](#). These IMPLEMENTATION DEFINED attributes can only provide additional qualifiers for the memory attribute encodings, and cannot change the memory attributes defined in [HMAIR0](#).

### Configurations

AArch32 System register HMAIR0 is architecturally mapped to AArch64 System register [AMAIR\\_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HMAIR0 is a 32-bit register.

### Field descriptions

The HMAIR0 bit assignments are:

If an implementation does not provide any IMPLEMENTATION DEFINED memory attributes, this register is RES0.

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the HMAIR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c10, c3, 0	100	000	1010	1111	0011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T10](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T10](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T10](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.58 HMAIR1, Hyp Auxiliary Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

### Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory attribute encodings defined by [HMAIR1](#). These IMPLEMENTATION DEFINED attributes can only provide additional qualifiers for the memory attribute encodings, and cannot change the memory attributes defined in [HMAIR1](#).

### Configurations

AArch32 System register HMAIR1 is architecturally mapped to AArch64 System register [AMAIR\\_EL2](#)[63:32].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HMAIR1 is a 32-bit register.

### Field descriptions

The HMAIR1 bit assignments are:

If an implementation does not provide any IMPLEMENTATION DEFINED memory attributes, this register is RES0.

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the HMAIR1

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c10, c3, 1	100	001	1010	1111	0011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T10](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T10](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T10](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.59 HCPTR, Hyp Architectural Feature Trap Register

The HCPTR characteristics are:

### Purpose

Controls:

- Trapping to Hyp mode of Non-secure access, at EL1 or EL0, to trace, and to Advanced SIMD and floating-point functionality.
- Hyp mode access to trace, and to Advanced SIMD and floating-point functionality.

### ———— Note ————

Accesses to this functionality:

- From Non-secure modes other than Hyp mode are also affected by settings in the [CPACR](#) and [NSACR](#).
- From Hyp mode are also affected by settings in the [NSACR](#).

Exceptions generated by the [CPACR](#) and [NSACR](#) controls are higher priority than those generated by the HCPTR controls.

### Configurations

AArch32 System register HCPTR is architecturally mapped to AArch64 System register [CPTR\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

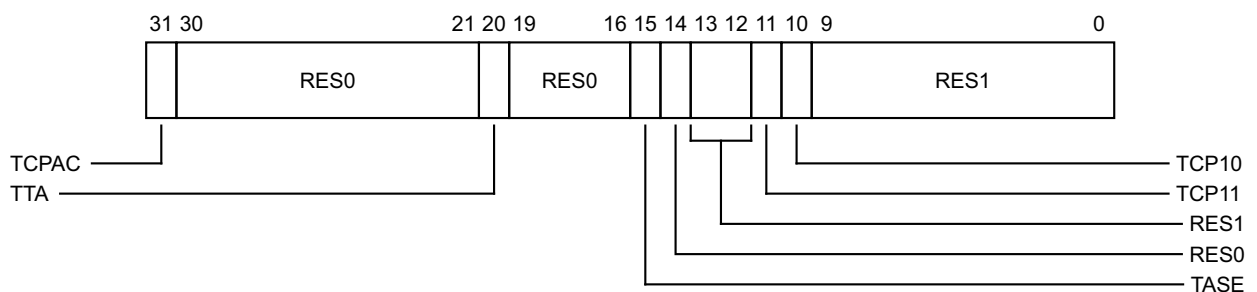

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HCPTR is a 32-bit register.

### Field descriptions

The HCPTR bit assignments are:

### TCPAC, bit [31]

Traps Non-secure EL1 accesses to the [CPACR](#) to Hyp mode.

0 This control does not cause any instructions to be trapped.

1 Non-secure EL1 accesses to the [CPACR](#) are trapped to Hyp mode.

### ———— Note ————

The [CPACR](#) is not accessible at EL0.

When this register has an architecturally-defined reset value, this field resets to 0.

### Bits [30:21]

Reserved, RES0.

### TTA, bit [20]

Traps Non-secure System register accesses to all implemented trace registers to Hyp mode.

- |   |  |
|---|--|
| 0 | This control does not cause any instructions to be trapped.  |
| 1 | Any Non-secure System register access to an implemented trace register is trapped to Hyp mode, unless the access is trapped to EL1 by a <a href="#">CPACR</a> or <a href="#">NSACR</a> control, or the access is from Non-secure EL0 and the definition of the register in the appropriate trace architecture specification indicates that the register is not accessible from EL0. A trapped instruction generates: <ul style="list-style-type: none"> <li>• A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.</li> <li>• An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.</li> </ul> |

If the implementation does not include a trace macrocell, or does not include a System register interface to the trace macrocell registers, it is IMPLEMENTATION DEFINED whether this bit:

- Is RES0.
- Is RES1.
- Can be written from Hyp mode, and from Secure Monitor mode when [SCR.NS](#) is 1.

If EL3 is implemented and is using AArch32, and the value of [NSACR.NSTRCDIS](#) is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

#### ————— Note —————

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the implementation includes an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and a resulting Undefined Instruction exception is higher priority than a HCPTR.TTA Hyp Trap exception.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

### Bits [19:16]

Reserved, RES0.

### TASE, bit [15]

Traps Non-secure execution of Advanced SIMD instructions to Hyp mode when the value of HCPTR.TCP10 is 0.

- |   |   |
|---|---|
| 0 | This control does not cause any instructions to be trapped.   |
| 1 | When the value of HCPTR.TCP10 is 0, any attempt to execute an Advanced SIMD instruction in Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a <a href="#">CPACR</a> or <a href="#">NSACR</a> control. A trapped instruction generates: <ul style="list-style-type: none"> <li>• A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.</li> <li>• An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.</li> </ul> |

When the value of HCPTR.TCP10 is 1, the value of this field is ignored.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, then it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of **NSACR**.NSASEDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see *Controls of Advanced SIMD operation that do not apply to floating-point operation* on page E1-2746.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### Bit [14]

Reserved, RES0.

#### Bits [13:12]

Reserved, RES1.

#### TCP11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the TCP10 bit then this field is UNKNOWN on a direct read of the HCPTR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of **NSACR**.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### TCP10, bit [10]

Trap Non-secure accesses to Advanced SIMD and floating-point functionality to Hyp mode:

- |   |  |
|---|--|
| 0 | This control does not cause any instructions to be trapped.  |
| 1 | Any attempted access to Advanced SIMD and floating-point functionality from Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a <b>CPACR</b> or <b>NSACR</b> control. A trapped instruction generates: <ul style="list-style-type: none"> <li>• A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.</li> <li>• An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.</li> </ul> |

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the **FPSCR**, **FPSID**, **MVFR0**, **MVFR1**, **MVFR2**, or **FPEXC** System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of **NSACR**.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### Bits [9:0]

Reserved, RES1.

## Accessing the HCPTR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c1, 2	100	010	0001	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL3 is implemented and is using AArch64:
  - If `CPTR_EL3.TCPAC==1`, accesses to this register from EL2 are trapped to EL3.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0)`:
  - If `HSTR_EL2.T1==1`, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:
  - If `HSTR_EL2.T1==1`, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and `SCR_EL3.NS == 1`:
  - If `HSTR.T1==1`, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.60 HCR, Hyp Configuration Register

The HCR characteristics are:

### Purpose

Provides configuration controls for virtualization, including defining whether various Non-secure operations are trapped to Hyp mode.

### Configurations

AArch32 System register HCR is architecturally mapped to AArch64 System register [HCR\\_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HCR is a 32-bit register.

### Field descriptions

The HCR bit assignments are:

### Bit [31]

Reserved, RES0.

### TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps Non-secure EL1 reads of the virtual memory control registers to Hyp mode. The registers for which read accesses are trapped are as follows:

[SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIRO](#), [AMAIRO](#), [CONTEXTIDR](#).

0 This control does not cause any instructions to be trapped.

- 1 Non-secure EL1 read accesses to the specified Virtual Memory controls are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

#### HCD, bit [29]

HVC instruction disable. Disables Non-secure state execution of HVC instructions.

- 0 HVC instruction execution is enabled at EL2 and Non-secure EL1.
- 1 HVC instructions are UNDEFINED at EL2 and Non-secure EL1. The Undefined Instruction exception is taken to the Exception level at which the HVC instruction is executed.

#### ————— Note —————

HVC instructions are always UNDEFINED at EL0.

This bit is only implemented if EL3 is not implemented. Otherwise, it is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### Bit [28]

Reserved, RES0.

#### TGE, bit [27]

Trap General Exceptions, from Non-secure EL0.

- 0 This control has no effect on execution at EL0.
- 1 When the value of [SCR.NS](#) is 0, this control has no effect on execution at EL0.  
When the value of [SCR.NS](#) is 1, then:
- All exceptions that would be routed to EL1 are routed to EL2.
  - The [SCTLR.M](#) bit is treated as being 0 for all purposes other than returning the result of a direct read of [SCTLR](#).
  - The [HCR.{FMO, IMO, AMO}](#) bits are treated as being 1 for all purposes other than returning the result of a direct read of [HCR](#).
  - All virtual interrupts are disabled.
  - Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.
  - An exception return to EL1 is treated as an illegal exception return.
  - Monitor mode execution of an MSR or CPS instruction that changes [CPSR.M](#) to a Non-secure EL1 mode is an illegal change to [PSTATE.M](#). For more information see [Illegal changes to PSTATE.M on page G1-4336](#).

Also, when [HCR.TGE](#) is 1:

- If EL3 is using AArch32, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing [SCR.NS](#) from 0 to 1 results in [SCR.NS](#) remaining as 0.
- The [HDCR.{TDRA, TDOSA, TDA, TDE}](#) bits are ignored and treated as being 1 other than for the purpose of a direct read of [HDCR](#).

In the following cases the field resets to 0:

- The PE resets into EL3 with EL3 using AArch32.
- The PE resets into EL2 with EL2 using AArch32.

Otherwise, the field reset value is architecturally UNKNOWN.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TVM, bit [26]

Trap Virtual Memory controls. Traps Non-secure EL1 writes to the virtual memory control registers to Hyp mode. The registers for which write accesses are trapped are as follows:

[SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIRO](#), [AMAIR1](#), [CONTEXTIDR](#).

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL1 write accesses to EL1 virtual memory control registers are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TTLB, bit [25]

Trap TLB maintenance instructions. Traps Non-secure EL1 execution of a TLBI instruction to Hyp mode. This applies to the following instructions:

[TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), [TLBIMVAALIS](#), [ITLBIALL](#), [ITLBMVA](#), [ITLBIASID](#), [DTLBIALL](#), [DTLBMVA](#), [DTLBIASID](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [TLBIMVAA](#), [TLBIMVAL](#), [TLBIMVAAL](#)

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL1 accesses to TLB maintenance instructions are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps Non-secure EL1 execution of those cache maintenance instructions to Hyp mode. This applies to the following instructions:

[ICIMVAU](#), [ICIALLU](#), [ICIALUIS](#), [DCCMVAU](#).

##### Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL1 execution of the specified instructions is trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TPC, bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps Non-secure EL1 execution of those cache maintenance instructions to Hyp mode. This applies to the following instructions:

[DCIMVAC](#), [DCCIMVAC](#), [DCCMVAC](#).

##### Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure execution of the specified instructions is trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps Non-secure EL1 execution of those cache maintenance instructions by set/way to Hyp mode. This applies to the following instructions:

[DCISW](#), [DCCSW](#), [DCCISW](#).

---

**Note**

---

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure execution of the specified instructions is trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

**TAC, bit [21]**

Trap Auxiliary Control Registers. Traps Non-secure EL1 accesses to the Auxiliary Control Registers to Hyp mode, from both Execution states. This applies to the following register accesses:

[ACTLR](#) and, if implemented, [ACTLR2](#).

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL1 accesses to the specified registers are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

**TIDCP, bit [20]**

Trap IMPLEMENTATION DEFINED functionality. Traps Non-secure EL1 accesses to the encodings for IMPLEMENTATION DEFINED System Registers to Hyp mode.

MCR and MRC instructions accessing the following encodings:

- All coproc==p15, CRn==c9, Opcode1 = {0-7}, CRm == {c0-c2, c5-c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c10, Opcode1 == {0-7}, CRm == {c0, c1, c4, c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c11, Opcode1=={0-7}, CRm == {c0-c8, c15}, opcode2 == {0-7}.

When HCR.TIDCP is set to 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from Non-secure EL0 is trapped to Hyp mode. If it is not, it is UNDEFINED, and the PE takes an Undefined Instruction exception to Non-secure Undefined mode.

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL1 accesses to the specified System register encodings for IMPLEMENTATION DEFINED functionality are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

**TSC, bit [19]**

Trap SMC instructions. Traps Non-secure EL1 execution of SMC instructions to Hyp mode.

- 0 This control does not cause any instructions to be trapped.
- 1 Any attempt to execute an SMC instruction at Non-secure EL1 is trapped to Hyp mode, regardless of the value of [SCR.SCD](#).

The ARMv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

---

**Note**

---

- This trap is only implemented if the implementation includes EL3.
- SMC instructions are always UNDEFINED at PL0.
- This bit traps execution of the SMC instruction. It is not a routing control for the SMC exception. Hyp Trap exceptions and SMC exceptions have different preferred return addresses.

When this register has an architecturally-defined reset value, this field resets to 0.

### TID3, bit [18]

Trap ID group 3. Traps Non-secure EL1 reads of the following registers to Hyp mode:

[ID\\_PFR0](#), [ID\\_PFR1](#), [ID\\_DFR0](#), [ID\\_AFR0](#), [ID\\_MMFR0](#), [ID\\_MMFR1](#), [ID\\_MMFR2](#), [ID\\_MMFR3](#), [ID\\_ISAR0](#), [ID\\_ISAR1](#), [ID\\_ISAR2](#), [ID\\_ISAR3](#), [ID\\_ISAR4](#), [ID\\_ISAR5](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [ID\\_MMFR4](#), except that if [ID\\_MMFR4](#) is implemented as RAZ/WI then it is IMPLEMENTATION DEFINED whether accesses to [ID\\_MMFR4](#) are trapped.

Also an MRC access to any of the following encodings:

- coproc==p15, opc1 == 0, CRn == c0, CRm == {c3-c7}, opc2 == {0,1}.
- coproc==p15, opc1 == 0, CRn == c0, CRm == c3, opc2 == 2.
- coproc==p15, opc1 == 0, CRn == c0, CRm == c5, opc2 == {4,5}.

It is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to the following encodings:

- coproc==p15, opc1 == 0, CRn == c0, CRm == c2, opc2 == 7.
- coproc==p15, opc1 == 0, CRn == c0, CRm == c3, opc2 == {3-7}.
- coproc==p15, opc1 == 0, CRn == c0, CRm == {c4, c6, c7}, opc2 == {2-7}.
- coproc==p15, opc1 == 0, CRn == c0, CRm == c5, opc2 == {2, 3, 6, 7}.

0 This control does not cause any instructions to be trapped.

1 The specified Non-secure EL1 read accesses to ID group 3 registers are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

### TID2, bit [17]

Trap ID group 2. Traps the following register accesses to Hyp mode:

- Non-secure EL1 and EL0 reads of the [CTR](#), [CCSIDR](#), [CLIDR](#), and [CSSELR](#).
- Non-secure EL1 and EL0 writes to the [CSSELR](#).

0 This control does not cause any instructions to be trapped.

1 The specified Non-secure EL1 and EL0 accesses to ID group 2 registers are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

### TID1, bit [16]

Trap ID group 1. Traps Non-secure EL1 reads of the following registers to Hyp mode:

[TCMTR](#), [TLBTR](#), [REVIDR](#), [AIDR](#).

0 This control does not cause any instructions to be trapped.

1 The specified Non-secure EL1 read accesses to ID group 1 registers are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

### TID0, bit [15]

Trap ID group 0. Traps the following register accesses to Hyp mode:

- Non-secure EL1 reads of the [JIDR](#) and [FPSID](#).
- If the [JIDR](#) is RAZ from Non-secure EL0, Non-secure EL0 reads of the [JIDR](#).

#### ————— Note —————

- It is IMPLEMENTATION DEFINED whether the [JIDR](#) is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then the Undefined Instruction exception takes precedence over this trap.
- The [FPSID](#) is not accessible at EL0.
- Writes to the [FPSID](#) are ignored, and not trapped by this control.

0 This control does not cause any instructions to be trapped.

- 1 The specified Non-secure EL1 read accesses to ID group 0 registers are trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TWE, bit [14]

Traps Non-secure EL0 and EL1 execution of WFE instructions to Hyp mode:

- 0 This control does not cause any instructions to be trapped.
- 1 Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to Hyp mode, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by [SCTLR.nTWE](#).

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

#### ———— Note ————

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TWI, bit [13]

Traps Non-secure EL0 and EL1 execution of WFI instructions to Hyp mode.

- 0 This control does not cause any instructions to be trapped.
- 1 Any attempt to execute a WFI instruction at Non-secure EL0 or EL1 is trapped to Hyp mode, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by [SCTLR.nTWI](#).

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

#### ———— Note ————

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to 0.

#### DC, bit [12]

Default Cacheability.

- 0 This control has no effect on the Non-secure EL1&0 translation regime.
- 1 In Non-secure state:
- The [SCTLR.M](#) field behaves as 0 for all purposes other than a direct read of the value of the field.
  - The [HCR.VM](#) field behaves as 1 for all purposes other than a direct read of the value of the field.
  - The memory type produced by the first stage of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2 and EL3 translation regimes.

This field is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

#### BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from Non-secure EL1 or Non-secure EL0:

00	No effect
01	Inner Shareable
10	Outer Shareable
11	Full system

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When this register has an architecturally-defined reset value, this field resets to 0.

#### FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from Non-secure EL1:

[BPIALL](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#),  
[ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#), [TLBIMVAA](#), [ICIALLU](#), [TLBIMVAL](#), [TLBIMVAAL](#).

0	This field has no effect on the operation of the specified instructions.
1	When one of the specified instruction is executed at Non-secure EL1, the instruction is broadcast within the Inner Shareable shareability domain.

When this register has an architecturally-defined reset value, this field resets to 0.

#### VA, bit [8]

Virtual SError interrupt exception.

0	This mechanism is not making a virtual SError interrupt pending.
1	A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is enabled only when the value of HCR.{TGE, AMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

When this register has an architecturally-defined reset value, this field resets to 0.

#### VI, bit [7]

Virtual IRQ exception.

0	This mechanism is not making a virtual IRQ pending.
1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR.{TGE, IMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

When this register has an architecturally-defined reset value, this field resets to 0.

#### VF, bit [6]

Virtual FIQ exception.

0	This mechanism is not making a virtual FIQ pending.
1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR.{TGE, FMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

When this register has an architecturally-defined reset value, this field resets to 0.

#### AMO, bit [5]

SError interrupt Mask Override. When this bit is set to 1, it overrides the effect of [CPSR.A](#), and enables virtual exception signaling by the VA bit.

If the value of HCR.TGE is 0, then Virtual SError Interrupts are enabled in Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.AMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

When this register has an architecturally-defined reset value, this field resets to 0.

#### IMO, bit [4]

IRQ Mask Override. When this bit is set to 1, it overrides the effect of CPSR.I, and enables virtual exception signaling by the VI bit.

If the value of HCR.TGE is 0, then Virtual IRQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.IMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

When this register has an architecturally-defined reset value, this field resets to 0.

#### FMO, bit [3]

FIQ Mask Override. When this bit is set to 1, it overrides the effect of CPSR.F, and enables virtual exception signaling by the VF bit.

If the value of HCR.TGE is 0, then Virtual FIQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.FMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

When this register has an architecturally-defined reset value, this field resets to 0.

#### PTW, bit [2]

Protected Table Walk. In the Non-secure PL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs then the value of this bit determines the behavior:

- 0 The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
- 1 The memory access generates a stage 2 Permission fault.

This field is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

#### SWIO, bit [1]

Set/Way Invalidation Override. Causes Non-secure EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way.

- 0 This control has no effect on the operation of data cache invalidate by set/way instructions.
- 1 Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When this bit is set to 1, DCISW performs the same invalidation as a DCCISW instruction.

As a result of changes to the behavior of DCISW, this bit is redundant in ARMv8. This bit can be implemented as RES1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the Non-secure EL1&0 translation regime. Possible values of this bit are:

- 0 Non-secure EL1&0 stage 2 address translation disabled.
- 1 Non-secure EL1&0 stage 2 address translation enabled.

If the HCR.DC bit is set to 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with HCR.VM being 1, regardless of the actual value of HCR.VM, other than the value returned by an explicit read of HCR.VM.

When the value of this bit is 1, data cache invalidate instructions executed at Non-secure EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR.SWIO bit.

This bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

## Accessing the HCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c1, 0	100	000	0001	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.61 HCR2, Hyp Configuration Register 2

The HCR2 characteristics are:

### Purpose

Provides additional configuration controls for virtualization.

### Configurations

AArch32 System register HCR2 is architecturally mapped to AArch64 System register [HCR\\_EL2](#)[63:32].

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HCR2 is a 32-bit register.

### Field descriptions

The HCR2 bit assignments are:

### Bits [31:7]

Reserved, RES0.

### MIOCNC, bit [6]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the Non-secure PL1&0 translation regime.

- 0 For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.
- 1 For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information see [Mismatched memory attributes](#) on page E2-2792.

The value of this field has no effect on translation regimes other than the Non-secure PL1&0 translation regime.

This field can be implemented as RAZ/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### TEA, bit [5]

Route synchronous External Abort exceptions to EL2. If the RAS Extension is implemented, the possible values of this bit are:

- 0 Do not route synchronous External Abort exceptions from Non-secure EL0 and EL1 to EL2.
- 1 Route synchronous External Abort exceptions from Non-secure EL0 and EL1 to EL2, if not routed to EL3.

This bit resets to zero on a Warm reset into AArch32 state.

When the RAS Extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TERR, bit [4]

Trap Error record accesses. If the RAS Extension is implemented, the possible values of this bit are:

- 0 Do not trap accesses to error record registers from Non-secure EL1 to EL2.
- 1 Accesses to the ER\* registers from Non-secure EL1 generate a Trap exception to EL2.

This bit resets to zero on a Warm reset into AArch32 state.

When the RAS Extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bits [3:2]

Reserved, RES0.

#### ID, bit [1]

Stage 2 Instruction access cacheability disable. For the Non-secure PL1&0 translation regime, when [HCR.VM==1](#), this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

- 0 This control has no effect on stage 2 of the Non-secure PL1&0 translation regime.
- 1 For the Non-secure PL1&0 translation regime, forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

When this register has an architecturally-defined reset value, this field resets to 0.

#### CD, bit [0]

Stage 2 Data access cacheability disable. When [HCR.VM==1](#), this forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable for the Non-secure PL1&0 translation regime.

- 0 This control has no effect on stage 2 of the Non-secure PL1&0 translation regime for data accesses and translation table walks.
- 1 For the Non-secure PL1&0 translation regime, forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the HCR2

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c1, 4	100	100	0001	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.62 HDFAR, Hyp Data Fault Address Register

The HDFAR characteristics are:

### Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception that is taken to Hyp mode.

### Configurations

AArch32 System register HDFAR is architecturally mapped to AArch64 System register [FAR\\_EL2](#)[31:0].

AArch32 System register HDFAR is architecturally mapped to AArch32 System register [DFAR](#) (S) when EL2 is implemented.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HDFAR is a 32-bit register.

### Field descriptions

The HDFAR bit assignments are:

### Bits [31:0]

VA of faulting address of synchronous Data Abort exception taken to Hyp mode.

On a Prefetch Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

### Accessing the HDFAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c6, c0, 0	100	000	0110	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.63 HIFAR, Hyp Instruction Fault Address Register

The HIFAR characteristics are:

### Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception that is taken to Hyp mode.

### Configurations

AArch32 System register HIFAR is architecturally mapped to AArch64 System register [FAR\\_EL2](#)[63:32].

AArch32 System register HIFAR is architecturally mapped to AArch32 System register [IFAR](#) (S) when EL2 is implemented.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HIFAR is a 32-bit register.

### Field descriptions

The HIFAR bit assignments are:

### Bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception taken to Hyp mode.

On a Data Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

### Accessing the HIFAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c6, c0, 2	100	010	0110	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.64 HMAIR0, Hyp Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

### Purpose

Along with [HMAIR1](#), provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIdx[2] indicates the HMAIR register to be used:

- When AttrIdx[2] is 0, HMAIR0 is used.
- When AttrIdx[2] is 1, [HMAIR1](#) is used.

### Configurations

AArch32 System register HMAIR0 is architecturally mapped to AArch64 System register [MAIR\\_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HMAIR0 is a 32-bit register.

### Field descriptions

The HMAIR0 bit assignments are:

**When *TTBCR.EAE*==1:**

31	24	23	16	15	8	7	0		
Attr3				Attr2		Attr1		Attr0	

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0000	Meaning when Attr<n>[7:4] is not 0000
0000	Device-nGnRnE memory	UNPREDICTABLE
00RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
01RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=00)
10RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=00)
11RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0	No Allocate
1	Allocate

## Accessing the HMAIRO

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c10, c2, 0	100	000	1010	1111	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T10 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T10 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T10 == 1$ , Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G6.2.65 HMAIR1, Hyp Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

Purpose

Along with HMAIR0, provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIdx[2] indicates the HMAIR register to be used:

- When AttrIdx[2] is 0, HMAIR0 is used.
- When AttrIdx[2] is 1, HMAIR1 is used.

Configurations

AArch32 System register HMAIR1 is architecturally mapped to AArch64 System register MAIR\_EL2[63:32].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HMAIR1 is a 32-bit register.

Field descriptions

The HMAIR1 bit assignments are:

When TTBCR.EAE==1:

31	24	23	16	15	8	7	0
Attr7				Attr6			
Attr5				Attr4			

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 4 to 7

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIdx[2:0] gives the value of <n> in Attr<n>.
- AttrIdx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
00RW, RW not 00	Normal memory, Outer Write-Through Transient
0100	Normal memory, Outer Non-cacheable
01RW, RW not 00	Normal memory, Outer Write-Back Transient
10RW	Normal memory, Outer Write-Through Non-transient
11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0000	Meaning when Attr<n>[7:4] is not 0000
0000	Device-nGnRnE memory	UNPREDICTABLE
00RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
01RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=00)
10RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=00)
11RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0	No Allocate
1	Allocate

## Accessing the HMAIR1

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c10, c2, 1	100	001	1010	1111	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T10 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T10 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T10 == 1$ , Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.66 HPFAR, Hyp IPA Fault Address Register

The HPFAR characteristics are:

### Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to Hyp mode.

### Configurations

AArch32 System register HPFAR is architecturally mapped to AArch64 System register [HPFAR\\_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HPFAR is a 32-bit register.

### Field descriptions

The HPFAR bit assignments are:

31	4	3	0
FIPA[39:12]			RES0

Execution in any Non-secure mode other than Hyp mode makes this register UNKNOWN.

### FIPA[39:12], bits [31:4]

Bits [39:12] of the faulting intermediate physical address.

### Bits [3:0]

Reserved, RES0.

### Accessing the HPFAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c6, c0, 4	100	100	0110	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.67 HRMR, Hyp Reset Management Register

The HRMR characteristics are:

### Purpose

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

### Configurations

AArch32 System register HRMR is architecturally mapped to AArch64 System register [RMR\\_EL2](#).

Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

### Attributes

HRMR is a 32-bit register.

### Field descriptions

The HRMR bit assignments are:

#### Bits [31:2]

Reserved, RES0.

#### RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0 on a Warm or Cold reset.

#### AA64, bit [0]

When EL2 can use AArch64, determines which Execution state the PE boots into after a Warm reset:

- 0 AArch32.
- 1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

### Accessing the HRMR

This register can be read using MRC with the following syntax:

MCR <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c12, c0, 2	100	010	1100	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL2 is the highest implemented Exception level.	x	0	1	-	-	RW	n/a
EL2 is the highest implemented Exception level.	x	1	1	-	n/a	RW	n/a

When HRMR is not implemented, the encoding for this register is UNDEFINED.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T12==1](#), Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T12==1](#), Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T12==1](#), Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.68 HSCTLR, Hyp System Control Register

The HSCTLR characteristics are:

### Purpose

Provides top level control of the system operation in Hyp mode.

### Configurations

AArch32 System register HSCTLR is architecturally mapped to AArch64 System register [SCTLR\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

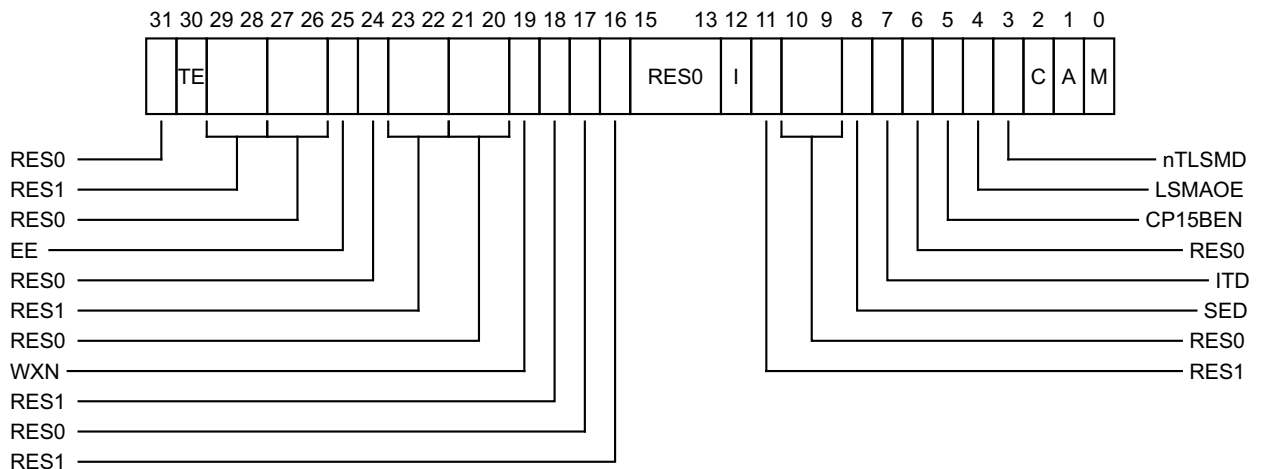

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HSCTLR is a 32-bit register.

### Field descriptions

The HSCTLR bit assignments are:

### Bit [31]

Reserved, RES0.

### TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to EL2 are taken to A32 or T32 state:

0 Exceptions, including reset, taken to A32 state.

1 Exceptions, including reset, taken to T32 state.

This field resets to a value that is architecturally UNKNOWN.

### Bits [29:28]

Reserved, RES1.

### Bits [27:26]

Reserved, RES0.

#### EE, bit [25]

The value of the PSTATE.E bit on entry to Hyp mode, the endianness of stage 1 translation table walks in the EL2 translation regime, and the endianness of stage 2 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

- 0 Little-endian. PSTATE.E is cleared to 0 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are little-endian.
- 1 Big-endian. PSTATE.E is set to 1 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an IMPLEMENTATION DEFINED value.

#### Bit [24]

Reserved, RES0.

#### Bits [23:22]

Reserved, RES1.

#### Bits [21:20]

Reserved, RES0.

#### WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

- 0 This control has no effect on memory access permissions.
- 1 Any region that is writable in the EL2 translation regime is forced to XN for accesses from software executing at EL2.

The WXN bit is permitted to be cached in a TLB.

This field resets to a value that is architecturally UNKNOWN.

#### Bit [18]

Reserved, RES1.

#### Bit [17]

Reserved, RES0.

#### Bit [16]

Reserved, RES1.

#### Bits [15:13]

Reserved, RES0.

#### I, bit [12]

Instruction access Cacheability control, for accesses at EL2:

- 0 All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache.

If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

- 1 All instruction access to Normal memory from EL2 can be cached at all levels of instruction and unified cache.
- If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the PL1&0 translation regime.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bit [11]

Reserved, RES1.

#### Bits [10:9]

Reserved, RES0.

#### SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL2.

- 0 SETEND instruction execution is enabled at EL2.

- 1 SETEND instructions are UNDEFINED at EL2.

If the implementation does not support mixed-endian operation at EL2, this bit is RES1.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL2.

- 0 All IT instruction functionality is enabled at EL2.

- 1 Any attempt at EL2 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with hw1[3:0] != 1000.
- All encodings of the subsequent instruction with the following values for hw1:

11xxxxxxxxxxxx

All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.

1011xxxxxxxxxxxx

All instructions in [Miscellaneous 16-bit instructions on page F3-2883](#).

10100xxxxxxxxxxx

ADD Rd, PC, #imm

01001xxxxxxxxxxx

LDR Rd, [PC, #imm]

0100x1xxx1111xxx

ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.

010001xx1xxxx111

ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see [Changes to an ITD control by an instruction in an IT block on page E1-2738](#)

ITD is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAZ/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### Bit [6]

Reserved, RES0.

#### CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==1111) encoding space from EL2:

- 0 EL2 execution of the [CP15DMB](#), [CP15DSB](#), and [CP15ISB](#) instructions is UNDEFINED.
- 1 EL2 execution of the [CP15DMB](#), [CP15DSB](#), and [CP15ISB](#) instructions is enabled.

CP15BEN is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAO/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### LSMAOE, bit [4]

##### *In ARMv8.2*

Load Multiple and Store Multiple Atomicity and Ordering Enable. When the OPTIONAL feature [ARMv8.2-LSMAOC](#) is implemented, defined values are:

- 0 For all memory accesses at EL2, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
- 1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL2 is as defined for ARMv8.0.

This bit is permitted to be cached in a TLB.

If this bit is not implemented, it is RES1.

When this register has an architecturally-defined reset value, this field resets to 1.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES1.

#### nTLSMD, bit [3]

##### *In ARMv8.2*

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory. When the OPTIONAL feature [ARMv8.2-LSMAOC](#) is implemented, defined values are:

- 0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
- 1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

If this bit is not implemented, it is RES1.

When this register has an architecturally-defined reset value, this field resets to 1.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES1.

**C, bit [2]**

Cacheability control, for data accesses at EL2:

- 0 All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.
- 1 All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, can be cached at all levels of data and unified cache.

This bit has no effect on the PL1&0 translation regime.

When this register has an architecturally-defined reset value, this field resets to 0.

**A, bit [1]**

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

- 0 Alignment fault checking disabled when executing at EL2.  
Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element or data elements being accessed.
- 1 Alignment fault checking enabled when executing at EL2.  
All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element or data elements being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

This field resets to a value that is architecturally UNKNOWN.

**M, bit [0]**

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

- 0 EL2 stage 1 address translation disabled.  
See the HSCTLR.I field for the behavior of instruction accesses to Normal memory.
- 1 EL2 stage 1 address translation enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the HSCTLR**

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c0, 0	100	000	0001	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.69 HSR, Hyp Syndrome Register

The HSR characteristics are:

### Purpose

Holds syndrome information for an exception taken to Hyp mode.

### Configurations

AArch32 System register HSR is architecturally mapped to AArch64 System register [ESR\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HSR is a 32-bit register.

### Field descriptions

The HSR bit assignments are:

Execution in any Non-secure PE mode other than Hyp mode makes this register UNKNOWN.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of HSR is UNKNOWN. The value written to HSR must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

### EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about. Possible values of this field are:

**EC == 000000**

Unknown reason.

See [ISS encoding for exceptions with an unknown reason](#).

**EC == 000001**

Trapped WFI or WFE instruction execution.

Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.

See [ISS encoding for an exception from a WFI or WFE instruction](#).

**EC == 000011**

Trapped MCR or MRC access with (coproc==1111) that is not reported using EC 0b000000.

See [ISS encoding for an exception from an MCR or MRC access](#).

**EC == 000100**

Trapped MCRR or MRRC access with (coproc==1111) that is not reported using EC 0b000000.

See [ISS encoding for an exception from an MCRR or MRRC access](#).

**EC == 000101**

Trapped MCR or MRC access with (coproc==1110).

See [ISS encoding for an exception from an MCR or MRC access](#).

**EC == 000110**

Trapped LDC or STC access.

The only architected uses of these instructions are:

- An STC to write data to memory from [DBGDTRRXint](#).
- An LDC to read data from memory to [DBGDTRTXint](#).

See [ISS encoding for an exception from an LDC or STC instruction](#).

**EC == 000111**

Access to Advanced SIMD or floating-point functionality trapped by a [HCPTR](#). {TASE, TCP10} control.

Excludes exceptions generated because Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.

See [ISS encoding for an exception from an access to SIMD or floating-point functionality, resulting from HCPTR](#).

**EC == 001000**

Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.

See [ISS encoding for an exception from an MCR or MRC access](#).

**EC == 001100**

Trapped MRRC access with (coproc==1110).

See [ISS encoding for an exception from an MCRR or MRRC access](#).

**EC == 001110**

Illegal exception return to AArch32 state.

See [ISS encoding for an exception from an Illegal state or PC alignment fault](#).

**EC == 010001**

Exception on SVC instruction execution in AArch32 state routed to EL2.

See [ISS encoding for an exception from HVC or SVC instruction execution](#).

**EC == 010010**

HVC instruction execution in AArch32 state, when HVC is not disabled.

See [ISS encoding for an exception from HVC or SVC instruction execution](#).

**EC == 010011**

Trapped execution of SMC instruction in AArch32 state.

See [ISS encoding for an exception from SMC instruction execution](#).

**EC == 100000**

Prefetch Abort from a lower Exception level.

See [ISS encoding for an exception from a Prefetch Abort](#).

**EC == 100001**

Prefetch Abort taken without a change in Exception level.

See [ISS encoding for an exception from a Prefetch Abort](#).

**EC == 100010**

PC alignment fault exception.

See [ISS encoding for an exception from an Illegal state or PC alignment fault](#).

**EC == 100100**

Data Abort from a lower Exception level.

See [ISS encoding for an exception from a Data Abort](#).

**EC == 100101**

Data Abort taken without a change in Exception level.

See [ISS encoding for an exception from a Data Abort](#).

All other EC values are reserved by ARM, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.

- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is **CONSTRAINED UNPREDICTABLE**, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-6133.

## IL, bit [25]

Instruction length bit. Indicates the size of the instruction that has been trapped to Hyp mode. When this bit is valid, possible values of this bit are:

0 16-bit instruction trapped.

1 32-bit instruction trapped.

This field is RES1 and not valid for the following cases:

- When the EC field is 0b000000, indicating an exception with an unknown reason.
- Prefetch Aborts.
- Data Aborts for which the HSR.ISS.ISV field is 0.
- When the EC value is 0b001110, indicating an Illegal state exception.

**- Note**

This is a change from the behavior in ARMv7, where the IL field is UNK/SBZP for the corresponding cases.

The IL field is not valid and is UNKNOWN on an exception from a PC alignment fault.

**ISS, bits [24:0]**

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

The following subsections describe each ISS format.

### *ISS encoding for exceptions with an unknown reason*

This encoding is used by:

- Unknown reason.

The ISS encoding for these exceptions is:

**Bits [24:0]**

Reserved, RES0.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction in the current PE mode in the current Security state, including:
  - A read access using a System register encoding pattern that is not allocated for reads at the current Exception level and Security state.
  - A write access using a System register encoding pattern that is not allocated for writes at the current Exception level and Security state.
  - Instruction encodings for instructions not implemented in the implementation.

- In Debug state, the attempted execution of an instruction bit pattern that is unallocated in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is unallocated in Non-debug state.
- The attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the `SCTLR`.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by `HCR.HCD`, `SCR.HCE`, or `SCR_EL3.HCE`.
  - An SMC instruction when disabled by `SCR.SCD` or `SCR_EL3.SMD`.
  - An HLT instruction when disabled by `EDSCR.HDE`.
- An exception generated because of the attempted execution of an MSR (Banked register) or MRS (Banked register) instruction that would access a Banked register that is not accessible from the Security state and PE mode at which the instruction was executed.

#### Note

An exception is generated only if the CONSTRAINED UNPREDICTABLE behavior of the instruction is that it is UNDEFINED, see *MSR/MRS Banked registers* on page K1-6117.

- Attempted execution, in Debug state, of:
  - A DCPS1 instruction in Non-secure state from EL0 when EL2 is using AArch32 and the value of `HCR.TGE` is 1.
  - A DCPS2 instruction at EL1 or EL0 when EL2 is not implemented, or when EL3 is using AArch32 and the value of `SCR.NS` is 0, or when EL3 is using AArch64 and the value of `SCR_EL3.NS` is 0.
  - A DCPS3 instruction when EL3 is not implemented, or when the value of `EDSCR.SDD` is 1.
- In Debug state when the value of `EDSCR.SDD` is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.

*Undefined Instruction exception, when the value of `HCR.TGE` is 1 on page G1-4357* describes the configuration settings for a trap that returns an `HSR.EC` value of 0b000000.

#### ISS encoding for an exception from a WFI or WFE instruction

This encoding is used by:

- Trapped WFI or WFE instruction execution.  
Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.

The ISS encoding for these exceptions is:

#### CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0 The COND field is not valid.
- 1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

#### COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

#### Bits [19:1]

Reserved, RES0.

#### TI, bit [0]

Trapped instruction. Possible values of this bit are:

- 0 WFI trapped.
- 1 WFE trapped.

*Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions on page G1-4437* describes the configuration settings for this trap.

#### ISS encoding for an exception from an MCR or MRC access

This encoding is used by:

- Trapped MCR or MRC access with (coproc==1111) that is not reported using EC 0b000000.
- Trapped MCR or MRC access with (coproc==1110).

- Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.

The ISS encoding for these exceptions is:

#### CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0 The COND field is not valid.
- 1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

#### COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

#### Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

#### Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

#### CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

#### Bit [9]

Reserved, RES0.

#### Rt, bits [8:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

#### CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

#### Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

- |   |   |
|---|---|
| 0 | Write to System register space. MCR instruction.          |
| 1 | Read from System register space. MRC or VMRS instruction. |

The following sections describe configuration settings for traps that are reported using EC value 0b000011:

- [Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the ID registers on page G1-4434.](#)
- [Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations on page G1-4433.](#)
- [Traps to Hyp mode of Non-secure EL1 execution of cache maintenance instructions on page G1-4432.](#)
- [Traps to Hyp mode of Non-secure EL1 execution of TLB maintenance instructions on page G1-4431.](#)
- [Traps to Hyp mode of Non-secure EL1 accesses to the Auxiliary Control Register on page G1-4432.](#)
- [Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers on page G1-4444.](#)
- [Traps to Hyp mode of Non-secure EL1 accesses to the CPACR on page G1-4439.](#)
- [Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers on page G1-4430.](#)
- [General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the \(coproc==0b1111\) encoding space on page G1-4440.](#)

The following sections describe configuration settings for traps that are reported using EC value 0b000101:

- [ID group 0, Primary device identification registers on page G1-4435.](#)
- [Traps to Hyp mode of Non-secure System register accesses to trace registers on page G1-4439.](#)
- [Trapping Non-secure System register accesses to Debug ROM registers on page G1-4442.](#)
- [Trapping Non-secure System register accesses to powerdown debug registers on page G1-4442.](#)
- [Trapping general Non-secure System register accesses to debug registers on page G1-4443.](#)

The following sections describes configuration settings for traps that are reported using EC value 0b001000:

- [ID group 0, Primary device identification registers on page G1-4435.](#)
- [ID group 3, Detailed feature identification registers on page G1-4436.](#)

#### ISS encoding for an exception from an MCRR or MRRC access

This encoding is used by:

- Trapped MCRR or MRRC access with (coproc==1111) that is not reported using EC 0b000000.
- Trapped MRRC access with (coproc==1110).

The ISS encoding for these exceptions is:

#### CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0 The COND field is not valid.
- 1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

#### COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

#### Opc1, bits [19:16]

The Opc1 value from the issued instruction.

#### Bits [15:14]

Reserved, RES0.

#### Rt2, bits [13:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

#### Bit [9]

Reserved, RES0.

#### Rt, bits [8:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

#### CRm, bits [4:1]

The CRm value from the issued instruction.

#### Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

- 0 Write to System register space. MCRR instruction.
- 1 Read from System register space. MRRC instruction.

The following sections describe configuration settings for traps that are reported using EC value 0b000100:

- [Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers on page G1-4430.](#)
- [General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the \(coproc == 0b1111\) encoding space on page G1-4440.](#)

The following sections describe configuration settings for traps that are reported using EC value 0b001100:

- [Traps to Hyp mode of Non-secure System register accesses to trace registers on page G1-4439.](#)
- [Trapping Non-secure System register accesses to Debug ROM registers on page G1-4442.](#)

#### ISS encoding for an exception from an LDC or STC instruction

This encoding is used by:

- Trapped LDC or STC access.  
The only architected uses of these instructions are:
  - An STC to write data to memory from [DBGDTRRXint](#).
  - An LDC to read data from memory to [DBGDTRTXint](#).

The ISS encoding for these exceptions is:

#### CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0 The COND field is not valid.
- 1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

#### COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.

- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

#### imm8, bits [19:12]

The immediate value from the issued instruction.

#### Bits [11:9]

Reserved, RES0.

#### Rn, bits [8:5]

The Rn value from the issued instruction. Valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction.

When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

#### Offset, bit [4]

Indicates whether the offset is added or subtracted:

- |   |                  |
|---|------------------|
| 0 | Subtract offset. |
| 1 | Add offset.      |

This bit corresponds to the U bit in the instruction encoding.

#### AM, bits [3:1]

Addressing mode. The permitted values of this field are:

- |     |   |
|-----|---|
| 000 | Immediate unindexed.  |
| 001 | Immediate post-indexed.   |
| 010 | Immediate offset.   |
| 011 | Immediate pre-indexed.  |
| 100 | Literal unindexed.<br>LDC instruction in A32 instruction set only.<br>For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved. |
| 110 | Literal offset.<br>LDC instruction only.<br>For a trapped STC instruction, this encoding is reserved.   |

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

#### Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

- |   |                                    |
|---|------------------------------------|
| 0 | Write to memory. STC instruction.  |
| 1 | Read from memory. LDC instruction. |

[Trapping general Non-secure System register accesses to debug registers on page G1-4443](#) describes the configuration settings for the trap that is reported using EC value 0b000110.

### ISS encoding for an exception from an access to SIMD or floating-point functionality, resulting from HCPTR

This encoding is used by:

- Access to Advanced SIMD or floating-point functionality trapped by a [HCPTR](#).{TASE, TCP10} control. Excludes exceptions generated because Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.

The ISS encoding for these exceptions is:

Excludes exceptions that occur because Advanced SIMD and floating-point functionality is not implemented, or because the value of [HCR.TGE](#) or [HCR\\_EL2.TGE](#) is 1. These are reported with EC value 0b000000.

#### CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0 The COND field is not valid.
- 1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

#### COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

#### Bits [19:6]

Reserved, RES0.

#### TA, bit [5]

Indicates trapped use of Advanced SIMD functionality. The possible values of this bit are:

- 0 Exception was not caused by trapped use of Advanced SIMD functionality.
- 1 Exception was caused by trapped use of Advanced SIMD functionality.

Any use of an Advanced SIMD instruction that is not also a floating-point instruction that is trapped to Hyp mode because of a trap configured in the [HCPTR](#) sets this bit to 1.

For a list of these instructions, see [Controls of Advanced SIMD operation that do not apply to floating-point operation](#) on page E1-2746.

#### Bit [4]

Reserved, RES0.

#### coproc, bits [3:0]

When the TA field returns the value 1, this field returns the value 1010, otherwise this field is RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- [General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers](#) on page G1-4437.
- [Traps to Hyp mode of Non-secure accesses to Advanced SIMD functionality](#) on page G1-4438.

#### ISS encoding for an exception from HVC or SVC instruction execution

This encoding is used by:

- Exception on SVC instruction execution in AArch32 state routed to EL2.
- HVC instruction execution in AArch32 state, when HVC is not disabled.

The ISS encoding for these exceptions is:

#### Bits [24:16]

Reserved, RES0.

#### imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, this is the value of the imm16 field of the issued instruction.

For an SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

[Supervisor Call exception, when the value of HCR.TGE is 1](#) on page G1-4357 describes the configuration settings for the trap reported with EC value 0b010001.

### ISS encoding for an exception from SMC instruction execution

This encoding is used by:

- Trapped execution of SMC instruction in AArch32 state.

The ISS encoding for these exceptions is:

#### CV, bit [24]

Condition code valid. Possible values of this bit are:

- 0 The COND field is not valid.
- 1 The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

#### COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

#### CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

- 0 The instruction was unconditional, or was conditional and passed its condition code check.
- 1 The instruction was conditional, and might have failed its condition code check.

#### Bits [18:0]

Reserved, RES0.

[Traps to Hyp mode of Non-secure EL1 execution of SMC instructions on page G1-4434](#) describes the configuration settings for this trap, for instructions executed in Non-secure PL1 modes.

### ISS encoding for an exception from a Prefetch Abort

This encoding is used by:

- Prefetch Abort from a lower Exception level.
- Prefetch Abort taken without a change in Exception level.

The ISS encoding for these exceptions is:

#### Bits [24:11]

Reserved, RES0.

#### FnV, bit [10]

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

0 [HIFAR](#) is valid.

1 [HIFAR](#) is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is 010000. It is RES0 for all other aborts.

#### EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

#### Bit [8]

Reserved, RES0.

#### S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0 Fault not on a stage 2 translation for a stage 1 translation table walk.

1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

#### Bit [6]

Reserved, RES0.

#### IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:

000000 Address size fault, translation table base register

000001 Address size fault, level 1

000010	Address size fault, level 2
000011	Address size fault, level 3
000101	Translation fault, level 1
000110	Translation fault, level 2
000111	Translation fault, level 3
001001	Access flag fault, level 1
001010	Access flag fault, level 2
001011	Access flag fault, level 3
001101	Permission fault, level 1
001110	Permission fault, level 2
001111	Permission fault, level 3
010000	Synchronous external abort, not on translation table walk
011000	Synchronous parity or ECC error on memory access, not on translation table walk
010101	Synchronous external abort, on translation table walk, level 1
010110	Synchronous external abort, on translation table walk, level 2
010111	Synchronous external abort, on translation table walk, level 3
011101	Synchronous parity or ECC error on memory access on translation table walk, level 1
011110	Synchronous parity or ECC error on memory access on translation table walk, level 2
011111	Synchronous parity or ECC error on memory access on translation table walk, level 3
100010	Debug exception, only when the EC value is 0b100001
110000	TLB conflict abort

All other values are reserved.

When the RAS Extension is implemented, 011000, 011101, 011110 and 011111 are reserved.

#### **Note**

ARMv8.2 requires the implementation of the RAS Extension.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Long-descriptor translation table lookup on page G4-4671](#).

The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100000:

- [Abort exceptions, when the value of HCR.TGE is 1 on page G1-4357](#).
- [Routing debug exceptions to EL2 using AArch32 on page G1-4358](#).

#### **ISS encoding for an exception from an Illegal state or PC alignment fault**

This encoding is used by:

- Illegal exception return to AArch32 state.
- PC alignment fault exception.

The ISS encoding for these exceptions is:

#### Bits [24:0]

Reserved, RES0.

For more information about the Illegal state exception, see:

- [Illegal changes to PSTATE.M on page G1-4336.](#)
- [Illegal return events from AArch32 state on page G1-4361.](#)
- [Legal returns that set PSTATE.IL to 1 on page G1-4363.](#)
- [The Illegal Execution state exception on page G1-4363.](#)

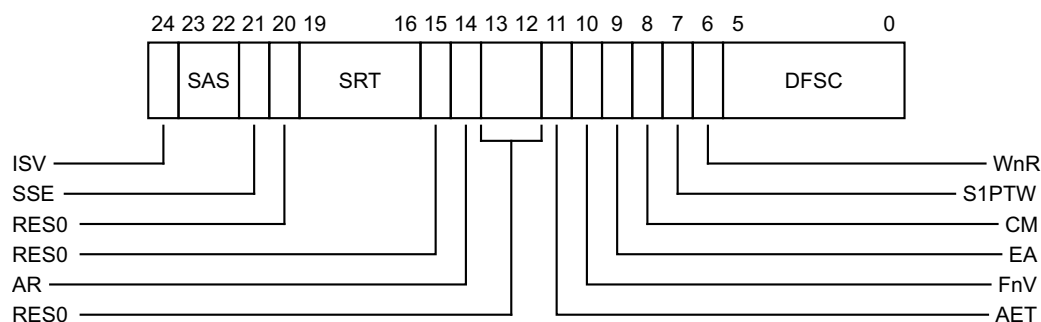

For more information about the PC alignment fault exception, see [Branching to an unaligned PC on page K1-6098.](#)

#### ISS encoding for an exception from a Data Abort

This encoding is used by:

- Data Abort from a lower Exception level.
- Data Abort taken without a change in Exception level.

The ISS encoding for these exceptions is:

#### ISV, bit [24]

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

0 No valid instruction syndrome. ISS[23:14] are RES0.

1 ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults except Data Aborts generated by stage 2 address translations for which all the following apply to the instruction that generated the Data Abort exception:

- The instruction is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
- The instruction is not performing register writeback.
- The instruction is not using the PC as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, as described in [Data Aborts in Memory access mode on page H4-5504](#), and otherwise indicates whether ISS[23:14] hold a valid syndrome.

**Note**

In the A32 instruction set, LDR\*T and STR\*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

When the RAS Extension is implemented, ISV is 0 for any Synchronous external abort.

ISV is set to 0 on a stage 2 abort on a stage 1 translation table walk.

When the RAS Extension is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a Synchronous external abort on stage 2 translation table walk.

**SAS, bits [23:22]**

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

00	Byte
01	Halfword
10	Word
11	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

**SSE, bit [21]**

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

0	Sign-extension not required.
1	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

**Bit [20]**

Reserved, RES0.

**SRT, bits [19:16]**

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

**Bit [15]**

Reserved, RES0.

**AR, bit [14]**

Acquire/Release. When ISV is 1, the possible values of this bit are:

0	Instruction did not have acquire/release semantics.
1	Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

**Bits [13:12]**

Reserved, RES0.

#### AET, bit [11:10]

Asynchronous Error Type.

When the RAS Extension is implemented and the value returned in the DFSC field is 010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

- |    |  |
|----|--|
| 00 | Uncontainable error (UC) or uncategorized.       |
| 01 | Unrecoverable error (UEU).                       |
| 10 | Restartable error (UEO) or Corrected error (CE). |
| 11 | Recoverable error (UER).                         |

On a synchronous Data Abort, this field is RES0.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

#### ———— Note ————

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

When RAS Extension is not implemented, or when DFSC is not 010001:

- Bit[11] is RES0.
- Bit[10] forms the FnV field.

#### ———— Note ————

ARMv8.2 requires the implementation of the RAS Extension.

#### FnV, bit [10]

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

- |   |  |
|---|--|
| 0 | <b>HDFAR</b> is valid.                                 |
| 1 | <b>HDFAR</b> is not valid, and holds an UNKNOWN value. |

When the RAS Extension is not implemented, this field is valid only if DFSC is 010000. It is RES0 for all other aborts.

When the RAS Extension is implemented:

- If DFSC is 010000, this field is valid.
- If DFSC is 010001, this bit forms part of the AET field.
- This field is RES0 for all other aborts.

#### ———— Note ————

ARMv8.2 requires the implementation of the RAS Extension.

#### EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

#### CM, bit [8]

Cache maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation instruction. For synchronous faults, the possible values of this bit are:

- |   |  |
|---|--|
| 0 | Fault not generated by a cache maintenance or address translation instruction. |
|---|--|

1 Fault generated by a cache maintenance or address translation instruction.

For an asynchronous Data Abort exception, this bit is 0.

#### S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

0 Fault not on a stage 2 translation for a stage 1 translation table walk.

1 Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

#### ————— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

#### WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction. The possible values of this bit are:

0 Abort caused by a read instruction.

1 Abort caused by a write instruction.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

On an asynchronous Data Abort:

- When the RAS Extension is not implemented this bit is UNKNOWN.
- When the RAS Extension is implemented this bit is RES0.

#### ————— **Note** —————

ARMv8.2 requires the implementation of the RAS Extension.

#### DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:

000000 Address size fault, translation table base register

000001 Address size fault, level 1

000010 Address size fault, level 2

000011 Address size fault, level 3

000101 Translation fault, level 1

000110 Translation fault, level 2

000111 Translation fault, level 3

001001 Access flag fault, level 1

001010 Access flag fault, level 2

001011 Access flag fault, level 3

001101 Permission fault, level 1

001110 Permission fault, level 2

001111 Permission fault, level 3

010000 Synchronous external abort, not on translation table walk

011000 Synchronous parity or ECC error on memory access, not on translation table walk

010001 SError interrupt

011001 SError interrupt from a parity or ECC error on memory access

010101 Synchronous external abort, on translation table walk, level 1

010110	Synchronous external abort, on translation table walk, level 2
010111	Synchronous external abort, on translation table walk, level 3
011101	Synchronous parity or ECC error on memory access on translation table walk, level 1
011110	Synchronous parity or ECC error on memory access on translation table walk, level 2
011111	Synchronous parity or ECC error on memory access on translation table walk, level 3
100001	Alignment fault
100010	Debug exception, only when the EC value is 0b100100
110000	TLB conflict abort
110100	IMPLEMENTATION DEFINED fault (Lockdown fault)
110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive access fault)

All other values are reserved.

When the RAS Extension is implemented, 011000, 011001, 011101, 011110, and 011111 are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Long-descriptor translation table lookup on page G4-4671](#).

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100100:

- [Abort exceptions, when the value of HCR.TGE is 1 on page G1-4357](#).
- [Routing debug exceptions to EL2 using AArch32 on page G1-4358](#).

The following describe cases that can cause a Data Abort exception that is taken to Hyp mode, and reported in the HSR with EC value of 0b100000 or 0b100100:

- [Hyp mode control of Non-secure access permissions on page G4-4614](#).
- [Memory fault reporting in Hyp mode on page G4-4675](#).

## Accessing the HSR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c5, c2, 0	100	000	0101	1111	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T5](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.70 HSTR, Hyp System Trap Register

The HSTR characteristics are:

### Purpose

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to the System register in the coproc == 1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

### Configurations

AArch32 System register HSTR is architecturally mapped to AArch64 System register [HSTR\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

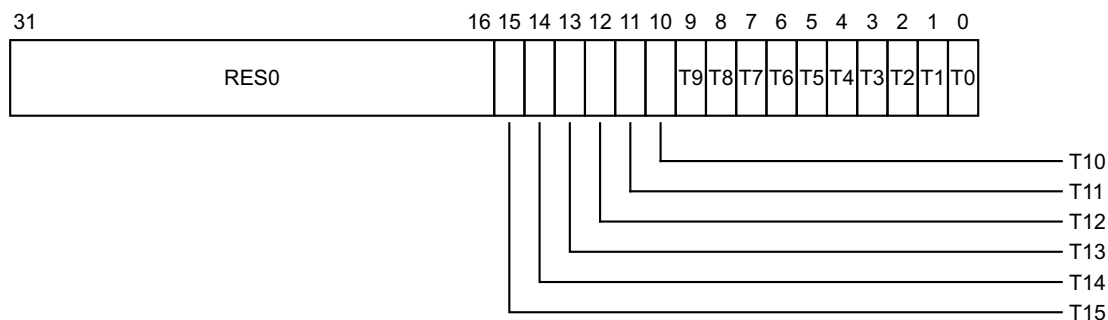

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HSTR is a 32-bit register.

### Field descriptions

The HSTR bit assignments are:

### Bits [31:16]

Reserved, RES0.

### T<n>, bit [n], for n = 0 to 15

Fields T14 and T4 are RES0.

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 1111 encoding space are trapped to Hyp mode:

- 0 This control has no effect on Non-secure EL0 or EL1 accesses to System registers.
- 1 Any Non-secure EL1 MCR, MRC access with coproc == 1111 and CRn == <n> is trapped to Hyp mode if the access is not UNDEFINED when the value of this field is 0.  
Any Non-secure EL1 MCRR, MRRC access with coproc == 1111 and CRm == <n> is trapped to Hyp mode if the access is not UNDEFINED when the value of this field is 0.

For example, when HSTR.T7 is 1:

- Any 32-bit access from a Non-secure EL1 mode, using an MCR or MRC instruction with coproc set to 1111 and <CRn> set to c7, and that is not UNDEFINED when HSTR.T7 is 0, is trapped to Hyp mode.

- Any 64-bit access from a Non-secure EL1 mode, using an MCRR or MRRC instruction with coproc set to 1111 and <CRm> set to c7, and that is not UNDEFINED when HSTR.T7 is 0, is trapped to Hyp mode.

When this register has an architecturally-defined reset value, this field resets to 0.

## Accessing the HSTR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c1, 3	100	011	0001	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G6.2.71 HTCR, Hyp Translation Control Register

The HTCR characteristics are:

Purpose

The control register for stage 1 of the EL2 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configurations

AArch32 System register HTCR is architecturally mapped to AArch64 System register [TCR\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

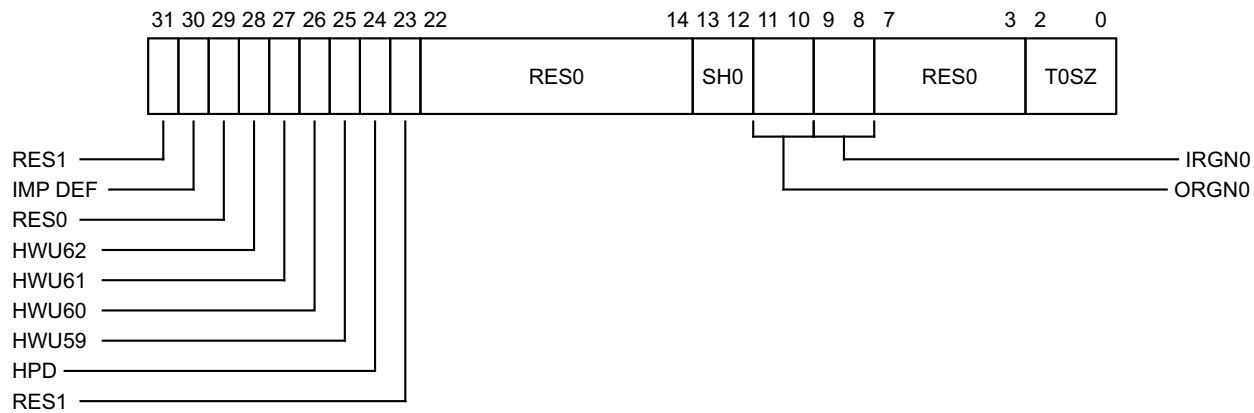

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

HTCR is a 32-bit register.

Field descriptions

The HTCR bit assignments are:

Bit [31]

Reserved, RES1.

IMP DEF, bit [30]

IMPLEMENTATION DEFINED.

Bit [29]

Reserved, RES0.

HWU62, bit [28]

In ARMv8.2

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table block or level 3 entry if the HTCR.HPD value is 1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.

- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the HTCR.HPD value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HWU61, bit [27]**

***In ARMv8.2***

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table block or level 3 entry if the HTCR.HPD value is 1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if HTCR.HPD bit value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HWU60, bit [26]**

***In ARMv8.2***

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table block or level 3 entry.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the HTCR.HPD bit value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HWU59, bit [25]**

***In ARMv8.2***

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table block or level 3 entry.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the HTCR.HPD bit value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HPD, bit [24]**

***In ARMv8.2***

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the PL2 translation regime.

Defined values are:

- 0 Hierarchical permissions are enabled.
- 1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This bit is RES0 if [ARMv8.2-AA32HPD](#) is not implemented.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

#### Bit [23]

Reserved, RES1.

#### Bits [22:14]

Reserved, RES0.

#### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [HTTBR](#).

- 00 Non-shareable
- 10 Outer Shareable
- 11 Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

#### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [HTTBR](#).

- 00 Normal memory, Outer Non-cacheable
- 01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
- 10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
- 11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

#### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [HTTBR](#).

- 00 Normal memory, Inner Non-cacheable
- 01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
- 10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
- 11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

#### Bits [7:3]

Reserved, RES0.

#### T0SZ, bits [2:0]

The size offset of the memory region addressed by [HTTBR](#). The region size is  $2^{(32-T0SZ)}$  bytes.

### Accessing the HTCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c2, c0, 2	100	010	0010	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T2](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T2](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T2](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G6.2.72     HTPIDR, Hyp Software Thread ID Register

The HTPIDR characteristics are:

Purpose

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.  
The PE makes no use of this register.

Configurations

AArch32 System register HTPIDR is architecturally mapped to AArch64 System register [TPIDR\\_EL2](#)[31:0].  
If EL2 is not implemented, this register is RES0 from EL3.  
The PE never updates this register. This means the register is always UNKNOWN on reset.

Attributes

HTPIDR is a 32-bit register.

Field descriptions

The HTPIDR bit assignments are:

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

Accessing the HTPIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c13, c0, 2	100	010	1101	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T13](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T13](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T13](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.73 HTTBR, Hyp Translation Table Base Register

The HTTBR characteristics are:

### Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

### Configurations

AArch32 System register HTTBR is architecturally mapped to AArch64 System register [TTBR0\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HTTBR is a 64-bit register.

### Field descriptions

The HTTBR bit assignments are:

#### Bits [63:48]

Reserved, RES0.

#### BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [HTCR.T0SZ](#) as follows:

- If [HTCR.T0SZ](#) is 0 or 1,  $x = 5 - \text{HTCR.T0SZ}$ .
- If [HTCR.T0SZ](#) is greater than 1,  $x = 14 - \text{HTCR.T0SZ}$ .

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

#### CnP, bit [0]

##### In ARMv8.2

Common not Private. In an implementation that includes [ARMv8.2-TTCNP](#), indicates whether each entry that is pointed to by HTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

- 0 The translation table entries pointed to by HTTBR are permitted to differ from corresponding entries for HTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of HTTBR.CnP on those other PEs.

- 1 The translation table entries pointed to by HTTB<sub>R</sub> are the same as the translation table entries pointed to by HTTB<sub>R</sub> on every other PE in the Inner Shareable domain for which the value of HTTB<sub>R</sub>.CnP is 1.

#### Note

If the value of the HTTB<sub>R</sub>.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those HTTB<sub>R</sub>s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6101](#).

In an implementation that does not include [ARMv8.2-TTCNP](#) this field is RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

## Accessing the HTTB<sub>R</sub>

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 4, <Rt>, <Rt2>, c2	0100	1111	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T2](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T2](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T2](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.74 HVBAR, Hyp Vector Base Address Register

The HVBAR characteristics are:

### Purpose

Holds the vector base address for any exception that is taken to Hyp mode.

### Configurations

AArch32 System register HVBAR is architecturally mapped to AArch64 System register [VBAR\\_EL2](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HVBAR is a 32-bit register.

### Field descriptions

The HVBAR bit assignments are:

31	5	4	0
Vector Base Address			
RES0			

#### Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

#### Bits [4:0]

Reserved, RES0.

### Accessing the HVBAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c12, c0, 0	100	000	1100	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T12](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T12](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T12](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.75 ICIALLU, Instruction Cache Invalidate All to PoU

The ICIALLU characteristics are:

### Purpose

Invalidate all instruction caches to PoU. If branch predictors are architecturally visible, also flush branch predictors.

### Configurations

AArch32 System instruction ICIALLU performs the same function as AArch64 System instruction [IC IALLU](#).

### Attributes

ICIALLU is a 32-bit System instruction.

### Field descriptions

ICIALLU ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

### Executing the ICIALLU instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c5, 0	000	000	0111	1111	0101

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [ICIALLUIS](#).

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HCR\_EL2.TPU == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HCR\_EL2.TPU == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HCR.TPU == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.76 ICIALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The ICIALLUIS characteristics are:

### Purpose

Invalidate all instruction caches Inner Shareable to PoU. If branch predictors are architecturally visible, also flush branch predictors.

### Configurations

AArch32 System instruction ICIALLUIS performs the same function as AArch64 System instruction [IC IALLUIS](#).

### Attributes

ICIALLUIS is a 32-bit System instruction.

### Field descriptions

ICIALLUIS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

### Executing the ICIALLUIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c1, 0	000	000	0111	1111	0001

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TPU](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.

- If `HSTR_EL2.T7`==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:
  - If `HCR_EL2.TPU`==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If `HSTR_EL2.T7`==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and `SCR_EL3.NS == 1`:
  - If `HCR.TPU`==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If `HSTR.T7`==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.77 ICIMVAU, Instruction Cache line Invalidate by VA to PoU

The ICIMVAU characteristics are:

### Purpose

Invalidate instruction cache line by virtual address to PoU.

### Configurations

AArch32 System instruction ICIMVAU performs the same function as AArch64 System instruction [IC IVAU](#).

### Attributes

ICIMVAU is a 32-bit System instruction.

### Field descriptions

The ICIMVAU input value bit assignments are:

### Bits [31:0]

Virtual address to use.

### Executing the ICIMVAU instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c5, 1	000	001	0111	1111	0101

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HCR\_EL2.TPU == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HCR\_EL2.TPU == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HCR.TPU == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If  $HSTR.T7 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.78 ID\_AFR0, Auxiliary Feature Register 0

The ID\_AFR0 characteristics are:

### Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G4-4701](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_AFR0 is architecturally mapped to AArch64 System register [ID\\_AFR0\\_EL1](#).

### Attributes

ID\_AFR0 is a 32-bit register.

### Field descriptions

The ID\_AFR0 bit assignments are:

### Bits [31:16]

Reserved, RES0.

### IMPLEMENTATION DEFINED, bits [15:12]

IMPLEMENTATION DEFINED.

### IMPLEMENTATION DEFINED, bits [11:8]

IMPLEMENTATION DEFINED.

### IMPLEMENTATION DEFINED, bits [7:4]

IMPLEMENTATION DEFINED.

### IMPLEMENTATION DEFINED, bits [3:0]

IMPLEMENTATION DEFINED.

### Accessing the ID\_AFR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 3	000	011	0000	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.79 ID\_DFR0, Debug Feature Register 0

The ID\_DFR0 characteristics are:

### Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page G4-4701.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_DFR0 is architecturally mapped to AArch64 System register [ID\\_DFR0\\_EL1](#).

### Attributes

ID\_DFR0 is a 32-bit register.

### Field descriptions

The ID\_DFR0 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
RES0	PerfMon	MProfDbg	MMapTrc	CopTrc	MMapDbg	CopSDBG	CopDbg								

#### Bits [31:28]

Reserved, RES0.

#### PerfMon, bits [27:24]

Performance Monitors. Support for System registers-based ARM Performance Monitors Extension, using registers in the coproc == 1111 encoding space, for A and R profile processors. Defined values are:

0000	Performance Monitors Extension System registers not implemented.
0001	Support for Performance Monitors Extension version 1 (PMUv1) System registers.
0010	Support for Performance Monitors Extension version 2 (PMUv2) System registers.
0011	Support for Performance Monitors Extension version 3 (PMUv3) System registers.
0100	Support for Performance Monitors Extension version 3 (PMUv3) System registers, with a 16-bit evtCount field.
1111	IMPLEMENTATION DEFINED form of Performance Monitors System registers supported. PMUv3 not supported.

All other values are reserved.

In ARMv8.0 the permitted values are 0000, 0011, and 1111.

From ARMv8.1 the permitted values are 0000, 0100, and 1111.

In ARMv7, the value 0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an ARMv8 implementation.

#### MProfDbg, bits [23:20]

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

0000	Not supported.
------	----------------

0001 Support for M profile Debug architecture, with memory-mapped access.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0000.

#### **MMapTrc, bits [19:16]**

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

0000 Not supported.  
0001 Support for ARM trace architecture, with memory-mapped access.  
All other values are reserved.  
In ARMv8-A the permitted values are 0000 and 0001.  
In the Trace registers, the ETMIDR gives more information about the implementation.

#### **CopTrc, bits [15:12]**

Support for System registers-based trace model, using registers in the coproc == 1110 encoding space. Defined values are:

0000 Not supported.  
0001 Support for ARM trace architecture, with System registers access.  
All other values are reserved.  
In ARMv8-A the permitted values are 0000 and 0001.  
In the Trace registers, the ETMIDR gives more information about the implementation.

#### **MMapDbg, bits [11:8]**

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In ARMv8-A this field is RES0.

The optional memory map defined by ARMv8 is not compatible with ARMv7.

#### **CopSDBG, bits [7:4]**

Support for a System registers-based Secure debug model, using registers in the coproc = 1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-Secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

#### **CopDbg, bits [3:0]**

Support for System registers-based debug model, using registers in the coproc == 1110 encoding space, for A and R profile processors. Defined values are:

0000 Not supported.  
0010 Support for ARMv6, v6 Debug architecture, with System registers access.  
0011 Support for ARMv6, v6.1 Debug architecture, with System registers access.  
0100 Support for ARMv7, v7 Debug architecture, with System registers access.  
0101 Support for ARMv7, v7.1 Debug architecture, with System registers access.  
0110 Support for ARMv8 debug architecture, with System registers access.  
0111 Support for ARMv8 debug architecture, with System registers access, and Virtualization Host extensions.  
1000 Support for ARMv8.2 debug architecture.

All other values are reserved.

In an ARMv8.0 implementation, the only permitted value is 0b0110.

In an ARMv8.1 implementation that does not include ARMv8.1-VHE, the permitted values are 0b0110 and 0b0111.

In an ARMv8.1 implementation that includes ARMv8.1-VHE, the only permitted value is 0b0111.

In an ARMv8.2 implementation, the only permitted value is 0b1000.

## Accessing the ID\_DFR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 2	000	010	0000	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TID3==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.80 ID\_ISAR0, Instruction Set Attribute Register 0

The ID\_ISAR0 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR1](#), [ID\\_ISAR2](#), [ID\\_ISAR3](#), [ID\\_ISAR4](#), and [ID\\_ISAR5](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G4-4701](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_ISAR0 is architecturally mapped to AArch64 System register [ID\\_ISAR0\\_EL1](#).

### Attributes

ID\_ISAR0 is a 32-bit register.

### Field descriptions

The ID\_ISAR0 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
RES0	Divide	Debug	Coproc	CmpBranch	BitField	BitCount	Swap								

#### Bits [31:28]

Reserved, RES0.

#### Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

0000 None implemented.

0001 Adds SDIV and UDIV in the T32 instruction set.

0010 As for 0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

0000 None implemented.

0001 Adds BKPT.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

0000 None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.

0001 Adds generic CDP, LDC, MCR, MRC, and STC.

0010 As for 0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.

0011 As for 0010, and adds generic MCRR and MRRC.

0100 As for 0011, and adds generic MCRR2 and MRRC2.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0000.

#### CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set.  
Defined values are:  
0000 None implemented.  
0001 Adds CBNZ and CBZ.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0001.

#### BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:  
0000 None implemented.  
0001 Adds BFC, BFI, SBFX, and UBFX.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0001.

#### BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:  
0000 None implemented.  
0001 Adds CLZ.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0001.

#### Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:  
0000 None implemented.  
0001 Adds SWP and SWPB.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0000.

### Accessing the ID\_ISAR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 0	000	000	0000	1111	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TID3==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.81 ID\_ISAR1, Instruction Set Attribute Register 1

The ID\_ISAR1 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0](#), [ID\\_ISAR2](#), [ID\\_ISAR3](#), [ID\\_ISAR4](#), and [ID\\_ISAR5](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G4-4701](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_ISAR1 is architecturally mapped to AArch64 System register [ID\\_ISAR1\\_EL1](#).

### Attributes

ID\_ISAR1 is a 32-bit register.

### Field descriptions

The ID\_ISAR1 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
Jazelle	Interwork	Immediate	IfThen	Extend	Except_AR	Except	Endian								

#### Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

0000 No support for Jazelle.

0001 Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

0000 None implemented.

0001 Adds the BX instruction, and the T bit in the PSR.

0010 As for 0001, and adds the BLX instruction. PC loads have BX-like behavior.

0011 As for 0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

#### Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

0000 None implemented.

0001 Adds:

- The MOVT instruction.
- The MOV instruction encodings with zero-extended 16-bit immediates.

- The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### **IfThen, bits [19:16]**

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

0000 None implemented.

0001 Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### **Extend, bits [15:12]**

Indicates the implemented Extend instructions. Defined values are:

0000 No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.

0001 Adds the SXTB, SXTB16, UXTB, and UXTH instructions.

0010 As for 0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### **Except\_AR, bits [11:8]**

Indicates the implemented A and R profile exception-handling instructions. Defined values are:

0000 None implemented.

0001 Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### **Except, bits [7:4]**

Indicates the implemented exception-handling instructions in the ARM instruction set. Defined values are:

0000 Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.

0001 Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### **Endian, bits [3:0]**

Indicates the implemented Endian instructions. Defined values are:

0000 None implemented.

0001 Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

## Accessing the ID\_ISAR1

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 1	000	001	0000	1111	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.82 ID\_ISAR2, Instruction Set Attribute Register 2

The ID\_ISAR2 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0](#), [ID\\_ISAR1](#), [ID\\_ISAR3](#), [ID\\_ISAR4](#), and [ID\\_ISAR5](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G4-4701](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_ISAR2 is architecturally mapped to AArch64 System register [ID\\_ISAR2\\_EL1](#).

### Attributes

ID\_ISAR2 is a 32-bit register.

### Field descriptions

The ID\_ISAR2 bit assignments are:

#### Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

- 0000 None implemented.
- 0001 Adds the REV, REV16, and REVSH instructions.
- 0010 As for 0001, and adds the RBIT instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### PSR\_AR, bits [27:24]

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

- 0000 None implemented.
- 0001 Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

#### **MultU, bits [23:20]**

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

- 0000 None implemented.
- 0001 Adds the UMULL and UMLAL instructions.
- 0010 As for 0001, and adds the UMAAL instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### **MultS, bits [19:16]**

Indicates the implemented advanced signed Multiply instructions. Defined values are:

- 0000 None implemented.
- 0001 Adds the SMULL and SMLAL instructions.
- 0010 As for 0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
- 0011 As for 0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

#### **Mult, bits [15:12]**

Indicates the implemented additional Multiply instructions. Defined values are:

- 0000 No additional instructions implemented. This means only MUL is implemented.
- 0001 Adds the MLA instruction.
- 0010 As for 0001, and adds the MLS instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### **MultiAccessInt, bits [11:8]**

Indicates the support for interruptible multi-access instructions. Defined values are:

- 0000 No support. This means the LDM and STM instructions are not interruptible.
- 0001 LDM and STM instructions are restartable.
- 0010 LDM and STM instructions are continuable.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### **MemHint, bits [7:4]**

Indicates the implemented Memory Hint instructions. Defined values are:

- 0000 None implemented.
- 0001 Adds the PLD instruction.
- 0010 Adds the PLD instruction. (0001 and 0010 have identical effects.)
- 0011 As for 0001 (or 0010), and adds the PLI instruction.
- 0100 As for 0011, and adds the PLDW instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0100.

### LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

- 0000 No additional load/store instructions implemented.
- 0001 Adds the LDRD and STRD instructions.
- 0010 As for 0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

### Accessing the ID\_ISAR2

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 2	000	010	0000	1111	0010

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TID3==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.83 ID\_ISAR3, Instruction Set Attribute Register 3

The ID\_ISAR3 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0](#), [ID\\_ISAR1](#), [ID\\_ISAR2](#), [ID\\_ISAR4](#), and [ID\\_ISAR5](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G4-4701](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_ISAR3 is architecturally mapped to AArch64 System register [ID\\_ISAR3\\_EL1](#).

### Attributes

ID\_ISAR3 is a 32-bit register.

### Field descriptions

The ID\_ISAR3 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
T32EE		TrueNOP		T32Copy		TabBranch		SynchPrim		SVC		SIMD		Saturate	

#### T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

0000 None implemented.

0001 Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

0000 None implemented. This means there are no NOP instructions that do not have any register dependencies.

0001 Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

0000 Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.

0001 Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

- 0000 None implemented.
  - 0001 Adds the TBB and TBH instructions.
- All other values are reserved.
- In ARMv8-A the only permitted value is 0001.

#### SynchPrim, bits [15:12]

Used in conjunction with ID\_ISAR4.SynchPrim\_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

- 0000 If SynchPrim\_frac == 0000, no Synchronization Primitives implemented.
- 0001 If SynchPrim\_frac == 0000, adds the LDREX and STREX instructions.  
If SynchPrim\_frac == 0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
- 0010 If SynchPrim\_frac == 0000, as for [0001, 0011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim\_frac are reserved.

In ARMv8-A the only permitted value is 0010.

#### SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

- 0000 Not implemented.
- 0001 Adds the SVC instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

- 0000 None implemented.
- 0001 Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
- 0011 As for 0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, [MVFR0](#), [MVFR1](#), and [MVFR2](#) give information about the implemented Advanced SIMD instructions.

#### Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

- 0000 None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
- 0001 Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

### Accessing the ID\_ISAR3

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 3	000	011	0000	1111	0010

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.84 ID\_ISAR4, Instruction Set Attribute Register 4

The ID\_ISAR4 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0](#), [ID\\_ISAR1](#), [ID\\_ISAR2](#), [ID\\_ISAR3](#), and [ID\\_ISAR5](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page G4-4701.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_ISAR4 is architecturally mapped to AArch64 System register [ID\\_ISAR4\\_EL1](#).

### Attributes

ID\_ISAR4 is a 32-bit register.

### Field descriptions

The ID\_ISAR4 bit assignments are:

#### SWP\_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

0000 SWP or SWPB instructions not implemented.

0001 SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if the [ID\\_ISAR0](#).Swap\_instrs field is 0000.

In ARMv8-A the only permitted value is 0000.

#### PSR\_M, bits [27:24]

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

0000 None implemented.

0001 Adds the M profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### SynchPrim\_frac, bits [23:20]

Used in conjunction with [ID\\_ISAR3](#).SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

0000 If SynchPrim == 0000, no Synchronization Primitives implemented. If SynchPrim == 0001, adds the LDREX and STREX instructions. If SynchPrim == 0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.

0011 If SynchPrim == 0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim\_frac are reserved.

In ARMv8-A the only permitted value is 0000.

#### Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

0000 None implemented. Barrier operations are provided only as System instructions in the (coproc==1111) encoding space.

0001 Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

0000 None implemented.

0001 Adds the SMC instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

0000 Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.

0001 Adds support for all of the writeback addressing modes.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

0000 Nonzero shifts supported only in MOV and shift instructions.

0001 Adds support for shifts of loads and stores over the range LSL 0-3.

0011 As for 0001, and adds support for other constant shift options, both on load/store and other instructions.

0100 As for 0011, and adds support for register-controlled shift options.

All other values are reserved.

In ARMv8-A the only permitted value is 0100.

#### Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

0000 None implemented. No T variant instructions are implemented.

0001 Adds the LDRBT, LDRT, STRBT, and STRT instructions.

0010 As for 0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

## Accessing the ID\_ISAR4

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 4	000	100	0000	1111	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.85 ID\_ISAR5, Instruction Set Attribute Register 5

The ID\_ISAR5 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0](#), [ID\\_ISAR1](#), [ID\\_ISAR2](#), [ID\\_ISAR3](#), and [ID\\_ISAR4](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G4-4701](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_ISAR5 is architecturally mapped to AArch64 System register [ID\\_ISAR5\\_EL1](#).

### Attributes

ID\_ISAR5 is a 32-bit register.

### Field descriptions

The ID\_ISAR5 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
RES0		RDM		RES0		CRC32		SHA2		SHA1		AES		SEVL	

#### Bits [31:28]

Reserved, RES0.

#### RDM, bits [27:24]

##### *In ARMv8.2 and ARMv8.1*

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

0000 No VQRDMLAH and VQRDMLSH instructions implemented.

0001 VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

In ARMv8.0 the only permitted value is 0000.

From ARMv8.1 the only permitted value is 0001. This feature is identified by the name [ARMv8.1-SIMD](#).

##### *In ARMv8.0.*

Reserved, RES0.

#### Bits [23:20]

Reserved, RES0.

#### CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

0000 No CRC32 instructions implemented.

0001 CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In ARMv8.0 the permitted values are 0000 and 0001.

From ARMv8.1 the only permitted value is 0001.

#### SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

0000 No SHA2 instructions implemented.

0001 SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

#### SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

0000 No SHA1 instructions implemented.

0001 SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

#### AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.

0000 No AES instructions implemented.

0001 AESE, AESD, AESMC, and AESIMC implemented.

0010 As for 0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

#### SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

0000 SEVL is implemented as a NOP.

0001 SEVL is implemented as Send Event Local.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

### Accessing the ID\_ISAR5

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 5	000	101	0000	1111	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TID3==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.86 ID\_MMFR0, Memory Model Feature Register 0

The ID\_MMFR0 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID\_MMFR1, ID\_MMFR2, ID\_MMFR3, and ID\_MMFR4.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G4-4701.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_MMFR0 is architecturally mapped to AArch64 System register ID\_MMFR0\_EL1.

### Attributes

ID\_MMFR0 is a 32-bit register.

### Field descriptions

The ID\_MMFR0 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
InnerShr	FCSE	AuxReg	TCM	ShareLvl	OuterShr	PMSA	VMSA	

#### InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

- 0000 Implemented as Non-cacheable.
- 0001 Implemented with hardware coherency support.
- 1111 Shareability ignored.

All other values are reserved.

In ARMv8 the permitted values are 0000, 0001, and 1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID\_MMFR0.ShareLvl having the value 0001.

When ID\_MMFR0.ShareLvl is zero, this field is UNK.

#### FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

- 0000 Not supported.
- 0001 Support for FCSE.

All other values are reserved.

In ARMv8 the only permitted value is 0000.

#### AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

- 0000 None supported.
- 0001 Support for Auxiliary Control Register only.

0010 Support for Auxiliary Fault Status Registers (**AIFSR** and **ADFSR**) and Auxiliary Control Register.

All other values are reserved.

In ARMv8 the only permitted value is 0010.

---

**Note**

---

Accesses to unimplemented Auxiliary registers are UNDEFINED.

---

#### TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

0000 Not supported.

0001 Support is IMPLEMENTATION DEFINED. ARMv7 requires this setting.

0010 Support for TCM only, ARMv6 implementation.

0011 Support for TCM and DMA, ARMv6 implementation.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

0000 One level of shareability implemented.

0001 Two levels of shareability implemented.

All other values are reserved.

In ARMv8 the only permitted value is 0001.

#### OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

0000 Implemented as Non-cacheable.

0001 Implemented with hardware coherency support.

1111 Shareability ignored.

All other values are reserved.

In ARMv8 the permitted values are 0000, 0001, and 1111.

#### PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

0000 Not supported.

0001 Support for IMPLEMENTATION DEFINED PMSA.

0010 Support for PMSAv6, with a Cache Type Register implemented.

0011 Support for PMSAv7, with support for memory subsections. ARMv7-R profile.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

0000 Not supported.

0001 Support for IMPLEMENTATION DEFINED VMSA.

0010 Support for VMSAv6, with Cache and TLB Type Registers implemented.

- 0011 Support for VMSAv7, with support for remapping and the Access flag. ARMv7-A profile.
- 0100 As for 0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
- 0101 As for 0100, and adds support for the Long-descriptor translation table format.
- All other values are reserved.
- In ARMv8-A the only permitted value is 0101.

## Accessing the ID\_MMFR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 4	000	100	0000	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.87 ID\_MMFR1, Memory Model Feature Register 1

The ID\_MMFR1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0](#), [ID\\_MMFR2](#), [ID\\_MMFR3](#), and [ID\\_MMFR4](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page G4-4701.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_MMFR1 is architecturally mapped to AArch64 System register [ID\\_MMFR1\\_EL1](#).

### Attributes

ID\_MMFR1 is a 32-bit register.

### Field descriptions

The ID\_MMFR1 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
BPred	L1TstCln	L1Uni	L1Hvd	L1UniSW	L1HvdSW	L1UniVA	L1HvdVA								

#### BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

0000 No branch predictor, or no MMU present. Implies a fixed MPU configuration.

0001 Branch predictor requires flushing on:

- Enabling or disabling a stage of address translation.
- Writing new data to instruction locations.
- Writing new mappings to the translation tables.
- Changes to the [TTBR0](#), [TTBR1](#), or [TTBCR](#) registers.
- Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.

0010 Branch predictor requires flushing on:

- Enabling or disabling a stage of address translation.
- Writing new data to instruction locations.
- Writing new mappings to the translation tables.
- Any change to the [TTBR0](#), [TTBR1](#), or [TTBCR](#) registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.

0011 Branch predictor requires flushing only on writing new data to instruction locations.

0100 For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In ARMv8-A the permitted values are 0010, 0011, or 0100. For values other than 0000 and 0100 the ARM Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

#### **L1TstCln, bits [27:24]**

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

- |      |  |
|------|--|
| 0000 | None supported.  |
| 0001 | Supported Level 1 data cache test and clean operations are: <ul style="list-style-type: none"><li>• Test and clean data cache.</li></ul> |
| 0010 | As for 0001, and adds: <ul style="list-style-type: none"><li>• Test, clean, and invalidate data cache.</li></ul>                         |

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### **L1Uni, bits [23:20]**

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

- |      |   |
|------|---|
| 0000 | None supported.   |
| 0001 | Supported entire Level 1 cache operations are: <ul style="list-style-type: none"><li>• Invalidate cache, including branch predictor if appropriate.</li><li>• Invalidate branch predictor, if appropriate.</li></ul>                                    |
| 0010 | As for 0001, and adds: <ul style="list-style-type: none"><li>• Clean cache, using a recursive model that uses the cache dirty status bit.</li><li>• Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.</li></ul> |

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### **L1Hvd, bits [19:16]**

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

- |      |   |
|------|---|
| 0000 | None supported.   |
| 0001 | Supported entire Level 1 cache operations are: <ul style="list-style-type: none"><li>• Invalidate instruction cache, including branch predictor if appropriate.</li><li>• Invalidate branch predictor, if appropriate.</li></ul>                                  |
| 0010 | As for 0001, and adds: <ul style="list-style-type: none"><li>• Invalidate data cache.</li><li>• Invalidate data cache and instruction cache, including branch predictor if appropriate.</li></ul>   |
| 0011 | As for 0010, and adds: <ul style="list-style-type: none"><li>• Clean data cache, using a recursive model that uses the cache dirty status bit.</li><li>• Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.</li></ul> |

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### **L1UniSW, bits [15:12]**

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

- |      |                 |
|------|-----------------|
| 0000 | None supported. |
|------|-----------------|

0001 Supported Level 1 unified cache line maintenance operations by set/way are:

- Clean cache line by set/way.

0010 As for 0001, and adds:

- Clean and invalidate cache line by set/way.

0011 As for 0010, and adds:

- Invalidate cache line by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### **L1HvdSW, bits [11:8]**

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

0000 None supported.

0001 Supported Level 1 Harvard cache line maintenance operations by set/way are:

- Clean data cache line by set/way.
- Clean and invalidate data cache line by set/way.

0010 As for 0001, and adds:

- Invalidate data cache line by set/way.

0011 As for 0010, and adds:

- Invalidate instruction cache line by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### **L1UniVA, bits [7:4]**

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

0000 None supported.

0001 Supported Level 1 unified cache line maintenance operations by VA are:

- Clean cache line by VA.
- Invalidate cache line by VA.
- Clean and invalidate cache line by VA.

0010 As for 0001, and adds:

- Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### **L1HvdVA, bits [3:0]**

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

0000 None supported.

0001 Supported Level 1 Harvard cache line maintenance operations by VA are:

- Clean data cache line by VA.
- Invalidate data cache line by VA.
- Clean and invalidate data cache line by VA.
- Clean instruction cache line by VA.

0010 As for 0001, and adds:

- Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

## Accessing the ID\_MMFR1

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 5	000	101	0000	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.88 ID\_MMFR2, Memory Model Feature Register 2

The ID\_MMFR2 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0](#), [ID\\_MMFR1](#), [ID\\_MMFR3](#), and [ID\\_MMFR4](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G4-4701](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_MMFR2 is architecturally mapped to AArch64 System register [ID\\_MMFR2\\_EL1](#).

### Attributes

ID\_MMFR2 is a 32-bit register.

### Field descriptions

The ID\_MMFR2 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
HWAccFlg	WFISall	MemBarr	UniTLB	HvdTLB	L1HvdRng	L1HvdBG	L1HvdFG								

#### HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the ARM Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

0000 Not supported.

0001 Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

In ARMv8 the only permitted value is 0000.

#### WFISall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

0000 Not supported.

0001 Support for WFI stalling.

All other values are reserved.

In ARMv8 the permitted values are 0000 and 0001.

#### MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==1111) encoding space:

0000 None supported.

0001 Supported memory barrier System instructions are:

- Data Synchronization Barrier (DSB).

0010 As for 0001, and adds:

- Instruction Synchronization Barrier (ISB).

- Data Memory Barrier (DMB).

All other values are reserved.

In ARMv8 the only permitted value is 0010.

ARM deprecates the use of these operations. ID\_ISAR4.Barrier\_instrs indicates the level of support for the preferred barrier instructions.

#### UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

0000	Not supported.
0001	Supported unified TLB maintenance operations are: <ul style="list-style-type: none"> <li>• Invalidate all entries in the TLB.</li> <li>• Invalidate TLB entry by VA.</li> </ul>
0010	As for 0001, and adds: <ul style="list-style-type: none"> <li>• Invalidate TLB entries by ASID match.</li> </ul>
0011	As for 0010, and adds: <ul style="list-style-type: none"> <li>• Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.</li> </ul>
0100	As for 0011, and adds: <ul style="list-style-type: none"> <li>• Invalidate Hyp mode unified TLB entry by VA.</li> <li>• Invalidate entire Non-secure PL1&amp;0 unified TLB.</li> <li>• Invalidate entire Hyp mode unified TLB.</li> </ul>
0101	As for 0100, and adds the following operations: <a href="#">TLBIMVALIS</a> , <a href="#">TLBIMVAALIS</a> , <a href="#">TLBIMVALHIS</a> , <a href="#">TLBIMVAL</a> , <a href="#">TLBIMVAAL</a> , <a href="#">TLBIMVALH</a> .
0110	As for 0101, and adds the following operations: <a href="#">TLBIIPAS2IS</a> , <a href="#">TLBIIPAS2LIS</a> , <a href="#">TLBIIPAS2</a> , <a href="#">TLBIIPAS2L</a> .

All other values are reserved.

In ARMv8-A the only permitted value is 0110.

#### HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. ARM deprecates the use of this field by software.

#### L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

0000	Not supported.
0001	Supported Level 1 Harvard cache maintenance range operations are: <ul style="list-style-type: none"> <li>• Invalidate data cache range by VA.</li> <li>• Invalidate instruction cache range by VA.</li> <li>• Clean data cache range by VA.</li> <li>• Clean and invalidate data cache range by VA.</li> </ul>

All other values are reserved.

In ARMv8 the only permitted value is 0000.

### L1HvDBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

- 0000 Not supported.
- 0001 Supported Level 1 Harvard cache background fetch operations are:
- Fetch instruction cache range by VA.
  - Fetch data cache range by VA.

All other values are reserved.

In ARMv8 the only permitted value is 0000.

### L1HvDFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

- 0000 Not supported.
- 0001 Supported Level 1 Harvard cache foreground fetch operations are:
- Fetch instruction cache range by VA.
  - Fetch data cache range by VA.

All other values are reserved.

In ARMv8 the only permitted value is 0000.

## Accessing the ID\_MMFR2

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 6	000	110	0000	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HCR\_EL2.TID3 == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $HSTR\_EL2.T0 == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HCR\_EL2.TID3 == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $HSTR\_EL2.T0 == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HCR.TID3 == 1$ , Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If  $HSTR.T0 == 1$ , Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.89 ID\_MMFR3, Memory Model Feature Register 3

The ID\_MMFR3 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0](#), [ID\\_MMFR1](#), [ID\\_MMFR2](#), and [ID\\_MMFR4](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G4-4701](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_MMFR3 is architecturally mapped to AArch64 System register [ID\\_MMFR3\\_EL1](#).

### Attributes

ID\_MMFR3 is a 32-bit register.

### Field descriptions

The ID\_MMFR3 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
Supersec	CMemSz	CohWalk	PAN	MaintBcst	BPMaint	CMaintSW	CMaintVA	

#### Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported.

Defined values are:

0000 Supersections supported.

1111 Supersections not supported.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 1111.

#### CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

0000 4GB, corresponding to a 32-bit physical address range.

0001 64GB, corresponding to a 36-bit physical address range.

0010 1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In ARMv8-A the permitted values are 0000, 0001, and 0010.

#### CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the point of unification. Defined values are:

0000 Updates to the translation tables require a clean to the point of unification to ensure visibility by subsequent translation table walks.

0001 Updates to the translation tables do not require a clean to the point of unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### PAN, bits [19:16]

##### *In ARMv8.2 and ARMv8.1*

Privileged Access Never. Indicates support for the PAN bit in [CPSR](#), [SPSR](#), and [DPSR](#) in AArch32. Defined values are:

0000 PAN not supported.

0001 PAN supported.

0010 PAN supported and [ATS1CPRP](#) and [ATS1CPWP](#) instructions supported.

All other values are reserved.

In ARMv8.0 the only permitted value is 0000.

In ARMv8.1 the only permitted value is 0001. This feature is identified by the name [ARMv8.1-PAN](#).

From ARMv8.2, the only permitted value is 0010. This feature is identified by the name [ARMv8.2-ATS1E1](#).

##### *In ARMv8.0.*

Reserved, RES0.

#### MaintBst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

0000 Cache, TLB, and branch predictor operations only affect local structures.

0001 Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.

0010 Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

0000 None supported.

0001 Supported branch predictor maintenance operations are:

- Invalidate all branch predictors.

0010 As for 0001, and adds:

- Invalidate branch predictors by VA.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

0000 None supported.

0001 Supported hierarchical cache maintenance instructions by set/way are:

- Invalidate data cache by set/way.
- Clean data cache by set/way.
- Clean and invalidate data cache by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

#### CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

- 0000 None supported.
- 0001 Supported hierarchical cache maintenance operations by VA are:
  - Invalidate data cache by VA.
  - Clean data cache by VA.
  - Clean and invalidate data cache by VA.
  - Invalidate instruction cache by VA.
  - Invalidate all instruction cache entries.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

#### Accessing the ID\_MMFR3

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 7	000	111	0000	1111	0001

#### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

#### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- If `HSTR_EL2.T0`==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:
  - If `HCR_EL2.TID3`==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If `HSTR_EL2.T0`==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and `SCR_EL3.NS == 1`:
  - If `HCR.TID3`==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If `HSTR.T0`==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.90 ID\_MMFR4, Memory Model Feature Register 4

The ID\_MMFR4 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0](#), [ID\\_MMFR1](#), [ID\\_MMFR2](#), and [ID\\_MMFR3](#).

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G4-4701.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_MMFR4 is architecturally mapped to AArch64 System register [ID\\_MMFR4\\_EL1](#).

In an implementation that does not include [ACTLR2](#) and [HACTLR2](#) this register is RAZ.

### Attributes

ID\_MMFR4 is a 32-bit register.

### Field descriptions

The ID\_MMFR4 bit assignments are:

31	24	23	20	19	16	15	12	11	8	7	4	3	0
RAZ				LSM		HPDS		CnP	XNX		AC2	SpecSEI	

#### Bits [31:24]

Reserved, RAZ.

#### LSM, bits [23:20]

##### *In ARMv8.2*

Indicates support for LSMAOE and nTLSMD bits in [HSCTLR](#) and [SCTLR](#). Defined values are:

0000 LSMAOE and nTLSMD bits not supported.

0001 LSMAOE and nTLSMD bits supported.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the only permitted value is 0000.

From ARMv8.2, the permitted values are 0000 and 0001. This feature is identified by the name [ARMv8.2-LSMAOC](#).

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RAZ.

#### HPDS, bits [19:16]

##### *In ARMv8.2*

Hierarchical permission disables bits in translation tables. Defined values are:

0000 Disabling of hierarchical controls not supported.

0001 Supports disabling of hierarchical controls using the [TTBCR2](#).HPD0, [TTBCR2](#).HPD1, and [HTCR](#).HPD bits.

0010 Supports disabling of hierarchical controls using the [TTBCR2.HPD0](#), [TTBCR2.HPD1](#), and [HTCR.HPD](#) bits, and hardware allocation of bits[62:59] of the last level page table descriptor for IMPLEMENTATION DEFINED use.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the only permitted value is 0000.

From ARMv8.2, the permitted values are 0000, 0001 and 0010. This feature is identified by the name [ARMv8.2-AA32HPD](#).

#### **Note**

The encoding 0000 implies that the encoding for [TTBCR2](#) is unallocated.

#### ***In ARMv8.1 and ARMv8.0.***

Reserved, RAZ.

#### **CnP, bits [15:12]**

##### ***In ARMv8.2***

Common not Private translations. Defined values are:

0000 Common not Private translations not supported.

0001 Common not Private translations supported.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the only permitted value is 0000.

From ARMv8.2, the only permitted value is 0001. This feature is identified by the name [ARMv8.2-TTCNP](#).

#### ***In ARMv8.1 and ARMv8.0.***

Reserved, RAZ.

#### **XXN, bits [11:8]**

##### ***In ARMv8.2***

Support for execute never control distinction at stage 2 bit. Defined values are:

0000 Distinction between EL0 and EL1 execute permission at stage 2 not supported.

0001 Distinction between EL0 and EL1 execute permission at stage 2 supported.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the only permitted value is 0000.

From ARMv8.2, the only permitted value is 0001. This feature is identified by the name [ARMv8.2-TTS2UXN](#).

#### ***In ARMv8.1 and ARMv8.0.***

Reserved, RAZ.

#### **AC2, bits [7:4]**

Indicates the extension of the [ACTLR](#) and [HACTLR](#) registers using [ACTLR2](#) and [HACTLR2](#).  
Defined values are:

0000 [ACTLR2](#) and [HACTLR2](#) are not implemented.

0001 [ACTLR2](#) and [HACTLR2](#) are implemented.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the permitted values are 0000 and 0001.

From ARMv8.2, the only permitted value is 0001.

### SpecSEI, bits [3:0]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

- 0000 The PE never generates an SError interrupt due to an external abort on a speculative read.
  - 0001 The PE might generate an SError interrupt due to an external abort on a speculative read.
- All other values are reserved.

When the RAS Extension is not implemented, this field is RAZ.

### Accessing the ID\_MMFR4

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c2, 6	000	110	0000	1111	0010

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- If EL2 is using AArch32 and [HCR.TID3](#)==1, then:
  - If this register is not RAZ/WI then Non-secure EL1 read accesses to this register are trapped to Hyp mode.
  - Otherwise, it is IMPLEMENTATION DEFINED whether Non-secure EL1 read accesses to this register are trapped to Hyp mode.
- If EL2 is using AArch64 and [HCR\\_EL2.TID3](#)==1, then:
  - If this register is not RAZ/WI then Non-secure EL1 read accesses to this register are trapped to EL2.
  - Otherwise, it is IMPLEMENTATION DEFINED whether Non-secure EL1 read accesses to this register are trapped to EL2.
- If [HSTR.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## G6.2.91 ID\_PFR0, Processor Feature Register 0

The ID\_PFR0 characteristics are:

### Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with [ID\\_PFR1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page G4-4701.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_PFR0 is architecturally mapped to AArch64 System register [ID\\_PFR0\\_EL1](#).

### Attributes

ID\_PFR0 is a 32-bit register.

### Field descriptions

The ID\_PFR0 bit assignments are:

31	28 27	16 15	12 11	8 7	4 3	0
RAS	RES0	State3	State2	State1	State0	

#### RAS, bits [31:28]

RAS Extension version. The defined values of this field are:

0000 No RAS Extension.

0001 Version 1 of the RAS Extension present.

All other values are reserved.

#### Bits [27:16]

Reserved, RES0.

#### State3, bits [15:12]

T32EE instruction set support. Defined values are:

0000 Not implemented.

0001 T32EE instruction set implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### State2, bits [11:8]

Jazelle extension support. Defined values are:

0000 Not implemented.

0001 Jazelle extension implemented, without clearing of [JOSCR.CV](#) on exception entry.

0010 Jazelle extension implemented, with clearing of [JOSCR.CV](#) on exception entry.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

### State1, bits [7:4]

T32 instruction set support. Defined values are:

- 0000 T32 instruction set not implemented.
- 0001 T32 encodings before the introduction of Thumb-2 technology implemented:
  - All instructions are 16-bit.
  - A BL or BLX is a pair of 16-bit instructions.
  - 32-bit instructions other than BL and BLX cannot be encoded.
- 0011 T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

### State0, bits [3:0]

A32 instruction set support. Defined values are:

- 0000 A32 instruction set not implemented.
- 0001 A32 instruction set implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

## Accessing the ID\_PFR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 0	000	000	0000	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TID3==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.92 ID\_PFR1, Processor Feature Register 1

The ID\_PFR1 characteristics are:

### Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with [ID\\_PFR0](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page G4-4701.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ID\_PFR1 is architecturally mapped to AArch64 System register [ID\\_PFR1\\_EL1](#).

### Attributes

ID\_PFR1 is a 32-bit register.

### Field descriptions

The ID\_PFR1 bit assignments are:

#### GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

- 0000 No System register interface to the GIC CPU interface is supported.
  - 0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
- All other values are reserved.

#### Virt\_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:

- 0000 No features from the ARMv7 Virtualization Extensions are implemented.
- 0001 The following features of the ARMv7 Virtualization Extensions are implemented:
  - The [SCR.SIF](#) bit, if EL3 is implemented.
  - The modifications to the [SCR.AW](#) and [SCR.FW](#) bits described in the Virtualization Extensions, if EL3 is implemented.
  - The MSR (Banked register) and MRS (Banked register) instructions.
  - The ERET instruction.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0000 when EL2 is implemented.
- 0001 when EL2 is not implemented.

This field is only valid when the value of ID\_PFR1.Virtualization is 0, otherwise it holds the value 0000.

---

**Note**

---

The ID\_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

---

**Sec\_frac, bits [23:20]**

Security fractional field. When the Security field is 0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

- |      |   |
|------|---|
| 0000 | No features from the ARMv7 Security Extensions are implemented.   |
| 0001 | The following features from the ARMv7 Security Extensions are implemented: <ul style="list-style-type: none"><li>• The VBAR register.</li><li>• The TTBCR.PD0 and TTBCR.PD1 bits.</li></ul> |
| 0010 | As for 0001, plus the ability to access Secure or Non-secure physical memory is supported.  |

All other values are reserved.

In ARMv8-A the permitted values are:

- 0000 when EL3 is implemented.
- 0001 or 0010 when EL3 is not implemented.

This field is only valid when the value of ID\_PFR1.Security is 0, otherwise it holds the value 0000.

**GenTimer, bits [19:16]**

Generic Timer support. Defined values are:

- |      |                            |
|------|----------------------------|
| 0000 | Not implemented.           |
| 0001 | Generic Timer implemented. |

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**Virtualization, bits [15:12]**

Virtualization support. Defined values are:

- |      |  |
|------|--|
| 0000 | EL2, Hyp mode, and the HVC instruction not implemented.  |
| 0001 | EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0001 implemented. |

All other values are reserved.

In ARMv8-A the permitted values are:

- 0000 when EL2 is not implemented.
- 0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0001.

---

**Note**

---

The ID\_ISARs do not identify whether the HVC instruction is implemented.

---

**MProgMod, bits [11:8]**

M profile programmers' model support. Defined values are:

- |      |   |
|------|---|
| 0000 | Not supported.                            |
| 0010 | Support for two-stack programmers' model. |

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

### Security, bits [7:4]

Security support. Defined values are:

- 0000 EL3, Monitor mode, and the SMC instruction not implemented.
- 0001 EL3, Monitor mode, the SMC instruction, and all the features described by Sec\_frac == 0001 implemented.
- 0010 As for 0001, and adds the ability to set the NSACR.RFR bit. Not permitted in ARMv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0000 when EL3 is not implemented.
- 0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0001.

### ProgMod, bits [3:0]

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

- 0000 Not supported.
- 0001 Supported.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

### Accessing the ID\_PFR1

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c1, 1	000	001	0000	1111	0001

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TID3==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.93 IFAR, Instruction Fault Address Register

The IFAR characteristics are:

### Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception.

### Configurations

AArch32 System register IFAR(NS) is architecturally mapped to AArch64 System register [FAR\\_EL1](#)[63:32].

AArch32 System register IFAR(S) is architecturally mapped to AArch32 System register [HIFAR](#) when EL2 is implemented.

AArch32 System register IFAR(S) is architecturally mapped to AArch64 System register [FAR\\_EL2](#)[63:32] when EL2 is implemented.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

IFAR is a 32-bit register.

### Field descriptions

The IFAR bit assignments are:

### Bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception.

### Accessing the IFAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c6, c0, 2	000	010	0110	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	IFAR_s
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	IFAR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	IFAR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	IFAR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	IFAR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	IFAR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	IFAR
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	IFAR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	IFAR_ns

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If [HCR.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR.T6](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.94 IFSR, Instruction Fault Status Register

The IFSR characteristics are:

### Purpose

Holds status information about the last instruction fault.

### Configurations

AArch32 System register IFSR is architecturally mapped to AArch64 System register [IFSR32\\_EL2](#).

The current translation table format determines which format of the register is used.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

IFSR is a 32-bit register.

### Field descriptions

The IFSR bit assignments are:

**When *TTBCR.EAE*==0:**

### Bits [31:17]

Reserved, RES0.

### FnV, bit [16]

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

0 [IFAR](#) is valid.

1 [IFAR](#) is not valid, and holds an UNKNOWN value.

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

### Bits [15:13]

Reserved, RES0.

### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.

In an implementation that does not provide any classification of external aborts, this bit is RES0.

For aborts other than external aborts this bit always returns 0.

### Bit [11]

Reserved, RES0.

#### FS[4], bit [10]

See FS[3:0], bits [3:0] for description of the FS field.

#### LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

- 0 Using the Short-descriptor translation table formats.
- 1 Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

#### Bits [8:4]

Reserved, RES0.

#### FS[3:0], bits [3:0]

Fault status bits. Interpreted with bit [10]. Possible values of FS[4:0] are:

00001	PC alignment fault
00010	Debug exception
00011	Access flag fault, level 1
00101	Translation fault, level 1
00110	Access flag fault, level 2
00111	Translation fault, level 2
01000	Synchronous external abort, not on translation table walk
01001	Domain fault, level 1
01011	Domain fault, level 2
01100	Synchronous external abort, on translation table walk, level 1
01101	Permission fault, level 1
01110	Synchronous external abort, on translation table walk, level 2
01111	Permission fault, level 2
10000	TLB conflict abort
10100	IMPLEMENTATION DEFINED fault (Lockdown fault)
11001	Synchronous parity or ECC error on memory access, not on translation table walk
11100	Synchronous parity or ECC error on translation table walk, level 1
11110	Synchronous parity or ECC error on translation table walk, level 2

All other values are reserved.

When the RAS Extension is implemented, 11001, 11100, and 11110 are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Short-descriptor translation table lookup on page G4-4669](#).

#### When TTBCR.EAE==1:

#### Bits [31:17]

Reserved, RES0.

#### FnV, bit [16]

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

0 [IFAR](#) is valid.

1 [IFAR](#) is not valid, and holds an UNKNOWN value.

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

#### Bits [15:13]

Reserved, RES0.

#### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.

In an implementation that does not provide any classification of external aborts, this bit is RES0.

For aborts other than external aborts this bit always returns 0.

#### Bits [11:10]

Reserved, RES0.

#### LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

0 Using the Short-descriptor translation table formats.

1 Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

#### Bits [8:6]

Reserved, RES0.

#### STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

000000 Address size fault in [TTBR0](#) or [TTBR1](#)

000001 Address size fault, level 1

000010 Address size fault, level 2

000011 Address size fault, level 3

000101 Translation fault, level 1

000110 Translation fault, level 2

000111 Translation fault, level 3

001001 Access flag fault, level 1

001010 Access flag fault, level 2

001011 Access flag fault, level 3

001101 Permission fault, level 1

001110 Permission fault, level 2

001111 Permission fault, level 3

010000 Synchronous external abort, not on translation table walk

010101 Synchronous external abort, on translation table walk, level 1

010110	Synchronous external abort, on translation table walk, level 2
010111	Synchronous external abort, on translation table walk, level 3
011000	Synchronous parity or ECC error on memory access, not on translation table walk
011101	Synchronous parity or ECC error on memory access on translation table walk, level 1
011110	Synchronous parity or ECC error on memory access on translation table walk, level 2
011111	Synchronous parity or ECC error on memory access on translation table walk, level 3
100001	PC alignment fault
100010	Debug exception
110000	TLB conflict abort

All other values are reserved.

When the RAS Extension is implemented, 011000, 011101, 011110, and 011111 are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Long-descriptor translation table lookup on page G4-4671](#).

## Accessing the IFSR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c5, c0, 1	000	001	0101	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	IFSR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	IFSR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	IFSR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	IFSR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	IFSR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	IFSR
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	IFSR_s
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	IFSR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	IFSR_ns

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T5==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T5==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If HCR.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T5==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.95 ISR, Interrupt Status Register

The ISR characteristics are:

### Purpose

Shows whether any IRQ, FIQ, or external abort is pending. In an implementation that includes EL2, when the register is accessed from Non-secure EL1, a pending interrupt might be a physical interrupt or a virtual interrupt, and the architecture does not provide any mechanism that software executing at Non-secure EL1 can use to determine whether a pending interrupt is physical or virtual. For all other accesses, any indicated interrupt must be a physical interrupt.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register ISR is architecturally mapped to AArch64 System register [ISR\\_EL1](#).

### Attributes

ISR is a 32-bit register.

### Field descriptions

The ISR bit assignments are:

#### Bits [31:9]

Reserved, RES0.

#### A, bit [8]

Asynchronous external abort pending bit:

0 No pending asynchronous external abort.

1 An asynchronous external abort is pending.

#### I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

0 No pending IRQ.

1 An IRQ interrupt is pending.

#### F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

0 No pending FIQ.

1 An FIQ interrupt is pending.

#### Bits [5:0]

Reserved, RES0.

### Accessing the ISR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c12, c1, 0	000	000	1100	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T12](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T12](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T12](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.96 ITLBIALL, Instruction TLB Invalidate All

The ITLBIALL characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at Secure EL1 when EL3 is using AArch64, all entries that would be required for the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at Non-secure EL1, all stage 1 translation table entries that would be required for the Non-secure PL1&0 translation regime and, if EL2 is implemented, they must match the current VMID.
- If executed at EL2, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this instruction.

ARM deprecates the use of this instruction. It is only provided for backwards compatibility with earlier versions of the ARM architecture.

### Configurations

There are no configuration notes.

### Attributes

ITLBIALL is a 32-bit System instruction.

### Field descriptions

ITLBIALL ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

### Executing the ITLBIALL instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c5, 0	000	000	1000	1111	0101

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When **HCR.FB** is 1, at Non-secure EL1 this instruction executes as a **TLBIALLS** operating on instruction TLBs only.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If **HCR\_EL2.TTLB**==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If **HSTR\_EL2.T8**==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If **HCR\_EL2.TTLB**==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If **HSTR\_EL2.T8**==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If **HCR.TTLB**==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If **HSTR.T8**==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.97 ITLBIASID, Instruction TLB Invalidate by ASID match

The ITLBIASID characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

ARM deprecates the use of this instruction. It is only provided for backwards compatibility with earlier versions of the ARM architecture.

### Configurations

There are no configuration notes.

### Attributes

ITLBIASID is a 32-bit System instruction.

### Field descriptions

The ITLBIASID input value bit assignments are:

31	8 7	0
RES0		ASID

#### Bits [31:8]

Reserved, RES0.

#### ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

### Executing the ITLBIASID instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c5, 2	000	010	1000	1111	0101

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIASIDIS](#) operating on instruction TLBs only.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

G6.2.98 ITLBIMVA, Instruction TLB Invalidate by VA

The ITLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

ARM deprecates the use of this instruction. It is only provided for backwards compatibility with earlier versions of the ARM architecture.

Configurations

There are no configuration notes.

Attributes

ITLBIMVA is a 32-bit System instruction.

Field descriptions

The ITLBIMVA input value bit assignments are:

31	12	11	8	7	0
VA			RES0	ASID	

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

## Executing the ITLBIMVA instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c5, 1	000	001	1000	1111	0101

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIMVAIS](#) operating on instruction TLBs only.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.99 JIDR, Jazelle ID Register

The JIDR characteristics are:

### Purpose

A Jazelle register, which identified the Jazelle architecture version.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

### Attributes

JIDR is a 32-bit register.

### Field descriptions

The JIDR bit assignments are:

### Bits [31:0]

RAZ.

### Accessing the JIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 7, <Rt>, c0, c0, 0	111	000	0000	1110	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	IMPLEMENTATION DEFINED	RO	n/a	RO
x	0	1	IMPLEMENTATION DEFINED	RO	RO	RO
x	1	1	IMPLEMENTATION DEFINED	n/a	RO	RO

For accesses from EL0 it is IMPLEMENTATION DEFINED whether the register is RO or UNDEFINED.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HCR\_EL2.TID0 == 1$ , Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HCR\_EL2.TID0 == 1$ , Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HCR.TID0 == 1$ , Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.

## G6.2.100 JMCR, Jazelle Main Configuration Register

The JMCR characteristics are:

### Purpose

A Jazelle register, which provides control of the Jazelle extension.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

### Attributes

JMCR is a 32-bit register.

### Field descriptions

The JMCR bit assignments are:

### Bits [31:0]

RAZ/WI.

### Accessing the JMCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 7, <Rt>, c2, c0, 0	111	000	0010	1110	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	IMPLEMENTATION DEFINED	RW	n/a	RW
x	0	1	IMPLEMENTATION DEFINED	RW	RW	RW
x	1	1	IMPLEMENTATION DEFINED	n/a	RW	RW

For accesses from EL0 it is IMPLEMENTATION DEFINED whether the register is RW or UNDEFINED.

## G6.2.101 JOSCR, Jazelle OS Control Register

The JOSCR characteristics are:

### Purpose

A Jazelle register, which provides operating system control of the Jazelle Extension.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

### Attributes

JOSCR is a 32-bit register.

### Field descriptions

The JOSCR bit assignments are:

### Bits [31:0]

RAZ/WI.

### Accessing the JOSCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 7, <Rt>, c1, c0, 0	111	000	0001	1110	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	IMPLEMENTATION DEFINED	RW	n/a	RW
x	0	1	IMPLEMENTATION DEFINED	RW	RW	RW
x	1	1	IMPLEMENTATION DEFINED	n/a	RW	RW

For accesses from EL0 it is IMPLEMENTATION DEFINED whether the register is RW or UNDEFINED.

G6.2.102 MAIR0, Memory Attribute Indirection Register 0

The MAIR0 characteristics are:

Purpose

Along with MAIR1, provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIdx[2] indicates the MAIR register to be used:

- When AttrIdx[2] is 0, MAIR0 is used.
- When AttrIdx[2] is 1, MAIR1 is used.

Configurations

AArch32 System register MAIR0 is architecturally mapped to AArch64 System register MAIR\_EL1[31:0].

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

When EL3 is using AArch32, write access to MAIR0(S) is disabled when the CP15SSDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MAIR0 is a 32-bit register.

Field descriptions

The MAIR0 bit assignments are:

When TTBCR.EAE==1:

31	24 23	16 15	8 7	0
Attr3	Attr2	Attr1	Attr0	

Attr<n>, bits [8n+7:8n], for n = 0 to 3

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIdx[2:0] gives the value of <n> in Attr<n>.
- AttrIdx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
00RW, RW not 00	Normal memory, Outer Write-Through Transient
0100	Normal memory, Outer Non-cacheable

Attr<n>[7:4]	Meaning
01RW, RW not 00	Normal memory, Outer Write-Back Transient
10RW	Normal memory, Outer Write-Through Non-transient
11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0000	Meaning when Attr<n>[7:4] is not 0000
0000	Device-nGnRnE memory	UNPREDICTABLE
00RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
01RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=00)
10RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=00)
11RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0	No Allocate
1	Allocate

## Accessing the MAIR0

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c10, c2, 0	000	000	1010	1111	0010

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	MAIR0_s
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	MAIR0
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	MAIR0
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	MAIR0
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	MAIR0
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	MAIR0
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	MAIR0
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	MAIR0_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	MAIR0_ns

When EL3 is using AArch32, write access to MAIR0\_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If HCR.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T10==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.103 MAIR1, Memory Attribute Indirection Register 1

The MAIR1 characteristics are:

### Purpose

Along with [MAIR0](#), provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIdx[2] indicates the MAIR register to be used:

- When AttrIdx[2] is 0, [MAIR0](#) is used.
- When AttrIdx[2] is 1, MAIR1 is used.

### Configurations

AArch32 System register MAIR1 is architecturally mapped to AArch64 System register [MAIR\\_EL1](#)[63:32].

MAIR1 and [NMRR](#) are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in [NMRR](#).
- When it is set to 1, the register is as described in MAIR1.

When EL3 is using AArch32, write access to MAIR1(S) is disabled when the CP15SSDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

MAIR1 is a 32-bit register.

### Field descriptions

The MAIR1 bit assignments are:

**When [TTBCR.EAE](#)==1:**

31	24 23	16 15	8 7	0
Attr7	Attr6	Attr5	Attr4	

**Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 4 to 7**

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIdx[2:0] gives the value of <n> in Attr<n>.
- AttrIdx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
00RW, RW not 00	Normal memory, Outer Write-Through Transient
0100	Normal memory, Outer Non-cacheable

Attr<n>[7:4]	Meaning
01RW, RW not 00	Normal memory, Outer Write-Back Transient
10RW	Normal memory, Outer Write-Through Non-transient
11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0000	Meaning when Attr<n>[7:4] is not 0000
0000	Device-nGnRnE memory	UNPREDICTABLE
00RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
01RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=00)
10RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=00)
11RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0	No Allocate
1	Allocate

## Accessing the MAIR1

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c10, c2, 1	000	001	1010	1111	0010

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	MAIR1_s
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	MAIR1_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	MAIR1_ns
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	MAIR1
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	MAIR1
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	MAIR1
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	MAIR1
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	MAIR1
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	MAIR1

When EL3 is using AArch32, write access to MAIR1\_s is UNDEFINED when the CP15SSDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If HCR.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T10==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G6.2.104 MIDR, Main ID Register

The MIDR characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MIDR is architecturally mapped to AArch64 System register [MIDR\\_EL1](#).

AArch32 System register MIDR is architecturally mapped to External register [MIDR\\_EL1](#).

Some fields of the MIDR are IMPLEMENTATION DEFINED. For details of the values of these fields for a particular ARMv8 implementation, and any implementation-specific significance of these values, see the product documentation.

Attributes

MIDR is a 32-bit register.

Field descriptions

The MIDR bit assignments are:

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

Hex representation	ASCII representation	Implementer
0x41	A	ARM Limited
0x42	B	Broadcom Corporation
0x43	C	Cavium Inc.
0x44	D	Digital Equipment Corporation
0x49	I	Infineon Technologies AG
0x4D	M	Motorola or Freescale Semiconductor Inc.
0x4E	N	NVIDIA Corporation
0x50	P	Applied Micro Circuits Corporation
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

#### Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

#### Architecture, bits [19:16]

The permitted values of this field are:

0001	ARMv4
0010	ARMv4T
0011	ARMv5 (obsolete)
0100	ARMv5T
0101	ARMv5TE
0110	ARMv5TEJ
0111	ARMv6
1111	Architectural features are individually identified in the ID_* registers, see <a href="#">Identification registers, functional group</a> on page G4-4727.

All other values are reserved.

#### PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

#### Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

### Accessing the MIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c0, 0	000	000	0000	1111	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T0 == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T0 == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T0 == 1$ , Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.105 MPIDR, Multiprocessor Affinity Register

The MPIDR characteristics are:

### Purpose

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MPIDR is architecturally mapped to AArch64 System register [MPIDR\\_EL1](#).

The assigned value of the MPIDR. {Aff2, Aff1, Aff0} or [MPIDR\\_EL1](#). {Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

In a uniprocessor system ARM recommends that each Aff<n> field of this register returns a value of 0.

### Attributes

MPIDR is a 32-bit register.

### Field descriptions

The MPIDR bit assignments are:

#### M, bit [31]

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

- 0 This implementation does not include the ARMv7 Multiprocessing Extensions functionality.
- 1 This implementation includes the ARMv7 Multiprocessing Extensions functionality.

In ARMv8 this bit is RES1.

#### U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

- 0 Processor is part of a multiprocessor system.
- 1 Processor is part of a uniprocessor system.

#### Bits [29:25]

Reserved, RES0.

#### MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. The possible values of this bit are:

- 0 Performance of PEs at the lowest affinity level is largely independent.
- 1 Performance of PEs at the lowest affinity level is very interdependent.

#### Aff2, bits [23:16]

Affinity level 2. The least significant affinity level field, for this PE in the system.

#### Aff1, bits [15:8]

Affinity level 1. The intermediate affinity level field, for this PE in the system.

#### Aff0, bits [7:0]

Affinity level 0. The most significant affinity level field, for this PE in the system.

### Accessing the MPIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c0, 5	000	101	0000	1111	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T0](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.106 MVBAR, Monitor Vector Base Address Register

The MVBAR characteristics are:

### Purpose

When EL3 is implemented and can use AArch32, holds the vector base address for any exception that is taken to Monitor mode.

Secure software must program the MVBAR with the required initial value as part of the PE boot sequence.

### Configurations

This register is only accessible in Secure state.

It is IMPLEMENTATION DEFINED whether MVBAR[0] has a fixed value and ignored writes, or takes the last value written to it.

Write access to MVBAR is disabled when the CP15SSDISABLE signal is asserted HIGH.

On a reset into EL3 using AArch32, the reset value of MVBAR is an IMPLEMENTATION DEFINED choice between:

- MVBAR[31:5] = an IMPLEMENTATION DEFINED value, which might be UNKNOWN.
- MVBAR[4:1] = RES0.
- MVBAR[0] = 0.

And:

- MVBAR[31:1] = an IMPLEMENTATION DEFINED value that is bits[31:1] of the AArch32 reset address.
- MVBAR[0] = 1.

### Attributes

MVBAR is a 32-bit register.

### Field descriptions

The MVBAR bit assignments are:

**When programmed with a vector base address:**

### Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

### Reserved, bits [4:0]

Reserved, see Configurations.

### Accessing the MVBAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c12, c0, 1	000	001	1100	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	-	RW
x	1	1	-	n/a	-	RW

When EL3 is using AArch32, write access to MVBAR is UNDEFINED when the CP15SSDISABLE signal is asserted HIGH.

If EL3 is implemented and is using AArch64, any read or write to MVBAR from Secure EL1 using AArch32 is trapped as an exception to EL3.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T12](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T12](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T12](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.107 MVFR0, Media and VFP Feature Register 0

The MVFR0 characteristics are:

### Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR1](#) and [MVFR2](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G4-4701](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MVFR0 is architecturally mapped to AArch64 System register [MVFR0\\_EL1](#).

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

### Attributes

MVFR0 is a 32-bit register.

### Field descriptions

The MVFR0 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
FPRound	FPSHVec	FPSqrt	FPDivide	FPTrap	FPDP	FPSP	SIMDReg								

#### FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

0000 Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the [FPSCR](#) setting.

0001 All rounding modes supported.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

#### FPSHVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

0000 Short vectors not supported.

0001 Short vector operation supported.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

0000 Not supported in hardware.

0001 Supported.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

#### **FPDivide, bits [19:16]**

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

0000 Not supported in hardware.

0001 Supported.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

#### **FPTrap, bits [15:12]**

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

0000 Not supported.

0001 Supported.

All other values are reserved.

A value of 0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

#### **FPDP, bits [11:8]**

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

0000 Not supported in hardware.

0001 Supported, VFPv2.

0010 Supported, VFPv3, VFPv4, or ARMv8. VFPv3 and ARMv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0001.
- VDIV.F64 is only available if the Divide field is 0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

#### **FPSP, bits [7:4]**

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

0000 Not supported in hardware.

0001 Supported, VFPv2.

0010 Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0001.
- VDIV.F32 is only available if the Divide field is 0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

#### SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

- 0000 The implementation has no Advanced SIMD and floating-point support.
- 0001 The implementation includes floating-point support with 16 x 64-bit registers.
- 0010 The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

#### Accessing the MVFR0

This register can be read using VMRS with the following syntax:

VMRS <Rt>, <spec\_reg>

This syntax is encoded with the following settings in the instruction encoding:

<spec_reg>	reg
MVFR0	0111

#### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} == 0$ :
  - If  $\text{CPACR.cp10} == 0$ , read accesses to this register from PL1 are UNDEFINED.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 0)$ :
  - If  $\text{CPTR\_EL2.TFP} == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $\text{HCR\_EL2.TID3} == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 1) \ \&\& \ (\text{HCR\_EL2.TGE} == 0)$ :
  - If  $\text{CPTR\_EL2.FPEN} == 0$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CPTR\_EL2.FPEN} == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $\text{HCR\_EL2.TID3} == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} == 1$ :
  - If  $\text{HCPTR.TCP10} == 1$ , Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If  $\text{HCPTR.TCP10} == 0$ , Non-secure read accesses to this register from EL2 are UNDEFINED.
  - If  $\text{HCR.TID3} == 1$ , Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} == 1$ :
  - If  $\text{NSACR.cp10} == 0$ , Non-secure read accesses to this register from EL1 and EL2 are UNDEFINED.
- When EL3 is implemented and is using AArch64:
  - If  $\text{CPTR\_EL3.TFP} == 1$ , read accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.2.108 MVFR1, Media and VFP Feature Register 1

The MVFR1 characteristics are:

### Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0](#) and [MVFR2](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page G4-4701](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MVFR1 is architecturally mapped to AArch64 System register [MVFR1\\_EL1](#).

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

### Attributes

MVFR1 is a 32-bit register.

### Field descriptions

The MVFR1 bit assignments are:

#### SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

0000 Not implemented.

0001 Implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

#### FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

0000 Not supported.

0001 Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.

0010 Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision and between double-precision and half-precision.

0011 As for 0010, and also includes support for half-precision floating-point arithmetic.

All other values are reserved.

The permitted values are:

- 0000 in an implementation without floating-point support.
- 0010 in an implementation with floating-point support, that does not include the [ARMv8.2-FP16](#) extension.
- 0011 in an implementation with floating-point support, that includes the [ARMv8.2-FP16](#) extension.

#### **SIMDHP, bits [23:20]**

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

- |      |   |
|------|---|
| 0000 | Not supported.  |
| 0001 | SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision. |
| 0010 | As for 0010, and also includes support for half-precision floating-point arithmetic.                                  |

All other values are reserved.

The permitted values are:

- 0000 in an implementation without SIMD floating-point support.
- 0001 in an implementation with SIMD floating-point support, that does not include the [ARMv8.2-FP16](#) extension.
- 0010 in an implementation with SIMD floating-point support, that includes the [ARMv8.2-FP16](#) extension.

#### **SIMDSP, bits [19:16]**

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

- |      |   |
|------|---|
| 0000 | Not implemented.  |
| 0001 | Implemented. This value is permitted only if the SIMDInt field is 0001. |

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

#### **SIMDInt, bits [15:12]**

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

- |      |                  |
|------|------------------|
| 0000 | Not implemented. |
| 0001 | Implemented.     |

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

#### **SIMDLS, bits [11:8]**

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

- |      |                  |
|------|------------------|
| 0000 | Not implemented. |
| 0001 | Implemented.     |

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

#### **FPDNaN, bits [7:4]**

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

- |      |  |
|------|--|
| 0000 | Not implemented, or hardware supports only the Default NaN mode. |
|------|--|

0001 Hardware supports propagation of NaN values.  
All other values are reserved.  
In ARMv8-A the permitted values are 0000 and 0001.

#### FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

0000 Not implemented, or hardware supports only the Flush-to-Zero mode of operation.  
0001 Hardware supports full denormalized number arithmetic.  
All other values are reserved.  
In ARMv8-A the permitted values are 0000 and 0001.

### Accessing the MVFR1

This register can be read using VMRS with the following syntax:

VMRS <Rt>, <spec\_reg>

This syntax is encoded with the following settings in the instruction encoding:

<spec_reg>	reg
MVFR1	0110

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When HCR\_EL2.E2H == 0:
  - If CPACR.cp10==00, read accesses to this register from PL1 are UNDEFINED.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If CPTR\_EL2.TFP==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If CPTR\_EL2.FPEN==00, Non-secure read accesses to this register from EL1 are trapped to EL2.

- If [CPTR\\_EL2.FPEN](#)==10, Non-secure read accesses to this register from EL1 are trapped to EL2.
- If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [HCPTR.TCP10](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HCPTR.TCP10](#)==1, Non-secure read accesses to this register from EL2 are UNDEFINED.
  - If [HCR.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [NSACR.cp10](#)==0, Non-secure read accesses to this register from EL1 and EL2 are UNDEFINED.
- When EL3 is implemented and is using AArch64:
  - If [CPTR\\_EL3.TFP](#)==1, read accesses to this register from EL1 and EL2 are trapped to EL3.

### G6.2.109 MVFR2, Media and VFP Feature Register 2

The MVFR2 characteristics are:

## Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with **MVFR0** and **MVFR1**.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page G4-4701.

## Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register MVFR2 is architecturally mapped to AArch64 System register [MVFR2\\_EL1](#).

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

## Attributes

MVFR2 is a 32-bit register.

## Field descriptions

The MVFR2 bit assignments are:

31	8	7	4	3	0
RES0			FPMisc		SIMDMisc

**Bits [31:8]**

Reserved, RES0.

**FPMisc, bits [7:4]**

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

0000 Not implemented, or no support for miscellaneous features.

0001      Support for Floating-point selection.

0010 As 0001, and Floating-point Conversion to Integer with Directed Rounding modes.

0011 As 0010, and Floating-point Round to Integer Floating-point.

0100 As 0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0100.

**SIMDMisc, bits [3:0]**

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

0000 Not implemented, or no support for miscellaneous features.

0001 Floating-point Conversion to Integer with Directed Rounding modes.

0010 As 0001, and Floating-point Round to Integer Floating-point.

0011 As 0010, and Floating-point MaxNum and MinNum.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0011.

## Accessing the MVFR2

This register can be read using VMRS with the following syntax:

VMRS <Rt>, <spec\_reg>

This syntax is encoded with the following settings in the instruction encoding:

<spec_reg>	reg
MVFR2	0101

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} = 0$ :
  - If  $\text{CPACR.cp10} = 00$ , read accesses to this register from PL1 are UNDEFINED.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 0)$ :
  - If  $\text{CPTR\_EL2.TFP} = 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $\text{HCR\_EL2.TID3} = 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If  $\text{CPTR\_EL2.FPEN} = 00$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CPTR\_EL2.FPEN} = 10$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $\text{HCR\_EL2.TID3} = 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} = 1$ :
  - If  $\text{HCPTR.TCP10} = 1$ , Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If  $\text{HCPTR.TCP10} = 1$ , Non-secure read accesses to this register from EL2 are UNDEFINED.
  - If  $\text{HCR.TID3} = 1$ , Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} = 1$ :
  - If  $\text{NSACR.cp10} = 0$ , Non-secure read accesses to this register from EL1 and EL2 are UNDEFINED.

- When EL3 is implemented and is using AArch64:
  - If [CPTR\\_EL3](#).TFP==1, read accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.2.110 NMRR, Normal Memory Remap Register

The NMRR characteristics are:

### Purpose

Provides additional mapping controls for memory regions that are mapped as Normal memory by their entry in the [PRRR](#).

Used in conjunction with the [PRRR](#).

### Configurations

AArch32 System register NMRR is architecturally mapped to AArch64 System register [MAIR\\_EL1](#)[63:32].

[MAIR1](#) and NMRR are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in [MAIR1](#).

When EL3 is using AArch32, write access to NMRR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

NMRR is a 32-bit register.

### Field descriptions

The NMRR bit assignments are:

**When [TTBCR.EAE](#)==0:**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OR7	OR6	OR5	OR4	OR3	OR2	OR1	OR0	IR7	IR6	IR5	IR4	IR3	IR2	IR1	IR0																

**OR<n>, bits [2n+17:2n+16], for n = 0 to 7**

Outer Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the [PRRR.TR<n>](#) entry. n is the value of the [TEX\[0\]](#), C, and B bits concatenated. The possible values of this field are:

- 00 Region is Non-cacheable.
- 01 Region is Write-Back, Write-Allocate.
- 10 Region is Write-Through, no Write-Allocate.
- 11 Region is Write-Back, no Write-Allocate.

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {[TEX\[0\]](#) = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

**IR<n>, bits [2n+1:2n], for n = 0 to 7**

Inner Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the [PRRR.TR<n>](#) entry. n is the value of the [TEX\[0\]](#), C, and B bits concatenated. The possible values of this field are:

- 00 Region is Non-cacheable.
- 01 Region is Write-Back, Write-Allocate.

10 Region is Write-Through, no Write-Allocate.

11 Region is Write-Back, no Write-Allocate.

The meaning of the field with  $n = 6$  is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination  $\{TEX[0] = 1, C = 1, B = 0\}$  is IMPLEMENTATION DEFINED.

## Accessing the NMRR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c10, c2, 1	000	001	1010	1111	0010

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	NMRR_s
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	NMRR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	NMRR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	NMRR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	NMRR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	NMRR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	NMRR
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	NMRR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	NMRR_ns

When EL3 is using AArch32, write access to NMRR\_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \ \&\& \ (HCR\_EL2.E2H == 0)$ :
  - If  $HCR\_EL2.TVM == 1$ , Non-secure write accesses to this register from EL1 are trapped to EL2.

- If [HCR\\_EL2](#).TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- If [HSTR\\_EL2](#).T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2](#).TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2](#).TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HSTR\\_EL2](#).T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR](#).TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If [HCR](#).TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR](#).T10==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.111 NSACR, Non-Secure Access Control Register

The NSACR characteristics are:

### Purpose

When EL3 is implemented and can use AArch32, defines the Non-secure access permissions to Trace, Advanced SIMD and floating-point functionality. Also includes IMPLEMENTATION DEFINED bits that can define Non-secure access permissions for IMPLEMENTATION DEFINED functionality.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

#### Note

In AArch64 state, the NSACR controls are replaced by controls in [CPTR\\_EL3](#).

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.

### Attributes

NSACR is a 32-bit register.

### Field descriptions

The NSACR bit assignments are:

If EL3 is implemented and is using AArch64 then:

- Any read of the NSACR from Non-secure EL2 or Non-secure EL1 returns a value of 0x0000C00.
- Any read or write to NSACR from Secure EL1 is trapped as an exception to EL3.

If EL3 is not implemented, then any read of the NSACR from EL2 or EL1 returns a value of 0x0000C00.

### Bits [31:21]

Reserved, RES0.

### NSTRCDIS, bit [20]

Disables Non-secure System register accesses to all implemented trace registers.

0 This control has no effect on:

- System register access to implemented trace registers.
- The behavior of [CPACR](#).TRCDIS and [HCPTR](#).TTA.

1 Non-secure System register accesses to all implemented trace registers are disabled, meaning:

- [CPACR](#).TRCDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.
- [HCPTR](#).TTA behaves as RAO/WI, regardless of its actual value.

The implementation of this field must correspond to the implementation of the [CPACR](#).TRCDIS field:

- If [CPACR](#).TRCDIS is RAZ/WI, this field is RAZ/WI.
- If [CPACR](#).TRCDIS is RW, this field is RW.

---

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the implementation includes an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED.
  - The architecture does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.
- 

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

**Bit [19]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [18:16]**

IMPLEMENTATION DEFINED.

**NSASEDIS, bit [15]**

Disables Non-secure access to the Advanced SIMD functionality.

- |   |   |
|---|---|
| 0 | This control has no effect on: <ul style="list-style-type: none"> <li>• Non-secure access to Advanced SIMD functionality.</li> <li>• The behavior of <a href="#">CPACR</a>.ASEDIS and <a href="#">HCPTR</a>.TASE.</li> </ul>  |
| 1 | Non-secure access to the Advanced SIMD functionality is disabled, meaning: <ul style="list-style-type: none"> <li>• <a href="#">CPACR</a>.ASEDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.</li> <li>• <a href="#">HCPTR</a>.TASE behaves as RAO/WI, regardless of its actual value.</li> </ul> |

The implementation of this field must correspond to the implementation of the [CPACR](#).ASEDIS field:

- If [CPACR](#).ASEDIS is RES0, this field is RES0. If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.
- If [CPACR](#).ASEDIS is RAZ/WI, this field is RAZ/WI.
- If [CPACR](#).ASEDIS is RW, this field is RW.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

**Bits [14:12]**

Reserved, RES0.

**cp11, bit [11]**

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the NSACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

### cp10, bit [10]

Enable Non-secure access to the Advanced SIMD and floating-point features. Possible values of the fields are:

- 0 Advanced SIMD and floating-point features can be accessed only from Secure state. Any attempt to access this functionality from Non-secure state is UNDEFINED.
- When the PE is in Non-secure state:
- The **CPACR**.{cp11, cp10} fields ignore writes and read as 0b00, access denied.
  - The **HCPTR**.{TCP11, TCP10} fields behave as RAO/WI, regardless of their actual values.

- 1 Advanced SIMD and floating-point features can be accessed from both Security states. If Non-secure access to the Advanced SIMD and floating-point functionality is enabled, the **CPACR** must be checked to determine the level of access that is permitted.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the **FPSCR**, **FPSID**, **MVFR0**, **MVFR1**, **MVFR2**, or **FPEXC** System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

### Bits [9:0]

Reserved, RES0.

## Accessing the NSACR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c1, 2	000	010	0001	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	RO	RO	RW
x	1	1	-	n/a	RO	RW

If EL3 is implemented and is using AArch64, any read from or write to NSACR from Secure EL1 is trapped as an exception to EL3.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T1 == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T1 == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T1 == 1$ , Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.112 PAR, Physical Address Register

The PAR characteristics are:

### Purpose

Returns the output address (OA) from an address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

### Configurations

AArch32 System register PAR is architecturally mapped to AArch64 System register [PAR\\_EL1](#).

The PAR returns a 32-bit value:

- When the PE is not in Hyp mode and is using the Short-descriptor translation table format.
- When the PE is in Hyp mode and executes an [ATS12NSOPR](#), [ATS12NSOPW](#), [ATS12NSOUR](#), or [ATS12NSOUW](#) instruction when the value of [HCR.VM](#) is 0 and the value of [TTBCR.EAE](#) is 0.

In these cases, PAR[63:32] is RES0.

Otherwise, the PAR returns a 64-bit value. This means it returns a 64-bit value in the following cases:

- When using the Long-descriptor translation table format.
- If the stage 1 address translation is disabled and [TTBCR.EAE](#) is set to 1.
- In an implementation that includes EL2, for the result of an [ATS1Cxx](#) instruction performed from Hyp mode.

For PL1&0 stage 1 translations, [TTBCR.EAE](#) selects the translation table format.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits[31:0] and do not modify bits[63:32].

The Configurations section specifies the cases where each PAR format is used.

## Field descriptions

The PAR bit assignments are:

### For all register layouts:

#### F, bit [0]

Indicates whether the instruction performed a successful address translation.

- |   |   |
|---|---|
| 0 | Address translation completed successfully. |
| 1 | Address translation aborted.                |

**When the instruction returned a 32-bit value to the PAR, PAR.F==0:**

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the NOS, SH, Inner, and Outer fields.
- See the NS bit description for constraints on the value it returns.

#### PA, bits [31:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[31:12].

#### LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

- 0 Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

#### NOS, bit [10]

Not Outer Shareable. When the returned value of PAR.SH is 1, indicates the Shareability attribute for the physical memory region:

- 0 Memory region is Outer Shareable.
- 1 Memory region is Inner Shareable.

When the returned value of PAR.SH is 0 the value returned to this field is UNKNOWN.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

#### NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

#### IMP DEF, bit [8]

IMPLEMENTATION DEFINED.

### SH, bit [7]

Shareability. Indicates whether the physical memory region is Non-shareable:

- |   |  |
|---|--|
| 0 | Memory is Non-shareable.   |
| 1 | Memory is shareable, and PAR.NOS indicates whether the region is Outer Shareable or Inner Shareable. |

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

### Inner[2:0], bits [6:4]

Inner cacheability attribute for the region. Permitted values are:

- |     |                                |
|-----|--------------------------------|
| 000 | Non-cacheable.                 |
| 001 | Device-nGnRnE.                 |
| 011 | Device-nGnRE.                  |
| 101 | Write-Back, Write-Allocate.    |
| 110 | Write-Through.                 |
| 111 | Write-Back, no Write-Allocate. |

The values 010 and 100 are reserved.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

### Outer[1:0], bits [3:2]

Outer cacheability attribute for the region. Permitted values are:

- |    |                                   |
|----|-----------------------------------|
| 00 | Non-cacheable.                    |
| 01 | Write-Back, Write-Allocate.       |
| 10 | Write-Through, no Write-Allocate. |
| 11 | Write-Back, no Write-Allocate.    |

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

### SS, bit [1]

Supersection. Used to indicate if the result is a Supersection:

- |   |  |
|---|--|
| 0 | Result is not a Supersection. PAR[31:12] contains OA[31:12].   |
| 1 | Result is a Supersection, and: <ul style="list-style-type: none"> <li>• PAR[31:24] contains OA[31:24].</li> <li>• PAR[23:16] contains OA[39:32].</li> <li>• PAR[15:12] contains 0b0000.</li> </ul> |

If an implementation supports less than 40 bits of physical address, the bits in the PAR field that correspond to physical address bits that are not implemented are UNKNOWN.

### F, bit [0]

Indicates whether the instruction performed a successful address translation.

- |   |   |
|---|---|
| 0 | Address translation completed successfully. |
|---|---|

**When the instruction returned a 32-bit value to the PAR, PAR.F==1:**

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**IMP DEF, bits [31:16]**

IMPLEMENTATION DEFINED.

**Bits [15:12]**

Reserved, RES0.

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

0 Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

**Bits [10:7]**

Reserved, RES0.

**FS, bits [6:1]**

Fault status bits. Bits [12,10,3:0] from the [DFSR](#), indicating the source of the abort.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

1 Address translation aborted.

**When the instruction returned a 64-bit value to the PAR, PAR.F==0:**

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the ATTR and SH fields.

- See the NS bit description for constraints on the value it returns.

**ATTR, bits [63:56]**

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR0 and MAIR1.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

**Bits [55:40]**

Reserved, RES0.

**PA, bits [39:12]**

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[39:12].

**LPAAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

- |   |  |
|---|--|
| 1 | Long-descriptor translation table format used. This means the PAR returned a 64-bit value. |
|---|--|

**IMP DEF, bit [10]**

IMPLEMENTATION DEFINED.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

**SH, bits [8:7]**

Shareability attribute, for the returned output address. Permitted values are:

- |    |                  |
|----|------------------|
| 00 | Non-shareable.   |
| 10 | Outer Shareable. |
| 11 | Inner Shareable. |

The value 01 is reserved.

———— **Note** —————

This field returns the value 10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

**Bits [6:1]**

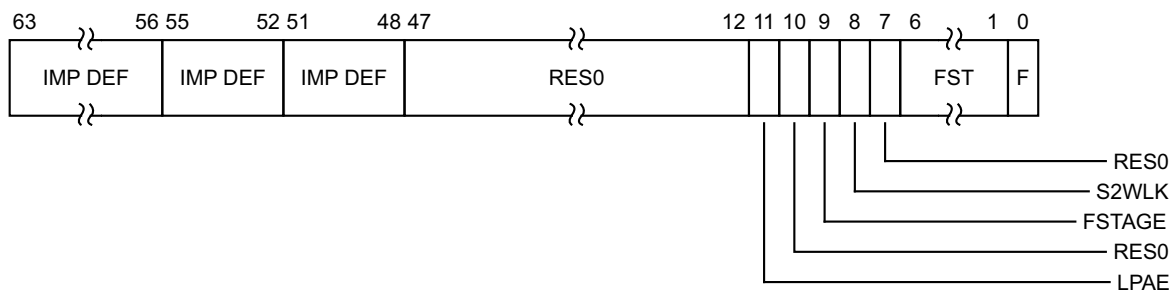

Reserved, RES0.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

- |   |   |
|---|---|
| 0 | Address translation completed successfully. |
|---|---|

**When the instruction returned a 64-bit value to the PAR, PAR.F==1:**

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

#### IMP DEF, bits [63:56]

IMPLEMENTATION DEFINED.

#### IMP DEF, bits [55:52]

IMPLEMENTATION DEFINED.

#### IMP DEF, bits [51:48]

IMPLEMENTATION DEFINED.

#### Bits [47:12]

Reserved, RES0.

#### LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

1 Long-descriptor translation table format used. This means the PAR returned a 64-bit value.

#### Bit [10]

Reserved, RES0.

#### FSTAGE, bit [9]

Indicates the translation stage at which the translation aborted:

0 Translation aborted because of a fault in the stage 1 translation.  
1 Translation aborted because of a fault in the stage 2 translation.

#### S2WLK, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

#### Bit [7]

Reserved, RES0.

#### FST, bits [6:1]

Fault status field. Values are as in the [DFSR.STATUS](#) and [IFSR.STATUS](#) fields when using the Long-descriptor translation table format.

#### F, bit [0]

Indicates whether the instruction performed a successful address translation.

1 Address translation aborted.

## Accessing the PAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c7, c4, 0	000	000	0111	1111	0100

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 0, <Rt>, <Rt2>, c7	0000	1111	0111

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	PAR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	PAR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	PAR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	PAR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	PAR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	PAR
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	PAR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	PAR_ns
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	PAR_s

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T7 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T7 == 1$ , Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.113 PRRR, Primary Region Remap Register

The PRRR characteristics are:

### Purpose

Controls the top level mapping of the TEX[0], C, and B memory region attributes.

### Configurations

AArch32 System register PRRR is architecturally mapped to AArch64 System register [MAIR\\_ELI](#)[31:0].

[MAIR0](#) and PRRR are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in [MAIR0](#).

When EL3 is using AArch32, write access to PRRR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

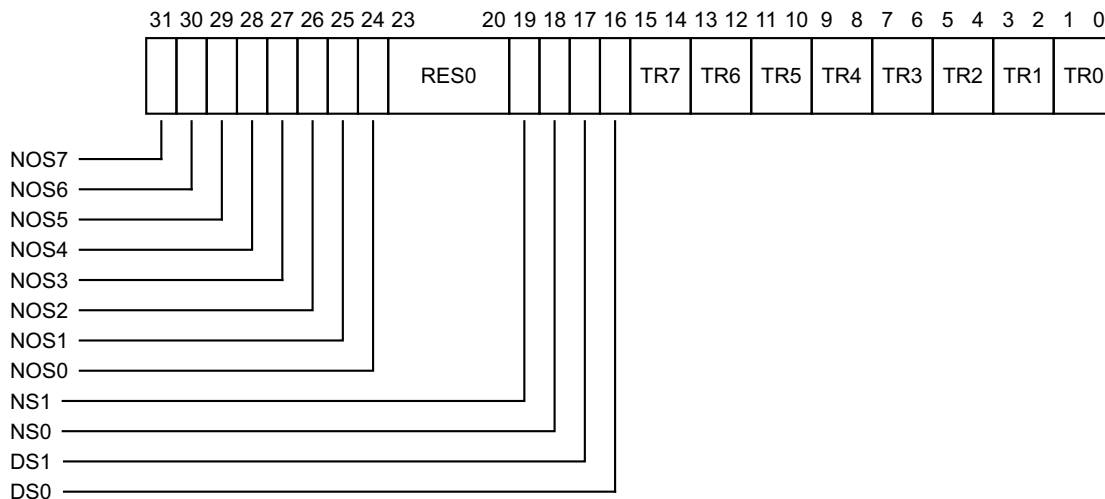

### Attributes

PRRR is a 32-bit register.

### Field descriptions

The PRRR bit assignments are:

**When *TTBCR.EAE*==0:**

**NOS<n>, bit [n+24], for n = 0 to 7**

Not Outer Shareable. NOS<n> is the Outer Shareable property for memory attributes n, if the region is mapped as Normal memory that is not Inner Non-cacheable, Outer Non-cacheable, and the appropriate PRRR. {NS0, NS1} field identifies the region as shareable. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values of each NOS<n> field other than NOS6 are:

- 0 Memory region is Outer Shareable.
- 1 Memory region is Inner Shareable.

The value of this bit is ignored if the region is:

- Device memory
- Normal memory that is at least one of:
  - Inner Non-cacheable, Outer Non-cacheable.
  - Identified by the appropriate PRRR.{NS0, NS1} field as Non-shareable.

The meaning of the NOS6 field is IMPLEMENTATION DEFINED.

#### Bits [23:20]

Reserved, RES0.

#### NS1, bit [19]

Mapping of S = 1 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 1.

The possible values of this bit are:

- |   |  |
|---|--|
| 0 | Region is Non-shareable.   |
| 1 | Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable. |

#### NS0, bit [18]

Mapping of S = 0 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 0.

The possible values of this bit are:

- |   |  |
|---|--|
| 0 | Region is Non-shareable.   |
| 1 | Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable. |

#### DS1, bit [17]

Mapping of S = 1 attribute for Device memory. In ARMv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

#### DS0, bit [16]

Mapping of S = 0 attribute for Device memory. In ARMv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

#### TR<n>, bits [2n+1:2n], for n = 0 to 7

TR<n> is the primary TEX mapping for memory attributes n, and defines the mapped memory type for a region with attributes n. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values for each field other than TR6 are:

- |    |                      |
|----|----------------------|
| 00 | Device-nGnRnE memory |
| 01 | Device-nGnRE memory  |
| 10 | Normal memory        |

The value 11 is reserved. The effect of programming a field to 11 is CONSTRAINED UNPREDICTABLE, see [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

The meaning of the TR6 field is IMPLEMENTATION DEFINED.

## Accessing the PRRR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c10, c2, 0	000	000	1010	1111	0010

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	PRRR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	PRRR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	PRRR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	PRRR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	PRRR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	PRRR
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	PRRR_s
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	PRRR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	PRRR_ns

When EL3 is using AArch32, write access to PRRR\_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.

- If [HCR\\_EL2](#).TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- If [HSTR\\_EL2](#).T10==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR](#).TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If [HCR](#).TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR](#).T10==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.114 REVIDR, Revision ID Register

The REVIDR characteristics are:

### Purpose

Provides implementation-specific minor revision information.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register REVIDR is architecturally mapped to AArch64 System register [REVIDR\\_EL1](#).

If REVIDR has the same value as [MIDR](#), then its contents have no significance.

### Attributes

REVIDR is a 32-bit register.

### Field descriptions

The REVIDR bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the REVIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c0, 6	000	110	0000	1111	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TID1==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.115 RMR, Reset Management Register

The RMR characteristics are:

### Purpose

If EL1 or EL3 is the highest implemented Exception level and this register is implemented:

- A write to the register at the highest implemented Exception level can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register RMR is architecturally mapped to AArch64 System register [RMR\\_EL1](#) when EL1 is highest implemented Exception level.

AArch32 System register RMR is architecturally mapped to AArch64 System register [RMR\\_EL3](#) when EL3 is implemented.

Only implemented if EL1 or EL3 is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

### Attributes

RMR is a 32-bit register.

### Field descriptions

The RMR bit assignments are:

#### Bits [31:2]

Reserved, RES0.

#### RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0 on a Warm or Cold reset.

#### AA64, bit [0]

When the highest implemented Exception level can use AArch64, determines which Execution state the PE boots into after a Warm reset:

- 0 AArch32.
- 1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

## Accessing the RMR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c12, c0, 2	000	010	1100	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL1 is the highest implemented Exception level.	x	x	x	-	RW	n/a	n/a
EL2 is the highest implemented Exception level.	x	0	1	-	-	-	n/a
EL2 is the highest implemented Exception level.	x	1	1	-	n/a	-	n/a
EL3 is the highest implemented Exception level.	x	x	0	-	-	n/a	RW
EL3 is the highest implemented Exception level.	x	0	1	-	-	-	RW
EL3 is the highest implemented Exception level.	x	1	1	-	n/a	-	RW

The encoding for this register is UNDEFINED:

- If the RMR is not implemented.
- At all Exception levels other than the highest implemented Exception level.

When EL3 is implemented, ARM deprecates accessing this register from any PE mode other than Monitor mode.

## G6.2.116 RVBAR, Reset Vector Base Address Register

The RVBAR characteristics are:

### Purpose

If EL3 is not implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch32 state.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

This register is only implemented if the highest Exception level implemented is capable of using AArch32, and is not EL3.

### Attributes

RVBAR is a 32-bit register.

### Field descriptions

The RVBAR bit assignments are:

### Bits [31:1]

Reset Address[31:1]. Bits [31:1] of the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 32-bit state.

### Bit [0]

Reserved, RES1.

### Accessing the RVBAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c12, c0, 1	000	001	1100	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL1 is the highest implemented Exception level.	x	x	x	-	RO	n/a	n/a
EL2 is the highest implemented Exception level.	x	0	1	-	-	RO	n/a
EL2 is the highest implemented Exception level.	x	1	1	-	n/a	RO	n/a
EL3 is the highest implemented Exception level.	x	x	0	-	-	n/a	-
EL3 is the highest implemented Exception level.	x	0	1	-	-	-	-
EL3 is the highest implemented Exception level.	x	1	1	-	n/a	-	-

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HSTR\_EL2.T12==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HSTR\_EL2.T12==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HSTR.T12==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.117 SCR, Secure Configuration Register

The SCR characteristics are:

### Purpose

When EL3 is implemented and can use AArch32, defines the configuration of the current Security state. It specifies:

- The Security state, either Secure or Non-secure.
- What mode the PE branches to if an IRQ, FIQ, or External Abort occurs.
- Whether the CPSR.F or CPSR.A bits can be modified when SCR.NS==1.

### Configurations

This register is only accessible in Secure state.

AArch32 System register SCR can be mapped to AArch64 System register [SCR\\_EL3](#), but this is not architecturally mandated.

Some or all RW fields of this register have defined reset values. These apply whenever the register is accessible. This means they apply when the PE resets into EL3 using AArch32.

### Attributes

SCR is a 32-bit register.

### Field descriptions

The SCR bit assignments are:

### Bits [31:16]

Reserved, RES0.

### TERR, bit [15]

Trap Error record accesses. If the RAS Extension is implemented, the possible values of this bit are:

- 0 Do not trap accesses to record registers from EL1 and EL2 to EL3.
- 1 Accesses to the ER\* registers from EL1 and EL2 generate a Trap exception to EL3.

This bit resets to 0 on Warm reset.

When the RAS Extension is not implemented, this field is RES0.

#### Bit [14]

Reserved, RES0.

#### TWE, bit [13]

Traps WFE instructions to Monitor mode.

- 0 This control does not cause any instructions to be trapped.
- 1 Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by [SCTLR.nTWE](#) or [HCR.TWE](#).  
Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

#### Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TWI, bit [12]

Traps WFI instructions to Monitor mode.

- 0 This control does not cause any instructions to be trapped.
- 1 Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by [SCTLR.nTWI](#) or [HCR.TWI](#).  
Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

#### Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bits [11:10]

Reserved, RES0.

#### SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory. The possible values for this bit are:

- 0 Secure state instruction fetches from Non-secure memory are permitted.
- 1 Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

### HCE, bit [8]

Hypervisor Call instruction enable. Enables EL2 and Non-secure EL1 execution of HVC instructions.

- 0 HVC instructions are:
- UNDEFINED at Non-secure EL1. The Undefined Instruction exception is taken from PL1 to PL1.
  - UNPREDICTABLE at EL2. Behavior is one of the following:
    - The instruction is UNDEFINED.
    - The instruction executes as a NOP.
- 1 HVC instructions are enabled at EL2 and Non-secure EL1.

#### ———— **Note** ————

HVC instructions are always UNDEFINED at EL0 and in Secure state.

If EL2 is not implemented, this bit is RES0 and HVC is UNDEFINED.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

### SCD, bit [7]

Secure Monitor Call disable. Disables SMC instructions.

- 0 SMC instructions are enabled.
- 1 In Non-secure state, SMC instructions are UNDEFINED. The Undefined Instruction exception is taken from the current Exception level to the current Exception level. In Secure state, behavior is one of the following:
- The instruction is UNDEFINED.
  - The instruction executes as a NOP.

#### ———— **Note** ————

SMC instructions are always UNDEFINED at PL0.

When this register has an architecturally-defined reset value, this field resets to 0.

### nET, bit [6]

Not Early Termination. This bit disables early termination. The possible values of this bit are:

- 0 Early termination permitted. Execution time of data operations can depend on the data values.
- 1 Disable early termination. The number of cycles required for data operations is forced to be independent of the data values.

This IMPLEMENTATION DEFINED mechanism can disable data dependent timing optimizations from multiplies and data operations. It can provide system support against information leakage that might be exploited by timing correlation types of attack.

On implementations that do not support early termination or do not support disabling early termination, this bit is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

### AW, bit [5]

When the value of SCR.EA is 1 and the value of HCR.AMO is 0, this bit controls whether CPSR.A masks an external abort taken from Non-secure state, and the possible values of this bit are:

- 0 External aborts taken from Non-secure state are not masked by CPSR.A, and are taken to EL3.
- External aborts taken from Secure state are masked by CPSR.A.

- 1 External aborts taken from either Security state are masked by **CPSR.A**. When **CPSR.A** is 0, the abort is taken to EL3.

When **SCR.EA** is 0 or **HCR.AMO** is 1, this bit has no effect.

When this register has an architecturally-defined reset value, this field resets to 0.

#### FW, bit [4]

When the value of **SCR.FIQ** is 1 and the value of **HCR.FMO** is 0, this bit controls whether **CPSR.F** masks an FIQ interrupt taken from Non-secure state, and the possible values of this bit are:

- 0 An FIQ taken from Non-secure state is not masked by **CPSR.F**, and is taken to EL3.  
An FIQ taken from Secure state is masked by **CPSR.F**.
- 1 An FIQ taken from either Security state is masked by **CPSR.F**. When **CPSR.F** is 0, the FIQ is taken to EL3.

When **SCR.FIQ** is 0 or **HCR.FMO** is 1, this bit has no effect.

When this register has an architecturally-defined reset value, this field resets to 0.

#### EA, bit [3]

External Abort handler. This bit controls which mode takes external aborts. The possible values of this bit are:

- 0 External aborts taken to Abort mode.
- 1 External aborts taken to Monitor mode.

When this register has an architecturally-defined reset value, this field resets to 0.

#### FIQ, bit [2]

FIQ handler. This bit controls which mode takes FIQ exceptions. The possible values of this bit are:

- 0 FIQs taken to FIQ mode.
- 1 FIQs taken to Monitor mode.

When this register has an architecturally-defined reset value, this field resets to 0.

#### IRQ, bit [1]

IRQ handler. This bit controls which mode takes IRQ exceptions. The possible values of this bit are:

- 0 IRQs taken to IRQ mode.
- 1 IRQs taken to Monitor mode.

When this register has an architecturally-defined reset value, this field resets to 0.

#### NS, bit [0]

Non-secure bit. Except when the PE is in Monitor mode, this bit determines the Security state of the PE:

- 0 PE is in Secure state.
- 1 PE is in Non-secure state.

If the **HCR.TGE** bit is set, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing the **SCR.NS** bit from 0 to 1 results in the **SCR.NS** bit remaining as 0.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the SCR

This register can be read using MRC with the following syntax:

```
MRC <syntax>
```

This register can be written using MCR with the following syntax:

```
MCR <syntax>
```

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c1, 0	000	000	0001	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	-	RW
x	1	1	-	n/a	-	RW

If EL3 is implemented and is using AArch64, any read or write to SCR from Secure EL1 using AArch32 is trapped as an exception to EL3.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G6.2.118 SCTL, System Control Register

The SCTL register characteristics are:

Purpose

Provides the top level control of the system, including its memory system.

Configurations

AArch32 System register SCTL is architecturally mapped to AArch64 System register [SCTL\\_EL1](#).

When EL3 is using AArch32, write access to SCTL(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SCTL is a 32-bit register.

Field descriptions

The SCTL bit assignments are:

Bit [31]

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to an Exception Level that is executing at PL1 are taken to A32 or T32 state:

- 0 Exceptions, including reset, taken to A32 state.
- 1 Exceptions, including reset, taken to T32 state.

When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION DEFINED choice between:

- 0.
- A value determined by an input configuration signal.

#### AFE, bit [29]

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model. The possible values of this bit are:

- |   |   |
|---|---|
| 0 | In the translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented. |
| 1 | In the translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported.                              |

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.

The AFE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TRE, bit [28]

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA. The possible values of this bit are:

- |   |  |
|---|--|
| 0 | TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.  |
| 1 | TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers. |

When the value of [TTBCR.EAE](#) is 1, this bit is RES1.

The TRE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bits [27:26]

Reserved, RES0.

#### EE, bit [25]

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

- |   |   |
|---|---|
| 0 | Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are little-endian. |
| 1 | Big-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are big-endian.       |

If an implementation does not provide Big-endian support for data accesses at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception Levels higher than EL0, this bit is RES1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an IMPLEMENTATION DEFINED choice between:

- 0.
- A value determined by an input configuration signal.

#### Bit [24]

Reserved, RES0.

#### SPAN, bit [23]

##### *In ARMv8.2 and ARMv8.1*

Set Privileged Access Never, on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

0 CPSR.PAN is set to 1 in the following situations:

- In Non-secure state, on taking an exception to EL1.
- In Secure state, when EL3 is using AArch64, on taking an exception to EL1.
- In Secure state, when EL3 is using AArch32, on taking an exception to EL3.

1 The value of CPSR.PAN is left unchanged on taking an exception.

##### *In ARMv8.0.*

Reserved, RES1.

#### Bit [22]

Reserved, RES1.

#### Bit [21]

Reserved, RES0.

#### UWXN, bit [20]

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1. The possible values of this bit are:

0 This control has no effect on memory access permissions.

1 Any region that is writable at PL0 forced to XN for accesses from software executing at PL1.

The UWXN bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

#### WXN, bit [19]

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

0 This control has no effect on memory access permissions.

1 Any region that is writable in the PL1&0 translation regime is forced to XN for accesses from software executing at PL1 or PL0.

The WXN bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, this field resets to 0.

#### nTWE, bit [18]

Traps EL0 execution of WFE instructions to Undefined mode.

0 Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.

1 This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to 1.

**Bit [17]**

Reserved, RES0.

**nTWI, bit [16]**

Traps EL0 execution of WFI instructions to Undefined mode.

- 0 Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
- 1 This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When this register has an architecturally-defined reset value, this field resets to 1.

**Bits [15:14]**

Reserved, RES0.

**V, bit [13]**

Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

- 0 Normal exception vectors. Base address is held in [VBAR](#).
- 1 High exception vectors (Hivecs), base address 0xFFFF0000. This base address cannot be remapped.

When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION DEFINED choice between:

- 0.
- A value determined by an input configuration signal.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL1 and EL0:

- 0 All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache.  
If the value of SCTL.R.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
- 1 All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache.  
If the value of SCTL.R.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

Instruction accesses to Normal memory from Non-secure EL1 and Non-secure EL0 are Cacheable regardless of the value of the SCTLR.I bit if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR\_EL2.DC is 1.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bit [11]

Reserved, RES1.

#### Bits [10:9]

Reserved, RES0.

#### SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

- 0 SETEND instruction execution is enabled at PL0 and PL1.
- 1 SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### ITD, bit [7]

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

- 0 All IT instruction functionality is enabled at PL1 and PL0.
- 1 Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED:
  - All encodings of the IT instruction with hw1[3:0] != 1000.
  - All encodings of the subsequent instruction with the following values for hw1:
    - 11xxxxxxxxxxxx  
All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
    - 1011xxxxxxxxxxxx  
All instructions in *Miscellaneous 16-bit instructions* on page F3-2883.
    - 10100xxxxxxxxxxx  
ADD Rd, PC, #imm
    - 01001xxxxxxxxxxx  
LDR Rd, [PC, #imm]
    - 0100x1xxx111xxx  
ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
    - 010001xx1xxx111  
ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see [Changes to an ITD control by an instruction in an IT block on page E1-2738](#).

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the [SCTLR\\_EL1](#). If it is not implemented then this bit is RAZ/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

#### CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==1111) encoding space from PL1 and PL0:

- 0 PL0 and PL1 execution of the [CP15DMB](#), [CP15DSB](#), and [CP15ISB](#) instructions is UNDEFINED.
- 1 PL0 and PL1 execution of the [CP15DMB](#), [CP15DSB](#), and [CP15ISB](#) instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the [SCTLR\\_EL1](#). If it is not implemented then this bit is RAO/WI.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 1.

#### LSMAOE, bit [4]

##### *In ARMv8.2*

Load Multiple and Store Multiple Atomicity and Ordering Enable. When the OPTIONAL feature [ARMv8.2-LSMAOC](#) is implemented, defined values are:

- 0 For all memory accesses at EL1 or EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
- 1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for ARMv8.0.

This bit is permitted to be cached in a TLB.

If this bit is not implemented, it is RES1.

When this register has an architecturally-defined reset value, this field resets to 1.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES1.

#### nTLSMD, bit [3]

##### *In ARMv8.2*

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory. When the OPTIONAL feature [ARMv8.2-LSMAOC](#) is implemented, defined values are:

- 0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
- 1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

If this bit is not implemented, it is RES1.

When this register has an architecturally-defined reset value, this field resets to 1.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES1.

#### C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

- |   |  |
|---|--|
| 0 | All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache. |
| 1 | All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache.      |

The PE ignores SCLTR.C for Non-secure state and data accesses to Normal memory from EL1 and EL0 are Cacheable if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR\_EL2.DC is 1.

When this register has an architecturally-defined reset value, this field resets to 0.

#### A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

- |   |   |
|---|---|
| 0 | Alignment fault checking disabled when executing at PL1 or PL0.<br>Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.  |
| 1 | Alignment fault checking enabled when executing at PL1 or PL0.<br>All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception. |

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When this register has an architecturally-defined reset value, this field resets to 0.

#### M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

- |   |   |
|---|---|
| 0 | EL1 and EL0 stage 1 address translation disabled.<br>See the SCLTR.I field for the behavior of instruction accesses to Normal memory. |
| 1 | EL1 and EL0 stage 1 address translation enabled.  |

In the Non-secure state the PE behaves as if the value of the SCLTR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of HCR.{DC, TGE} is not {0, 0}.
- EL2 is using AArch64 and the value of HCR\_EL2.{DC, TGE} is not {0, 0}.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the SCLTR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c0, 0	000	000	0001	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	SCTLR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	SCTLR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	SCTLR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	SCTLR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	SCTLR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	SCTLR
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	SCTLR_s
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	SCTLR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	SCTLR_ns

When EL3 is using AArch32, write access to SCTLR\_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T1==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T1==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If HCR.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T1==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.119 SPSR, Saved Program Status Register

The SPSR characteristics are:

### Purpose

Holds the saved process state for the current mode.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

### Attributes

SPSR is a 32-bit register.

## Field descriptions

The SPSR bit assignments are:

### N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to the current mode, and copied to [CPSR.N](#) on executing an exception return operation in the current mode.

### Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to the current mode, and copied to [CPSR.Z](#) on executing an exception return operation in the current mode.

### C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to the current mode, and copied to [CPSR.C](#) on executing an exception return operation in the current mode.

### V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to the current mode, and copied to [CPSR.V](#) on executing an exception return operation in the current mode.

### Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to the current mode, and copied to [CPSR.Q](#) on executing an exception return operation in the current mode.

### IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

### J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

#### Bit [23]

Reserved, RES0.

#### PAN, bit [22]

##### *In ARMv8.2 and ARMv8.1*

When [ARMv8.1-PAN](#) is implemented, set to the value of [CPSR.PAN](#) on taking an exception to the current mode, and copied to [CPSR.PAN](#) on executing an exception return operation in the current mode.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

##### *In ARMv8.0.*

Reserved, RES0.

#### Bit [21]

Reserved, RES0.

#### IL, bit [20]

Illegal Execution state bit. Shows the value of [PSTATE.IL](#) immediately before the exception was taken.

#### GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

#### IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

#### E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

- |   |                         |
|---|-------------------------|
| 0 | Little-endian operation |
| 1 | Big-endian operation.   |

Instruction fetches ignore this bit.

When the reset value of the [SCTLR.EE](#) bit is defined by a configuration input signal, that value also applies to the [CPSR.E](#) bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

#### A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

- |   |                       |
|---|-----------------------|
| 0 | Exception not masked. |
| 1 | Exception masked.     |

#### I, bit [7]

IRQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### F, bit [6]

FIQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

- 0 Taken from A32 state.
- 1 Taken from T32 state.

#### M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

- 1 Exception taken from AArch32.

#### M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

M[3:0]	Mode
0b0000	User
0b0001	FIQ
0b0010	IRQ
0b0011	Supervisor
0b0110	Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)
0b0111	Abort
0b1010	Hyp
0b1011	Undefined
0b1111	System

Other values are reserved.

## G6.2.120 SPSR\_abt, Saved Program Status Register (Abort mode)

The SPSR\_abt characteristics are:

### Purpose

Holds the saved process state when an exception is taken to Abort mode.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

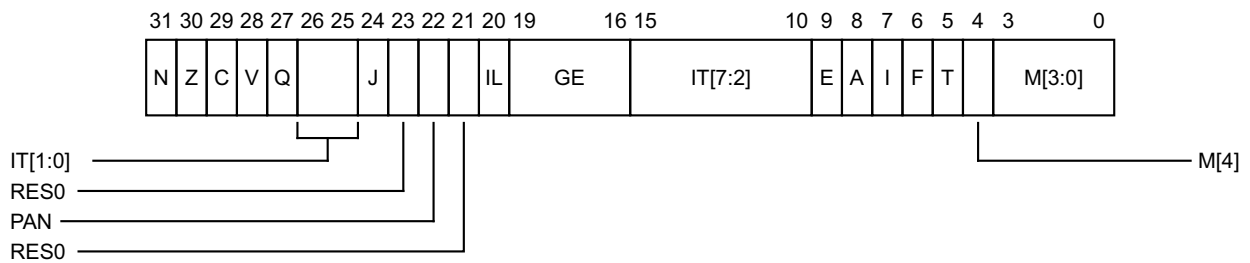

AArch32 System register SPSR\_abt is architecturally mapped to AArch64 System register [SPSR\\_abt](#).

### Attributes

SPSR\_abt is a 32-bit register.

### Field descriptions

The SPSR\_abt bit assignments are:

#### N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to Abort mode, and copied to [CPSR.N](#) on executing an exception return operation in Abort mode.

#### Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to Abort mode, and copied to [CPSR.Z](#) on executing an exception return operation in Abort mode.

#### C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to Abort mode, and copied to [CPSR.C](#) on executing an exception return operation in Abort mode.

#### V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to Abort mode, and copied to [CPSR.V](#) on executing an exception return operation in Abort mode.

#### Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to Abort mode, and copied to [CPSR.Q](#) on executing an exception return operation in Abort mode.

#### IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

#### J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

#### Bit [23]

Reserved, RES0.

#### PAN, bit [22]

##### *In ARMv8.2 and ARMv8.1*

When [ARMv8.1-PAN](#) is implemented, set to the value of [CPSR.PAN](#) on taking an exception to Abort mode, and copied to [CPSR.PAN](#) on executing an exception return operation in Abort mode.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

##### *In ARMv8.0.*

Reserved, RES0.

#### Bit [21]

Reserved, RES0.

#### IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

#### GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

#### IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

#### E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0 Little-endian operation

1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

#### A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

#### I, bit [7]

IRQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### F, bit [6]

FIQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

- 0 Taken from A32 state.
- 1 Taken from T32 state.

#### M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

- 1 Exception taken from AArch32.

#### M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

M[3:0]	Mode
0b0000	User
0b0001	FIQ
0b0010	IRQ
0b0011	Supervisor
0b0110	Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)
0b0111	Abort
0b1011	Undefined
0b1111	System

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

### Accessing the SPSR\_abt

This register can be read using MRS (banked register) with the following syntax:

```
MRS <Rd>, <banked_reg>
```

This register can be written using MSR (banked register) with the following syntax:

```
MSR <banked_reg>, <Rd>
```

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	R	M	M1
SPSR_abt	1	1	0100

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

Using MRS (banked register) and MSR (banked register) instructions, at PL1 this register is only accessible from PE modes other than Abort mode. In Abort mode, it is accessible as the current SPSR.

## G6.2.121 SPSR\_fiq, Saved Program Status Register (FIQ mode)

The SPSR\_fiq characteristics are:

### Purpose

Holds the saved process state when an exception is taken to FIQ mode.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

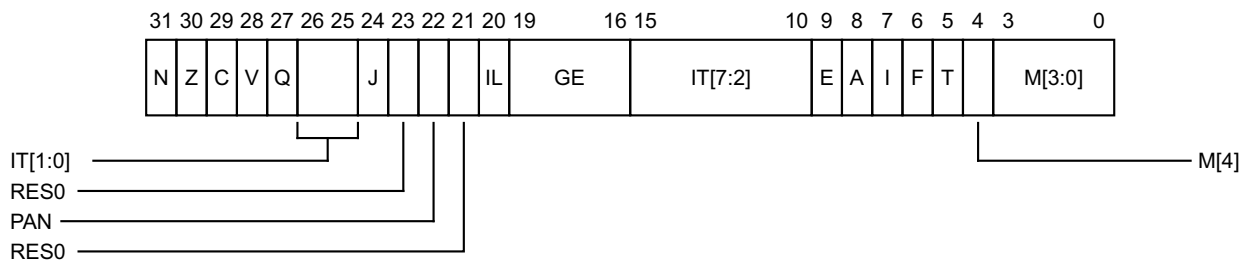

AArch32 System register SPSR\_fiq is architecturally mapped to AArch64 System register [SPSR\\_fiq](#).

### Attributes

SPSR\_fiq is a 32-bit register.

### Field descriptions

The SPSR\_fiq bit assignments are:

#### N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to FIQ mode, and copied to [CPSR.N](#) on executing an exception return operation in FIQ mode.

#### Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to FIQ mode, and copied to [CPSR.Z](#) on executing an exception return operation in FIQ mode.

#### C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to FIQ mode, and copied to [CPSR.C](#) on executing an exception return operation in FIQ mode.

#### V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to FIQ mode, and copied to [CPSR.V](#) on executing an exception return operation in FIQ mode.

#### Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to FIQ mode, and copied to [CPSR.Q](#) on executing an exception return operation in FIQ mode.

#### IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

#### J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

#### Bit [23]

Reserved, RES0.

#### PAN, bit [22]

##### *In ARMv8.2 and ARMv8.1*

When [ARMv8.1-PAN](#) is implemented, set to the value of [CPSR.PAN](#) on taking an exception to FIQ mode, and copied to [CPSR.PAN](#) on executing an exception return operation in FIQ mode.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

##### *In ARMv8.0.*

Reserved, RES0.

#### Bit [21]

Reserved, RES0.

#### IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

#### GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

#### IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

#### E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

- |   |                         |
|---|-------------------------|
| 0 | Little-endian operation |
| 1 | Big-endian operation.   |

Instruction fetches ignore this bit.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

#### A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

- |   |                       |
|---|-----------------------|
| 0 | Exception not masked. |
| 1 | Exception masked.     |

#### I, bit [7]

IRQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### F, bit [6]

FIQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

- 0 Taken from A32 state.
- 1 Taken from T32 state.

#### M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

- 1 Exception taken from AArch32.

#### M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

M[3:0]	Mode
0b0000	User
0b0001	FIQ
0b0010	IRQ
0b0011	Supervisor
0b0110	Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)
0b0111	Abort
0b1011	Undefined
0b1111	System

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

### Accessing the SPSR\_fiq

This register can be read using MRS (banked register) with the following syntax:

```
MRS <Rd>, <banked_reg>
```

This register can be written using MSR (banked register) with the following syntax:

```
MSR <banked_reg>, <Rd>
```

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	R	M	M1
SPSR_fiq	1	0	1110

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

Using MRS (banked register) and MSR (banked register) instructions, at PL1 this register is only accessible from PE modes other than FIQ mode. In FIQ mode, it is accessible as the current SPSR.

## G6.2.122 SPSR\_hyp, Saved Program Status Register (Hyp mode)

The SPSR\_hyp characteristics are:

### Purpose

Holds the saved process state when an exception is taken to Hyp mode.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register SPSR\_hyp is architecturally mapped to AArch64 System register [SPSR\\_EL2](#).

### Attributes

SPSR\_hyp is a 32-bit register.

### Field descriptions

The SPSR\_hyp bit assignments are:

#### N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to Hyp mode, and copied to [CPSR.N](#) on executing an exception return operation in Hyp mode.

#### Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to Hyp mode, and copied to [CPSR.Z](#) on executing an exception return operation in Hyp mode.

#### C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to Hyp mode, and copied to [CPSR.C](#) on executing an exception return operation in Hyp mode.

#### V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to Hyp mode, and copied to [CPSR.V](#) on executing an exception return operation in Hyp mode.

#### Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to Hyp mode, and copied to [CPSR.Q](#) on executing an exception return operation in Hyp mode.

#### IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

#### J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

#### Bit [23]

Reserved, RES0.

#### PAN, bit [22]

##### *In ARMv8.2 and ARMv8.1*

When [ARMv8.1-PAN](#) is implemented, set to the value of [CPSR.PAN](#) on taking an exception to Hyp mode, and copied to [CPSR.PAN](#) on executing an exception return operation in Hyp mode.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

##### *In ARMv8.0.*

Reserved, RES0.

#### Bit [21]

Reserved, RES0.

#### IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

#### GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

#### IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

#### E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0 Little-endian operation

1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

#### A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

#### I, bit [7]

IRQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### F, bit [6]

FIQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

- 0 Taken from A32 state.
- 1 Taken from T32 state.

#### M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

- 1 Exception taken from AArch32.

#### M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

M[3:0]	Mode
0b0000	User
0b0001	FIQ
0b0010	IRQ
0b0011	Supervisor
0b0111	Abort
0b1010	Hyp
0b1011	Undefined
0b1111	System

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries](#) on page K1-6117.

### Accessing the SPSR\_hyp

This register can be read using MRS (banked register) with the following syntax:

```
MRS <Rd>, <banked_reg>
```

This register can be written using MSR (banked register) with the following syntax:

```
MSR <banked_reg>, <Rd>
```

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	R	M	M1
SPSR_hyp	1	1	1110

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	-	RW
x	1	1	-	n/a	-	RW

Using MRS (banked register) and MSR (banked register) instructions, this register is only accessible from Monitor mode. In Hyp mode, this register is accessible as the current SPSR.

## G6.2.123 SPSR\_irq, Saved Program Status Register (IRQ mode)

The SPSR\_irq characteristics are:

### Purpose

Holds the saved process state when an exception is taken to IRQ mode.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

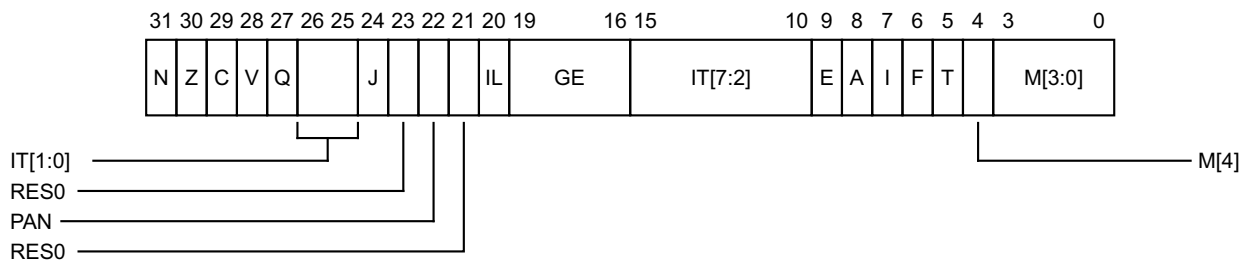

AArch32 System register SPSR\_irq is architecturally mapped to AArch64 System register [SPSR\\_irq](#).

### Attributes

SPSR\_irq is a 32-bit register.

### Field descriptions

The SPSR\_irq bit assignments are:

#### N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to IRQ mode, and copied to [CPSR.N](#) on executing an exception return operation in IRQ mode.

#### Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to IRQ mode, and copied to [CPSR.Z](#) on executing an exception return operation in IRQ mode.

#### C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to IRQ mode, and copied to [CPSR.C](#) on executing an exception return operation in IRQ mode.

#### V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to IRQ mode, and copied to [CPSR.V](#) on executing an exception return operation in IRQ mode.

#### Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to IRQ mode, and copied to [CPSR.Q](#) on executing an exception return operation in IRQ mode.

#### IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

#### J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

#### Bit [23]

Reserved, RES0.

#### PAN, bit [22]

##### *In ARMv8.2 and ARMv8.1*

When [ARMv8.1-PAN](#) is implemented, set to the value of [CPSR.PAN](#) on taking an exception to IRQ mode, and copied to [CPSR.PAN](#) on executing an exception return operation in IRQ mode.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

##### *In ARMv8.0.*

Reserved, RES0.

#### Bit [21]

Reserved, RES0.

#### IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

#### GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

#### IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

#### E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0 Little-endian operation

1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

#### A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

#### I, bit [7]

IRQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### F, bit [6]

FIQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

- 0 Taken from A32 state.
- 1 Taken from T32 state.

#### M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

- 1 Exception taken from AArch32.

#### M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

M[3:0]	Mode
0b0000	User
0b0001	FIQ
0b0010	IRQ
0b0011	Supervisor
0b0110	Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)
0b0111	Abort
0b1011	Undefined
0b1111	System

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

### Accessing the SPSR\_irq

This register can be read using MRS (banked register) with the following syntax:

```
MRS <Rd>, <banked_reg>
```

This register can be written using MSR (banked register) with the following syntax:

```
MSR <banked_reg>, <Rd>
```

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	R	M	M1
SPSR_irq	1	1	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

Using MRS (banked register) and MSR (banked register) instructions, at PL1 this register is only accessible from PE modes other than IRQ mode. In IRQ mode, it is accessible as the current SPSR.

## G6.2.124 SPSR\_mon, Saved Program Status Register (Monitor mode)

The SPSR\_mon characteristics are:

### Purpose

Holds the saved process state when an exception is taken to Monitor mode.

### Configurations

This register is only accessible in Secure state.

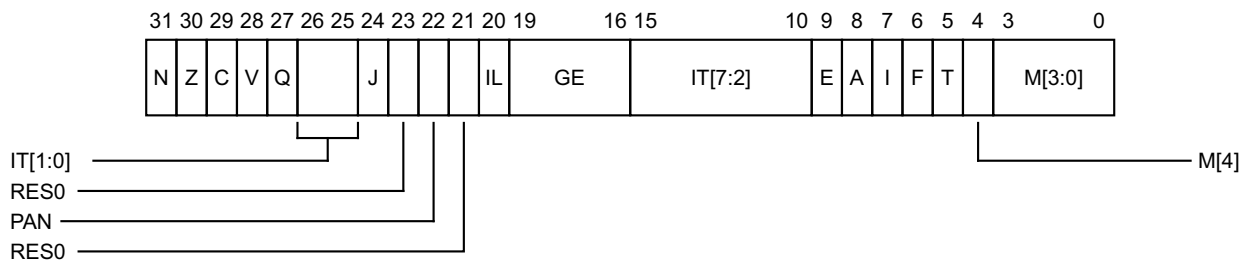

AArch32 System register SPSR\_mon can be mapped to AArch64 System register [SPSR\\_EL3](#), but this is not architecturally mandated.

### Attributes

SPSR\_mon is a 32-bit register.

### Field descriptions

The SPSR\_mon bit assignments are:

#### N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to Monitor mode, and copied to [CPSR.N](#) on executing an exception return operation in Monitor mode.

#### Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to Monitor mode, and copied to [CPSR.Z](#) on executing an exception return operation in Monitor mode.

#### C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to Monitor mode, and copied to [CPSR.C](#) on executing an exception return operation in Monitor mode.

#### V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to Monitor mode, and copied to [CPSR.V](#) on executing an exception return operation in Monitor mode.

#### Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to Monitor mode, and copied to [CPSR.Q](#) on executing an exception return operation in Monitor mode.

#### IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

#### J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

#### Bit [23]

Reserved, RES0.

#### PAN, bit [22]

##### *In ARMv8.2 and ARMv8.1*

When [ARMv8.1-PAN](#) is implemented, set to the value of [CPSR.PAN](#) on taking an exception to Monitor mode, and copied to [CPSR.PAN](#) on executing an exception return operation in Monitor mode.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

##### *In ARMv8.0.*

Reserved, RES0.

#### Bit [21]

Reserved, RES0.

#### IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

#### GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

#### IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

#### E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

- 0 Little-endian operation
- 1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

#### A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### I, bit [7]

IRQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### F, bit [6]

FIQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

- 0 Taken from A32 state.
- 1 Taken from T32 state.

#### M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

- 1 Exception taken from AArch32.

#### M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

M[3:0]	Mode
0b0000	User
0b0001	FIQ
0b0010	IRQ
0b0011	Supervisor
0b0110	Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)
0b0111	Abort
0b1010	Hyp
0b1011	Undefined
0b1111	System

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

### Accessing the SPSR\_mon

This register can be read using MRS (banked register) with the following syntax:

MRS <Rd>, <banked\_reg>

This register can be written using MSR (banked register) with the following syntax:

MSR <banked\_reg>, <Rd>

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	R	M	M1
SPSR_mon	1	1	1100

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	-	RW
x	1	1	-	n/a	-	RW

Using MRS (banked register) and MSR (banked register) instructions, this register is only accessible from EL3 modes other than Monitor mode. In Monitor mode, it is accessible as the current SPSR.

## G6.2.125 SPSR\_svc, Saved Program Status Register (Supervisor mode)

The SPSR\_svc characteristics are:

### Purpose

Holds the saved process state when an exception is taken to Supervisor mode.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

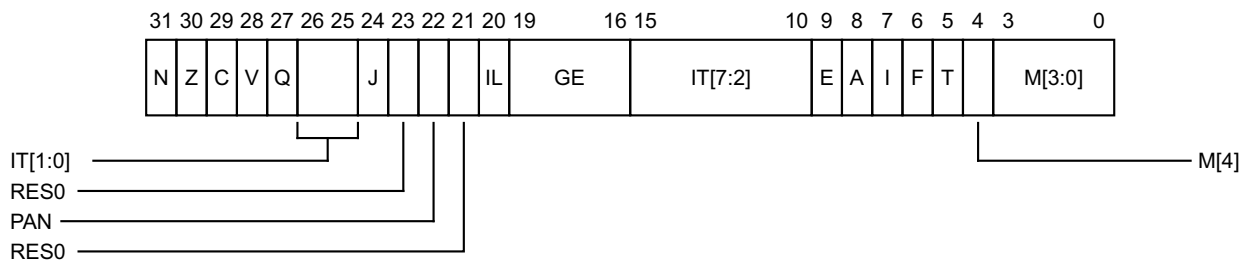

AArch32 System register SPSR\_svc is architecturally mapped to AArch64 System register [SPSR\\_EL1](#).

### Attributes

SPSR\_svc is a 32-bit register.

### Field descriptions

The SPSR\_svc bit assignments are:

#### N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to Supervisor mode, and copied to [CPSR.N](#) on executing an exception return operation in Supervisor mode.

#### Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to Supervisor mode, and copied to [CPSR.Z](#) on executing an exception return operation in Supervisor mode.

#### C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to Supervisor mode, and copied to [CPSR.C](#) on executing an exception return operation in Supervisor mode.

#### V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to Supervisor mode, and copied to [CPSR.V](#) on executing an exception return operation in Supervisor mode.

#### Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to Supervisor mode, and copied to [CPSR.Q](#) on executing an exception return operation in Supervisor mode.

#### IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

#### J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

#### Bit [23]

Reserved, RES0.

#### PAN, bit [22]

##### *In ARMv8.2 and ARMv8.1*

When [ARMv8.1-PAN](#) is implemented, set to the value of [CPSR.PAN](#) on taking an exception to Supervisor mode, and copied to [CPSR.PAN](#) on executing an exception return operation in Supervisor mode.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

##### *In ARMv8.0.*

Reserved, RES0.

#### Bit [21]

Reserved, RES0.

#### IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

#### GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

#### IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

#### E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

- 0 Little-endian operation
- 1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTL.R.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

#### A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### I, bit [7]

IRQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### F, bit [6]

FIQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

- 0 Taken from A32 state.
- 1 Taken from T32 state.

#### M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

- 1 Exception taken from AArch32.

#### M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

M[3:0]	Mode
0b0000	User
0b0001	FIQ
0b0010	IRQ
0b0011	Supervisor
0b0110	Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)
0b0111	Abort
0b1011	Undefined
0b1111	System

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

### Accessing the SPSR\_svc

This register can be read using MRS (banked register) with the following syntax:

```
MRS <Rd>, <banked_reg>
```

This register can be written using MSR (banked register) with the following syntax:

```
MSR <banked_reg>, <Rd>
```

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	R	M	M1
SPSR_svc	1	1	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

Using MRS (banked register) and MSR (banked register) instructions, at PL1 this register is only accessible from PE modes other than Supervisor mode. In Supervisor mode, it is accessible as the current SPSR.

## G6.2.126 SPSR\_und, Saved Program Status Register (Undefined mode)

The SPSR\_und characteristics are:

### Purpose

Holds the saved process state when an exception is taken to Undefined mode.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register SPSR\_und is architecturally mapped to AArch64 System register [SPSR\\_und](#).

### Attributes

SPSR\_und is a 32-bit register.

### Field descriptions

The SPSR\_und bit assignments are:

#### N, bit [31]

Set to the value of [CPSR.N](#) on taking an exception to Undefined mode, and copied to [CPSR.N](#) on executing an exception return operation in Undefined mode.

#### Z, bit [30]

Set to the value of [CPSR.Z](#) on taking an exception to Undefined mode, and copied to [CPSR.Z](#) on executing an exception return operation in Undefined mode.

#### C, bit [29]

Set to the value of [CPSR.C](#) on taking an exception to Undefined mode, and copied to [CPSR.C](#) on executing an exception return operation in Undefined mode.

#### V, bit [28]

Set to the value of [CPSR.V](#) on taking an exception to Undefined mode, and copied to [CPSR.V](#) on executing an exception return operation in Undefined mode.

#### Q, bit [27]

Set to the value of [CPSR.Q](#) on taking an exception to Undefined mode, and copied to [CPSR.Q](#) on executing an exception return operation in Undefined mode.

#### IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

#### J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

#### Bit [23]

Reserved, RES0.

#### PAN, bit [22]

##### *In ARMv8.2 and ARMv8.1*

When [ARMv8.1-PAN](#) is implemented, set to the value of [CPSR.PAN](#) on taking an exception to Undefined mode, and copied to [CPSR.PAN](#) on executing an exception return operation in Undefined mode.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

##### *In ARMv8.0.*

Reserved, RES0.

#### Bit [21]

Reserved, RES0.

#### IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

#### GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

#### IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

#### E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

- 0 Little-endian operation
- 1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

#### A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### I, bit [7]

IRQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### F, bit [6]

FIQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from. Possible values of this bit are:

- 0 Taken from A32 state.
- 1 Taken from T32 state.

#### M[4], bit [4]

Execution state that the exception was taken from. Possible values of this bit are:

- 1 Exception taken from AArch32.

#### M[3:0], bits [3:0]

AArch32 mode that an exception was taken from. The possible values are:

M[3:0]	Mode
0b0000	User
0b0001	FIQ
0b0010	IRQ
0b0011	Supervisor
0b0110	Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)
0b0111	Abort
0b1011	Undefined
0b1111	System

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

### Accessing the SPSR\_und

This register can be read using MRS (banked register) with the following syntax:

```
MRS <Rd>, <banked_reg>
```

This register can be written using MSR (banked register) with the following syntax:

```
MSR <banked_reg>, <Rd>
```

This syntax is encoded with the following settings in the instruction encoding:

<banked_reg>	R	M	M1
SPSR_und	1	1	0110

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

Using MRS (banked register) and MSR (banked register) instructions, at PL1 this register is only accessible from PE modes other than Undefined mode. In Undefined mode, it is accessible as the current SPSR.

## G6.2.127 TCMTR, TCM Type Register

The TCMTR characteristics are:

### Purpose

Provides information about the implementation of the TCM.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

### Attributes

TCMTR is a 32-bit register.

### Field descriptions

The TCMTR bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

### Accessing the TCMTR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c0, 2	000	010	0000	1111	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TID1==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

**G6.2.128 TLBIALL, TLB Invalidate All**

The TLBIALL characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at Secure EL1 when EL3 is using AArch64, all entries that would be required for the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at Non-secure EL1, all stage 1 translation table entries that would be required for the Non-secure PL1&0 translation regime and, if EL2 is implemented, they must match the current VMID.
- If executed at EL2, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this instruction.

**Configurations**

There are no configuration notes.

**Attributes**

TLBIALL is a 32-bit System instruction.

**Field descriptions**

TLBIALL ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

**Executing the TLBIALL instruction**

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 0	000	000	1000	1111	0111

**Accessibility**

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIALLIS](#).

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T8==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T8==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If HSTR.T8==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.129 TLBIALLH, TLB Invalidate All, Hyp mode

The TLBIALLH characteristics are:

### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation only applies to the PE that executes this instruction.

### Configurations

There are no configuration notes.

### Attributes

TLBIALLH is a 32-bit System instruction.

### Field descriptions

TLBIALLH ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

### Executing the TLBIALLH instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c7, 0	100	000	1000	1111	0111

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.130 TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable

The TLBIALLHIS characteristics are:

### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

### Configurations

There are no configuration notes.

### Attributes

TLBIALLHIS is a 32-bit System instruction.

### Field descriptions

TLBIALLHIS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

### Executing the TLBIALLHIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c3, 0	100	000	1000	1111	0011

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.131 TLBIALLIS, TLB Invalidate All, Inner Shareable

The TLBIALLIS characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at Secure EL1 when EL3 is using AArch64, all entries that would be required for the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at Non-secure EL1, all stage 1 translation table entries that would be required for the Non-secure PL1&0 translation regime and, if EL2 is implemented, they must match the current VMID.
- If executed at EL2, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

### Configurations

There are no configuration notes.

### Attributes

TLBIALLIS is a 32-bit System instruction.

### Field descriptions

TLBIALLIS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

### Executing the TLBIALLIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 0	000	000	1000	1111	0011

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HCR\_EL2.TTLB == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If  $HSTR\_EL2.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HCR\_EL2.TTLB == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If  $HSTR\_EL2.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HCR.TTLB == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If  $HSTR.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.132 TLBIALLNSNH, TLB Invalidate All, Non-Secure Non-Hyp

The TLBIALLNSNH characteristics are:

### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation only applies to the PE that executes this instruction.

### Configurations

There are no configuration notes.

### Attributes

TLBIALLNSNH is a 32-bit System instruction.

### Field descriptions

TLBIALLNSNH ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

### Executing the TLBIALLNSNH instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c7, 4	100	100	1000	1111	0111

### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \ \&\& \ (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \ \&\& \ (HCR\_EL2.E2H == 1) \ \&\& \ (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

### G6.2.133 TLBIALLNSNHIS, TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable

The TLBIALLNSNHIS characteristics are:

#### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

#### Configurations

There are no configuration notes.

#### Attributes

TLBIALLNSNHIS is a 32-bit System instruction.

#### Field descriptions

TLBIALLNSNHIS ignores the value in the register specified by the instruction. Software does not have to write a value to the register before issuing this instruction.

#### Executing the TLBIALLNSNHIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c3, 4	100	100	1000	1111	0011

#### Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T8 == 1$ , Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.134 TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

### Configurations

There are no configuration notes.

### Attributes

TLBIASID is a 32-bit System instruction.

### Field descriptions

The TLBIASID input value bit assignments are:

### Bits [31:8]

Reserved, RES0.

### ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

### Executing the TLBIASID instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 2	000	010	1000	1111	0111

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIASIDIS](#).

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 0)$ :
  - If [HCR\\_EL2.TTLB](#)=1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)=1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If [HCR\\_EL2.TTLB](#)=1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)=1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} = 1$ :
  - If [HCR.TTLB](#)=1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)=1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.135 TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

### Configurations

There are no configuration notes.

### Attributes

TLBIASIDIS is a 32-bit System instruction.

### Field descriptions

The TLBIASIDIS input value bit assignments are:

#### Bits [31:8]

Reserved, RES0.

#### ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this operation.

### Executing the TLBIASIDIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 2	000	010	1000	1111	0011

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.136 TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this instruction.

### Configurations

#### ———— Note ————

This System instruction is not implemented in architecture versions before ARMv8.

### Attributes

TLBIIPAS2 is a 32-bit System instruction.

### Field descriptions

The TLBIIPAS2 input value bit assignments are:

31	28 27	0
RES0	IPA[39:12]	

#### Bits [31:28]

Reserved, RES0.

#### IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

### Executing the TLBIIPAS2 instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c4, 1	100	001	1000	1111	0100

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If SCR.NS is 0, this instruction is a NOP.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.137 TLBIIPAS2IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable

The TLBIIPAS2IS characteristics are:

### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

### Configurations

#### Note

This System instruction is not implemented in architecture versions before ARMv8.

### Attributes

TLBIIPAS2IS is a 32-bit System instruction.

### Field descriptions

The TLBIIPAS2IS input value bit assignments are:

31	28	27	0
RES0	IPA[39:12]		

#### Bits [31:28]

Reserved, RES0.

#### IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

### Executing the TLBIIPAS2IS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c0, 1	100	001	1000	1111	0000

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If SCR.NS is 0, this instruction is a NOP.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.138 TLBIIPAS2L, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level

The TLBIIPAS2L characteristics are:

### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this instruction.

### Configurations

#### Note

This System instruction is not implemented in architecture versions before ARMv8.

### Attributes

TLBIIPAS2L is a 32-bit System instruction.

### Field descriptions

The TLBIIPAS2L input value bit assignments are:

31	28	27	0
RES0	IPA[39:12]		

#### Bits [31:28]

Reserved, RES0.

#### IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

### Executing the TLBIIPAS2L instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c4, 5	100	101	1000	1111	0100

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If SCR.NS is 0, this instruction is a NOP.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.139 TLBIIPAS2LIS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable

The TLBIIPAS2LIS characteristics are:

### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

### Configurations

#### Note

This System instruction is not implemented in architecture versions before ARMv8.

### Attributes

TLBIIPAS2LIS is a 32-bit System instruction.

### Field descriptions

The TLBIIPAS2LIS input value bit assignments are:

31	28 27	0
RES0	IPA[39:12]	

#### Bits [31:28]

Reserved, RES0.

#### IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

### Executing the TLBIIPAS2LIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c0, 5	100	101	1000	1111	0000

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If SCR.NS is 0, this instruction is a NOP.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.140 TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

### Configurations

There are no configuration notes.

### Attributes

TLBIMVA is a 32-bit System instruction.

### Field descriptions

The TLBIMVA input value bit assignments are:

31	12 11	8 7	0
VA	RES0	ASID	

#### VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

#### Bits [11:8]

Reserved, RES0.

#### ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

## Executing the TLBIMVA instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 1	000	001	1000	1111	0111

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIMVAIS](#).

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.141 TLBIMVAA, TLB Invalidate by VA, All ASID

The TLBIMVAA characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

### Configurations

There are no configuration notes.

### Attributes

TLBIMVAA is a 32-bit System instruction.

### Field descriptions

The TLBIMVAA input value bit assignments are:

#### VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

#### Bits [11:0]

Reserved, RES0.

### Executing the TLBIMVAA instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 3	000	011	1000	1111	0111

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIMVAAIS](#).

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.142 TLBIMVAAIS, TLB Invalidate by VA, All ASID, Inner Shareable

The TLBIMVAAIS characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

### Configurations

There are no configuration notes.

### Attributes

TLBIMVAAIS is a 32-bit System instruction.

### Field descriptions

The TLBIMVAAIS input value bit assignments are:

31	12 11	0
VA		RES0

#### VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

#### Bits [11:0]

Reserved, RES0.

### Executing the TLBIMVAAIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 3	000	011	1000	1111	0011

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T8==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T8==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If HSTR.T8==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.143 TLBIMVAAL, TLB Invalidate by VA, All ASID, Last level

The TLBIMVAAL characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

### Configurations

#### ———— Note ————

This System instruction is not implemented in architecture versions before ARMv8.

### Attributes

TLBIMVAAL is a 32-bit System instruction.

### Field descriptions

The TLBIMVAAL input value bit assignments are:

#### VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

#### Bits [11:0]

Reserved, RES0.

### Executing the TLBIMVAAL instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 7	000	111	1000	1111	0111

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIMVAALIS](#).

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \ \&\& \ (HCR\_EL2.E2H == 0)$ :
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \ \&\& \ (HCR\_EL2.E2H == 1) \ \&\& \ (HCR\_EL2.TGE == 0)$ :
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.144 TLBIMVAALIS, TLB Invalidate by VA, All ASID, Last level, Inner Shareable

The TLBIMVAALIS characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

### Configurations

#### Note

This System instruction is not implemented in architecture versions before ARMv8.

### Attributes

TLBIMVAALIS is a 32-bit System instruction.

### Field descriptions

The TLBIMVAALIS input value bit assignments are:

#### VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this operation, regardless of the ASID.

#### Bits [11:0]

Reserved, RES0.

### Executing the TLBIMVAALIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 7	000	111	1000	1111	0011

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.145 TLBIMVAH, TLB Invalidate by VA, Hyp mode

The TLBIMVAH characteristics are:

### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this instruction.

### Configurations

There are no configuration notes.

### Attributes

TLBIMVAH is a 32-bit System instruction.

### Field descriptions

The TLBIMVAH input value bit assignments are:

31	12	11	0
VA			RES0

#### VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

#### Bits [11:0]

Reserved, RES0.

### Executing the TLBIMVAH instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c7, 1	100	001	1000	1111	0111

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.146 TLBIMVAHIS, TLB Invalidate by VA, Hyp mode, Inner Shareable

The TLBIMVAHIS characteristics are:

### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

### Configurations

There are no configuration notes.

### Attributes

TLBIMVAHIS is a 32-bit System instruction.

### Field descriptions

The TLBIMVAHIS input value bit assignments are:

#### VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

#### Bits [11:0]

Reserved, RES0.

### Executing the TLBIMVAHIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c3, 1	100	001	1000	1111	0011

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.147 TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

### Configurations

There are no configuration notes.

### Attributes

TLBIMVAIS is a 32-bit System instruction.

### Field descriptions

The TLBIMVAIS input value bit assignments are:

31	12 11	8 7	0
VA	RES0	ASID	

#### VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

#### Bits [11:8]

Reserved, RES0.

#### ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

## Executing the TLBIMVAIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 1	000	001	1000	1111	0011

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.148 TLBIMVAL, TLB Invalidate by VA, Last level

The TLBIMVAL characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this instruction.

### Configurations

This System instruction is not implemented in architecture versions before ARMv8.

### Attributes

TLBIMVAL is a 32-bit System instruction.

### Field descriptions

The TLBIMVAL input value bit assignments are:

31	12 11	8 7	0
VA		RES0	ASID

#### VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

#### Bits [11:8]

Reserved, RES0.

#### ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

### Executing the TLBIMVAL instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c7, 5	000	101	1000	1111	0111

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [TLBIMVALIS](#).

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR.TTLB](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.149 TLBIMVALH, TLB Invalidate by VA, Last level, Hyp mode

The TLBIMVALH characteristics are:

### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this instruction.

### Configurations

This System instruction is not implemented in architecture versions before ARMv8.

### Attributes

TLBIMVALH is a 32-bit System instruction.

### Field descriptions

The TLBIMVALH input value bit assignments are:

31	12	11	0
VA			RES0

#### VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

#### Bits [11:0]

Reserved, RES0.

### Executing the TLBIMVALH instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c7, 5	100	101	1000	1111	0111

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.150 TLBIMVALHIS, TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable

The TLBIMVALHIS characteristics are:

### Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

### Configurations

This System instruction is not implemented in architecture versions before ARMv8.

### Attributes

TLBIMVALHIS is a 32-bit System instruction.

### Field descriptions

The TLBIMVALHIS input value bit assignments are:

### VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

### Bits [11:0]

Reserved, RES0.

### Executing the TLBIMVALHIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c8, c3, 5	100	101	1000	1111	0011

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	WO
x	0	1	-	-	WO	WO
x	1	1	-	n/a	WO	WO

If EL2 is not implemented, this instruction is UNDEFINED.

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T8](#)==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.151 TLBIMVALIS, TLB Invalidate by VA, Last level, Inner Shareable

The TLBIMVALIS characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented, the entry would be used with the current VMID.

From the entries that match these requirement, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this instructions.

### Configurations

This System instruction is not implemented in architecture versions before ARMv8.

### Attributes

TLBIMVALIS is a 32-bit System instruction.

### Field descriptions

The TLBIMVALIS input value bit assignments are:

31	12 11	8 7	0
VA	RES0	ASID	

#### VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

#### Bits [11:8]

Reserved, RES0.

#### ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

## Executing the TLBIMVALIS instruction

This instruction is executed using MCR with the following syntax:

MCR <syntax>

This syntax uses the following encoding in the System instruction encoding space:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c8, c3, 5	000	101	1000	1111	0011

## Accessibility

The instruction is executable as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T8==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
  - If HSTR\_EL2.T8==1, Non-secure execution of this instruction at EL1 is trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TTLB==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.
  - If HSTR.T8==1, Non-secure execution of this instruction at EL1 is trapped to Hyp mode.

## G6.2.152 TLBTR, TLB Type Register

The TLBTR characteristics are:

### Purpose

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

### Attributes

TLBTR is a 32-bit register.

### Field descriptions

The TLBTR bit assignments are:

#### IMPLEMENTATION DEFINED, bits [31:1]

IMPLEMENTATION DEFINED.

#### nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB:

- |   |                                     |
|---|-------------------------------------|
| 0 | Unified TLB.                        |
| 1 | Separate Instruction and Data TLBs. |

### Accessing the TLBTR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c0, c0, 3	000	011	0000	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T0==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TID1==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T0==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.153 TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

### Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

### Configurations

AArch32 System register TPIDRPRW is architecturally mapped to AArch64 System register [TPIDR\\_EL1](#)[31:0].

The PE never updates this register. This means the register is always UNKNOWN on reset.

### Attributes

TPIDRPRW is a 32-bit register.

### Field descriptions

The TPIDRPRW bit assignments are:

### Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

### Accessing the TPIDRPRW

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c0, 4	000	100	1101	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	TPIDRPRW_s
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	TPIDRPRW
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	TPIDRPRW
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	TPIDRPRW
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	TPIDRPRW
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	TPIDRPRW
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	TPIDRPRW
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	TPIDRPRW_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	TPIDRPRW_ns

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):  
— If [HSTR\\_EL2.T13==1](#), Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):  
— If [HSTR\\_EL2.T13==1](#), Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:  
— If [HSTR.T13==1](#), Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.154 TPIDRURO, PL0 Read-Only Software Thread ID Register

The TPIDRURO characteristics are:

### Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

### Configurations

AArch32 System register TPIDRURO is architecturally mapped to AArch64 System register [TPIDRRO\\_EL0](#)[31:0].

The PE never updates this register. This means the register is always UNKNOWN on reset.

### Attributes

TPIDRURO is a 32-bit register.

### Field descriptions

The TPIDRURO bit assignments are:

### Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

### Accessing the TPIDRURO

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c0, 3	000	011	1101	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	RO	n/a	n/a	RW	TPIDRURO_s
EL3 is using AArch32.	x	0	1	RO	RW	RW	RW	TPIDRURO_ns
EL3 is using AArch32.	x	1	1	RO	n/a	RW	RW	TPIDRURO_ns
EL3 is not implemented.	x	x	0	RO	RW	n/a	n/a	TPIDRURO
EL3 is not implemented.	x	0	1	RO	RW	RW	n/a	TPIDRURO
EL3 is not implemented.	x	1	1	RO	n/a	RW	n/a	TPIDRURO
EL3 is using AArch64.	x	x	0	RO	RW	n/a	n/a	TPIDRURO
EL3 is using AArch64.	x	0	1	RO	RW	RW	n/a	TPIDRURO
EL3 is using AArch64.	x	1	1	RO	n/a	RW	n/a	TPIDRURO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T13](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T13](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T13](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.

## G6.2.155 TPIDRURW, PL0 Read/Write Software Thread ID Register

The TPIDRURW characteristics are:

### Purpose

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

### Configurations

AArch32 System register TPIDRURW is architecturally mapped to AArch64 System register [TPIDR\\_EL0](#)[31:0].

The PE never updates this register. This means the register is always UNKNOWN on reset.

### Attributes

TPIDRURW is a 32-bit register.

### Field descriptions

The TPIDRURW bit assignments are:

### Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

### Accessing the TPIDRURW

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c13, c0, 2	000	010	1101	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	RW	n/a	n/a	RW	TPIDRURW_s
EL3 is using AArch32.	x	0	1	RW	RW	RW	RW	TPIDRURW_ns
EL3 is using AArch32.	x	1	1	RW	n/a	RW	RW	TPIDRURW_ns
EL3 is not implemented.	x	x	0	RW	RW	n/a	n/a	TPIDRURW
EL3 is not implemented.	x	0	1	RW	RW	RW	n/a	TPIDRURW
EL3 is not implemented.	x	1	1	RW	n/a	RW	n/a	TPIDRURW
EL3 is using AArch64.	x	x	0	RW	RW	n/a	n/a	TPIDRURW
EL3 is using AArch64.	x	0	1	RW	RW	RW	n/a	TPIDRURW
EL3 is using AArch64.	x	1	1	RW	n/a	RW	n/a	TPIDRURW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T13](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T13](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T13](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.

## G6.2.156 TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

### Purpose

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using [TTBR0](#) and addresses translated using [TTBR1](#).
- The translation table format used by this stage of translation.

In ARMv8.2, when the value of TTBCR.{EAE, T2E} is {1,1}, TTBCR is used with [TTBCR2](#).

### Configurations

AArch32 System register TTBCR is architecturally mapped to AArch64 System register [TCR\\_EL1](#)[31:0].

The current translation table format determines which format of the register is used.

When EL3 is using AArch32, write access to TTBCR(S) is disabled when the CP15SSDISABLE signal is asserted HIGH.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

### Attributes

TTBCR is a 32-bit register.

### Field descriptions

The TTBCR bit assignments are:

#### For all register layouts:

#### EAE, bit [31]

Extended Address Enable. The meanings of the possible values of this bit are:

- |   |  |
|---|--|
| 0 | Use the VMSAv8-32 translation system with the Short-descriptor translation table format. |
| 1 | Use the VMSAv8-32 translation system with the Long-descriptor translation table format.  |

#### When TTBCR.EAE==0:

#### EAE, bit [31]

Extended Address Enable. The meanings of the possible values of this bit are:

- |   |  |
|---|--|
| 0 | Use the VMSAv8-32 translation system with the Short-descriptor translation table format. |
|---|--|

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bits [30:6]

Reserved, RES0.

#### PD1, bit [5]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#). The encoding of this bit is:

- 0 Perform translation table walks using [TTBR1](#).
- 1 A TLB miss on an address that is translated using [TTBR1](#) generates a Translation fault. No translation table walk is performed.

When this register has an architecturally-defined reset value, this field resets to 0.

#### PD0, bit [4]

Translation table walk disable for translations using [TTBR0](#). This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using [TTBR0](#). The encoding of this bit is:

- 0 Perform translation table walks using [TTBR0](#).
- 1 A TLB miss on an address that is translated using [TTBR0](#) generates a Translation fault. No translation table walk is performed.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bit [3]

Reserved, RES0.

#### N, bits [2:0]

Indicate the width of the base address held in [TTBR0](#). In [TTBR0](#), the base address field is bits[31:14-N]. The value of N also determines:

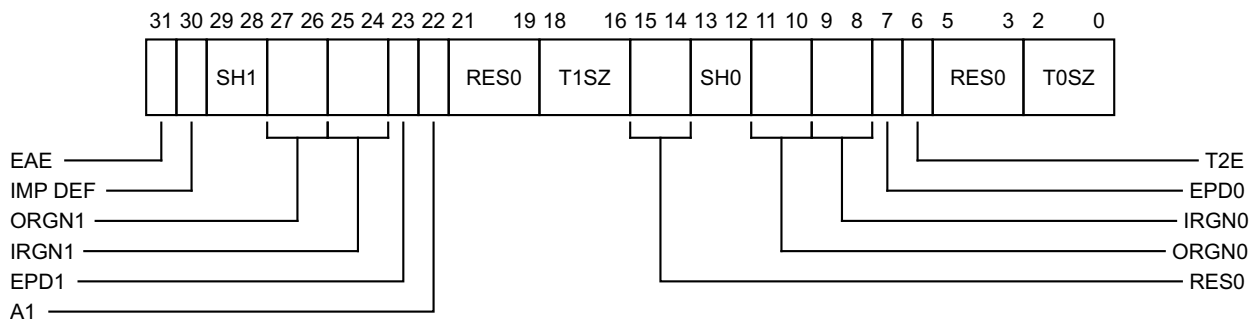

- Whether [TTBR0](#) or [TTBR1](#) is used as the base address for translation table walks.
- The size of the translation table pointed to by [TTBR0](#).

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with ARMv5 and ARMv6.

When this register has an architecturally-defined reset value, this field resets to 0.

#### When *TTBCR.EAE*==1:

#### EAE, bit [31]

Extended Address Enable. The meanings of the possible values of this bit are:

- 1 Use the VMSAv8-32 translation system with the Long-descriptor translation table format.

When this register has an architecturally-defined reset value, this field resets to 0.

#### IMP DEF, bit [30]

IMPLEMENTATION DEFINED.

When this register has an architecturally-defined reset value, this field resets to 0.

#### SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1](#). Defined values are:

00	Non-shareable
10	Outer Shareable
11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

When this register has an architecturally-defined reset value, this field resets to 0.

#### ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1](#).

00	Normal memory, Outer Non-cacheable
01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

When this register has an architecturally-defined reset value, this field resets to 0.

#### IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1](#).

00	Normal memory, Inner Non-cacheable
01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

When this register has an architecturally-defined reset value, this field resets to 0.

#### EPD1, bit [23]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#). The encoding of this bit is:

0	Perform translation table walks using <a href="#">TTBR1</a> .
1	A TLB miss on an address that is translated using <a href="#">TTBR1</a> generates a Translation fault. No translation table walk is performed.

When this register has an architecturally-defined reset value, this field resets to 0.

#### A1, bit [22]

Selects whether [TTBR0](#) or [TTBR1](#) defines the ASID. The encoding of this bit is:

0	<a href="#">TTBR0</a> .ASID defines the ASID.
1	<a href="#">TTBR1</a> .ASID defines the ASID.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bits [21:19]

Reserved, RES0.

#### TTBSZ, bits [18:16]

See [Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format on page G4-4594](#) for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bits [15:14]

Reserved, RES0.

#### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0.

00	Non-shareable
10	Outer Shareable
11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries on page K1-6117](#).

When this register has an architecturally-defined reset value, this field resets to 0.

#### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0.

00	Normal memory, Outer Non-cacheable
01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

When this register has an architecturally-defined reset value, this field resets to 0.

#### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0.

00	Normal memory, Inner Non-cacheable
01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

When this register has an architecturally-defined reset value, this field resets to 0.

#### EPD0, bit [7]

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0. The encoding of this bit is:

0	Perform translation table walks using TTBR0.
1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

When this register has an architecturally-defined reset value, this field resets to 0.

#### T2E, bit [6]

##### *In ARMv8.2*

TTBCR2 Enable.

Defined values are:

0	TTBCR2 is disabled. The contents of TTBCR2 are treated as 0 for all purposes other than reading or writing the register.
---	--

1 [TTBCR2](#) is enabled.

If  $\text{TTBCR.EAE} = 0$ , then the behavior is as if the bit is 0.

This bit is RES0 if [ARMv8.2-AA32HPD](#) is not implemented.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

#### Bits [5:3]

Reserved, RES0.

#### T0SZ, bits [2:0]

See [Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format on page G4-4594](#) for how [TTBCR](#).{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using [TTBR0](#) and [TTBR1](#).

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the TTBCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c2, c0, 2	000	010	0010	1111	0000

### Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	TTBCR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	TTBCR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	TTBCR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	TTBCR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	TTBCR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	TTBCR
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	TTBCR_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	TTBCR_ns
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	TTBCR_s

When EL3 is using AArch32, write access to TTBCR\_s is UNDEFINED when the CP15SSDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $HCR\_EL2.TVM == 1$ , Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If  $HCR\_EL2.TRVM == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $HSTR\_EL2.T2 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HCR\_EL2.TVM == 1$ , Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If  $HCR\_EL2.TRVM == 1$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $HSTR\_EL2.T2 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HCR.TVM == 1$ , Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If  $HCR.TRVM == 1$ , Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If  $HSTR.T2 == 1$ , Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.157 TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

### Purpose

The second control register for stage 1 of the PL1&0 translation regime.

If ARMv8.2-AA32HPD is not implemented and ARMv8.2-TTPBHA is not implemented, then this register is not implemented and its encoding is unallocated. Otherwise:

- When the value of [TTBCR](#).{EAE, T2E} is not {1, 1}, the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of [TTBCR](#).{EAE, T2E} is {1, 1}, TTBCR2 is used with [TTBCR](#).

### Configurations

AArch32 System register TTBCR2 is architecturally mapped to AArch64 System register [TCR\\_EL1](#)[63:32].

When EL3 is using AArch32, write access to TTBCR2(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.2.

### Attributes

TTBCR2 is a 32-bit register.

### Field descriptions

The TTBCR2 bit assignments are:

### Bits [31:19]

Reserved, RES0.

### HWU162, bit [18]

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR1](#) if TTBCR2.HPD1==1 and [TTBCR](#).T2E==1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TTBCR2.HPD1 value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

#### HWU161, bit [17]

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR1](#) if TTBCR2.HPD1==1 and [TTBCR.T2E](#)==1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TTBCR2.HPD1 value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

#### HWU160, bit [16]

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR1](#) if TTBCR2.HPD1==1 and [TTBCR.T2E](#)==1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TTBCR2.HPD1 value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

#### HWU159, bit [15]

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR1](#) if TTBCR2.HPD1==1 and [TTBCR.T2E](#)==1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TTBCR2.HPD1 value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

#### HWU062, bit [14]

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR0](#) if TTBCR2.HPD0==1 and [TTBCR.T2E](#)==1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TTBCR2.HPD0 value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

#### HWU061, bit [13]

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR0](#) if TTBCR2.HPD0==1 and [TTBCR.T2E](#)==1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.

- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TTBCR2.HPD0 value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

#### HWU060, bit [12]

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR0](#) if TTBCR2.HPD0==1 and [TTBCR.T2E](#)==1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TTBCR2.HPD0 value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

#### HWU059, bit [11]

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR0](#) if TTBCR2.HPD0==1 and [TTBCR.T2E](#)==1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TTBCR2.HPD0 value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

#### HPD1, bit [10]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR1](#).

Defined values are:

- 0 Hierarchical permissions are enabled.
- 1 Hierarchical permissions are disabled if [TTBCR.T2E](#) == 1.

When disabled, the permissions are treated as if the bits are 0.

If [TTBCR.T2E](#) == 0, the hierarchical permissions are enabled.

This bit is RES0 if [ARMv8.2-AA32HPD](#) is not implemented.

#### HPD0, bit [9]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR0](#).

Defined values are:

- 0 Hierarchical permissions are enabled.
- 1 Hierarchical permissions are disabled if [TTBCR.T2E](#) == 1.

When disabled, the permissions are treated as if the bits are 0.

If [TTBCR.T2E](#) == 0, the hierarchical permissions are enabled.

This bit is RES0 if [ARMv8.2-AA32HPD](#) is not implemented.

#### Bits [8:0]

Reserved, RES0.

## Accessing the TTBCR2

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c2, c0, 3	000	011	0010	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	TTBCR2_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	TTBCR2_ns
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	TTBCR2
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	TTBCR2
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	TTBCR2
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	TTBCR2
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	TTBCR2
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	TTBCR2
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	TTBCR2_s

When EL3 is using AArch32, write access to TTBCR2\_s is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T2==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.

- If [HCR\\_EL2](#).TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- If [HSTR\\_EL2](#).T2==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HCR](#).TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If [HCR](#).TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR](#).T2==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.158 TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

### Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

### Configurations

AArch32 System register TTBR0 is architecturally mapped to AArch64 System register [TTBR0\\_EL1](#).

[TTBCR](#).EAE determines which TTBR0 format is used:

EAE==0 32-bit format is used. TTBR0[63:32] are ignored.

EAE==1 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR0.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

### Field descriptions

The TTBR0 bit assignments are:

**When [TTBCR.EAE](#)==0:**

### TTBR0, bits [31:7]

Translation table base address, bits[31:x], where x is 14-([TTBCR.N](#)). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

### IRGN[0], bit [6]

See the [IRGN\[1\]](#) description.

#### NOS, bit [5]

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

- 0 Memory is Outer Shareable.
- 1 Memory is Inner Shareable.

This bit is ignored when the value of TTBR0.S is 0.

#### RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

- 00 Normal memory, Outer Non-cacheable.
- 01 Normal memory, Outer Write-Back Write-Allocate Cacheable.
- 10 Normal memory, Outer Write-Through Cacheable.
- 11 Normal memory, Outer Write-Back no Write-Allocate Cacheable.

#### IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is UNK/SBZP.

#### S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:

- 0 Memory is Non-shareable.
- 1 Memory is shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

#### IRGN[1], bit [0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

- 00 Normal memory, Inner Non-cacheable.
- 01 Normal memory, Inner Write-Back Write-Allocate Cacheable.
- 10 Normal memory, Inner Write-Through Cacheable.
- 11 Normal memory, Inner Write-Back no Write-Allocate Cacheable.

#### ———— Note ————

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

#### When TTBCR.EAE==1:

### Bits [63:56]

Reserved, RES0.

### ASID, bits [55:48]

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either TTBR0.ASID or TTBR1.ASID.

### BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are **CONSTRAINED UNPREDICTABLE**, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.T0SZ](#) as follows:

- If [TTBCR.T0SZ](#) is 0 or 1,  $x = 5 - \text{TTBCR.T0SZ}$ .
- If [TTBCR.T0SZ](#) is greater than 1,  $x = 14 - \text{TTBCR.T0SZ}$ .

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

### CnP, bit [0]

#### In ARMv8.2

Common not Private. In an implementation that includes [ARMv8.2-TTCNP](#), when [TTBCR.EAE](#) ==1, indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.

- |   |   |
|---|---|
| 0 | The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by: <ul style="list-style-type: none"> <li>• The value of TTBR0.CnP on those other PEs.</li> <li>• The value of <a href="#">TTBCR.EAE</a> on those other PEs.</li> <li>• The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID.</li> </ul>  |
| 1 | The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply: <ul style="list-style-type: none"> <li>• The translation table entries are pointed to by this instance of TTBR0.</li> <li>• The value of the applicable <a href="#">TTBCR.EAE</a> field is 1.</li> <li>• The ASID is the same as the current ASID.</li> <li>• For the Non-secure instance of TTBR0, the VMID is the same as the current VMID.</li> </ul> |

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

#### ———— Note ————

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6101](#).

In an implementation that does not include [ARMv8.2-TTCNP](#) this field is RES0.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

## Accessing the TTBR0

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 0, <Rt>, <Rt2>, c2	0000	1111	0010

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	TTBR0
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	TTBR0
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	TTBR0
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	TTBR0
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	TTBR0
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	TTBR0
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	TTBR0_s
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	TTBR0_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	TTBR0_ns

When EL3 is using AArch32, write access to TTBR0\_s is UNDEFINED when the CP15SSDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T2==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T2==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If HCR.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T2==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.159 TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

### Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

### Configurations

AArch32 System register TTBR1 is architecturally mapped to AArch64 System register [TTBR1\\_EL1](#).

[TTBCR](#).EAE determines which TTBR1 format is used:

EAE==0 32-bit format is used. TTBR1[63:32] are ignored.

EAE==1 64-bit format is used.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR1.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

### Field descriptions

The TTBR1 bit assignments are:

**When *TTBCR.EAE*==0:**

### TTB1, bits [31:7]

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

### IRGN[0], bit [6]

See the IRGN[1] description.

#### NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

- 0 Memory is Outer Shareable.
- 1 Memory is Inner Shareable.

This bit is ignored when the value of TTBR1.S is 0.

#### RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

- 00 Normal memory, Outer Non-cacheable.
- 01 Normal memory, Outer Write-Back Write-Allocate Cacheable.
- 10 Normal memory, Outer Write-Through Cacheable.
- 11 Normal memory, Outer Write-Back no Write-Allocate Cacheable.

#### IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is UNK/SBZP.

#### S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:

- 0 Memory is Non-shareable.
- 1 Memory is shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

#### IRGN[1], bit [0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

- 00 Normal memory, Inner Non-cacheable.
- 01 Normal memory, Inner Write-Back Write-Allocate Cacheable.
- 10 Normal memory, Inner Write-Through Cacheable.
- 11 Normal memory, Inner Write-Back no Write-Allocate Cacheable.

#### ———— Note ————

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

#### When TTBCR.EAE==1:

### Bits [63:56]

Reserved, RES0.

### ASID, bits [55:48]

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either TTBR0.ASID or TTBR1.ASID.

### BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.T1SZ](#) as follows:

- If [TTBCR.T1SZ](#) is 0 or 1,  $x = 5 - \text{TTBCR.T1SZ}$ .
- If [TTBCR.T1SZ](#) is greater than 1,  $x = 14 - \text{TTBCR.T1SZ}$ .

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

### CnP, bit [0]

#### In ARMv8.2

Common not Private. In an implementation that includes [ARMv8.2-TTCNP](#), when [TTBCR.EAE](#) ==1, indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.

- |   |   |
|---|---|
| 0 | The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by: <ul style="list-style-type: none"> <li>• The value of TTBR1.CnP on those other PEs.</li> <li>• The value of <a href="#">TTBCR.EAE</a> on those other PEs.</li> <li>• The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID.</li> </ul>  |
| 1 | The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply: <ul style="list-style-type: none"> <li>• The translation table entries are pointed to by this instance of TTBR1.</li> <li>• The value of the applicable <a href="#">TTBCR.EAE</a> field is 1.</li> <li>• The ASID is the same as the current ASID.</li> <li>• For the Non-secure instance of TTBR1, the VMID is the same as the current VMID.</li> </ul> |

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

#### ———— Note ————

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6101](#).

In an implementation that does not include [ARMv8.2-TTCNP](#) this field is RES0.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

## Accessing the TTBR1

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c2, c0, 1	000	001	0010	1111	0000

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 1, <Rt>, <Rt2>, c2	0001	1111	0010

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	TTBR1
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	TTBR1
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	TTBR1
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	TTBR1
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	TTBR1
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	TTBR1
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	TTBR1_ns
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	TTBR1_ns
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	TTBR1_s

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T2==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TVM==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
  - If HCR\_EL2.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If HSTR\_EL2.T2==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HCR.TVM==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
  - If HCR.TRVM==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
  - If HSTR.T2==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G6.2.160 VBAR, Vector Base Address Register

The VBAR characteristics are:

Purpose

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.  
Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

Configurations

AArch32 System register VBAR is architecturally mapped to AArch64 System register [VBAR\\_EL1](#)[31:0].  
When EL3 is using AArch32, write access to VBAR(S) is disabled when the CP15SDISABLE signal is asserted HIGH.  
Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VBAR is a 32-bit register.

Field descriptions

The VBAR bit assignments are:

Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.  
When this register has an architecturally-defined reset value, this field resets to an IMPLEMENTATION DEFINED value.

Bits [4:0]

Reserved, RES0.

Accessing the VBAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c12, c0, 0	000	000	1100	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW	VBAR <sub>s</sub>
EL3 is using AArch32.	x	0	1	-	RW	RW	RW	VBAR <sub>ns</sub>
EL3 is using AArch32.	x	1	1	-	n/a	RW	RW	VBAR <sub>ns</sub>
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a	VBAR
EL3 is not implemented.	x	0	1	-	RW	RW	n/a	VBAR
EL3 is not implemented.	x	1	1	-	n/a	RW	n/a	VBAR
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a	VBAR
EL3 is using AArch64.	x	0	1	-	RW	RW	n/a	VBAR
EL3 is using AArch64.	x	1	1	-	n/a	RW	n/a	VBAR

When EL3 is using AArch32, write access to VBAR<sub>s</sub> is UNDEFINED when the CP15SDISABLE signal is asserted HIGH.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HSTR\_EL2.T12==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HSTR\_EL2.T12==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HSTR.T12==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G6.2.161 VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of [MPIDR](#).

Configurations

AArch32 System register VMPIDR is architecturally mapped to AArch64 System register [VMPIDR\\_EL2](#)[31:0].

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MPIDR](#).

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VMPIDR is a 32-bit register.

Field descriptions

The VMPIDR bit assignments are:

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

- 0 This implementation does not include the ARMv7 Multiprocessing Extensions functionality.
  - 1 This implementation includes the ARMv7 Multiprocessing Extensions functionality.
- In ARMv8 this bit is RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

- 0 Processor is part of a multiprocessor system.
- 1 Processor is part of a uniprocessor system.

When this register has an architecturally-defined reset value, this field resets to the value of [MPIDR.U](#).

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. The possible values of this bit are:

- 0 Performance of PEs at the lowest affinity level is largely independent.
- 1 Performance of PEs at the lowest affinity level is very interdependent.

When this register has an architecturally-defined reset value, this field resets to the value of [MPIDR.MT](#).

#### Aff2, bits [23:16]

Affinity level 2. The least significant affinity level field, for this PE in the system.

When this register has an architecturally-defined reset value, this field resets to the value of [MPIDR.Aff2](#).

#### Aff1, bits [15:8]

Affinity level 1. The intermediate affinity level field, for this PE in the system.

When this register has an architecturally-defined reset value, this field resets to the value of [MPIDR.Aff1](#).

#### Aff0, bits [7:0]

Affinity level 0. The most significant affinity level field, for this PE in the system.

When this register has an architecturally-defined reset value, this field resets to the value of [MPIDR.Aff0](#).

### Accessing the VMPIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c0, c0, 5	100	101	0000	1111	0000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T0](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If [HSTR\\_EL2.T0](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If [HSTR.T0](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.162 VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

### Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of [MIDR](#).

### Configurations

AArch32 System register VPIDR is architecturally mapped to AArch64 System register [VPIDR\\_EL2](#).

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MIDR](#).

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

VPIDR is a 32-bit register.

### Field descriptions

The VPIDR bit assignments are:

### Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

Hex representation	ASCII representation	Implementer
0x41	A	ARM Limited
0x42	B	Broadcom Corporation
0x43	C	Cavium Inc.
0x44	D	Digital Equipment Corporation
0x49	I	Infineon Technologies AG
0x4D	M	Motorola or Freescale Semiconductor Inc.
0x4E	N	NVIDIA Corporation
0x50	P	Applied Micro Circuits Corporation
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

When this register has an architecturally-defined reset value, this field resets to the value of [MIDR.Implementer](#).

#### Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

When this register has an architecturally-defined reset value, this field resets to the value of [MIDR.Variant](#).

#### Architecture, bits [19:16]

The permitted values of this field are:

0001	ARMv4
0010	ARMv4T
0011	ARMv5 (obsolete)
0100	ARMv5T
0101	ARMv5TE
0110	ARMv5TEJ
0111	ARMv6
1111	Architectural features are individually identified in the ID_* registers, see <a href="#">Identification registers, functional group on page G4-4727</a> .

All other values are reserved.

When this register has an architecturally-defined reset value, this field resets to the value of [MIDR.Architecture](#).

#### PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

When this register has an architecturally-defined reset value, this field resets to the value of [MIDR.PartNum](#).

#### Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

When this register has an architecturally-defined reset value, this field resets to the value of [MIDR.Revision](#).

### Accessing the VPIDR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c0, c0, 0	100	000	0000	1111	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T0](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T0](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T0](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

G6.2.163 VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

Purpose

The control register for stage 2 of the Non-secure PL1&0 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configurations

AArch32 System register VTCR is architecturally mapped to AArch64 System register [VTCR\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

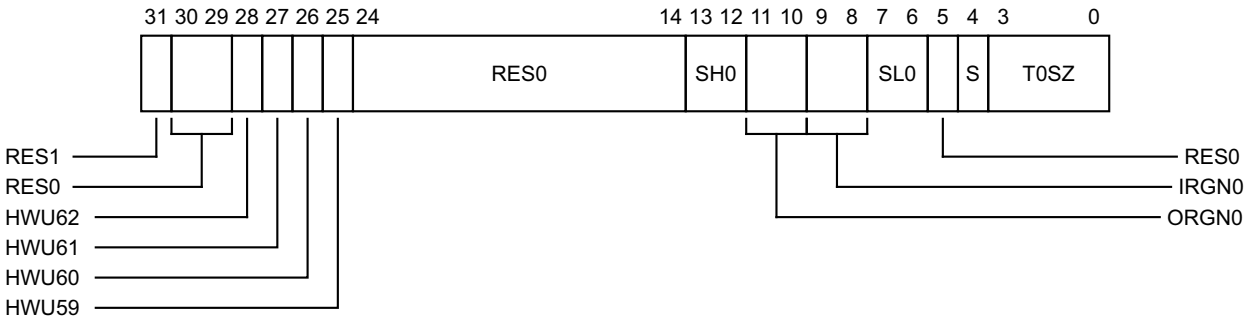

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VTCR is a 32-bit register.

Field descriptions

The VTCR bit assignments are:

Bit [31]

Reserved, RES1.

Bits [30:29]

Reserved, RES0.

HWU62, bit [28]

In ARMv8.2

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table block or level 3 entry.

Defined values are:

- 0 The stage 2 translation table entry block or level 3 entry cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 2 translation table entry block or level 3 entry can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

In ARMv8.1 and ARMv8.0.

Reserved, RES0.

#### HWU61, bit [27]

##### *In ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table block or level 3 entry.

Defined values are:

- 0 The stage 2 translation table entry block or level 3 entry cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 2 translation table entry block or level 3 entry can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### HWU60, bit [26]

##### *In ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table block or level 3 entry.

Defined values are:

- 0 The stage 2 translation table entry block or level 3 entry cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 2 translation table entry block or level 3 entry can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### HWU59, bit [25]

##### *In ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table block or level 3 entry.

Defined values are:

- 0 The stage 2 translation table entry block or level 3 entry cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 2 translation table entry block or level 3 entry can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### Bits [24:14]

Reserved, RES0.

#### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [VTBTR](#).

- 00 Non-shareable
- 10 Outer Shareable
- 11 Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-6117.

#### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [VTTBR](#).

00	Normal memory, Outer Non-cacheable
01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

#### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [VTTBR](#).

00	Normal memory, Inner Non-cacheable
01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

#### SL0, bits [7:6]

Starting level for translation table walks using [VTTBR](#).

00	Start at level 2
01	Start at level 1

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.

#### Bit [5]

Reserved, RES0.

#### S, bit [4]

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the behavior is CONSTRAINED UNPREDICTABLE and the stage 2 T0SZ value is treated as an UNKNOWN value, see [Misprogramming VTCR.S on page K1-6114](#).

#### T0SZ, bits [3:0]

The size offset of the memory region addressed by [VTTBR](#). The region size is  $2^{(32-T0SZ)}$  bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

#### ———— Note —————

This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

### Accessing the VTCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c2, c1, 2	100	010	0010	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T2](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T2](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T2](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.2.164 VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

### Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

### Configurations

AArch32 System register VTTBR is architecturally mapped to AArch64 System register [VTTBR\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

VTTBR is a 64-bit register.

### Field descriptions

The VTTBR bit assignments are:

#### Bits [63:56]

Reserved, RES0.

#### VMID, bits [55:48]

The VMID for the translation table.

When this register has an architecturally-defined reset value, this field resets to 0.

#### BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [VTCR.SL0](#) and [VTCR.T0SZ](#) as follows:

- If [VTCR.SL0](#) is 00, meaning that lookup starts at level 2, then x is 14 - [VTCR.T0SZ](#).
- If [VTCR.SL0](#) is 01, meaning that lookup starts at level 1, then x is 5 - [VTCR.T0SZ](#).
- If [VTCR.SL0](#) is either 10 or 11 then a stage 2 level 1 Translation fault is generated.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

This field resets to a value that is architecturally UNKNOWN.

## CnP, bit [0]

### In ARMv8.2

Common not Private. In an implementation that includes [ARMv8.2-TTCNP](#), indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

- 0 The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
- 1 The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

### Note

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6101](#).

In an implementation that does not include [ARMv8.2-TTCNP](#) this field is RES0.

### In ARMv8.1 and ARMv8.0.

Reserved, RES0.

## Accessing the VTTBR

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 6, <Rt>, <Rt2>, c2	0110	1111	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \ \&\& \ (HCR\_EL2.E2H == 0)$ :
  - If  $HSTR\_EL2.T2 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \ \&\& \ (HCR\_EL2.E2H == 1) \ \&\& \ (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T2 == 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HSTR.T2 == 1$ , Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## G6.3 Debug registers

This section lists the Debug System registers in AArch32 state, in alphabetic order.

### G6.3.1 DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

#### Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGAUTHSTATUS is architecturally mapped to AArch64 System register [DBGAUTHSTATUS\\_EL1](#).

AArch32 System register DBGAUTHSTATUS is architecturally mapped to External register [DBGAUTHSTATUS\\_EL1](#).

This register is required in all implementations.

#### Attributes

DBGAUTHSTATUS is a 32-bit register.

#### Field descriptions

The DBGAUTHSTATUS bit assignments are:

#### Bits [31:8]

Reserved, RES0.

#### SNID, bits [7:6]

Secure non-invasive debug. Possible values of this field are:

- 00 Not implemented. EL3 is not implemented and the implemented Security state is Non-secure state.
  - 10 Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
  - 11 Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.
- Other values are reserved.

#### SID, bits [5:4]

Secure invasive debug. Possible values of this field are:

- 00 Not implemented. EL3 is not implemented and the implemented Security state is Non-secure state.
  - 10 Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
  - 11 Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.
- Other values are reserved.

#### NSNID, bits [3:2]

Non-secure non-invasive debug. Possible values of this field are:

- 00 Not implemented. EL3 is not implemented and the implemented Security state is Secure state.

- 10 Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
  - 11 Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.
- Other values are reserved.

**NSID, bits [1:0]**

Non-secure invasive debug. Possible values of this field are:

- 00 Not implemented. EL3 is not implemented and the implemented Security state is Secure state.
  - 10 Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
  - 11 Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.
- Other values are reserved.

**Accessing the DBGAUTHSTATUS**

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c14, 6	000	110	0111	1110	1110

**Accessibility**

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDA](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, read accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.3.2 DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

### Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>](#). If EL2 is implemented and this breakpoint supports Context matching, [DBGBVR<n>](#) can be associated with a Breakpoint Extended Value Register [DBGBXVR<n>](#) for VMID matching.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGBCR<n> is architecturally mapped to AArch64 System register [DBGBCR<n>\\_EL1](#).

AArch32 System register DBGBCR<n> is architecturally mapped to External register [DBGBCR<n>\\_EL1](#).

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

### Attributes

DBGBCR<n> is a 32-bit register.

### Field descriptions

The DBGBCR<n> bit assignments are:

When the E field is zero, all the other fields in the register are ignored.

#### Bits [31:24]

Reserved, RES0.

#### BT, bits [23:20]

Breakpoint Type. Possible values are:

0000	Unlinked instruction address match.
0001	Linked instruction address match.
0010	Unlinked Context ID match.
0011	Linked Context ID match.
0100	Unlinked instruction address mismatch.
0101	Linked instruction address mismatch.
0110	Unlinked <a href="#">CONTEXTIDR_EL1</a> match (introduced in ARMv8.1).
0111	Linked <a href="#">CONTEXTIDR_EL1</a> match (introduced in ARMv8.1).
1000	Unlinked VMID match.
1001	Linked VMID match.

1010	Unlinked VMID and Context ID match.
1011	Linked VMID and Context ID match.
1100	Unlinked <a href="#">CONTEXTIDR_EL2</a> match (introduced in ARMv8.1).
1101	Linked <a href="#">CONTEXTIDR_EL2</a> match (introduced in ARMv8.1).
1110	Unlinked Full Context ID match (introduced in ARMv8.1).
1111	Linked Full Context ID match (introduced in ARMv8.1).

The field breaks down as follows:

- BT[3:1]: Base type.
 

000	Match address. <a href="#">DBGBVR&lt;n&gt;</a> is the address of an instruction.
001	Match Context ID. <a href="#">DBGBVR&lt;n&gt;</a> .ContextID is a Context ID compared against <a href="#">CONTEXTIDR</a> when <a href="#">ARMv8.1-VHE</a> is not implemented, or not in a Host OS or a Host Application. When <a href="#">ARMv8.1-VHE</a> is implemented, and in a Host OS or Host Application, the Context ID is compared against <a href="#">CONTEXTIDR_EL2</a> .
010	Mismatch address. <a href="#">DBGBVR&lt;n&gt;</a> is the address of an instruction to be stepped.
011	Match <a href="#">CONTEXTIDR_EL1</a> . <a href="#">DBGBVR&lt;n&gt;</a> .ContextID is a Context ID compared against <a href="#">CONTEXTIDR</a> .
100	Match VMID. <a href="#">DBGBXVR&lt;n&gt;</a> .VMID is a VMID compared against <a href="#">VTTBR</a> .VMID.
101	Match VMID and Context ID. <a href="#">DBGBVR&lt;n&gt;</a> .ContextID is a Context ID compared against <a href="#">CONTEXTIDR</a> , and <a href="#">DBGBXVR&lt;n&gt;</a> .VMID is a VMID compared against <a href="#">VTTBR</a> .VMID.
110	Match <a href="#">CONTEXTIDR_EL2</a> . <a href="#">DBGBXVR&lt;n&gt;</a> .ContextID2 is a Context ID compared against <a href="#">CONTEXTIDR_EL2</a> .
111	Match Full Context ID. <a href="#">DBGBVR&lt;n&gt;</a> .ContextID is compared against <a href="#">CONTEXTIDR_EL1</a> , and <a href="#">DBGBXVR&lt;n&gt;</a> .ContextID2 is compared against <a href="#">CONTEXTIDR_EL2</a> .
- BT[0]: Enable linking.

Constraints on breakpoint programming mean some values are reserved under certain conditions. For more information, see [Reserved DBGBCR<n>.BT values on page G2-4490](#).

This field resets to a value that is architecturally UNKNOWN.

#### LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of [DBGBCR<n>.E](#) is 0.

This field resets to a value that is architecturally UNKNOWN.

#### SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see [Breakpoint usage constraints on page G2-4490](#).

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-4480](#).

This field resets to a value that is architecturally UNKNOWN.

### HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint *n* is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-4480](#).

This field resets to a value that is architecturally UNKNOWN.

### Bits [12:9]

Reserved, RES0.

### BAS, bits [8:5]

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0011	DBGBVR< <i>n</i> >	Use for T32 instructions.
1100	DBGBVR< <i>n</i> >+2	Use for T32 instructions.
1111	DBGBVR< <i>n</i> >	Use for A32 instructions.

All other values are reserved. For more information, see [Reserved DBGBCR<\*n\*>.{SSC, HMC, PMC} values on page G2-4491](#).

For more information on using the BAS field in Address Match breakpoints, see [Using the BAS field in Address Match breakpoints on page G2-4483](#).

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Step instruction at	Constraint for debuggers
0000	-	Use for a match anywhere breakpoint.
0011	DBGBVR< <i>n</i> >	Use for stepping T32 instructions.
1100	DBGBVR< <i>n</i> >+2	Use for stepping T32 instructions.
1111	DBGBVR< <i>n</i> >	Use for stepping A32 instructions.

All other values are reserved. For more information, see [Reserved DBGBCR<\*n\*>.{SSC, HMC, PMC} values on page G2-4491](#).

For more information on using the BAS field in address mismatch breakpoints, see [Using the BAS field in Address Match breakpoints on page G2-4483](#).

For Context matching breakpoints, this field is RES1 and ignored.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

### Bits [4:3]

Reserved, RES0.

**PMC, bits [2:1]**

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint *n* is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<*n*>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-4480](#).

This field resets to a value that is architecturally UNKNOWN.

**E, bit [0]**

Enable breakpoint DBGBVR<*n*>. Possible values are:

- 0 Breakpoint disabled.
- 1 Breakpoint enabled.

This field resets to a value that is architecturally UNKNOWN.

**Accessing the DBGBCR<*n*>**

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, <CRm>, 5	000	101	0000	1110	n<3:0>

- <CRm> is in the range c0 - c15.

**Accessibility**

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see:

- [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state.
- [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state.
- [Software Access debug event on page H3-5493](#) for accesses to this register taken to Debug state.

Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `EDSCR.TDA==1`, `DBGOSLSR.OSLK==0`, and halting is allowed, accesses to this register from EL1 and EL2 generate a Software Access debug event.
- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1`:
  - If `MDCR_EL2.TDA==1`, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and `SCR_EL3.NS == 1`:
  - If `HDCR.TDA==1`, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If `MDCR_EL3.TDA==1`, accesses to this register from EL1 and EL2 are trapped to EL3.

### G6.3.3 DBGBVR<n>, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n> characteristics are:

#### Purpose

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint n together with control register [DBGBCR<n>](#). If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register [DBGXVR<n>](#) for VMID matching.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGBVR<n> is architecturally mapped to AArch64 System register [DBGBVR<n>\\_EL1](#)[31:0].

AArch32 System register DBGBVR<n> is architecturally mapped to External register [DBGBVR<n>\\_EL1](#)[31:0].

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

#### ———— Note ————

Writes to DBGBVR<n> do not modify [DBGBVR<n>\\_EL1](#)[63:32].

#### Attributes

How this register is interpreted depends on the value of [DBGBCR<n>](#).BT.

- When [DBGBCR<n>](#).BT is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>](#).BT is 0b001x, 0b101x, or 0b111x, this register holds a Context ID.

For other values of [DBGBCR<n>](#).BT, this register is RES0.

Some breakpoints might not support Context ID comparison. For more information, see the description of the [DBGDIDR](#).CTX\_CMPs field.

#### Field descriptions

The DBGBVR<n> bit assignments are:

**When [DBGBCR<n>](#).BT==0b0x0x:**

#### VA[31:2], bits [31:2]

Bits[31:2] of the address value for comparison.

This field resets to a value that is architecturally UNKNOWN.

#### Bits [1:0]

Reserved, RES0.

**When *DBGBCR<n>.BT==0b001x*:**

**ContextID, bits [31:0]**

Context ID value for comparison.

The value is compared against [CONTEXTIDR](#) in the following cases:

- The PE is in Secure state.
- EL2 is using AArch32.
- When [ARMv8.1-VHE](#) is not implemented.
- When [ARMv8.1-VHE](#) is implemented, EL2 is using AArch64, and [HCR\\_EL2.E2H](#) is 0.
- When [ARMv8.1-VHE](#) is implemented, EL2 is using AArch64, [HCR\\_EL2.{E2H, TGE}](#) is {1, 0}, and the PE is in Non-secure EL0 or EL1.

When [ARMv8.1-VHE](#) is implemented, EL2 is using AArch64, [HCR\\_EL2.{E2H, TGE}](#) is {1, 1} and the PE is in Non-secure EL0, the value is compared against [CONTEXTIDR\\_EL2](#).

This field resets to a value that is architecturally UNKNOWN.

**When *DBGBCR<n>.BT==0b101x* and *EL2* implemented:**

**ContextID, bits [31:0]**

Context ID value for comparison against [CONTEXTIDR](#).

This field resets to a value that is architecturally UNKNOWN.

**When *DBGBCR<n>.BT==0b111x* and *EL2* implemented:**

**ContextID, bits [31:0]**

Context ID value for comparison against [CONTEXTIDR\\_EL2](#).

This field resets to a value that is architecturally UNKNOWN.

**Accessing the *DBGBVR<n>***

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, <CRm>, 4	000	100	0000	1110	n<3:0>

- <CRm> is in the range c0 - c15.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see:

- [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state.
- [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state.
- [Software Access debug event on page H3-5493](#) for accesses to this register taken to Debug state.

Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `EDSCR.TDA==1`, `DBGOSLSR.OSLK==0`, and halting is allowed, accesses to this register from EL1 and EL2 generate a Software Access debug event.
- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1`:
  - If `MDCR_EL2.TDA==1`, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and `SCR_EL3.NS == 1`:
  - If `HDCR.TDA==1`, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If `MDCR_EL3.TDA==1`, accesses to this register from EL1 and EL2 are trapped to EL3.

### G6.3.4 DBGBXVR<n>, Debug Breakpoint Extended Value Registers, n = 0 - 15

The DBGBXVR<n> characteristics are:

#### Purpose

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register [DBGBCR<n>](#) and a value register [DBGBVR<n>](#), where EL2 is implemented and breakpoint n supports Context matching.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGBXVR<n> is architecturally mapped to AArch64 System register [DBGBVR<n>\\_EL1](#)[63:32].

AArch32 System register DBGBXVR<n> is architecturally mapped to External register [DBGBVR<n>\\_EL1](#)[63:32].

#### Note

Writes to DBGBXVR<n> do not modify [DBGBVR<n>\\_EL1](#)[31:0].

This register is unallocated in any of the following cases:

- Breakpoint n is not implemented.
- Breakpoint n does not support Context matching.
- EL2 is not implemented.

For more information, see the description of the [DBGDIDR.CTX\\_CMPs](#) field.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

#### Attributes

How this register is interpreted depends on the value of [DBGBCR<n>.BT](#).

- When [DBGBCR<n>.BT](#) is 0b10xx, this register holds a VMID.
- When [DBGBCR<n>.BT](#) is 0b11xx, this register holds a Context ID.

For other values of [DBGBCR<n>.BT](#), this register is RES0.

#### Field descriptions

The DBGBXVR<n> bit assignments are:

**When [DBGBCR<n>.BT](#)==0b10xx and EL2 implemented:**

31	16 15	8 7	0
RES0		VMID[15:8]	VMID[7:0]

#### Bits [31:16]

Reserved, RES0.

#### VMID[15:8], bits [15:8]

**In ARMv8.2 and ARMv8.1**

Extension to VMID[7:0]. See VMID[7:0] for more details.

This field resets to a value that is architecturally UNKNOWN.

**In ARMv8.0.**

Reserved, RES0.

#### VMID[7:0], bits [7:0]

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- [ARMv8.1-VMID16](#) is not implemented.

When [ARMv8.1-VMID16](#) is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- [VTCR\\_EL2.VS](#) has a value of 0.
- EL2 is using AArch32.

This field resets to a value that is architecturally UNKNOWN.

#### When *DBGBCR<n>.BT==0b11xx* and *EL2* implemented:

#### ContextID2, bits [31:0]

Context ID value for comparison against [CONTEXTIDR\\_EL2](#).

This field resets to a value that is architecturally UNKNOWN.

#### Accessing the DBGXVR<n>

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, <CRm>, 1	000	001	0001	1110	n<3:0>

- <CRm> is in the range c0 - c15.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see:

- [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state.
- [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state.
- [Software Access debug event on page H3-5493](#) for accesses to this register taken to Debug state.

Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [EDSCR.TDA==1](#), [DBGOSLSR.OSLK==0](#), and halting is allowed, accesses to this register from EL1 and EL2 generate a Software Access debug event.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA==1](#), Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDA==1](#), Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA==1](#), accesses to this register from EL1 and EL2 are trapped to EL3.

### G6.3.5 DBGCLAIMCLR, Debug Claim Tag Clear register

The DBGCLAIMCLR characteristics are:

#### Purpose

Used by software to read the values of the CLAIM tag bits, and to clear these bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

#### ———— Note ————

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET](#) register.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGCLAIMCLR is architecturally mapped to AArch64 System register [DBGCLAIMCLR\\_ELI](#).

AArch32 System register DBGCLAIMCLR is architecturally mapped to External register [DBGCLAIMCLR\\_ELI](#).

An implementation must include 8 CLAIM tag bits.

This register is in the Cold reset domain. See the CLAIM field description for the effect of a Cold reset on the value returned by this register. This register is not affected by a Warm reset.

#### Attributes

DBGCLAIMCLR is a 32-bit register.

#### Field descriptions

The DBGCLAIMCLR bit assignments are:

31	8	7	0
RAZ/SBZ			CLAIM

#### Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

#### CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

A cold reset clears the CLAIM tag bits to 0.

#### Accessing the DBGCLAIMCLR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c9, 6	000	110	0111	1110	1001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.3.6 DBGCLAIMSET, Debug Claim Tag Set register

The DBGCLAIMSET characteristics are:

### Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

### Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR](#) register.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGCLAIMSET is architecturally mapped to AArch64 System register [DBGCLAIMSET\\_EL1](#).

AArch32 System register DBGCLAIMSET is architecturally mapped to External register [DBGCLAIMSET\\_EL1](#).

An implementation must include 8 CLAIM tag bits.

### Attributes

DBGCLAIMSET is a 32-bit register.

### Field descriptions

The DBGCLAIMSET bit assignments are:

### Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

### CLAIM, bits [7:0]

Set CLAIM tag bits. RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

A cold reset clears the CLAIM tag bits to 0.

### Accessing the DBGCLAIMSET

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c8, 6	000	110	0111	1110	1000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.3.7 DBGDCCINT, DCC Interrupt Enable Register

The DBGDCCINT characteristics are:

### Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDCCINT is architecturally mapped to AArch64 System register [MDCCINT\\_EL1](#).

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

DBGDCCINT is a 32-bit register.

### Field descriptions

The DBGDCCINT bit assignments are:

### Bit [31]

Reserved, RES0.

### RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

0 No interrupt request generated by DTRRX.

1 Interrupt request will be generated on RXfull == 1.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

When this register has an architecturally-defined reset value, this field resets to 0.

### TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

0 No interrupt request generated by DTRTX.

1 Interrupt request will be generated on TXfull == 0.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

When this register has an architecturally-defined reset value, this field resets to 0.

### Bits [28:0]

Reserved, RES0.

## Accessing the DBGDCCINT

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c2, 0	000	000	0000	1110	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If MDCR\_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HDCR.TDA==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If MDCR\_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.3.8 DBGDEVID, Debug Device ID register 0

The DBGDEVID characteristics are:

### Purpose

Adds to the information given by the [DBGDIDR](#) by describing other features of the debug implementation.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

This register is required in all implementations.

### Attributes

DBGDEVID is a 32-bit register.

### Field descriptions

The DBGDEVID bit assignments are:

### CIDMask, bits [31:28]

Indicates the level of support for the Context ID matching breakpoint masking capability. Permitted values of this field are:

0000 Context ID masking is not implemented.

0001 Context ID masking is implemented.

All other values are reserved. The value of this for ARMv8 is 0000.

### AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Permitted values for this field are:

0000 None supported.

0001 Support for External Debug Auxiliary Control Register, [EDACR](#).

All other values are reserved.

### DoubleLock, bits [23:20]

Indicates the presence of the [DBGOSDLR](#), OS Double Lock Register. Permitted values of this field are:

0000 The [DBGOSDLR](#) is not present.

0001 The [DBGOSDLR](#) is present.

All other values are reserved. The value of this for ARMv8 is 0001.

### VirtExtns, bits [19:16]

Indicates whether EL2 is implemented. Permitted values of this field are:

0000 EL2 is not implemented.

0001 EL2 is implemented.

All other values are reserved.

#### VectorCatch, bits [15:12]

Defines the form of Vector Catch exception implemented. Permitted values of this field are:

- 0000 Address matching Vector Catch exception implemented.
- 0001 Exception matching Vector Catch exception implemented.
- All other values are reserved.

#### BPAAddrMask, bits [11:8]

Indicates the level of support for the instruction address matching breakpoint masking capability. Permitted values of this field are:

- 0000 Breakpoint address masking might be implemented. If not implemented, [DBGBCR<n>](#)[28:24] is RAZ/WI.
- 0001 Breakpoint address masking is implemented.
- 1111 Breakpoint address masking is not implemented. [DBGBCR<n>](#)[28:24] is RES0.
- All other values are reserved. The value of this for ARMv8 is 1111.

#### WPAddrMask, bits [7:4]

Indicates the level of support for the data address matching watchpoint masking capability. Permitted values of this field are:

- 0000 Watchpoint address masking might be implemented. If not implemented, [DBGWCR<n>](#).MASK (Address mask) is RAZ/WI.
- 0001 Watchpoint address masking is implemented.
- 1111 Watchpoint address masking is not implemented. [DBGWCR<n>](#).MASK (Address mask) is RES0.
- All other values are reserved. The value of this for ARMv8 is 0001.

#### PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Permitted values of this field are:

- 0000 Architecture-defined form of PC Sample-based Profiling not implemented using external debug registers.
- 0010 Only [EDPCSR](#) and [EDCIDSR](#) are implemented. This option is only permitted if EL3 and EL2 are not implemented.
- 0011 [EDPCSR](#), [EDCIDSR](#), and [EDVIDSR](#) are implemented.
- All other values are reserved.

From ARMv8.2 onwards, the only permitted value is 0b0000. The architecture defines the functionality in a different set of registers, see [PMDEVID](#).

### Accessing the DBGDEVID

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c2, 7	000	111	0111	1110	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDA](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, read accesses to this register from EL1 and EL2 are trapped to EL3.

### G6.3.9 DBGDEVID1, Debug Device ID register 1

The DBGDEVID1 characteristics are:

## Purpose

Adds to the information given by the [DBGDIDR](#) by describing other features of the debug implementation.

## Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

This register is required in all implementations.

## Attributes

DBGDEVID1 is a 32-bit register.

## Field descriptions

The DBGDEVID1 bit assignments are:

**Bits [31:4]**

Reserved, RES0.

**PCSROffset, bits [3:0]**

This field indicates the offset applied to PC samples returned by reads of [EDPCSR](#). Permitted values of this field in ARMv8 are:

0000 EDPCSR not implemented.

0010 **EDPCSR** implemented. Samples have no offset applied and do not sample the instruction set state in AArch32 state.

### - Note

In ARMv7, a PCSROffset value of 0000 has an alternative meaning that **EDPCSR** is implemented and returns values that have an offset applied and indicate the Instruction set state. This implementation option is not permitted in ARMv8.

From ARMv8.2 onwards, the only permitted value is 0b0000. The architecture defines the functionality in a different set of registers, see [PMDEVID](#).

## Accessing the DBGDEVID1

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c1, 7	000	111	0111	1110	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDA](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, read accesses to this register from EL1 and EL2 are trapped to EL3.

G6.3.10     **DBGDEVID2, Debug Device ID register 2**

The DBGDEVID2 characteristics are:

**Purpose**

Reserved for future descriptions of features of the debug implementation.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

**Attributes**

DBGDEVID2 is a 32-bit register.

**Field descriptions**

The DBGDEVID2 bit assignments are:

**Bits [31:0]**

Reserved, RES0.

**Accessing the DBGDEVID2**

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c7, c0, 7	000	111	0111	1110	0000

**Accessibility**

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If MDCR\_EL2.TDA==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HDCR.TDA==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If MDCR\_EL3.TDA==1, read accesses to this register from EL1 and EL2 are trapped to EL3.

### G6.3.11 DBGDIDR, Debug ID Register

The DBGDIDR characteristics are:

## Purpose

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

## Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

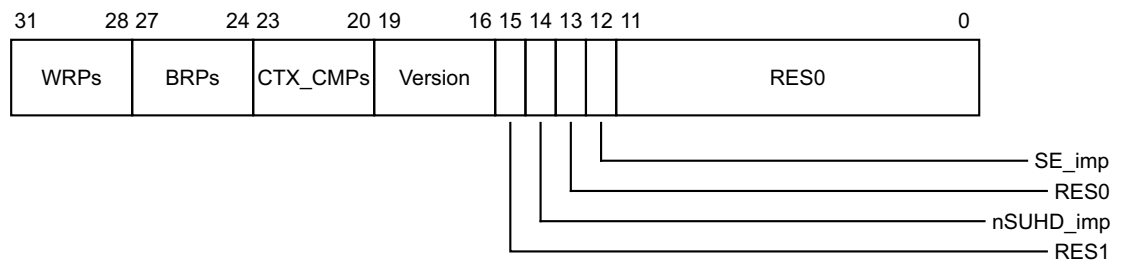

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

### Attributes

DBGDIDR is a 32-bit register.

## Field descriptions

The DBGDIDR bit assignments are:

**WRPs, bits [31:28]**

The number of watchpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented watchpoints, to 0b1111 for 16 implemented watchpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as [ID\\_AA64DFR0\\_EL1](#).WRPs.

**BRPs, bits [27:24]**

The number of breakpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented breakpoint, to 0b1111 for 16 implemented breakpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as ID\_AA64DFR0\_EL1.BRPs.

**CTX CMPs, bits [23:20]**

The number of breakpoints that can be used for Context matching, minus 1.

Permitted values of this field are from 0b0000 for 1 Context matching breakpoint, to 0b1111 for 16 Context matching breakpoints.

The Context matching breakpoints must be the highest addressed breakpoints. For example, if six breakpoints are implemented and two are Context matching breakpoints, they must be breakpoints 4 and 5.

If AArch64 is implemented, this field has the same value as [ID\\_AA64DFR0\\_EL1.CTX\\_CMPs](#).

**Version, bits [19:16]**

The Debug architecture version. Defined values are:

0001	ARMv6, v6 Debug architecture.
0010	ARMv6, v6.1 Debug architecture.
0011	ARMv7, v7 Debug architecture, with baseline CP14 registers implemented.
0100	ARMv7, v7 Debug architecture, with all CP14 registers implemented.
0101	ARMv7, v7.1 Debug architecture.
0110	ARMv8, v8 Debug architecture.
0111	ARMv8.1, v8 Debug architecture, with Virtualization Host Extensions.
1000	ARMv8.2, v8.2 Debug architecture.

All other values are reserved.

- In an ARMv8.0 implementation, the only permitted value is 0110.
- In an ARMv8.1 implementation that includes [ARMv8.1-VHE](#), the only permitted value is 0111.
- In an ARMv8.1 implementation that does not include [ARMv8.1-VHE](#), the permitted values are 0110 and 0111.
- In an ARMv8.2 implementation, the only permitted value is 1000.

**Bit [15]**

Reserved, RES1.

**nSUHD\_imp, bit [14]**

In ARMv7-A, was Secure User Halting Debug not implemented.

The value of this bit must match the value of the SE\_imp bit.

**Bit [13]**

Reserved, RES0.

**SE\_imp, bit [12]**

EL3 implemented. The meanings of the values of this bit are:

0	EL3 not implemented.
1	EL3 implemented.

The value of this bit must match the value of the nSUHD\_imp bit.

**Bits [11:0]**

Reserved, RES0.

**Accessing the DBGDIDR**

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c0, 0	000	000	0000	1110	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

ARM deprecates any access to this register from EL0.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [DBGDSCRExt.UDCCdis](#)==1, read accesses to this register from EL0 are trapped to Undefined mode.
  - If [MDSCR\\_EL1.TDCC](#)==1, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [HDCR.TDA](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## G6.3.12 DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

### Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. ARMv8 deprecates any use of this register.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDRAR is architecturally mapped to AArch64 System register [MDRAR\\_EL1](#).

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

### Attributes

DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

### Field descriptions

The DBGDRAR bit assignments are:

#### When accessing as a 32-bit register:

#### ROMADDR[31:12], bits [31:12]

Bits[31:12] of the ROM table physical address. Bits [11:0] of the address are zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

#### Bits [11:2]

Reserved, RES0.

#### Valid, bits [1:0]

This field indicates whether the ROM Table address is valid. The permitted values of this field are:

00 ROM Table address is not valid. Software must ignore ROMADDR.

11 ROM Table address is valid.

Other values are reserved.

#### When accessing as a 64-bit register:

#### Bits [63:48]

Reserved, RES0.

#### ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR [47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

ARM strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

#### Bits [11:2]

Reserved, RES0.

#### Valid, bits [1:0]

This field indicates whether the ROM Table address is valid. The permitted values of this field are:

00 ROM Table address is not valid. Software must ignore ROMADDR.

11 ROM Table address is valid.

Other values are reserved.

### Accessing the DBGDRAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, c0, 0	000	000	0001	1110	0000

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p14, 0, <Rt>, <Rt2>, c1	0000	1110	0001

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `DBGDSCRExt.UDCCdis`==1, read accesses to this register from EL0 are trapped to Undefined mode.
  - If `MDSCR_EL1.TDCC`==1, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS` == 1:
  - If `MDCR_EL2.TDRA`==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and `SCR_EL3.NS` == 1:
  - If `HDCR.TDRA`==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.

G6.3.13 DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

Purpose

In earlier versions of the ARM Architecture, this register defines the offset from the base address defined in [DBGDRAR](#) of the physical base address of the debug registers for the PE. ARMv8 deprecates any use of this register.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

Field descriptions

The DBGDSAR bit assignments are:

When accessing as a 32-bit register:

Offset, bits [31:0]

This register value is RAZ.

When accessing as a 64-bit register:

Offset, bits [63:0]

This register value is RAZ.

Accessing the DBGDSAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c2, c0, 0	000	000	0010	1110	0000

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p14, 0, <Rt>, <Rt2>, c2	0000	1110	0010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [DBGDSCRExt.UDCCdis](#)==1, read accesses to this register from EL0 are trapped to Undefined mode.
  - If [MDSCR\\_EL1.TDCC](#)==1, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDRA](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [HDCR.TDRA](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

G6.3.14 DBGDSCRext, Debug Status and Control Register, External View

The DBGDSCRext characteristics are:

Purpose

Main control register for the debug implementation.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
AArch32 System register DBGDSCRext is architecturally mapped to AArch64 System register [MDSCR\\_EL1](#).

This register is required in all implementations.

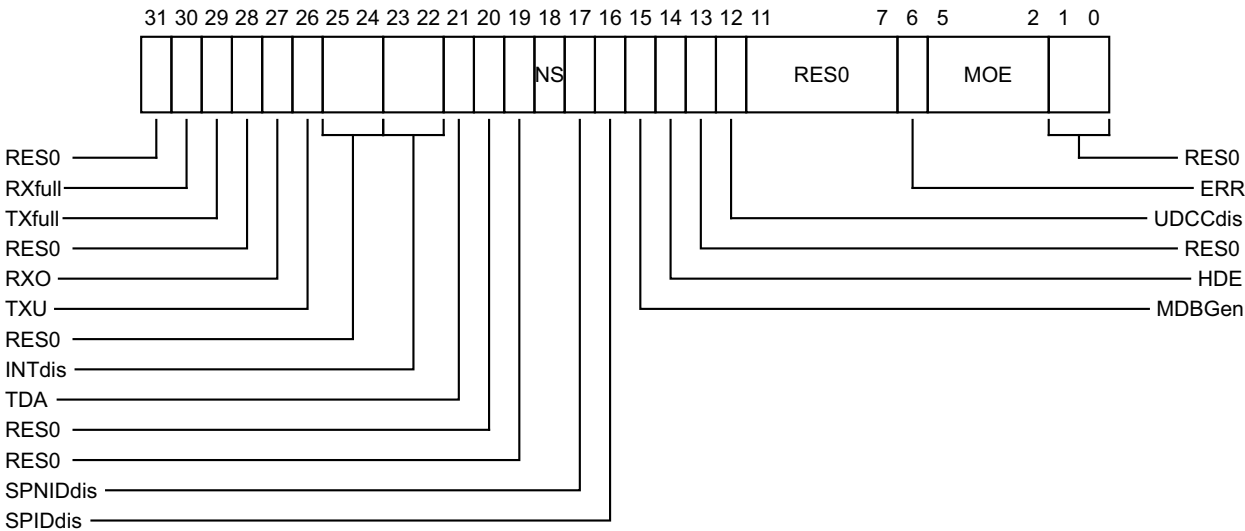

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DBGDSCRext is a 32-bit register.

Field descriptions

The DBGDSCRext bit assignments are:

Bit [31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Used for save/restore of [EDSCR.RXfull](#).

When [DBGOSLSR.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.RXfull](#).

ARM deprecates use of this bit other than for save/restore. Use [DBGDSCRint](#) to access the DTRRX full status.

Reads and writes of this bit are indirect accesses to [EDSCR.RXfull](#).

The architected behavior of this field determines the value it returns after a reset.

#### TXfull, bit [29]

DTRTX full. Used for save/restore of [EDSCR.TXfull](#).

When [DBGOSLSR.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.TXfull](#).

ARM deprecates use of this bit other than for save/restore. Use [DBGDSCRint](#) to access the DTRTX full status.

Reads and writes of this bit are indirect accesses to [EDSCR.TXfull](#).

The architected behavior of this field determines the value it returns after a reset.

#### Bit [28]

Reserved, RES0.

#### RXO, bit [27]

Used for save/restore of [EDSCR.RXO](#).

When [DBGOSLSR.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.RXO](#).

Reads and writes of this bit are indirect accesses to [EDSCR.RXO](#).

The architected behavior of this field determines the value it returns after a reset.

#### TXU, bit [26]

Used for save/restore of [EDSCR.TXU](#).

When [DBGOSLSR.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.TXU](#).

Reads and writes of this bit are indirect accesses to [EDSCR.TXU](#).

The architected behavior of this field determines the value it returns after a reset.

#### Bits [25:24]

Reserved, RES0.

#### INTdis, bits [23:22]

Used for save/restore of [EDSCR.INTdis](#).

When [DBGOSLSR.OSLK](#) == 0 (the OS lock is unlocked), this field is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1 (the OS lock is locked), this field is RW and holds the value of [EDSCR.INTdis](#).

Reads and writes of this field are indirect accesses to [EDSCR.INTdis](#).

The architected behavior of this field determines the value it returns after a reset.

#### TDA, bit [21]

Used for save/restore of [EDSCR.TDA](#).

When [DBGOSLSR.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.TDA](#).

Reads and writes of this bit are indirect accesses to [EDSCR.TDA](#).

The architected behavior of this field determines the value it returns after a reset.

#### Bit [20]

Reserved, RES0.

#### SC2, bit [19]

##### *In ARMv8.1*

Used for save/restore of [EDSCR.SC2](#).

When [DBGOSLSR.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.SC2](#).

Reads and writes of this bit are indirect accesses to [EDSCR.SC2](#).

If the PC Sample-based Profiling Extension is not implemented, then this field is RES0.

##### *In ARMv8.2 and ARMv8.0.*

Reserved, RES0.

#### NS, bit [18]

Non-secure status. Returns the inverse of `IsSecure()`. This bit is RO.

ARM deprecates use of this field.

#### SPNIDdis, bit [17]

Secure privileged profiling disabled status bit. This bit is RO. Permitted values are:

- 0 If EL3 is implemented, profiling allowed in Secure privileged modes.
- 1 If EL3 is implemented, profiling prohibited in Secure privileged modes.

This field is RES0 if EL3 is not implemented.

- This field is RES1 if either:
  - EL3 is using AArch64 and the Effective value of [SCR\\_EL3.NS](#) is 1.
  - EL3 is using AArch32 and the Effective value of [SCR.NS](#) is 1.
- Otherwise, the field is RES0 if any of the following applies, and RES1 otherwise:
  - [ARMv8.2-Debug](#) is not implemented and `ExternalSecureNoninvasiveDebugEnabled()` returns TRUE.
  - EL3 is using AArch32 and the value of [SDCR.SPME](#) is 1.
  - EL3 is using AArch64 and the value of [MDCR\\_EL3.SPME](#) is 1.

ARM deprecates use of this field.

#### SPIDdis, bit [16]

Secure privileged AArch32 invasive self-hosted debug disabled status bit. This bit is RO and depends on the value of [SDCR.SPD](#) and the pseudocode function `AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()`. Permitted values are:

- 0 Self-hosted debug enabled in Secure privileged AArch32 modes.
- 1 Self-hosted debug disabled in Secure privileged AArch32 modes.

This bit reads as 1 if any of the following is true and reads as 0 otherwise:

- [SDCR.SPD](#) has the value 10.
- [SDCR.SPD](#) has the value 00 and `AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()` returns FALSE.

ARM deprecates use of this field.

#### **MDBGen, bit [15]**

Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

0 Breakpoint, Watchpoint, and Vector Catch exceptions disabled.

1 Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

#### **HDE, bit [14]**

Used for save/restore of [EDSCR.HDE](#).

When [DBGOSLSR.OSLK](#) = 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) = 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.HDE](#).

Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The architected behavior of this field determines the value it returns after a reset.

#### **Bit [13]**

Reserved, RES0.

#### **UDCCdis, bit [12]**

Traps EL0 accesses to the DCC registers to Undefined mode.

0 This control does not cause any instructions to be trapped.

1 EL0 accesses to the [DBGDSCRint](#), [DBGDTRRXint](#), [DBGDTRTXint](#), [DBGDIDR](#), [DBGDSAR](#), and [DBGDRAR](#) are trapped to Undefined mode.

#### **———— Note ————**

All accesses to these registers are trapped, including LDC and STC accesses to [DBGDTRTXint](#) and [DBGDTRRXint](#), and MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#).

Traps of EL0 accesses to the [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

When this register has an architecturally-defined reset value, this field resets to 0.

#### **Bits [11:7]**

Reserved, RES0.

#### **ERR, bit [6]**

Used for save/restore of [EDSCR.ERR](#).

When [DBGOSLSR.OSLK](#) = 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) = 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.ERR](#).

Reads and writes of this bit are indirect accesses to [EDSCR.ERR](#).

The architected behavior of this field determines the value it returns after a reset.

#### **MOE, bits [5:2]**

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

0001 Breakpoint

0011 Software breakpoint (BKPT) instruction

0101 Vector catch

1010 Watchpoint

This field resets to a value that is architecturally UNKNOWN.

#### Bits [1:0]

Reserved, RES0.

### Accessing the DBGDSCRext

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c2, 2	000	010	0000	1110	0010

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

Individual fields within this register might have restricted accessibility when `DBGOSLSR.OSLK == 0` (the OS lock is unlocked.) See the field descriptions for more detail.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1`:
  - If `MDCR_EL2.TDA==1`, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and `SCR_EL3.NS == 1`:
  - If `HDCR.TDA==1`, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If `MDCR_EL3.TDA==1`, accesses to this register from EL1 and EL2 are trapped to EL3.

### G6.3.15 DBGDSCRint, Debug Status and Control Register, Internal View

The DBGDSCRint characteristics are:

#### Purpose

Main control register for the debug implementation. This is an internal, read-only view.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

This register is required in all implementations.

DBGDSCRint.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} are UNKNOWN when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither UNPREDICTABLE nor return UNKNOWN values, it is permissible for an implementation to return the values of DBGDSCRExt.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} for these fields at EL0.

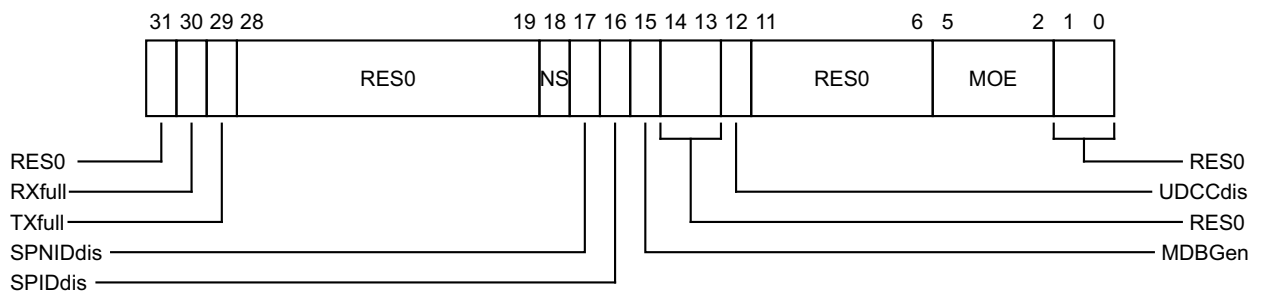

It is also permissible for an implementation to return the same values as defined for a read of DBGDSCRint at EL1 or above. (This is the case even if the implementation does not support AArch32 at EL1 or above.)

#### Attributes

DBGDSCRint is a 32-bit register.

#### Field descriptions

The DBGDSCRint bit assignments are:

#### Bit [31]

Reserved, RES0.

#### RXfull, bit [30]

DTRRX full. Read-only view of the equivalent bit in the [EDSCR](#).

#### TXfull, bit [29]

DTRTX full. Read-only view of the equivalent bit in the [EDSCR](#).

#### Bits [28:19]

Reserved, RES0.

#### NS, bit [18]

Non-secure status.

Read-only view of the equivalent bit in the [DBGDSCRExt](#). ARM deprecates use of this field.

#### SPNIDdis, bit [17]

Secure privileged non-invasive debug disable.

Read-only view of the equivalent bit in the [DBGDSCRext](#). ARM deprecates use of this field.

#### SPIDdis, bit [16]

Secure privileged invasive debug disable.

Read-only view of the equivalent bit in the [DBGDSCRext](#). ARM deprecates use of this field.

#### MDBGGen, bit [15]

Monitor debug events enable.

Read-only view of the equivalent bit in the [DBGDSCRext](#).

#### Bits [14:13]

Reserved, RES0.

#### UDCCdis, bit [12]

User mode access to Debug Communications Channel disable.

Read-only view of the equivalent bit in the [DBGDSCRext](#). ARM deprecates use of this field.

#### Bits [11:6]

Reserved, RES0.

#### MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

0001	Breakpoint
0011	Software breakpoint (BKPT) instruction
0101	Vector catch
1010	Watchpoint

Read-only view of the equivalent bit in the [DBGDSCRext](#).

#### Bits [1:0]

Reserved, RES0.

### Accessing the DBGDSCRint

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c1, 0	000	000	0000	1110	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [DBGDSCRExt.UDCCdis](#)==1, read accesses to this register from EL0 are trapped to Undefined mode.
  - If [MDSCR\\_EL1.TDCC](#)==1, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDA](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

G6.3.16 DBGDTRRText, Debug OS Lock Data Transfer Register, Receive, External View

The DBGDTRRText characteristics are:

Purpose

Used for save/restore of [DBGDTRRXint](#). It is a component of the Debug Communications Channel.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
AArch32 System register DBGDTRRText is architecturally mapped to AArch64 System register [OSDTRRX\\_EL1](#).

Attributes

DBGDTRRText is a 32-bit register.

Field descriptions

The DBGDTRRText bit assignments are:

Bits [31:0]

Update DTRRX without side-effect.  
Writes to this register update the value in DTRRX and do not change RXfull.  
Reads of this register return the last value written to DTRRX and do not change RXfull.  
For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).  
This field resets to a value that is architecturally UNKNOWN.

Accessing the DBGDTRRText

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c0, 2	000	010	0000	1110	0000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

ARM deprecates reads and writes of DBGDTRRXext through the System register interface when the OS lock is unlocked.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

G6.3.17 DBGDTRRXint, Debug Data Transfer Register, Receive

The DBGDTRRXint characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. It is a component of the Debug Communications Channel.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
AArch32 System register DBGDTRRXint is architecturally mapped to AArch64 System register [DBGDTRRX\\_ELO](#).  
AArch32 System register DBGDTRRXint is architecturally mapped to External register [DBGDTRRX\\_ELO](#).  
This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGDTRRXint is a 32-bit register.

Field descriptions

The DBGDTRRXint bit assignments are:

Bits [31:0]

Update DTRRX.  
If RXfull is set to 1, then reads of this register return the last value written to DTRRX and clear RXfull to 0.  
For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).  
This field resets to a value that is architecturally UNKNOWN.

Accessing the DBGDTRRXint

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c5, 0	000	000	0000	1110	0101

Data can be stored to memory from this register using [STC](#).

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules, in Non-debug state:

- In both security states, and not dependent on other bits:
  - If [DBGDSCRext.UDCCdis](#)==1, read accesses to this register from EL0 are trapped to Undefined mode.
  - If [MDSCR\\_EL1.TDCC](#)==1, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [HDCR.TDA](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

### **Note**

Read accesses to this register are not trapped in Debug state.

G6.3.18 DBGDTRTXext, Debug OS Lock Data Transfer Register, Transmit

The DBGDTRTXext characteristics are:

Purpose

Used for save/restore of [DBGDTRTXint](#). It is a component of the Debug Communication Channel.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDTRTXext is architecturally mapped to AArch64 System register [OSDTRTX\\_EL1](#).

Attributes

DBGDTRTXext is a 32-bit register.

Field descriptions

The DBGDTRTXext bit assignments are:

Bits [31:0]

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

This field resets to a value that is architecturally UNKNOWN.

Accessing the DBGDTRTXext

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c3, 2	000	010	0000	1110	0011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

ARM deprecates reads and writes of DBGDTRTXtext through the System register interface when the OS lock is unlocked.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

G6.3.19 DBGDTRTXint, Debug Data Transfer Register, Transmit

The DBGDTRTXint characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. It is a component of the Debug Communication Channel.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGDTRTXint is architecturally mapped to AArch64 System register [DBGDTRTX\\_EL0](#).

AArch32 System register DBGDTRTXint is architecturally mapped to External register [DBGDTRTX\\_EL0](#).

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

Attributes

DBGDTRTXint is a 32-bit register.

Field descriptions

The DBGDTRTXint bit assignments are:

Bits [31:0]

Return DTRTX.

If TXfull is set to 0, then writes of this register update the value in DTRTX and set TXfull to 1.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

This field resets to a value that is architecturally UNKNOWN.

Accessing the DBGDTRTXint

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c5, 0	000	000	0000	1110	0101

Data can be loaded from memory into this register using [LDC \(immediate\)](#) and [LDC \(literal\)](#).

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	WO	WO	n/a	WO
x	0	1	WO	WO	WO	WO
x	1	1	WO	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules, in Non-debug state:

- In both security states, and not dependent on other bits:
  - If [DBGDSCRExt.UDCCdis](#)==1, write accesses to this register from EL0 are trapped to Undefined mode.
  - If [MDSCR\\_EL1.TDCC](#)==1, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [HDCR.TDA](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, write accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

### **Note**

Write accesses to this register are not trapped in Debug state.

G6.3.20     **DBGOSDLR, Debug OS Double Lock Register**

The DBGOSDLR characteristics are:

**Purpose**

Locks out the external debug interface.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.  
AArch32 System register DBGOSDLR is architecturally mapped to AArch64 System register [OSDLR\\_EL1](#).

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

DBGOSDLR is a 32-bit register.

**Field descriptions**

The DBGOSDLR bit assignments are:

**Bits [31:1]**

Reserved, RES0.

**DLK, bit [0]**

OS Double Lock control bit. Possible values are:

- 0            OS Double Lock unlocked.
- 1            OS Double Lock locked, if [DBGPRCR](#).CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the DBGOSDLR**

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, c3, 4	000	100	0001	1110	0011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDOSA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDOSA](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDOSA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

G6.3.21 DBGOSECCR, Debug OS Lock Exception Catch Control Register

The DBGOSECCR characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
AArch32 System register DBGOSECCR is architecturally mapped to AArch64 System register OSECCR\_EL1.  
AArch32 System register DBGOSECCR is architecturally mapped to External register EDECCR.  
If OSLSR.OSLK == 0 then DBGOSECCR returns an UNKNOWN value on reads and ignores writes.

Attributes

DBGOSECCR is a 32-bit register.

Field descriptions

The DBGOSECCR bit assignments are:

When OSLSR.OSLK==1:

EDECCR, bits [31:0]

Used for save/restore to EDECCR over powerdown.  
Reads or writes to this field are indirect accesses to EDECCR.

Accessing the DBGOSECCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c6, 2	000	010	0000	1110	0110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

G6.3.22     **DBGOSLAR, Debug OS Lock Access Register**

The DBGOSLAR characteristics are:

**Purpose**

Provides a lock for the debug registers. The OS lock also disables some Software debug events.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGOSLAR is architecturally mapped to AArch64 System register [OSLAR\\_EL1](#).

AArch32 System register DBGOSLAR is architecturally mapped to External register [OSLAR\\_EL1](#).

**Attributes**

DBGOSLAR is a 32-bit register.

**Field descriptions**

The DBGOSLAR bit assignments are:

**Bits [31:0]**

OS Lock Access. Writing the value 0xC5ACCE55 to the DBGOSLAR sets the OS lock to 1. Writing any other value sets the OS lock to 0.

Use [DBGOSLSR.OSLK](#) to check the current status of the lock.

**Accessing the DBGOSLAR**

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, c0, 4	000	100	0001	1110	0000

**Accessibility**

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2](#).TDOSA==1, Non-secure write accesses to this register from EL1 are trapped to EL2 using AArch64.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR](#).TDOSA==1, Non-secure write accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3](#).TDOSA==1, write accesses to this register from EL1 and EL2 are trapped to EL3 using AArch64.

### G6.3.23 DBGOSLSR, Debug OS Lock Status Register

The DBGOSLSR characteristics are:

#### Purpose

Provides status information for the OS lock.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGOSLSR is architecturally mapped to AArch64 System register [OSLSR\\_EL1](#).

The OS lock status is also visible in the external debug interface through EDPRSR.

This register is in the Cold reset domain. Some or all RW fields of this register have defined reset values. On a Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

#### Attributes

DBGOSLSR is a 32-bit register.

#### Field descriptions

The DBGOSLSR bit assignments are:

#### Bits [31:4]

Reserved, RES0.

#### OSLM[1], bit [3]

See below for description of the OSLM field.

#### nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

#### OSLK, bit [1]

OS Lock Status. The possible values are:

- 0 OS lock unlocked.
- 1 OS lock locked.

The OS lock is locked and unlocked by writing to the OS Lock Access Register.

When this register has an architecturally-defined reset value, this field resets to 1.

### OSLM[0], bit [0]

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented. In ARMv8 these bits are as follows:

10 OS lock implemented. DBGOSSRR not implemented.

All other values are reserved.

### Accessing the DBGOSLSR

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, c1, 4	000	100	0001	1110	0001

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDOSA](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TDOSA](#)==1, Non-secure read accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDOSA](#)==1, read accesses to this register from EL1 and EL2 are trapped to EL3.

### G6.3.24 DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

#### Purpose

Controls behavior of the PE on powerdown request.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGPRCR is architecturally mapped to AArch64 System register [DBGPRCR\\_EL1](#).

Bit [0] of this register is mapped to [EDPRCR](#).CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

#### Attributes

DBGPRCR is a 32-bit register.

#### Field descriptions

The DBGPRCR bit assignments are:

#### Bits [31:1]

Reserved, RES0.

#### CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown. Possible values of this bit are:

- 0 If the system responds to a powerdown request, it powers down Core power domain.
- 1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

Writes to this bit are permitted regardless of the state of the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request Core no powerdown regardless of whether invasive debug is permitted.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR](#).COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state.

#### Accessing the DBGPRCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c1, c4, 4	000	100	0001	1110	0100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2](#).TDOSA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR](#).TDOSA==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3](#).TDOSA==1, accesses to this register from EL1 and EL2 are trapped to EL3.

G6.3.25 DBGVCR, Debug Vector Catch Register

The DBGVCR characteristics are:

Purpose

Controls Vector Catch debug events.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGVCR is architecturally mapped to AArch64 System register [DBGVCR32\\_EL2](#).

This register is required in all implementations.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

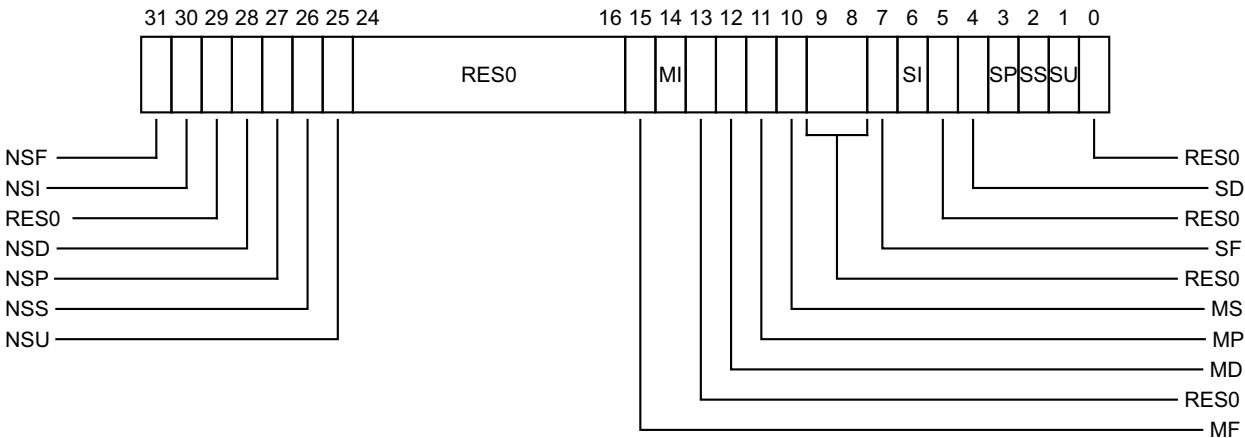

Attributes

DBGVCR is a 32-bit register.

Field descriptions

The DBGVCR bit assignments are:

**When EL3 implemented and using AArch32:**

NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

This field resets to a value that is architecturally UNKNOWN.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

This field resets to a value that is architecturally UNKNOWN.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort vector catch enable in Non-secure state.

The exception vector offset is 0x10.  
This field resets to a value that is architecturally UNKNOWN.

**NSP, bit [27]**

Prefetch Abort vector catch enable in Non-secure state.  
The exception vector offset is 0x0C.  
This field resets to a value that is architecturally UNKNOWN.

**NSS, bit [26]**

Supervisor Call (SVC) vector catch enable in Non-secure state.  
The exception vector offset is 0x08.  
This field resets to a value that is architecturally UNKNOWN.

**NSU, bit [25]**

Undefined Instruction vector catch enable in Non-secure state.  
The exception vector offset is 0x04.  
This field resets to a value that is architecturally UNKNOWN.

**Bits [24:16]**

Reserved, RES0.

**MF, bit [15]**

FIQ vector catch enable in Monitor mode.  
The exception vector offset is 0x1C.  
This field resets to a value that is architecturally UNKNOWN.

**MI, bit [14]**

IRQ vector catch enable in Monitor mode.  
The exception vector offset is 0x18.  
This field resets to a value that is architecturally UNKNOWN.

**Bit [13]**

Reserved, RES0.

**MD, bit [12]**

Data Abort vector catch enable in Monitor mode.  
The exception vector offset is 0x10.  
This field resets to a value that is architecturally UNKNOWN.

**MP, bit [11]**

Prefetch Abort vector catch enable in Monitor mode.  
The exception vector offset is 0x0C.  
This field resets to a value that is architecturally UNKNOWN.

**MS, bit [10]**

Secure Monitor Call (SMC) vector catch enable in Monitor mode.  
The exception vector offset is 0x08.  
This field resets to a value that is architecturally UNKNOWN.

**Bits [9:8]**

Reserved, RES0.

- SF, bit [7]

FIQ vector catch enable in Secure state.  
The exception vector offset is 0x1C.  
This field resets to a value that is architecturally UNKNOWN.
- SI, bit [6]

IRQ vector catch enable in Secure state.  
The exception vector offset is 0x18.  
This field resets to a value that is architecturally UNKNOWN.
- Bit [5]

Reserved, RES0.
- SD, bit [4]

Data Abort vector catch enable in Secure state.  
The exception vector offset is 0x10.  
This field resets to a value that is architecturally UNKNOWN.
- SP, bit [3]

Prefetch Abort vector catch enable in Secure state.  
The exception vector offset is 0x0C.  
This field resets to a value that is architecturally UNKNOWN.
- SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.  
The exception vector offset is 0x08.  
This field resets to a value that is architecturally UNKNOWN.
- SU, bit [1]

Undefined Instruction vector catch enable in Secure state.  
The exception vector offset is 0x04.  
This field resets to a value that is architecturally UNKNOWN.
- Bit [0]

Reserved, RES0.

When EL3 implemented and using AArch64:

**NSF, bit [31]**

FIQ vector catch enable in Non-secure state.  
The exception vector offset is 0x1C.  
This field resets to a value that is architecturally UNKNOWN.

**NSI, bit [30]**

IRQ vector catch enable in Non-secure state.  
The exception vector offset is 0x18.  
This field resets to a value that is architecturally UNKNOWN.

**Bit [29]**

Reserved, RES0.

**NSD, bit [28]**

Data Abort vector catch enable in Non-secure state.  
The exception vector offset is 0x10.  
This field resets to a value that is architecturally UNKNOWN.

**NSP, bit [27]**

Prefetch Abort vector catch enable in Non-secure state.  
The exception vector offset is 0x0C.  
This field resets to a value that is architecturally UNKNOWN.

**NSS, bit [26]**

Supervisor Call (SVC) vector catch enable in Non-secure state.  
The exception vector offset is 0x08.  
This field resets to a value that is architecturally UNKNOWN.

**NSU, bit [25]**

Undefined Instruction vector catch enable in Non-secure state.  
The exception vector offset is 0x04.  
This field resets to a value that is architecturally UNKNOWN.

**Bits [24:8]**

Reserved, RES0.

**SE, bit [7]**

FIQ vector catch enable in Secure state.  
The exception vector offset is 0x1C.  
This field resets to a value that is architecturally UNKNOWN.

**SI, bit [6]**

IRQ vector catch enable in Secure state.  
The exception vector offset is 0x18.  
This field resets to a value that is architecturally UNKNOWN.

**Bit [5]**

Reserved, RES0.

**SD, bit [4]**

Data Abort vector catch enable in Secure state.  
The exception vector offset is 0x10.

This field resets to a value that is architecturally UNKNOWN.

#### SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is 0x0C.

This field resets to a value that is architecturally UNKNOWN.

#### SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is 0x08.

This field resets to a value that is architecturally UNKNOWN.

#### SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is 0x04.

This field resets to a value that is architecturally UNKNOWN.

#### Bit [0]

Reserved, RES0.

#### When EL3 not implemented:

#### Bits [31:8]

Reserved, RES0.

#### F, bit [7]

FIQ vector catch enable.

The exception vector offset is 0x1C.

This field resets to a value that is architecturally UNKNOWN.

#### I, bit [6]

IRQ vector catch enable.

The exception vector offset is 0x18.

This field resets to a value that is architecturally UNKNOWN.

#### Bit [5]

Reserved, RES0.

#### D, bit [4]

Data Abort vector catch enable.

The exception vector offset is 0x10.

This field resets to a value that is architecturally UNKNOWN.

#### P, bit [3]

Prefetch Abort vector catch enable.

The exception vector offset 0x0C.

This field resets to a value that is architecturally UNKNOWN.

#### S, bit [2]

Supervisor Call (SVC) vector catch enable.

The exception vector offset is 0x08.

This field resets to a value that is architecturally UNKNOWN.

#### U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is 0x04.

This field resets to a value that is architecturally UNKNOWN.

#### Bit [0]

Reserved, RES0.

### Accessing the DBGVCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c7, 0	000	000	0000	1110	0111

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If MDCR\_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR](#).TDA==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3](#).TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.3.26 DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

### Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGWCR<n> is architecturally mapped to AArch64 System register [DBGWCR<n>\\_EL1](#).

AArch32 System register DBGWCR<n> is architecturally mapped to External register [DBGWCR<n>\\_EL1](#).

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

### Attributes

DBGWCR<n> is a 32-bit register.

### Field descriptions

The DBGWCR<n> bit assignments are:

When the E field is zero, all the other fields in the register are ignored.

#### Bits [31:29]

Reserved, RES0.

#### MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

00000 No mask.

00001 Reserved.

00010 Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of [DBGWCRn\\_EL1](#).
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0xFFFFFFFF mask for address).

This field resets to a value that is architecturally UNKNOWN.

#### Bits [23:21]

Reserved, RES0.

#### WT, bit [20]

Watchpoint type. Possible values are:

- 0 Unlinked data address match.
- 1 Linked data address match.

This field resets to a value that is architecturally UNKNOWN.

#### LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

This field resets to a value that is architecturally UNKNOWN.

#### SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page G2-4499](#).

This field resets to a value that is architecturally UNKNOWN.

#### HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page G2-4499](#).

This field resets to a value that is architecturally UNKNOWN.

#### BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>](#) is being watched.

BAS	Description
xxxxxxx1	Match byte at <a href="#">DBGWVR&lt;n&gt;</a>
xxxxxx1x	Match byte at <a href="#">DBGWVR&lt;n&gt;+1</a>
xxxxx1xx	Match byte at <a href="#">DBGWVR&lt;n&gt;+2</a>
xxxx1xxx	Match byte at <a href="#">DBGWVR&lt;n&gt;+3</a>

In cases where [DBGWVR<n>](#) addresses a double-word:

BAS	Description, if <a href="#">DBGWVR&lt;n&gt;[2] == 0</a>
xxx1xxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;+4</a>
xx1xxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;+5</a>
x1xxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;+6</a>
1xxxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;+7</a>

If `DBGWVR<n>[2] == 1`, only `BAS[3:0]` are used and `BAS[7:4]` are ignored. ARM deprecates setting `DBGWVR<n>[2] == 1`.

The valid values for `BAS` are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See [Reserved `DBGWCR<n>.BAS` values on page G2-4507](#)

This field resets to a value that is architecturally UNKNOWN.

#### LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

- 01 Match instructions that load from a watchpointed address.
- 10 Match instructions that store to a watchpointed address.
- 11 Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field resets to a value that is architecturally UNKNOWN.

#### PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint `n` is generated. This field must be interpreted along with the `SSC` and `HMC` fields.

For more information on the operation of the `SSC`, `HMC`, and `PAC` fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page G2-4499](#).

This field resets to a value that is architecturally UNKNOWN.

#### E, bit [0]

Enable watchpoint `n`. Possible values are:

- 0 Watchpoint disabled.
- 1 Watchpoint enabled.

This field resets to a value that is architecturally UNKNOWN.

### Accessing the `DBGWCR<n>`

This register can be read using `MRC` with the following syntax:

`MRC <syntax>`

This register can be written using `MCR` with the following syntax:

`MCR <syntax>`

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, <CRm>, 7	000	111	0000	1110	n<3:0>

- <CRm> is in the range c0 - c15.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see:

- [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state.
- [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state.
- [Software Access debug event on page H3-5493](#) for accesses to this register taken to Debug state.

Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [EDSCR.TDA==1](#), [DBGOSLSR.OSLK==0](#), and halting is allowed, accesses to this register from EL1 and EL2 generate a Software Access debug event.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS == 1](#):
  - If [MDCR\\_EL2.TDA==1](#), Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS == 1](#):
  - If [HDCR.TDA==1](#), Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA==1](#), accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.3.27 DBGWFAR, Debug Watchpoint Fault Address Register

The DBGWFAR characteristics are:

### Purpose

Previously returned information about the address of the instruction that accessed a watchpointed address. Is now deprecated and RES0.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

### Attributes

DBGWFAR is a 32-bit register.

### Field descriptions

The DBGWFAR bit assignments are:

### Bits [31:0]

Reserved, RES0.

### Accessing the DBGWFAR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, c6, 0	000	000	0000	1110	0110

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $\text{SCR\_EL3.NS} = 1$ :
  - If  $\text{MDCR\_EL2.TDA} = 1$ , Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} = 1$ :
  - If  $\text{HDCR.TDA} = 1$ , Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If  $\text{MDCR\_EL3.TDA} = 1$ , accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.3.28 DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n> characteristics are:

### Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DBGWVR<n> is architecturally mapped to AArch64 System register [DBGWVR<n>\\_EL1](#)[31:0].

AArch32 System register DBGWVR<n> is architecturally mapped to External register [DBGWVR<n>\\_EL1](#)[31:0].

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

### Attributes

DBGWVR<n> is a 32-bit register.

### Field descriptions

The DBGWVR<n> bit assignments are:

#### VA, bits [31:2]

Bits[31:2] of the address value for comparison.

ARM deprecates setting [DBGWVR<n>](#)[2] = 1.

This field resets to a value that is architecturally UNKNOWN.

#### Bits [1:0]

Reserved, RES0.

### Accessing the DBGWVR<n>

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p14, 0, <Rt>, c0, <CRm>, 6	000	110	0000	1110	n<3:0>

- <CRm> is in the range c0 - c15.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see:

- [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state.
- [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state.
- [Software Access debug event on page H3-5493](#) for accesses to this register taken to Debug state.

Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `EDSCR.TDA==1`, `DBGOSLSR.OSLK==0`, and halting is allowed, accesses to this register from EL1 and EL2 generate a Software Access debug event.
- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1`:
  - If `MDCR_EL2.TDA==1`, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If `MDCR_EL3.TDA==1`, accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.3.29 DLR, Debug Link Register

The DLR characteristics are:

### Purpose

In Debug state, holds the address to restart from.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

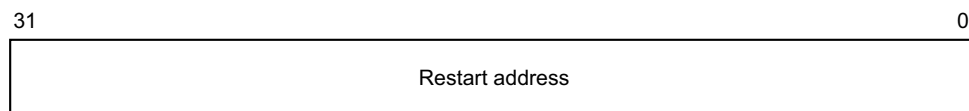

AArch32 System register DLR is architecturally mapped to AArch64 System register [DLR\\_EL0](#)[31:0].

### Attributes

DLR is a 32-bit register.

### Field descriptions

The DLR bit assignments are:

### Bits [31:0]

Restart address.

### Accessing the DLR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 3, <Rt>, c4, c5, 1	011	001	0100	1111	0101

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

Access to this register is from Debug state only. During normal execution this register is unallocated.

### G6.3.30 DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

#### Purpose

Holds the saved process state on entry to Debug state.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register DSPSR is architecturally mapped to AArch64 System register [DSPSR\\_EL0](#).

#### Attributes

DSPSR is a 32-bit register.

#### Field descriptions

The DSPSR bit assignments are:

**When entering Debug state from AArch32 and exiting Debug state to AArch32:**

#### N, bit [31]

Set to the value of [CPSR.N](#) on entering Debug state, and copied to [CPSR.N](#) on exiting Debug state.

#### Z, bit [30]

Set to the value of [CPSR.Z](#) on entering Debug state, and copied to [CPSR.Z](#) on exiting Debug state.

#### C, bit [29]

Set to the value of [CPSR.C](#) on entering Debug state, and copied to [CPSR.C](#) on exiting Debug state.

#### V, bit [28]

Set to the value of [CPSR.V](#) on entering Debug state, and copied to [CPSR.V](#) on exiting Debug state.

#### Q, bit [27]

Set to the value of [CPSR.Q](#) on entering Debug state, and copied to [CPSR.Q](#) on exiting Debug state.

#### IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

#### J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

#### Bit [23]

Reserved, RES0.

**PAN, bit [22]**

***In ARMv8.2 and ARMv8.1***

When [ARMv8.1-PAN](#) is implemented, set to the value of [CPSR.PAN](#) on entering Debug state, and copied to [CPSR.PAN](#) on exiting Debug state.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

***In ARMv8.0.***

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of [PSTATE.SS](#) immediately before Debug state was entered.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of [PSTATE.IL](#) immediately before Debug state was entered.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

0 Little-endian operation

1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the [SCTLR.EE](#) bit is defined by a configuration input signal, that value also applies to the [CPSR.E](#) bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

SError interrupt mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

#### F, bit [6]

FIQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the Debug state entry was taken from. Possible values of this bit are:

- 0 Taken from A32 state.
- 1 Taken from T32 state.

#### M[4], bit [4]

Execution state that Debug state was entered from. Possible values of this bit are:

- 1 Exception taken from AArch32.

#### M[3:0], bits [3:0]

AArch32 mode that Debug state was entered from. The possible values are:

M[3:0]	Mode
0b0000	User
0b0001	FIQ
0b0010	IRQ
0b0011	Supervisor
0b0110	Monitor (only valid in Secure state, if EL3 is implemented and can use AArch32)
0b0111	Abort
0b1010	Hyp
0b1011	Undefined
0b1111	System

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries](#) on page K1-6117.

### Accessing the DSPSR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 3, <Rt>, c4, c5, 0	011	000	0100	1111	0101

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

Access to this register is from Debug state only. During normal execution this register is unallocated.

### G6.3.31 HDCR, Hyp Debug Control Register

The HDCR characteristics are:

#### Purpose

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

#### Configurations

AArch32 System register HDCR is architecturally mapped to AArch64 System register [MDCR\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

HDCR is a 32-bit register.

#### Field descriptions

The HDCR bit assignments are:

#### Bits [31:18]

Reserved, RES0.

#### HPMD, bit [17]

##### *In ARMv8.2 and ARMv8.1*

Guest Performance Monitors Disable. This control prohibits event counting at EL2. Permitted values are:

- 0 Event counting allowed in Hyp mode.
- 1 Event counting prohibited in Hyp mode.

In an ARMv8.1 implementation, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

This control applies only to:

- The event counters in the range [0..(HPMN-1)].
- If [PMCR.DP](#) is set to 1, [PMCCNTR](#).

The other event counters are unaffected. When [PMCR.DP](#) is set to 0, [PMCCNTR](#) is unaffected.

When this register has an architecturally-defined reset value, this field resets to 0.

**In ARMv8.0.**

Reserved, RES0.

**Bits [16:12]**

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 System register accesses to the Debug ROM registers to Hyp mode.

0 This control does not cause any instructions to be trapped.

1 Non-secure EL0 and EL1 System register accesses to the [DBGDRAR](#) or [DBGDSAR](#) are trapped to Hyp mode, unless it is trapped by [DBGDSCRext.UDCCdis](#).

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to 0.

**TDOSA, bit [10]**

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

0 This control does not cause any instructions to be trapped.

1 Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and the [DBGPRCR](#).
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

**Note**

These registers are not accessible at EL0.

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to 0.

**TDA, bit [9]**

Trap debug access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers in the (coproc==1110) encoding space that are not trapped by either of the following:

- [HDCR.TDRA](#).
- [HDCR.TDOSA](#).

0 This control does not cause any instructions to be trapped.

1 Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by [HDCR.TDRA](#) and [HDCR.TDOSA](#), are trapped to Hyp mode, unless it is trapped by [DBGDSCRext.UDCCdis](#).

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

When this register has an architecturally-defined reset value, this field resets to 0.

**TDE, bit [8]**

Trap Debug exceptions. The possible values of this bit are:

0 This control has no effect on the routing of debug exceptions, and has no effect on Non-secure accesses to debug registers.

- 1 In Non-secure state:
- Debug exceptions generated at EL1 or EL0 are routed to EL2.
  - The HDCR.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

When [HCR.TGE](#) = 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

When this register has an architecturally-defined reset value, this field resets to 0.

#### HPME, bit [7]

Hypervisor Performance Monitors Counters Enable. The possible values of this bit are:

- 0 Hyp mode Performance Monitors counters disabled.
- 1 Hyp mode Performance Monitors counters enabled.

When the value of this bit is 1, the Performance Monitors counters that are reserved for use from Hyp mode or Secure state are enabled. For more information see the description of the HPMN field.

If the Performance Monitors Extension is not implemented, this field is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### TPM, bit [6]

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to Hyp mode.

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode.

#### ————— Note —————

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors Extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### TPMCR, bit [5]

Trap [PMCR](#) accesses. Traps Non-secure EL0 and EL1 accesses to the [PMCR](#) to Hyp mode.

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL0 and EL1 accesses to the [PMCR](#) are trapped to Hyp mode, unless it is trapped by [PMUSERENR.EN](#).

#### ————— Note —————

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors Extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### HPMN, bits [4:0]

Defines the number of Performance Monitors counters that are accessible from Non-secure EL1 modes, and from Non-secure EL0 modes if unprivileged access is enabled.

If the Performance Monitors Extension is not implemented, this field is RES0.

In Non-secure state, HPMN divides the Performance Monitors counters as follows. If software is accessing Performance Monitors counter  $n$  then, in Non-secure state:

- If  $n$  is in the range  $0 \leq n < \text{HPMN}$ , the counter is accessible from EL1 and EL2, and from EL0 if unprivileged access to the counters is enabled. **PMCR.E** enables the operation of counters in this range.
- If  $n$  is in the range  $\text{HPMN} \leq n < \text{PMCR.N}$ , the counter is accessible only from EL2 and from Secure state. **HDCR.HPME** enables the operation of counters in this range.

If this field is set to 0, or to a value larger than **PMCR.N**, then the following **CONSTRAINED UNPREDICTABLE** behavior applies:

- The value returned by a direct read of **HDCR.HPMN** is **UNKNOWN**.
- Either:
  - An **UNKNOWN** number of counters are reserved for EL2 use. That is, the PE behaves as if **HDCR.HPMN** is set to an **UNKNOWN** non-zero value less than **PMCR.N**.
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

When this register has an architecturally-defined reset value, if this field is implemented as an **RW** field, it resets to the value of **PMCR.N**.

## Accessing the HDCR

This register can be read using **MRC** with the following syntax:

**MRC** <syntax>

This register can be written using **MCR** with the following syntax:

**MCR** <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c1, c1, 1	100	001	0001	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL2 are trapped to EL3 using AArch64.

### G6.3.32 SDCR, Secure Debug Control Register

The SDCR characteristics are:

#### Purpose

When EL3 is implemented and can use AArch32, controls debug and performance monitors functionality in Secure state.

#### Configurations

This register is only accessible in Secure state.

AArch32 System register SDCR can be mapped to AArch64 System register [MDCR\\_EL3](#), but this is not architecturally mandated.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

SDCR is a 32-bit register.

#### Field descriptions

The SDCR bit assignments are:

#### Bits [31:22]

Reserved, RES0.

#### EPMAD, bit [21]

External debug interface Performance Monitors registers disable. This disables access to these registers by an external debugger:

- 0 Access to Performance Monitors registers from external debugger is permitted.
- 1 Access to Performance Monitors registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension is not implemented or does not support external debug interface accesses this bit is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### EDAD, bit [20]

External debug interface breakpoint and watchpoint register access disable. This disables access to these registers by an external debugger:

- 0 Access to breakpoint and watchpoint registers from external debugger is permitted.

- 1 Access to breakpoint and watchpoint registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bits [19:18]

Reserved, RES0.

#### SPME, bit [17]

Secure Performance Monitors enable. This allows event counting in Secure state:

- 0 Event counting prohibited in Secure state.  
In an ARMv8.0 or ARMv8.1 implementation, event counting is prohibited unless ExternalSecureNoninvasiveDebugEnabled() is TRUE, meaning this control is overridden by the IMPLEMENTATION DEFINED authentication interface.
- 1 Event counting allowed in Secure state.

If the Performance Monitors Extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bit [16]

Reserved, RES0.

#### SPD, bits [15:14]

AArch32 Secure privileged debug. Enables or disables debug exceptions from Secure state, other than Breakpoint Instruction exceptions. Valid values for this field are:

- 00 Legacy mode. Debug exceptions from Secure EL1 are enabled by the authentication interface.
- 10 Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
- 11 Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if [SDER32\\_EL3.SUIDEN](#) == 1.

Ignored in Non-secure state. Debug exceptions from Breakpoint Instruction exceptions are always enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bits [13:0]

Reserved, RES0.

### Accessing the SDCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c3, 1	000	001	0001	1111	0011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	-	RW
x	1	1	-	n/a	-	RW

If EL3 is implemented and is using AArch64, any read or write to SDCR from Secure EL1 using AArch32 is trapped as an exception to EL3.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):  
— If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):  
— If [HSTR\\_EL2.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:  
— If [HSTR.T1](#)==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

### G6.3.33 SDER, Secure Debug Enable Register

The SDER characteristics are:

#### Purpose

Controls invasive and non-invasive debug in the Secure EL0 mode.

#### Configurations

This register is only accessible in Secure state.

AArch32 System register SDER is architecturally mapped to AArch64 System register [SDER32\\_EL3](#).

If EL3 is not implemented and EL1 supports AArch32, SDER is implemented only if the implemented Security state is Secure state.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

SDER is a 32-bit register.

#### Field descriptions

The SDER bit assignments are:

#### Bits [31:2]

Reserved, RES0.

#### SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable:

- 0 Performance Monitors event counting prohibited in Secure EL0 unless allowed by [MDCR\\_EL3.SPME](#), [SDCR.SPME](#).  
In an ARMv8.0 or ARMv8.1 implementation, event counting can also be allowed using the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().
- 1 Performance Monitors event counting allowed in Secure EL0.

When this register has an architecturally-defined reset value, this field resets to 0.

#### SUIDEN, bit [0]

Secure User Invasive Debug Enable:

- 0 Debug exceptions other than Breakpoint Instruction exceptions from Secure EL0 are disabled, unless enabled by [MDCR\\_EL3.SPD32](#) or [SDCR.SPD](#).
- 1 Debug exceptions from Secure EL0 are enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

## Accessing the SDER

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c1, c1, 1	000	001	0001	1111	0001

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL3 is not implemented.	x	x	0	-	RW	n/a	n/a
EL3 is not implemented.	x	0	1	-	-	-	n/a
EL3 is not implemented.	x	1	1	-	n/a	-	n/a
EL3 is using AArch64.	x	x	0	-	RW	n/a	n/a
EL3 is using AArch64.	x	0	1	-	-	-	n/a
EL3 is using AArch64.	x	1	1	-	n/a	-	n/a
EL3 is using AArch32.	x	x	0	-	n/a	n/a	RW
EL3 is using AArch32.	x	0	1	-	-	-	RW
EL3 is using AArch32.	x	1	1	-	n/a	-	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HSTR\_EL2.T1==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HSTR\_EL2.T1==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If HSTR.T1==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.

## **G6.4 Performance Monitors registers**

This section lists the Performance Monitors registers in AArch32.

## G6.4.1 PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

### Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR](#), increments.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCCFILTR is architecturally mapped to AArch64 System register [PMCCFILTR\\_ELO](#).

AArch32 System register PMCCFILTR is architecturally mapped to External register [PMCCFILTR\\_ELO](#).

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMCCFILTR is a 32-bit register.

### Field descriptions

The PMCCFILTR bit assignments are:

#### P, bit [31]

Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

- 0 Count cycles in EL1.
- 1 Do not count cycles in EL1.

When this register has an architecturally-defined reset value, this field resets to 0.

#### U, bit [30]

User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

- 0 Count cycles in EL0.
- 1 Do not count cycles in EL0.

When this register has an architecturally-defined reset value, this field resets to 0.

#### NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### NSU, bit [28]

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### NSH, bit [27]

Non-secure EL2 (Hyp mode) filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

0 Do not count cycles in EL2.

1 Count cycles in EL2.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### Bits [26:0]

Reserved, RES0.

### Accessing the PMCCFILTR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c15, 7	000	111	1110	1111	1111

PMCCFILTR can also be accessed by using [PMXEVTYPERR](#) with [PMSELR](#).SEL set to 0b11111.

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR](#).EN==0, accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0](#).EN==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2](#).TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR](#).TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3](#).TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## G6.4.2 PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

### Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See [Time as measured by the Performance Monitors cycle counter on page D5-2139](#) for more information.

[PMCCFILTR](#) determines the modes and states in which the PMCCNTR can increment.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCCNTR is architecturally mapped to AArch64 System register [PMCCNTR\\_ELO](#).

AArch32 System register PMCCNTR is architecturally mapped to External register [PMCCNTR\\_ELO](#).

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

### Field descriptions

The PMCCNTR bit assignments are:

#### When accessing as a 32-bit register:

#### CCNT, bits [31:0]

Cycle count. Depending on the values of [PMCR](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR.C](#) sets this field to 0.

#### When accessing as a 64-bit register:

### CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR](#).C sets this field to 0.

### Accessing the PMCCNTR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c13, 0	000	000	1001	1111	1101

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 0, <Rt>, <Rt2>, c9	0000	1111	1001

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `PMUSERENR.CR==0`, and `PMUSERENR.EN==0`, read accesses to this register from EL0 are trapped to Undefined mode.
  - If `PMUSERENR_EL0.CR==0`, and `PMUSERENR_EL0.EN==0`, read accesses to this register from EL0 are trapped to EL1.
  - If `PMUSERENR.EN==0`, write accesses to this register from EL0 are trapped to Undefined mode.
  - If `PMUSERENR_EL0.EN==0`, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0)`:
  - If `HSTR_EL2.T9==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1`:
  - If `MDCR_EL2.TPM==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:
  - If `HSTR_EL2.T9==1`, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and `SCR_EL3.NS == 1`:
  - If `HDCR.TPM==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If `HSTR.T9==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If `MDCR_EL3.TPM==1`, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

G6.4.3 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which common architectural and common microarchitectural feature events in the range 0x000 to 0x01F are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
AArch32 System register PMCEID0 is architecturally mapped to AArch64 System register [PMCEID0\\_EL0](#)[31:0].  
AArch32 System register PMCEID0 is architecturally mapped to External register [PMCEID0](#)[31:0].

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

The PMCEID0 bit assignments are:

ID[31:0], bits [31:0]

PMCEID0[n] maps to event n. For a list of event numbers and descriptions, see [Events, event numbers, and mnemonics on page D5-2152](#).  
For each bit:  
0 The common event is not implemented.  
1 The common event is implemented.  
Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.  
Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

Accessing the PMCEID0

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 6	000	110	1001	1111	1100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, read accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [HDCR.TPM](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If [HSTR.T9](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

G6.4.4 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which common architectural and common microarchitectural feature events in the range 0x020 to 0x03F are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
AArch32 System register PMCEID1 is architecturally mapped to AArch64 System register [PMCEID1\\_EL0](#)[31:0].  
AArch32 System register PMCEID1 is architecturally mapped to External register [PMCEID1](#)[31:0].

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

The PMCEID1 bit assignments are:

ID[63:32], bits [31:0]

PMCEID1[n] maps to event (n + 32). For a list of event numbers and descriptions, see [Events, event numbers, and mnemonics on page D5-2152](#).

For each bit:

- 0 The common event is not implemented.
- 1 The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.  
Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

Accessing the PMCEID1

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 7	000	111	1001	1111	1100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, read accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [HDCR.TPM](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If [HSTR.T9](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

G6.4.5 PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which common architectural and common microarchitectural feature events in the range 0x4000 to 0x401F are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
AArch32 System register PMCEID2 is architecturally mapped to AArch64 System register [PMCEID0\\_EL0](#)[63:32].  
AArch32 System register PMCEID2 is architecturally mapped to External register [PMCEID2](#)[63:32].  
This register is introduced in ARMv8.1.

Attributes

PMCEID2 is a 32-bit register.

Field descriptions

The PMCEID2 bit assignments are:

ID[16415:16384], bits [31:0]

PMCEID2[31:0] maps to common events 0x4000 to 0x401F. For a list of event numbers and descriptions, see [Events, event numbers, and mnemonics on page D5-2152](#).  
For each bit:  
0 The common event is not implemented.  
1 The common event is implemented.  
Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.  
Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

Accessing the PMCEID2

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 4	000	100	1001	1111	1110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, read accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, read accesses to this register from EL0 are trapped to EL1.

## G6.4.6 PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

### Purpose

Defines which common architectural and common microarchitectural feature events in the range 0x4020 to 0x403F are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCEID3 is architecturally mapped to AArch64 System register [PMCEID1\\_EL0](#)[63:32].

AArch32 System register PMCEID3 is architecturally mapped to External register [PMCEID3](#)[63:32].

This register is introduced in ARMv8.1.

### Attributes

PMCEID3 is a 32-bit register.

### Field descriptions

The PMCEID3 bit assignments are:

#### ID[16447:16416], bits [31:0]

PMCEID3[31:0] maps to common events 0x4020 to 0x403F. For a list of event numbers and descriptions, see [Events, event numbers, and mnemonics on page D5-2152](#).

For each bit:

0            The common event is not implemented.

1            The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

### Accessing the PMCEID3

This register can be read using MRC with the following syntax:

MRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 5	000	101	1001	1111	1110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `PMUSERENR.EN==0`, read accesses to this register from EL0 are trapped to Undefined mode.
  - If `PMUSERENR_EL0.EN==0`, read accesses to this register from EL0 are trapped to EL1.

## G6.4.7 PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

### Purpose

Disables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENCLR is used in conjunction with the [PMCNTENSET](#) register.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCNTENCLR is architecturally mapped to AArch64 System register [PMCNTENCLR\\_EL0](#).

AArch32 System register PMCNTENCLR is architecturally mapped to External register [PMCNTENCLR\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMCNTENCLR is a 32-bit register.

### Field descriptions

The PMCNTENCLR bit assignments are:

#### C, bit [31]

[PMCCNTR](#) disable bit. Disables the cycle counter register. Possible values are:

- 0 When read, means the cycle counter is disabled. When written, has no effect.
- 1 When read, means the cycle counter is enabled. When written, disables the cycle counter.

#### P<n>, bit [n], for n = 0 to 30

Event counter disable bit for [PMEVCNTR<n>](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN if EL2 is using AArch64 or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

Possible values of each bit are:

- 0 When read, means that [PMEVCNTR<n>](#) is disabled. When written, has no effect.
- 1 When read, means that [PMEVCNTR<n>](#) is enabled. When written, disables [PMEVCNTR<n>](#).

### Accessing the PMCNTENCLR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 2	000	010	1001	1111	1100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of [HDCR.HPMN](#) or [MDCR\\_EL2.HPMN](#) can change the behavior of accesses to PMCNTENCLR. See the description of the P<n> bit.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HSTR.T9](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## G6.4.8 PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

### Purpose

Enables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENSET is used in conjunction with the [PMCNTENCLR](#) register.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCNTENSET is architecturally mapped to AArch64 System register [PMCNTENSET\\_EL0](#).

AArch32 System register PMCNTENSET is architecturally mapped to External register [PMCNTENSET\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMCNTENSET is a 32-bit register.

### Field descriptions

The PMCNTENSET bit assignments are:

#### C, bit [31]

[PMCCNTR](#) enable bit. Enables the cycle counter register. Possible values are:

- 0 When read, means the cycle counter is disabled. When written, has no effect.
- 1 When read, means the cycle counter is enabled. When written, enables the cycle counter.

#### P<n>, bit [n], for n = 0 to 30

Event counter enable bit for [PMEVCNTR<n>](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2.HPMN](#), if EL2 is using AArch64 or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

Possible values of each bit are:

- 0 When read, means that [PMEVCNTR<n>](#) is disabled. When written, has no effect.
- 1 When read, means that [PMEVCNTR<n>](#) event counter is enabled. When written, enables [PMEVCNTR<n>](#).

### Accessing the PMCNTENSET

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 1	000	001	1001	1111	1100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of [HDCR](#).HPMN can change the behavior of accesses to PMCNTENSET. See the description of the P<n> bit.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR](#).EN==0, accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR](#).EL0.EN==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR](#).EL2.T9==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR](#).EL2.TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR](#).EL2.T9==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR](#).TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If [HSTR](#).T9==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR](#).EL3.TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## G6.4.9 PMCR, Performance Monitors Control Register

The PMCR characteristics are:

### Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMCR is architecturally mapped to AArch64 System register [PMCR\\_ELO](#).

AArch32 System register PMCR[6:0] is architecturally mapped to External register [PMCR\\_ELO](#)[6:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMCR is a 32-bit register.

### Field descriptions

The PMCR bit assignments are:

31	24	23	16	15	11	10	7	6	5	4	3	2	1	0				
IMP				IDCODE				N		RES0		LC	DP	X	D	C	P	E

#### IMP, bits [31:24]

Implementer code. This field is RO with an IMPLEMENTATION DEFINED value.

The implementer codes are allocated by ARM. Values have the same interpretation as bits [31:24] of the [MIDR](#).

#### IDCODE, bits [23:16]

Identification code. This field is RO with an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that is specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

#### N, bits [15:11]

Number of event counters. A RO field that indicates the number counters implemented. A value of 0b00000 in this field indicates that only the Cycle Count Register [PMCCNTR](#) is implemented.

The value of this field is the number of event counters implemented. This value is in the range of 0b00000, in which case only the [PMCCNTR](#) is implemented, to 0b11111, which indicates that the [PMCCNTR](#) and 31 event counters are implemented.

In an implementation that includes EL2, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of [HDCR](#).HPMN if EL2 is using AArch32, or the value of [MDCR\\_EL2](#).HPMN if EL2 is using AArch64.

#### Bits [10:7]

Reserved, RES0.

#### LC, bit [6]

Long cycle counter enable. Determines which **PMCCNTR** bit generates an overflow recorded by **PMOVSr**[31].

- 0 Cycle counter overflow on increment that changes **PMCCNTR**[31] from 1 to 0.
- 1 Cycle counter overflow on increment that changes **PMCCNTR**[63] from 1 to 0.

ARM deprecates use of **PMCR.LC** = 0.

This field resets to a value that is architecturally UNKNOWN.

#### DP, bit [5]

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

- 0 **PMCCNTR**, if enabled, counts when event counting is prohibited.
- 1 **PMCCNTR** does not count when event counting is prohibited.

Counting events is never prohibited in Non-secure state. However, there are some restrictions on counting events in Secure state. For more information about the interaction between the Performance Monitors and EL3, see *Interaction with EL3* on page D5-2145

When EL3 is not implemented, this field is RES0:

- When **ARMv8.1-PMU** is not implemented.
- When **ARMv8.1-PMU** is implemented, only if EL2 is not implemented.

Otherwise this field is RW.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### X, bit [4]

Enable export of events in an IMPLEMENTATION DEFINED event stream. The possible values of this bit are:

- 0 Do not export events.
- 1 Export events where not prohibited.

This field enables the exporting of events over an event bus to another device, for example to an OPTIONAL trace macrocell. If the implementation does not include such an event bus then this field is RAZ/WI, otherwise it is an RW field.

In an implementation that includes an event bus, no events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### D, bit [3]

Clock divider. The possible values of this bit are:

- 0 When enabled, **PMCCNTR** counts every clock cycle.
- 1 When enabled, **PMCCNTR** counts once every 64 clock cycles.

This bit is RW.

If **PMCR.LC** = 1, this bit is ignored and the cycle counter counts every clock cycle.

ARM deprecates use of **PMCR.D** = 1.

When this register has an architecturally-defined reset value, this field resets to 0.

#### C, bit [2]

Cycle counter reset. This bit is WO. The effects of writing to this bit are:

- 0 No action.
- 1 Reset **PMCCNTR** to zero.

This bit is always RAZ.

Resetting **PMCCNTR** does not clear the **PMCCNTR** overflow bit to 0.

#### P, bit [1]

Event counter reset. This bit is WO. The effects of writing to this bit are:

0 No action.

1 Reset all event counters accessible in the current EL, not including **PMCCNTR**, to zero.

This bit is always RAZ.

In Non-secure EL0 and EL1, if EL2 is implemented, a write of 1 to this bit does not reset event counters that **HDCR**.HPMN or **MDCR\_EL2**.HPMN reserves for EL2 use.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Resetting the event counters does not clear any overflow bits to 0.

#### E, bit [0]

Enable. The possible values of this bit are:

0 All counters that are accessible at Non-secure EL1, including **PMCCNTR**, are disabled.

1 All counters that are accessible at Non-secure EL1 are enabled by **PMCNTENSET**.

This bit is RW.

If EL2 is implemented, this bit does not affect the operation of event counters that **HDCR**.HPMN or **MDCR\_EL2**.HPMN reserves for EL2 use.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the PMCR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 0	000	000	1001	1111	1100

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If `PMUSERENR.EN==0`, accesses to this register from EL0 are trapped to Undefined mode.
  - If `PMUSERENR_EL0.EN==0`, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0)`:
  - If `HSTR_EL2.T9==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and `SCR_EL3.NS == 1`:
  - If `MDCR_EL2.TPM==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
  - If `MDCR_EL2.TPMCR==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:
  - If `HSTR_EL2.T9==1`, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and `SCR_EL3.NS == 1`:
  - If `HDCR.TPM==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If `HDCR.TPMCR==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If `HSTR.T9==1`, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If `MDCR_EL3.TPM==1`, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

**G6.4.10      PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30**

The PMEVCNTR<n> characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Configurations**

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMEVCNTR<n> is architecturally mapped to AArch64 System register [PMEVCNTR<n>\\_EL0](#).

AArch32 System register PMEVCNTR<n> is architecturally mapped to External register [PMEVCNTR<n>\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

**Attributes**

PMEVCNTR<n> is a 32-bit register.

**Field descriptions**

The PMEVCNTR<n> bit assignments are:

**Bits [31:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

**Accessing the PMEVCNTR<n>**

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, <CRm>, <opc2>	000	n<2:0>	1110	1111	10:n<4:3>

- <opc2> is in the range 0 - 7.
- <CRm> is in the range c8 - c11.

PMEVCNTR<n> can also be accessed by using [PMXEVCNTR](#) with [PMSELR](#).SEL set to the value of <n>.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVCNTR<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- In Non-secure state, for an access from PL1 or a permitted access from PL0, if [PMSELR.SEL](#), or [PMSELR\\_EL0.SEL](#) if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of [PMUSERENR.EN](#) is 1.
  - EL1 is using AArch64 and the value of [PMUSERENR\\_EL0.EN](#) is 1.

### Note

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, [HDCR.HPMN](#) identifies the number of accessible counters.
- If EL2 is using AArch64, [MDCR\\_EL2.HPMN](#) identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, and [PMUSERENR.ER](#)==0, read accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR.EN](#)==0, write accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, and [PMUSERENR\\_EL0.ER](#)==0, read accesses to this register from EL0 are trapped to EL1.
  - If [PMUSERENR\\_EL0.EN](#)==0, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## G6.4.11 PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

### Purpose

Configures event counter n, where n is 0 to 30.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMEVTYPER<n> is architecturally mapped to AArch64 System register [PMEVTYPER<n>\\_EL0](#).

AArch32 System register PMEVTYPER<n> is architecturally mapped to External register [PMEVTYPER<n>\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMEVTYPER<n> is a 32-bit register.

### Field descriptions

The PMEVTYPER<n> bit assignments are:

### P, bit [31]

Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

- 0 Count events in EL1.
- 1 Do not count events in EL1.

### U, bit [30]

User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

- 0 Count events in EL0.
- 1 Do not count events in EL0.

### NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

#### NSU, bit [28]

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

#### NSH, bit [27]

Non-secure EL2 (Hyp mode) filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

0 Do not count events in EL2.

1 Count events in EL2.

#### Bit [26]

Reserved, RES0.

#### MT, bit [25]

Multithreading. When the implementation is multi-threaded, the valid values for this bit are:

0 Count events only on controlling PE.

1 Count events from any PE with the same affinity at level 1 and above as this PE.

When the implementation is not multi-threaded, this bit is RES0.

#### Note

- An implementation is described as multi-threaded when the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach. That is, the performance of PEs at the lowest affinity level is highly interdependent. On such an implementation, the value of MPIDR\_EL1.MT, when read at the highest implemented Exception level, is 1.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

#### Bits [24:16]

Reserved, RES0.

#### evtCount[15:10], bits [15:10]

##### *In ARMv8.2 and ARMv8.1*

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

##### *In ARMv8.0.*

Reserved, RES0.

#### evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter [PMEVCNTR<n>](#).

Software must program this field with an event that is supported by the PE being programmed.

There are three ranges of event numbers:

- Event numbers in the range 0x000 to 0x03F are common architectural and microarchitectural events.
- Event numbers in the range 0x040 to 0x0BF are ARM recommended common architectural and microarchitectural events.
- Event numbers in the range 0x0C0 to 0x3FF are IMPLEMENTATION DEFINED events.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the event type:

- For the range 0x000 to 0x03F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

———— **Note** —————

UNPREDICTABLE means the event must not expose privileged information.

ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

## Accessing the PMEVTYPER<n>

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, <CRm>, <opc2>	000	n<2:0>	1110	1111	11:n<4:3>

- <opc2> is in the range 0 - 7.
- <CRm> is in the range c12 - c15.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	n/a
x	0	1	RW	RW	RW	n/a
x	1	1	RW	n/a	RW	n/a

This register is accessible at EL0 when [PMUSERENR.EN](#) is set to 1.

PMEVTYPER<n> can also be accessed by using [PMXEVTYPER](#) with [PMSELR.SEL](#) set to n.

If <n> is greater or equal to the number of accessible counters, reads and writes of PMEVTYPER<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

- In Non-secure state, for an access from PL1 or a permitted access from PL0, if [PMSELR.SEL](#), or [PMSELR\\_EL0.SEL](#) if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of [PMUSERENR.EN](#) is 1.
  - EL1 is using AArch64 and the value of [PMUSERENR\\_EL0.EN](#) is 1.

---

**Note**

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, [HDCR.HPMN](#) identifies the number of accessible counters.
- If EL2 is using AArch64, [MDCR\\_EL2.HPMN](#) identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

---

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [HDCR.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## G6.4.12 PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

### Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENCLR is used in conjunction with the [PMINTENSET](#) register.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMINTENCLR is architecturally mapped to AArch64 System register [PMINTENCLR\\_EL1](#).

AArch32 System register PMINTENCLR is architecturally mapped to External register [PMINTENCLR\\_EL1](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMINTENCLR is a 32-bit register.

### Field descriptions

The PMINTENCLR bit assignments are:

#### C, bit [31]

[PMCCNTR](#) overflow interrupt request disable bit. Possible values are:

- 0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

#### P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>](#).

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [HDCR](#).HPMN. Otherwise, N is the value in [PMCR](#).N.

Bits [30:N] are RAZ/WI.

Possible values are:

- 0 When read, means that the [PMEVCNTR<n>](#) event counter interrupt request is disabled. When written, has no effect.
- 1 When read, means that the [PMEVCNTR<n>](#) event counter interrupt request is enabled. When written, disables the [PMEVCNTR<n>](#) interrupt request.

### Accessing the PMINTENCLR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 2	000	010	1001	1111	1110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of [HDCR](#).HPMN can change the behavior of accesses to PMINTENCLR. See the description of the P<n> bit.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2](#).T9==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2](#).TPM==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2](#).T9==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR](#).TPM==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR](#).T9==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3](#).TPM==1, accesses to this register from EL1 and EL2 are trapped to EL3.

### G6.4.13 PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

#### Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENSET is used in conjunction with the [PMINTENCLR](#) register.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMINTENSET is architecturally mapped to AArch64 System register [PMINTENSET\\_EL1](#).

AArch32 System register PMINTENSET is architecturally mapped to External register [PMINTENSET\\_EL1](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

PMINTENSET is a 32-bit register.

#### Field descriptions

The PMINTENSET bit assignments are:

#### C, bit [31]

[PMCCNTR](#) overflow interrupt request enable bit. Possible values are:

- 0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 1 When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

#### P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>](#).

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [HDCR](#).HPMN. Otherwise, N is the value in [PMCR](#).N.

Bits [30:N] are RAZ/WI.

Possible values are:

- 0 When read, means that the [PMEVCNTR<n>](#) event counter interrupt request is disabled. When written, has no effect.
- 1 When read, means that the [PMEVCNTR<n>](#) event counter interrupt request is enabled. When written, enables the [PMEVCNTR<n>](#) interrupt request.

#### Accessing the PMINTENSET

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 1	000	001	1001	1111	1110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

If EL2 is implemented, in Non-secure EL1 and EL0 modes, the value of [HDCR](#).HPMN can change the behavior of accesses to PMINTENSET. See the description of the P<n> bit.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2](#).T9==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2](#).TPM==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2](#).T9==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR](#).TPM==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
  - If [HSTR](#).T9==1, Non-secure accesses to this register from EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3](#).TPM==1, accesses to this register from EL1 and EL2 are trapped to EL3.

## G6.4.14 PMOVSr, Performance Monitors Overflow Flag Status Register

The PMOVSr characteristics are:

### Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMOVSr is architecturally mapped to AArch64 System register [PMOVSCLR\\_EL0](#).

AArch32 System register PMOVSr is architecturally mapped to External register [PMOVSCLR\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMOVSr is a 32-bit register.

### Field descriptions

The PMOVSr bit assignments are:

#### C, bit [31]

[PMCCNTR](#) overflow bit. Possible values are:

- 0 When read, means the cycle counter has not overflowed. When written, has no effect.
- 1 When read, means the cycle counter has overflowed. When written, clears the overflow bit to 0.

[PMCR.LC](#) controls whether an overflow is detected from [PMCCNTR](#)[31] or from [PMCCNTR](#)[63].

#### P<n>, bit [n], for n = 0 to 30

Event counter overflow clear bit for [PMEVCNTR<n>](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2.HPMN](#) if EL2 is using AArch64 or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

Possible values of each bit are:

- 0 When read, means that [PMEVCNTR<n>](#) has not overflowed. When written, has no effect.
- 1 When read, means that [PMEVCNTR<n>](#) has overflowed. When written, clears the [PMEVCNTR<n>](#) overflow bit to 0.

### Accessing the PMOVSr

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 3	000	011	1001	1111	1100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 1) && ([HCR\\_EL2.TGE](#) == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [HDCR.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If [HSTR.T9](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## G6.4.15 PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

### Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMOVSSET is architecturally mapped to AArch64 System register [PMOVSSET\\_EL0](#).

AArch32 System register PMOVSSET is architecturally mapped to External register [PMOVSSET\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMOVSSET is a 32-bit register.

### Field descriptions

The PMOVSSET bit assignments are:

#### C, bit [31]

[PMCCNTR](#) overflow bit. Possible values are:

- 0 When read, means the cycle counter has not overflowed. When written, has no effect.
- 1 When read, means the cycle counter has overflowed. When written, sets the overflow bit to 1.

#### P<n>, bit [n], for n = 0 to 30

Event counter overflow set bit for [PMEVCNTR<n>](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN if EL2 is using AArch64 or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

Possible values are:

- 0 When read, means that [PMEVCNTR<n>](#) has not overflowed. When written, has no effect.
- 1 When read, means that [PMEVCNTR<n>](#) has overflowed. When written, sets the [PMEVCNTR<n>](#) overflow bit to 1.

### Accessing the PMOVSSET

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 3	000	011	1001	1111	1110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 1) && ([HCR\\_EL2.TGE](#) == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [HDCR.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If [HSTR.T9](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## G6.4.16 PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

### Purpose

Selects the current event counter [PMEVCNTR<n>](#) or the cycle counter, CCNT.

PMSELR is used in conjunction with [PMXEVTYPER](#) to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with [PMXVCNTR](#), to determine the value of a selected event counter.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMSELR is architecturally mapped to AArch64 System register [PMSELR\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMSELR is a 32-bit register.

### Field descriptions

The PMSELR bit assignments are:

### Bits [31:5]

Reserved, RES0.

### SEL, bits [4:0]

Selects event counter, [PMEVCNTR<n>](#), where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to [PMXEVTYPER](#) or [PMXVCNTR](#) occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR.SEL is 0b11111 it selects the cycle counter and:

- A read of the [PMXEVTYPER](#) returns the value of [PMCCFILTR](#).
- A write of the [PMXEVTYPER](#) writes to [PMCCFILTR](#).
- A read or write of [PMXVCNTR](#) has CONSTRAINED UNPREDICTABLE effects, that can be one of the following:
  - Access to [PMXVCNTR](#) is UNDEFINED.
  - Access to [PMXVCNTR](#) behaves as a NOP.
  - Access to [PMXVCNTR](#) behaves as if the register is RAZ/WI.
  - Access to [PMXVCNTR](#) behaves as if the PMSELR.SEL field contains an UNKNOWN value.

If this field is set to a value greater than or equal to the number of implemented counters, but not equal to 31, the results of access to [PMXEVTYPER](#) or [PMXVCNTR](#) are CONSTRAINED UNPREDICTABLE, and can be one of the following:

- Access to [PMXEVTYPER](#) or [PMXVCNTR](#) is UNDEFINED.

- Access to [PMXEVTYPYPER](#) or [PMXEVCNTR](#) behaves as a NOP.
- Access to [PMXEVTYPYPER](#) or [PMXEVCNTR](#) behaves as if the register is RAZ/WI.
- Access to [PMXEVTYPYPER](#) or [PMXEVCNTR](#) behaves as if the PMSELR.SEL field contains an UNKNOWN value.
- Access to [PMXEVTYPYPER](#) or [PMXEVCNTR](#) behaves as if the PMSELR.SEL field contains 0b11111.

Direct reads of this field return an UNKNOWN value.

## Accessing the PMSELR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 5	000	101	1001	1111	1100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, and [PMUSERENR.ER](#)==0, accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, and [PMUSERENR\\_EL0.ER](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $HSTR\_EL2.T9 == 1$ , Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $SCR\_EL3.NS == 1$ :
  - If  $HDCR.TPM == 1$ , Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If  $HSTR.T9 == 1$ , Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If  $MDCR\_EL3.TPM == 1$ , accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## G6.4.17 PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

### Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see [SW\\_INCR](#).

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMSWINC is architecturally mapped to AArch64 System register [PMSWINC\\_EL0](#).

AArch32 System register PMSWINC is architecturally mapped to External register [PMSWINC\\_EL0](#).

### Attributes

PMSWINC is a 32-bit register.

### Field descriptions

The PMSWINC bit assignments are:

#### Bit [31]

Reserved, RES0.

#### P<n>, bit [n], for n = 0 to 30

Event counter software increment bit for [PMEVCNTR<n>](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2.HPMN](#) if EL2 is using AArch64 or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

The effects of writing to this bit are:

- 0 No action. The write to this bit is ignored.
- 1 If [PMEVCNTR<n>](#) is enabled and configured to count the software increment event, increments [PMEVCNTR<n>](#) by 1. If [PMEVCNTR<n>](#) is disabled, or not configured to count the software increment event, the write to this bit is ignored.

### Accessing the PMSWINC

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c12, 4	000	100	1001	1111	1100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, and [PMUSERENR.SW](#)==0, write accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, and [PMUSERENR\\_EL0.SW](#)==0, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 1) && ([HCR\\_EL2.TGE](#) == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and [SCR\\_EL3.NS](#) == 1:
  - If [HDCR.TPM](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If [HSTR.T9](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, write accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

#### G6.4.18 PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

## Purpose

Enables or disables User mode access to the Performance Monitors.

## Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMUSERENR is architecturally mapped to AArch64 System register [PMUSERENR\\_EL0](#).

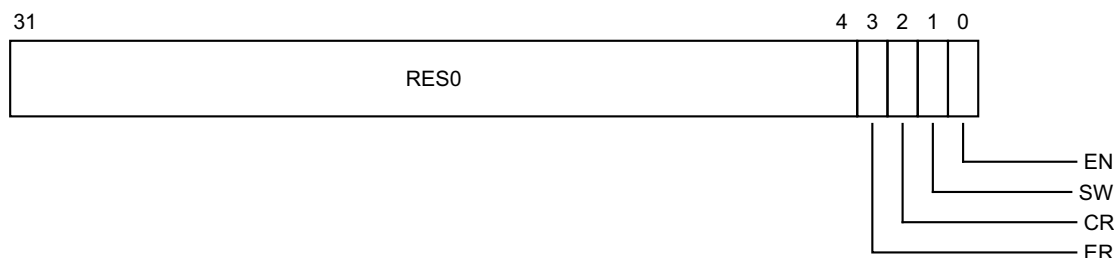

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch32. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMUSERENR is a 32-bit register.

## Field descriptions

The PMUSERENR bit assignments are:

**Bits [31:4]**

Reserved, RES0.

**ER, bit [3]**

Event counter read trap control:

- |   |  |
|---|--|
| 0 | EL0 reads of the <b>PMXVCNTR</b> and <b>PMEVCNTR&lt;n&gt;</b> , and EL0 read/write access to the <b>PMSELR</b> , are trapped to Undefined mode if <b>PMUSERENR.EN</b> is also 0. |
| 1 | This control does not cause any instructions to be trapped.  |

When this register has an architecturally-defined reset value, this field resets to 0.

**CR, bit [2]**

Cycle counter read trap control:

- |   |   |
|---|---|
| 0 | EL0 reads of the <b>PMCCNTR</b> are trapped to Undefined mode if <b>PMUSERENR.EN</b> is also 0. |
| 1 | This control does not cause any instructions to be trapped.                                     |

When this register has an architecturally-defined reset value, this field resets to 0.

## SW, bit [1]

Software increment write trap control:

- EL0 writes to the **PMSWINC** are trapped to Undefined mode if **PMUSERENR.EN** is also 0.

- 1 This control does not cause any instructions to be trapped.  
When this register has an architecturally-defined reset value, this field resets to 0.

#### EN, bit [0]

Traps EL0 accesses to the Performance Monitors registers to Undefined mode:

- 0 EL0 accesses to the Performance Monitors registers are trapped to Undefined mode, unless enabled by one of PMUSERENR.{ER, CR, SW}.
- 1 This control does not cause any instructions to be trapped. Software can access all PMU registers at EL0.

#### Note

- The PMUSERENR register is always RO at EL0 and not trapped by this bit.
- EL0 cannot read or write [PMINTENSET](#) and [PMINTENCLR](#).

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the PMUSERENR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c14, 0	000	000	1001	1111	1110

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RW	n/a	RW
x	0	1	RO	RW	RW	RW
x	1	1	RO	n/a	RW	RW

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and  $\text{SCR\_EL3.NS} = 1$ :
  - If  $\text{MDCR\_EL2.TPM} = 1$ , Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If  $\text{HSTR\_EL2.T9} = 1$ , Non-secure write accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} = 1$ :
  - If  $\text{HDCR.TPM} = 1$ , Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If  $\text{HSTR.T9} = 1$ , Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If  $\text{MDCR\_EL3.TPM} = 1$ , accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## G6.4.19 PMXEVNTR, Performance Monitors Selected Event Count Register

The PMXEVNTR characteristics are:

### Purpose

Reads or writes the value of the selected event counter, [PMXEVNTR<n>](#). [PMSELR.SEL](#) determines which event counter is selected.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMXEVNTR is architecturally mapped to AArch64 System register [PMXEVNTR\\_ELO](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMXEVNTR is a 32-bit register.

### Field descriptions

The PMXEVNTR bit assignments are:

### PMXEVNTR<n>, bits [31:0]

Value of the selected event counter, [PMXEVNTR<n>](#), where n is the value stored in [PMSELR.SEL](#).

### Accessing the PMXEVNTR

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c13, 2	000	010	1001	1111	1101

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

If [PMSELR.SEL](#) is greater than or equal to the number of accessible counters then reads and writes of PMXEVCNTR are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if [PMSELR.SEL](#) has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if [PMSELR.SEL](#) is 31.
- In Non-secure state, for an access from PL1 or a permitted access from PL0, if [PMSELR.SEL](#), or [PMSELR\\_EL0.SEL](#) if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of [PMUSERENR.EN](#) is 1.
  - EL1 is using AArch64 and the value of [PMUSERENR\\_EL0.EN](#) is 1.

### Note

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, [HDCR.HPMN](#) identifies the number of accessible counters.
- If EL2 is using AArch64, [MDCR\\_EL2.HPMN](#) identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, and [PMUSERENR.ER](#)==0, read accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR.EN](#)==0, write accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, and [PMUSERENR\\_EL0.ER](#)==0, read accesses to this register from EL0 are trapped to EL1.
  - If [PMUSERENR\\_EL0.EN](#)==0, write accesses to this register from EL0 are trapped to EL1.

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If [HDCR.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If [HSTR.T9](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

G6.4.20 PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

Purpose

When [PMSELR.SEL](#) selects an event counter, this accesses a [PMEVTYPER<n>](#) register. When [PMSELR.SEL](#) selects the cycle counter, this accesses [PMCCFILTR](#).

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register PMXEVTYPER is architecturally mapped to AArch64 System register [PMXEVTYPER\\_EL0](#).

When the value of [PMSELR.SEL](#) is 31, to select the cycle counter, RW fields in this register have defined reset values that apply only when the PE resets into an Exception level that is using AArch32. See [PMCCFILTR](#) for the reset values.

Otherwise, RW fields in this register reset to IMPLEMENTATION DEFINED values that might be UNKNOWN. This applies whenever [PMSELR.SEL](#) selects an event counter.

Attributes

PMXEVTYPER is a 32-bit register.

Field descriptions

The PMXEVTYPER bit assignments are:

Bits [31:0]

Event type register or [PMCCFILTR](#).

When [PMSELR.SEL](#) = 31, this register accesses [PMCCFILTR](#).

Otherwise, this register accesses [PMEVTYPER<n>](#) where n is the value in [PMSELR.SEL](#).

Accessing the PMXEVTYPER

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c9, c13, 1	000	001	1001	1111	1101

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

If [PMSELR.SEL](#) is greater than or equal to the number of accessible counters then reads and writes of [PMXEVTYPER](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if [PMSELR.SEL](#) has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if [PMSELR.SEL](#) is 31.
- In Non-secure state, for an access from PL1 or a permitted access from PL0, if [PMSELR.SEL](#), or [PMSELR\\_EL0.SEL](#) if EL1 is using AArch64, is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2. Accesses from PL0 are permitted when:
  - EL1 is using AArch32 and the value of [PMUSERENR.EN](#) is 1.
  - EL1 is using AArch64 and the value of [PMUSERENR\\_EL0.EN](#) is 1.

### Note

In an implementation that includes EL2, in Non-secure state at EL0 and EL1:

- If EL2 is using AArch32, [HDCR.HPMN](#) identifies the number of accessible counters.
- If EL2 is using AArch64, [MDCR\\_EL2.HPMN](#) identifies the number of accessible counters.

Otherwise, the number of accessible counters is the number of implemented counters.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR.EN](#)==0, accesses to this register from EL0 are trapped to Undefined mode.
  - If [PMUSERENR\\_EL0.EN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 0):
  - If [HSTR\\_EL2.T9](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and  $\text{SCR\_EL3.NS} == 1$ :
  - If  $\text{MDCR\_EL2.TPM} == 1$ , Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 1) \ \&\& \ (\text{HCR\_EL2.TGE} == 0)$ :
  - If  $\text{HSTR\_EL2.T9} == 1$ , Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} == 1$ :
  - If  $\text{HDCR.TPM} == 1$ , Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
  - If  $\text{HSTR.T9} == 1$ , Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.
- When EL3 is implemented and is using AArch64:
  - If  $\text{MDCR\_EL3.TPM} == 1$ , accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## **G6.5 Generic Timer registers**

This section lists the Generic Timer registers in AArch32.

G6.5.1 CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
AArch32 System register CNTFRQ is architecturally mapped to AArch64 System register [CNTFRQ\\_EL0](#).  
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

The CNTFRQ bit assignments are:

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

Accessing the CNTFRQ

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c0, 0	000	000	1110	1111	0000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL1 is the highest implemented Exception level.	x	x	x	RO	RW	n/a	n/a
EL2 is the highest implemented Exception level.	x	0	1	RO	RO	RW	n/a
EL2 is the highest implemented Exception level.	x	1	1	RO	n/a	RW	n/a
EL3 is the highest implemented Exception level.	x	x	0	RO	RO	RO	RW
EL3 is the highest implemented Exception level.	x	0	1	RO	RO	RO	RW
EL3 is the highest implemented Exception level.	x	1	1	RO	n/a	RO	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} == 0$ :
  - If  $\text{CNTKCTL\_EL1.EL0PCTEN} == 0$ , and  $\text{CNTKCTL\_EL1.EL0VCTEN} == 0$ , read accesses to this register from EL0 are trapped to EL1.
  - If  $\text{CNTKCTL.PL0PCTEN} == 0$ , and  $\text{CNTKCTL.PL0VCTEN} == 0$ , read accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 1) \ \&\& \ (\text{HCR\_EL2.TGE} == 0)$ :
  - If  $\text{CNTKCTL\_EL1.EL0PCTEN} == 0$ , and  $\text{CNTKCTL\_EL1.EL0VCTEN} == 0$ , Non-secure read accesses to this register from EL0 are trapped to EL1.
  - If  $\text{CNTKCTL.PL0PCTEN} == 0$ , and  $\text{CNTKCTL.PL0VCTEN} == 0$ , Non-secure read accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 1) \ \&\& \ (\text{HCR\_EL2.TGE} == 1)$ :
  - If  $\text{CNTHCTL\_EL2.EL0PCTEN} == 0$ , and  $\text{CNTHCTL\_EL2.EL0VCTEN} == 0$ , Non-secure read accesses to this register from EL0 are trapped to EL2.

## G6.5.2 CNTHCTL, Counter-timer Hyp Control register

The CNTHCTL characteristics are:

### Purpose

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

### Configurations

AArch32 System register CNTHCTL is architecturally mapped to AArch64 System register [CNTHCTL\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTHCTL is a 32-bit register.

### Field descriptions

The CNTHCTL bit assignments are:

### Bits [31:8]

Reserved, RES0.

### EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register [CNTPCT](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

### EVNTDIR, bit [3]

Controls which transition of the counter register [CNTPCT](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

- 0 A 0 to 1 transition of the trigger bit triggers an event.
- 1 A 1 to 0 transition of the trigger bit triggers an event.

### EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTPCT](#):

- 0 Disables the event stream.
- 1 Enables the event stream.

### PL1PCEN, bit [1]

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to Hyp mode.

- 0 Non-secure EL0 and EL1 accesses to the [CNTP\\_CTL](#), [CNTP\\_CVAL](#), and [CNTP\\_TVAL](#) are trapped to Hyp mode, unless the it is trapped by [CNTKCTL.PL0PTEN](#).

1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

#### PL1PCTEN, bit [0]

Traps Non-secure EL0 and EL1 accesses to the physical counter register to Hyp mode.

0 Non-secure EL0 and EL1 accesses to the [CNTPCT](#) are trapped to Hyp mode, unless it is trapped by [CNTKCTL.PL0PCTEN](#).

1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

### Accessing the CNTHCTL

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c14, c1, 0	100	000	1110	1111	0001

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

### G6.5.3 CNTHP\_CTL, Counter-timer Hyp Physical Timer Control register

The CNTHP\_CTL characteristics are:

## Purpose

Control register for the Hyp mode physical timer.

## Configurations

AArch32 System register CNTHP\_CTL is architecturally mapped to AArch64 System register CNTHP\_CTL\_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 with EL2 using AArch32, or into EL3 with EL3 using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

## Attributes

CNTHP\_CTL is a 32-bit register.

## Field descriptions

The CNTHP\_CTL bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

0 Timer condition is not met.

1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see *Operation of the CompareValue views of the timers* on page D6-2187 and *Operation of the TimerValue views of the timers* on page D6-2188.

This bit is read-only.

This field resets to a value that is architecturally UNKNOWN.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

0 Timer interrupt is not masked by the IMASK bit.

1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to a value that is architecturally UNKNOWN.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

- 0            Timer disabled.  
1            Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHP\\_TVAL](#) continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the CNTHP\_CTL**

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c14, c2, 1	100	001	1110	1111	0010
p15, 0, <Rt>, c14, c2, 1	000	001	1110	1111	0010

**Accessibility**

The register is accessible in software as follows:

<syntax>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
p15, 4, <Rt>, c14, c2, 1	x	x	0	-	-	n/a	-
p15, 4, <Rt>, c14, c2, 1	x	0	1	-	-	RW	RW
p15, 4, <Rt>, c14, c2, 1	x	1	1	-	n/a	RW	RW
p15, 0, <Rt>, c14, c2, 1	x	x	0	<a href="#">CNTP_CTL</a>	<a href="#">CNTP_CTL</a>	n/a	<a href="#">CNTP_CTL</a>
p15, 0, <Rt>, c14, c2, 1	0	0	1	<a href="#">CNTP_CTL</a>	<a href="#">CNTP_CTL</a>	<a href="#">CNTP_CTL</a>	<a href="#">CNTP_CTL</a>
p15, 0, <Rt>, c14, c2, 1	0	1	1	<a href="#">CNTP_CTL</a>	n/a	<a href="#">CNTP_CTL</a>	<a href="#">CNTP_CTL</a>
p15, 0, <Rt>, c14, c2, 1	1	0	1	<a href="#">CNTP_CTL</a>	<a href="#">CNTP_CTL</a>	n/a	n/a
p15, 0, <Rt>, c14, c2, 1	1	1	1	RW	n/a	n/a	n/a

This table applies to all instructions that can access this register.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If CNTHCTL\_EL2.EL0PTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.

#### G6.5.4 CNTHP\_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP\_CVAL characteristics are:

## Purpose

Holds the compare value for the Hyp mode physical timer.

## Configurations

AArch32 System register CNTHP\_CVAL is architecturally mapped to AArch64 System register CNTHP\_CVAL\_EL2.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTHP\_CVAL is a 64-bit register.

## Field descriptions

The CNTHP\_CVAL bit assignments are:

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When `CNTHP_CTL.ENABLE` is 1, the timer condition is met when  $(\text{CNTPTCT} - \text{CompareValue})$  is greater than zero. This means that `CompareValue` acts like a 64-bit upcounter timer. When the timer condition is met:

- `CNTHP_CTL`.ISTATUS is set to 1.
- If `CNTHP_CTL`.IMASK is 0, an interrupt is generated.

When **CNTHP\_CTL.ENABLE** is 0, the timer condition is not met, but **CNTPCT** continues to count.

## Accessing the CNTHP\_CVAL

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 6, <Rt>, <Rt2>, c14	0110	1111	1110
p15, 2, <Rt>, <Rt2>, c14	0010	1111	1110

## Accessibility

The register is accessible in software as follows:

<syntax>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
p15, 6, <Rt>, <Rt2>, c14	x	x	0	-	-	n/a	-
p15, 6, <Rt>, <Rt2>, c14	x	0	1	-	-	RW	RW
p15, 6, <Rt>, <Rt2>, c14	x	1	1	-	n/a	RW	RW
p15, 2, <Rt>, <Rt2>, c14	x	x	0	CNTP_CVAL	CNTP_CVAL	n/a	CNTP_CVAL
p15, 2, <Rt>, <Rt2>, c14	0	0	1	CNTP_CVAL	CNTP_CVAL	CNTP_CVAL	CNTP_CVAL
p15, 2, <Rt>, <Rt2>, c14	0	1	1	CNTP_CVAL	n/a	CNTP_CVAL	CNTP_CVAL
p15, 2, <Rt>, <Rt2>, c14	1	0	1	CNTP_CVAL	CNTP_CVAL	n/a	n/a
p15, 2, <Rt>, <Rt2>, c14	1	1	1	RW	n/a	n/a	n/a

This table applies to all instructions that can access this register.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If CNTHCTL\_EL2.EL0PTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.

## G6.5.5 CNTHP\_TVAL, Counter-timer Hyp Physical Timer TimerValue register

The CNTHP\_TVAL characteristics are:

### Purpose

Holds the timer value for the Hyp mode physical timer.

### Configurations

AArch32 System register CNTHP\_TVAL is architecturally mapped to AArch64 System register [CNTHP\\_TVAL\\_EL2](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTHP\_TVAL is a 32-bit register.

### Field descriptions

The CNTHP\_TVAL bit assignments are:

### TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHP\\_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHP\\_CTL.ENABLE](#) is 1, the value returned is ([CNTHP\\_CVAL](#) - [CNTPCT](#)).

On a write of this register, [CNTHP\\_CVAL](#) is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHP\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - [CNTHP\\_CVAL](#)) is greater than zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHP\\_CTL.ISTATUS](#) is set to 1.
- If [CNTHP\\_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHP\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

### Accessing the CNTHP\_TVAL

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 4, <Rt>, c14, c2, 0	100	000	1110	1111	0010
p15, 0, <Rt>, c14, c2, 0	000	000	1110	1111	0010

## Accessibility

The register is accessible in software as follows:

<syntax>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
p15, 4, <Rt>, c14, c2, 0	x	x	0	-	-	n/a	-
p15, 4, <Rt>, c14, c2, 0	x	0	1	-	-	RW	RW
p15, 4, <Rt>, c14, c2, 0	x	1	1	-	n/a	RW	RW
p15, 0, <Rt>, c14, c2, 0	x	x	0	CNTP_TVAL	CNTP_TVAL	n/a	CNTP_TVAL
p15, 0, <Rt>, c14, c2, 0	0	0	1	CNTP_TVAL	CNTP_TVAL	CNTP_TVAL	CNTP_TVAL
p15, 0, <Rt>, c14, c2, 0	0	1	1	CNTP_TVAL	n/a	CNTP_TVAL	CNTP_TVAL
p15, 0, <Rt>, c14, c2, 0	1	0	1	CNTP_TVAL	CNTP_TVAL	n/a	n/a
p15, 0, <Rt>, c14, c2, 0	1	1	1	RW	n/a	n/a	n/a

This table applies to all instructions that can access this register.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If CNTHCTL\_EL2.EL0PTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.

### G6.5.6 CNTHV\_CTL, Counter-timer Virtual Timer Control register (EL2)

The CNTHV\_CTL characteristics are:

## Purpose

Provides AArch32 access to the control register for the EL2 virtual timer.

**- Note**

The EL2 virtual timer is implemented by [ARMv8.1-VHE](#). It is only accessible from AArch32 state when EL0 is using AArch32, EL2 is using AArch64, and the value of `HCR_EL2.{E2H, TGE}` is `{1, 1}`.

## Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTHV\_CTL is architecturally mapped to AArch64 System register CNTHV\_CTL\_EL2.

This register is introduced in ARMv8.1.

## Attributes

CNTHV\_CTL is a 32-bit register.

## Field descriptions

The CNTHV\_CTL bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

0 Timer condition is not met.

1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see *Operation of the CompareValue views of the timers* on page D6-2187 and *Operation of the TimerValue views of the timers* on page D6-2188.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

0 Timer interrupt is not masked by the IMASK bit.

1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

#### ENABLE, bit [0]

Enables the timer. Permitted values are:

0 Timer disabled.

1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHV\\_TVAL](#) continues to count down.

#### Note

Disabling the output signal might be a power-saving option.

### Accessing the CNTHV\_CTL

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c3, 1	000	001	1110	1111	0011

This register is accessed using the encoding for [CNTV\\_CTL](#).

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	<a href="#">CNTV_CTL</a>	<a href="#">CNTV_CTL</a>	n/a	<a href="#">CNTV_CTL</a>
0	0	1	<a href="#">CNTV_CTL</a>	<a href="#">CNTV_CTL</a>	<a href="#">CNTV_CTL</a>	<a href="#">CNTV_CTL</a>
0	1	1	<a href="#">CNTV_CTL</a>	n/a	<a href="#">CNTV_CTL</a>	<a href="#">CNTV_CTL</a>
1	0	1	<a href="#">CNTV_CTL</a>	<a href="#">CNTV_CTL</a>	n/a	n/a
1	1	1	RW	n/a	n/a	n/a

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If CNTHCTL\_EL2.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.

G6.5.7 CNTHV\_CVAL, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV\_CVAL characteristics are:

Purpose

Provides AArch32 access to the compare value for the EL2 virtual timer.

————— **Note** —————

The EL2 virtual timer is implemented by [ARMv8.1-VHE](#). It is only accessible from AArch32 state when EL0 is using AArch32, EL2 is using AArch64, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
AArch32 System register CNTHV\_CVAL is architecturally mapped to AArch64 System register [CNTHV\\_CVAL\\_EL2](#).  
This register is introduced in ARMv8.1.

Attributes

CNTHV\_CVAL is a 64-bit register.

Field descriptions

The CNTHV\_CVAL bit assignments are:

CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When [CNTHV\\_CTL](#).ENABLE is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHV\\_CTL](#).ISTATUS is set to 1.
- If [CNTHV\\_CTL](#).IMASK is 0, an interrupt is generated.

When [CNTHV\\_CTL](#).ENABLE is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

Accessing the CNTHV\_CVAL

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 3, <Rt>, <Rt2>, c14	0011	1111	1110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	<a href="#">CNTV_CVAL</a>	<a href="#">CNTV_CVAL</a>	n/a	<a href="#">CNTV_CVAL</a>
0	0	1	<a href="#">CNTV_CVAL</a>	<a href="#">CNTV_CVAL</a>	<a href="#">CNTV_CVAL</a>	<a href="#">CNTV_CVAL</a>
0	1	1	<a href="#">CNTV_CVAL</a>	n/a	<a href="#">CNTV_CVAL</a>	<a href="#">CNTV_CVAL</a>
1	0	1	<a href="#">CNTV_CVAL</a>	<a href="#">CNTV_CVAL</a>	n/a	n/a
1	1	1	RW	n/a	n/a	n/a

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state](#) on page G1-4344 for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64](#) on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If [CNTHCTL\\_EL2.EL0VTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL2.

## G6.5.8 CNTHV\_TVAL, Counter-timer Virtual Timer TimerValue register (EL2)

The CNTHV\_TVAL characteristics are:

### Purpose

Provides AArch32 access to the timer value for the EL2 virtual timer.

### Note

The EL2 virtual timer is implemented by [ARMv8.1-VHE](#). It is only accessible from AArch32 state when EL0 is using AArch32, EL2 is using AArch64, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTHV\_TVAL is architecturally mapped to AArch64 System register [CNTHV\\_TVAL\\_EL2](#).

This register is introduced in ARMv8.1.

### Attributes

CNTHV\_TVAL is a 32-bit register.

### Field descriptions

The CNTHV\_TVAL bit assignments are:

### TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHV\\_CTL](#).ENABLE is 0, the value returned is UNKNOWN.
- If [CNTHV\\_CTL](#).ENABLE is 1, the value returned is ([CNTHV\\_CVAL](#) - [CNTVCT](#)).

On a write of this register, [CNTHV\\_CVAL](#) is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHV\\_CTL](#).ENABLE is 1, the timer condition is met when ([CNTVCT](#) - [CNTHV\\_CVAL](#)) is greater than zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV\\_CTL](#).ISTATUS is set to 1.
- If [CNTV\\_CTL](#).IMASK is 0, an interrupt is generated.

When [CNTV\\_CTL](#).ENABLE is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

### Accessing the CNTHV\_TVAL

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c3, 0	000	000	1110	1111	0011

This register is accessed using the encoding for [CNTV\\_TVAL](#).

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	<a href="#">CNTV_TVAL</a>	<a href="#">CNTV_TVAL</a>	n/a	<a href="#">CNTV_TVAL</a>
0	0	1	<a href="#">CNTV_TVAL</a>	<a href="#">CNTV_TVAL</a>	<a href="#">CNTV_TVAL</a>	<a href="#">CNTV_TVAL</a>
0	1	1	<a href="#">CNTV_TVAL</a>	n/a	<a href="#">CNTV_TVAL</a>	<a href="#">CNTV_TVAL</a>
1	0	1	<a href="#">CNTV_TVAL</a>	<a href="#">CNTV_TVAL</a>	n/a	n/a
1	1	1	RW	n/a	n/a	n/a

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If [CNTHCTL\\_EL2.EL0VTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL2.

## G6.5.9 CNTKCTL, Counter-timer Kernel Control register

The CNTKCTL characteristics are:

### Purpose

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTKCTL is architecturally mapped to AArch64 System register [CNTKCTL\\_EL1](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTKCTL is a 32-bit register.

### Field descriptions

The CNTKCTL bit assignments are:

### Bits [31:10]

Reserved, RES0.

### PL0PTEN, bit [9]

Traps PL0 accesses to the physical timer registers to Undefined mode.

- 0 PL0 accesses to the [CNTP\\_CTL](#), [CNTP\\_CVAL](#), and [CNTP\\_TVAL](#) registers are trapped to Undefined mode.
- 1 This control does not cause any instructions to be trapped.

### PL0VTEN, bit [8]

Traps PL0 accesses to the virtual timer registers to Undefined mode.

- 0 PL0 accesses to the [CNTV\\_CTL](#), [CNTV\\_CVAL](#), and [CNTV\\_TVAL](#) registers are trapped to Undefined mode.
- 1 This control does not cause any instructions to be trapped.

### EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register [CNTVCT](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

### EVNTDIR, bit [3]

Controls which transition of the counter register **CNTVCT** trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

- 0 A 0 to 1 transition of the trigger bit triggers an event.
- 1 A 1 to 0 transition of the trigger bit triggers an event.

### EVNTEN, bit [2]

Enables the generation of an event stream from the counter register **CNTVCT**:

- 0 Disables the event stream.
- 1 Enables the event stream.

### PL0VCTEN, bit [1]

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

- 0 PL0 accesses to the **CNTVCT** are trapped to Undefined mode.  
PL0 accesses to the **CNTFRQ** register are trapped to Undefined mode, if **CNTKCTL.PL0PCTEN** is also 0.
- 1 This control does not cause any instructions to be trapped.

### PL0PCTEN, bit [0]

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

- 0 PL0 accesses to the **CNTPCT** are trapped to Undefined mode.  
PL0 accesses to the **CNTFRQ** register are trapped to Undefined mode, if **CNTKCTL.PL0VCTEN** is also 0.
- 1 This control does not cause any instructions to be trapped.

## Accessing the CNTKCTL

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c1, 0	000	000	1110	1111	0001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

### G6.5.10 CNTP\_CTL, Counter-timer Physical Timer Control register

The CNTP\_CTL characteristics are:

## Purpose

Control register for the EL1 physical timer.

## Configurations

AArch32 System register CNTP\_CTL is architecturally mapped to AArch64 System register CNTP\_CTL\_EL0.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 they apply only to the Secure instance of the register. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

## Attributes

CNTP\_CTL is a 32-bit register.

## Field descriptions

The CNTP\_CTL bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

0 Timer condition is not met.

1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see *Operation of the CompareValue views of the timers* on page D6-2187 and *Operation of the TimerValue views of the timers* on page D6-2188.

This bit is read-only.

This field resets to a value that is architecturally UNKNOWN.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

0 Timer interrupt is not masked by the IMASK bit.

1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to a value that is architecturally UNKNOWN.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0 Timer disabled.
- 1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP\\_TVAL](#) continues to count down.

#### ————— Note —————

Disabling the output signal might be a power-saving option.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the CNTP\_CTL

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c2, 1	000	001	1110	1111	0010

### Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	RW	RW	n/a	n/a	CNTP_CTL
EL3 is not implemented.	0	0	1	RW	RW	RW	n/a	CNTP_CTL
EL3 is not implemented.	0	1	1	RW	n/a	RW	n/a	CNTP_CTL
EL3 is not implemented.	1	0	1	RW	RW	n/a	n/a	CNTP_CTL
EL3 is not implemented.	1	1	1	<a href="#">CNTHP_CTL</a>	n/a	n/a	n/a	-
EL3 is using AArch64.	x	x	0	RW	RW	n/a	n/a	CNTP_CTL
EL3 is using AArch64.	0	0	1	RW	RW	RW	n/a	CNTP_CTL
EL3 is using AArch64.	0	1	1	RW	n/a	RW	n/a	CNTP_CTL
EL3 is using AArch64.	1	0	1	RW	RW	n/a	n/a	CNTP_CTL
EL3 is using AArch64.	1	1	1	<a href="#">CNTHP_CTL</a>	n/a	n/a	n/a	-

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	RW	n/a	n/a	RW	CNTP_CTL_s
EL3 is using AArch32.	x	0	1	RW	RW	RW	RW	CNTP_CTL_ns
EL3 is using AArch32.	x	1	1	RW	n/a	RW	RW	CNTP_CTL_ns

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} = 0$ :
  - If  $\text{CNTKCTL\_EL1.EL0PTEN} = 0$ , accesses to this register from EL0 are trapped to EL1.
  - If  $\text{CNTKCTL.PL0PTEN} = 0$ , accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 0)$ :
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 0$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 0$ , and  $\text{CNTKCTL\_EL1.EL0PTEN} = 1$ , Non-secure accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If  $\text{CNTHCTL\_EL2.EL1PTEN} = 0$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CNTHCTL\_EL2.EL1PTEN} = 0$ , and  $\text{CNTKCTL\_EL1.EL0PTEN} = 1$ , Non-secure accesses to this register from EL0 are trapped to EL2.
  - If  $\text{CNTKCTL\_EL1.EL0PTEN} = 0$ , Non-secure accesses to this register from EL0 are trapped to EL1.
  - If  $\text{CNTKCTL.PL0PTEN} = 0$ , Non-secure accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 1)$ :
  - If  $\text{CNTHCTL\_EL2.EL0PTEN} = 0$ , Non-secure accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} = 1$ :
  - If  $\text{CNTHCTL.PL1PCEN} = 0$ , Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.

### G6.5.11 CNTP\_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP\_CVAL characteristics are:

## Purpose

Holds the compare value for the EL1 physical timer.

## Configurations

AArch32 System register CNTP\_CVAL is architecturally mapped to AArch64 System register CNTP\_CVAL\_EL0.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTP\_CVAL is a 64-bit register.

## Field descriptions

The CNTP\_CVAL bit assignments are:

**CompareValue, bits [63:0]**

Holds the EL1 physical timer CompareValue.

When `CNTP_CTL.ENABLE` is 1, the timer condition is met when  $(\text{CNTPCT} - \text{CompareValue})$  is greater than zero. This means that `CompareValue` acts like a 64-bit upcounter timer. When the timer condition is met:

- `CNTP_CTL`.ISTATUS is set to 1.
- If `CNTP_CTL`.IMASK is 0, an interrupt is generated.

When **CNTP\_CTL.ENABLE** is 0, the timer condition is not met, but **CNTPCT** continues to count.

## Accessing the CNTP\_CVAL

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 2, <Rt>, <Rt2>, c14	0010	1111	1110

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is using AArch32.	x	x	0	RW	n/a	n/a	RW	CNTP_CVAL_s
EL3 is using AArch32.	x	0	1	RW	RW	RW	RW	CNTP_CVAL_ns
EL3 is using AArch32.	x	1	1	RW	n/a	RW	RW	CNTP_CVAL_ns
EL3 is not implemented.	x	x	0	RW	RW	n/a	n/a	CNTP_CVAL
EL3 is not implemented.	0	0	1	RW	RW	RW	n/a	CNTP_CVAL

EL3 is using AArch64.	x	x	0	RW	RW	n/a	n/a	CNTP_CVAL
EL3 is using AArch64.	0	0	1	RW	RW	RW	n/a	CNTP_CVAL
EL3 is using AArch64.	0	1	1	RW	n/a	RW	n/a	CNTP_CVAL
EL3 is using AArch64.	1	0	1	RW	RW	n/a	n/a	CNTP_CVAL
EL3 is using AArch64.	1	1	1	CNTHP_CVAL	n/a	n/a	n/a	-

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When  $HCR\_EL2.E2H == 0$ :
  - If  $CNTHCTL\_EL1.EL0PTEN == 0$ , accesses to this register from EL0 are trapped to EL1.
  - If  $CNTHCTL.PL0PTEN == 0$ , accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 0)$ :
  - If  $CNTHCTL\_EL2.EL1PCEN == 0$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $CNTHCTL\_EL2.EL1PCEN == 0$ , and  $CNTHCTL\_EL1.EL0PTEN == 1$ , Non-secure accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(SCR\_EL3.NS == 1) \&\& (HCR\_EL2.E2H == 1) \&\& (HCR\_EL2.TGE == 0)$ :
  - If  $CNTHCTL\_EL2.EL1PTEN == 0$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $CNTHCTL\_EL2.EL1PTEN == 0$ , and  $CNTHCTL\_EL1.EL0PTEN == 1$ , Non-secure accesses to this register from EL0 are trapped to EL2.
  - If  $CNTHCTL\_EL1.EL0PTEN == 0$ , Non-secure accesses to this register from EL0 are trapped to EL1.
  - If  $CNTHCTL.PL0PTEN == 0$ , Non-secure accesses to this register from EL0 are trapped to Undefined mode.

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If CNTHCTL\_EL2.EL0PTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If CNTHCTL.PL1PCEN==0, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.

## G6.5.12 CNTP\_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP\_TVAL characteristics are:

### Purpose

Holds the timer value for the EL1 physical timer.

### Configurations

AArch32 System register CNTP\_TVAL is architecturally mapped to AArch64 System register [CNTP\\_TVAL\\_ELO](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTP\_TVAL is a 32-bit register.

### Field descriptions

The CNTP\_TVAL bit assignments are:

### TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP\\_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP\\_CTL.ENABLE](#) is 1, the value returned is ([CNTP\\_CVAL](#) - [CNTPCT](#)).

On a write of this register, [CNTP\\_CVAL](#) is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - [CNTP\\_CVAL](#)) is greater than zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP\\_CTL.ISTATUS](#) is set to 1.
- If [CNTP\\_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

### Accessing the CNTP\_TVAL

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c2, 0	000	000	1110	1111	0010

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility				Instance
	E2H	TGE	NS	EL0	EL1	EL2	EL3	
EL3 is not implemented.	x	x	0	RW	RW	n/a	n/a	CNTP_TVAL
EL3 is not implemented.	0	0	1	RW	RW	RW	n/a	CNTP_TVAL

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} = 0$ :
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 0$ , accesses to this register from EL0 are trapped to EL1.
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 0$ , accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 0)$ :
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 0$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 0$ , and  $\text{CNTHCTL\_EL2.EL1PCEN} = 1$ , Non-secure accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 0$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 0$ , and  $\text{CNTHCTL\_EL2.EL1PCEN} = 1$ , Non-secure accesses to this register from EL0 are trapped to EL2.
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 1$ , Non-secure accesses to this register from EL0 are trapped to EL1.
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 1$ , Non-secure accesses to this register from EL0 are trapped to Undefined mode.

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If CNTHCTL\_EL2.EL0PTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and SCR\_EL3.NS == 1:
  - If CNTHCTL.PL1PCEN==0, Non-secure accesses to this register from EL0 and EL1 are trapped to Hyp mode.

### G6.5.13 CNTPCT, Counter-timer Physical Count register

The CNTPCT characteristics are:

#### Purpose

Holds the 64-bit physical count value.

#### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTPCT is architecturally mapped to AArch64 System register [CNTPCT\\_EL0](#).

#### Attributes

CNPCT is a 64-bit register.

#### Field descriptions

The CNTPCT bit assignments are:

#### Bits [63:0]

Physical count value.

#### Accessing the CNTPCT

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 0, <Rt>, <Rt2>, c14	0000	1111	1110

#### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch32 state* on page G1-4344 for exceptions taken to AArch32 state and *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827 for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} == 0$ :
  - If  $\text{CNTKCTL\_EL1.EL0PCTEN} == 0$ , read accesses to this register from EL0 are trapped to EL1.
  - If  $\text{CNTKCTL.PL0PCTEN} == 0$ , read accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 0)$ :
  - If  $\text{CNTHCTL\_EL2.EL1PCTEN} == 0$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CNTHCTL\_EL2.EL1PCTEN} == 0$ , and  $\text{CNTKCTL\_EL1.EL0PCTEN} == 1$ , Non-secure read accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 1) \ \&\& \ (\text{HCR\_EL2.TGE} == 0)$ :
  - If  $\text{CNTHCTL\_EL2.EL1PCTEN} == 0$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CNTHCTL\_EL2.EL1PCTEN} == 0$ , and  $\text{CNTKCTL\_EL1.EL0PCTEN} == 1$ , Non-secure read accesses to this register from EL0 are trapped to EL2.
  - If  $\text{CNTKCTL\_EL1.EL0PCTEN} == 0$ , Non-secure read accesses to this register from EL0 are trapped to EL1.
  - If  $\text{CNTKCTL.PL0PCTEN} == 0$ , Non-secure read accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 1) \ \&\& \ (\text{HCR\_EL2.TGE} == 1)$ :
  - If  $\text{CNTHCTL\_EL2.EL0PCTEN} == 0$ , Non-secure read accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch32 and  $\text{SCR\_EL3.NS} == 1$ :
  - If  $\text{CNTHCTL.PL1PCTEN} == 0$ , Non-secure read accesses to this register from EL0 and EL1 are trapped to Hyp mode.

## G6.5.14 CNTV\_CTL, Counter-timer Virtual Timer Control register

The CNTV\_CTL characteristics are:

### Purpose

Control register for the virtual timer.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTV\_CTL is architecturally mapped to AArch64 System register [CNTV\\_CTL\\_EL0](#).

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTV\_CTL is a 32-bit register.

### Field descriptions

The CNTV\_CTL bit assignments are:

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0 Timer condition is not met.
- 1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D6-2187](#) and [Operation of the TimerValue views of the timers on page D6-2188](#).

This bit is read-only.

This field resets to a value that is architecturally UNKNOWN.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0 Timer interrupt is not masked by the IMASK bit.
- 1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to a value that is architecturally UNKNOWN.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0 Timer disabled.
- 1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV\\_TVAL](#) continues to count down.

#### ———— Note ————

Disabling the output signal might be a power-saving option.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the CNTV\_CTL

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c3, 1	000	001	1110	1111	0011

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
0	0	1	RW	RW	RW	RW
0	1	1	RW	n/a	RW	RW
1	0	1	RW	RW	n/a	n/a
1	1	1	<a href="#">CNTHV_CTL</a>	n/a	n/a	n/a

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When HCR\_EL2.E2H == 0:
  - If [CNTKCTL\\_EL1.EL0VTEN](#)==0, accesses to this register from EL0 are trapped to EL1.
  - If [CNTKCTL.PL0VTEN](#)==0, accesses to this register from EL0 are trapped to Undefined mode.

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If CNTKCTL\_EL1.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL1.
  - If CNTKCTL.PL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If CNTHCTL\_EL2.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.

G6.5.15 CNTV\_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV\_CVAL characteristics are:

Purpose

Holds the compare value for the virtual timer.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.  
AArch32 System register CNTV\_CVAL is architecturally mapped to AArch64 System register [CNTV\\_CVAL\\_EL0](#).  
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

CNTV\_CVAL is a 64-bit register.

Field descriptions

The CNTV\_CVAL bit assignments are:

CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When [CNTV\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTV\\_CTL.ISTATUS](#) is set to 1.
- If [CNTV\\_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

Accessing the CNTV\_CVAL

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 3, <Rt>, <Rt2>, c14	0011	1111	1110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
0	0	1	RW	RW	RW	RW
0	1	1	RW	n/a	RW	RW
1	0	1	RW	RW	n/a	n/a
1	1	1	CNTHV_CVAL	n/a	n/a	n/a

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} = 0$ :
  - If  $\text{CNTKCTL\_EL1.EL0VTEN} = 0$ , accesses to this register from EL0 are trapped to EL1.
  - If  $\text{CNTKCTL.PL0VTEN} = 0$ , accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If  $\text{CNTKCTL\_EL1.EL0VTEN} = 0$ , Non-secure accesses to this register from EL0 are trapped to EL1.
  - If  $\text{CNTKCTL.PL0VTEN} = 0$ , Non-secure accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 1)$ :
  - If  $\text{CNTHCTL\_EL2.EL0VTEN} = 0$ , Non-secure accesses to this register from EL0 are trapped to EL2.

## G6.5.16 CNTV\_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV\_TVAL characteristics are:

### Purpose

Holds the timer value for the virtual timer.

### Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTV\_TVAL is architecturally mapped to AArch64 System register [CNTV\\_TVAL\\_ELO](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTV\_TVAL is a 32-bit register.

### Field descriptions

The CNTV\_TVAL bit assignments are:

#### TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If [CNTV\\_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV\\_CTL.ENABLE](#) is 1, the value returned is  $(\text{CNTV\_CVAL} - (\text{CNTPCT} - \text{CNTVOFF}))$ .

On a write of this register, [CNTV\\_CVAL](#) is set to  $(\text{CNTPCT} + \text{TimerValue})$ , where TimerValue is treated as a signed 32-bit integer.

When [CNTP\\_CTL.ENABLE](#) is 1, the timer condition is met when  $(\text{CNTPCT} - \text{CNTP\_CVAL})$  is greater than zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV\\_CTL.ISTATUS](#) is set to 1.
- If [CNTV\\_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

### Accessing the CNTV\_TVAL

This register can be read using MRC with the following syntax:

MRC <syntax>

This register can be written using MCR with the following syntax:

MCR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	opc2	CRn	coproc	CRm
p15, 0, <Rt>, c14, c3, 0	000	000	1110	1111	0011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
0	0	1	RW	RW	RW	RW
0	1	1	RW	n/a	RW	RW
1	0	1	RW	RW	n/a	n/a
1	1	1	CNTHV_TVAL	n/a	n/a	n/a

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When HCR\_EL2.E2H == 0:
  - If CNTHCTL\_EL1.EL0VTEN==0, accesses to this register from EL0 are trapped to EL1.
  - If CNTHCTL.PL0VTEN==0, accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If CNTHCTL\_EL1.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL1.
  - If CNTHCTL.PL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to Undefined mode.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If CNTHCTL\_EL2.EL0VTEN==0, Non-secure accesses to this register from EL0 are trapped to EL2.

G6.5.17 CNTVCT, Counter-timer Virtual Count register

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in CNTPCT minus the virtual offset visible in CNTVOFF.

Configurations

There is one instance of this register that is used in both Secure and Non-secure states.

AArch32 System register CNTVCT is architecturally mapped to AArch64 System register CNTVCT\_EL0.

The value of this register is the same as the value of CNTPCT in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented and is using AArch64, HCR\_EL2.{E2H, TGE} is {1, 1}, and this register is read from Non-secure EL0.

Attributes

CNTVCT is a 64-bit register.

Field descriptions

The CNTVCT bit assignments are:

Bits [63:0]

Virtual count value.

Accessing the CNTVCT

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 1, <Rt>, <Rt2>, c14	0001	1111	1110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-4344](#) for exceptions taken to AArch32 state and [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) for exceptions taken to AArch64 state. Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} = 0$ :
  - If  $\text{CNTKCTL.PL0VCTEN} = 0$ , read accesses to this register from EL0 are trapped to Undefined mode.
  - If  $\text{CNTKCTL\_EL1.EL0VCTEN} = 0$ , read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If  $\text{CNTKCTL.PL0VCTEN} = 0$ , Non-secure read accesses to this register from EL0 are trapped to Undefined mode.
  - If  $\text{CNTKCTL\_EL1.EL0VCTEN} = 0$ , Non-secure read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 1)$ :
  - If  $\text{CNTHCTL\_EL2.EL0PCTEN} = 0$ , Non-secure read accesses to this register from EL0 are trapped to EL2.

G6.5.18 CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in CNTPCT and the virtual count value visible in CNTVCT.

Configurations

AArch32 System register CNTVOFF is architecturally mapped to AArch64 System register CNTVOFF\_EL2.

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

———— Note ————

When EL2 is implemented and is using AArch64, if HCR\_EL2.{E2H, TGE} is {1, 1}, the virtual counter uses a fixed virtual offset of zero when CNTVCT is read from Non-secure EL0.

When EL2 is implemented and can use AArch32, on a reset into an Exception level that is using AArch32 this register resets to an IMPLEMENTATION DEFINED value that might be UNKNOWN.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

The CNTVOFF bit assignments are:

Bits [63:0]

Virtual offset.

Accessing the CNTVOFF

This register can be read using MRRC with the following syntax:

MRRC <syntax>

This register can be written using MCRR with the following syntax:

MCRR <syntax>

This syntax is encoded with the following settings in the instruction encoding:

<syntax>	opc1	coproc	CRm
p15, 4, <Rt>, <Rt2>, c14	0100	1111	1110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

# Part H

## External Debug

# Chapter H1

## About External Debug

This chapter gives an overview of ARMv8 external debug, and specifies the required debug authentication. It contains the following sections:

- [Introduction to external debug](#) on page H1-5430.
- [External debug](#) on page H1-5431.
- [Required debug authentication](#) on page H1-5432.

---

**Note**

For information about self-hosted debug, see [Chapter D2 AArch64 Self-hosted Debug](#) and [Chapter G2 AArch32 Self-hosted Debug](#).

---

## H1.1 Introduction to external debug

ARMv8 supports both:

### Self-hosted debug

The PE itself hosts a debugger. That is, developers developing software to run on the PE use debugger software running on the same PE.

### External debug

The debugger is external to the PE. The debugging might be either on-chip, for example in a second PE, or off-chip, for example a JTAG debugger. External debug is particularly useful for:

- Hardware bring-up. That is, debugging during development when a system is first powered up and not all of the software functionality is available.
- PEs that are deeply embedded inside systems.

To support external debug, the ARM architecture defines required features that are called *external debug features*.

### H1.1.1 Definition of a debugger in the context of external debug

When the description of external debug in this Part of the manual describes a *debugger* as controlling external debug this debugger might be a second on-chip PE or an off-chip device such as a JTAG debugger.

## H1.2 External debug

Debug events allow an external debugger to halt the PE. ARMv8 provides the following debug events:

- [Halting Step debug events on page H3-5476](#):
  - The debugger can use this resource to make the PE step through code one line at a time.
- [Halt Instruction debug event on page H3-5486](#):
  - This might occur when software executes the Halting breakpoint instruction, HLT.
- [Exception Catch debug event on page H3-5487](#):
  - This can be programmed to occur on all entries to a given Exception level.
- [External Debug Request debug event on page H3-5490](#):
  - An embedded cross-trigger can signal this debug event.
- [OS Unlock Catch debug event on page H3-5491](#):
  - This might occur when the state of the OS Lock changes from locked to unlocked.
- [Reset Catch debug events on page H3-5492](#):
  - This might occur when the PE exits reset state.
- [Software Access debug event on page H3-5493](#):
  - This can be programmed to occur when software tries to access the Breakpoint Value registers, the Breakpoint Control registers, the Watchpoint value registers, or the Watchpoint Control registers. It caused a trap to Debug state.

Breakpoints and watchpoints can also halt the PE.

When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state:
  - The ITR contains a single register, EDITR, and associated flow-control flags.
- The *Debug Communications Channel*, DCC, passes data between the PE and the debugger:
  - The DCC includes the data transfer registers, DTRRX and DTRTX, and associated flow-control flags.
  - Although the DCC is an essential part of Debug state operation, it can also be used in Non-debug state.
- The PE cannot service any interrupts in Debug state.

[Chapter H2 Debug State](#) describes Debug state in more detail.

## H1.3 Required debug authentication

Any implementation must provide the debug authentication defined in this section, that controls:

- Whether the PE can halt.
- Whether non-invasive debug is permitted.
- Some legacy aspects of the AArch32 self-hosted debug model.

The pseudocode functions shown in [Table H1-1](#), and the conditions that follow that table, define the architectural requirements for debug authentication.

**Table H1-1 Debug authentication functions**

Pseudocode function	Description
<a href="#">ExternalSecureNoninvasiveDebugEnabled()</a>	Returns TRUE if Secure non-invasive debug is enabled.
<a href="#">AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()</a>	Returns TRUE if Secure invasive self-hosted debug is enabled in AArch32 state.
<a href="#">ExternalSecureInvasiveDebugEnabled()</a>	Returns TRUE if Secure invasive debug is enabled.
<a href="#">ExternalNoninvasiveDebugEnabled()</a>	Returns TRUE if Non-secure non-invasive debug is enabled.
<a href="#">ExternalInvasiveDebugEnabled()</a>	Returns TRUE if Non-secure invasive debug is enabled.

The following conditions always apply:

- if [ExternalInvasiveDebugEnabled\(\)](#) is FALSE then [ExternalSecureInvasiveDebugEnabled\(\)](#) is FALSE.
- if [ExternalNoninvasiveDebugEnabled\(\)](#) is FALSE then [ExternalSecureNoninvasiveDebugEnabled\(\)](#) is FALSE.
- if [ExternalInvasiveDebugEnabled\(\)](#) is TRUE then [ExternalNoninvasiveDebugEnabled\(\)](#) is TRUE.
- if [ExternalSecureInvasiveDebugEnabled\(\)](#) is TRUE then [ExternalSecureNoninvasiveDebugEnabled\(\)](#) is TRUE.

ARM recommends the use of the interface described in [Recommended authentication interface on page K2-6140](#) to provide this debug authentication. The pseudocode functions in [Chapter J1 ARMv8 Pseudocode](#), that are linked to by the entries in the [Pseudocode function](#) column of [Table H1-1](#), assume that this interface is implemented.

# Chapter H2

## Debug State

This chapter describes Debug state. It contains the following sections:

- [About Debug state on page H2-5434.](#)
- [Halting the PE on debug events on page H2-5435.](#)
- [Entering Debug state on page H2-5442.](#)
- [Behavior in Debug state on page H2-5445.](#)
- [Exiting Debug state on page H2-5471.](#)

---

**Note**

[Table K11-1 on page K11-6282](#) disambiguates the general register references used in this chapter.

---

## H2.1 About Debug state

In external debug, debug events allow an external debugger to halt the PE. The PE then enters Debug state. When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state.
- The *Debug Communications Channel*, DCC, passes data between the PE and the debugger.

The PE cannot service any interrupts in Debug state.

## H2.2 Halting the PE on debug events

For details of debug events, see [Introduction to Halting debug events on page H3-5474](#) and [Breakpoint and Watchpoint debug events on page H2-5436](#).

On a debug event, the PE must do one of the following:

- Enter Debug state.
- Pend the debug event.
- Generate a debug exception.
- Ignore the debug event.

This behavior depends on both:

- Whether halting is allowed by the current state of the debug authentication interface. See [Halting allowed and halting prohibited](#).
- The type of debug event and the programming of the debug control registers.
  - See [Halting debug events](#) for all Halting debug events.
  - See [Breakpoint and Watchpoint debug events on page H2-5436](#) for Breakpoint and Watchpoint debug events.

See also [Other debug exceptions on page H2-5437](#).

This means that behavior can be CONSTRAINED UNPREDICTABLE if the conditions change. See [Synchronization and Halting debug events on page H3-5494](#).

[Summary of debug events and possible outcomes on page H3-5474](#) summarizes the possible outcomes of each type of debug event.

### H2.2.1 Halting allowed and halting prohibited

Halting can be either allowed or prohibited:

- Halting is always prohibited in Debug state.
- Halting is always prohibited when `DoubleLockStatus() == TRUE`.
  - This means that OS Double Lock is locked.
- Halting is also controlled by the IMPLEMENTATION DEFINED authentication interface, and is prohibited when either:
  - The PE is in Non-secure state and `ExternalInvasiveDebugEnabled() == FALSE`.
  - The PE is in Secure state and `ExternalSecureInvasiveDebugEnabled() == FALSE`.

———— **Note** ————

See [Appendix K2 Recommended External Debug Interface](#) for more information on these functions.

- Otherwise, halting is allowed.

See

- [Pseudocode description of Halting on debug events on page H2-5441](#)
- [Required debug authentication on page H1-5432](#).

### H2.2.2 Halting debug events

The Halting debug events are described in [Chapter H3 Halting Debug Events](#).

When a Halting debug event is generated, it causes entry to Debug state if all of:

- Halting is allowed. See [Halting allowed and halting prohibited on page H2-5435](#).
- The Halting debug event is one of:
  - A Halt Instruction debug event and `EDSCR.HDE == 1`.
  - A Software Access debug event and `OSLSR_EL1.OSLK == 0`, meaning that the OS Lock is unlocked.
  - Neither a Halt Instruction debug event nor a Software Access debug event.

---

**Note**

- A Halt Instruction debug event is the only Halting debug event that relies on `EDSCR.HDE == 1`.
  - Halting on Breakpoint and Watchpoint debug events is also controlled by `EDSCR.HDE`. See [Breakpoint and Watchpoint debug events](#).
  - `EDSCR.HDE` can be written by software when the OS Lock is locked. Privileged code can use `SDCR.TDOSA` and `HDCR.TDOSA` to trap writes to these registers.
- 

If a Halting debug event does not generate entry to Debug state because the conditions listed in this section do not hold, then:

- If the Halting debug event is a Halt Instruction debug event, the instruction that generated the Halting debug event is treated as UNDEFINED.
- If the Halting debug event is an Exception Catch debug event or a Software Access debug event, it is ignored.

In all other cases the Halting debug event is pended, see [Pending Halting debug events on page H3-5494](#).

[Summary of actions from debug events on page H2-5439](#) summarizes the possible outcome for each type of Debug event.

---

**Note**

Halting debug events never generate debug exceptions.

---

### H2.2.3 Breakpoint and Watchpoint debug events

A breakpoint or watchpoint generates an entry to Debug state if all of the following conditions hold:

- Halting debug is enabled, that is `EDSCR.HDE == 1`.
- Halting is allowed. See [Halting allowed and halting prohibited on page H2-5435](#).
- The OS Lock is unlocked, that is `OSLSR.OSLK == 0`.

The Address Mismatch breakpoint type is reserved when all of these conditions are met.

`MDSCR_EL1.MDE` or `DBGDSCRext.MDBGn` is ignored when determining whether to enter Debug state. A breakpoint or watchpoint that generates entry to Debug state is a Breakpoint or Watchpoint debug event and does not generate a debug exception.

A breakpoint or watchpoint that does not generate an entry to Debug state either:

- Generates a Breakpoint or Watchpoint exception.
- Is ignored.

---

**Note**

`EDSCR.HDE` is ignored when determining whether to generate a debug exception. The debug exception is suppressed only if the PE enters Debug state. This means that the use of Halting debug mode in Non-secure state does not affect the Exception model in Secure state.

---

See [Chapter D2 AArch64 Self-hosted Debug](#), [Chapter G2 AArch32 Self-hosted Debug](#), and the Note in [Other debug exceptions on page H2-5437](#).

## H2.2.4 Other debug exceptions

The following events never generate entry to Debug state:

- Breakpoint Instruction exceptions.
- Software Step exceptions.
- Vector Catch exceptions.

The behavior of these events is unchanged when Halting debug mode is enabled, that is when `EDSCR.HDE == 1`. This means that these events can do one of the following:

- They can generate a debug exception.
- They can be ignored.

For additional information, see [Chapter D2 AArch64 Self-hosted Debug](#) and [Chapter G2 AArch32 Self-hosted Debug](#).

## H2.2.5 Debug state entry and debug event prioritization

The following are synchronous debug events:

- Breakpoint debug event.
- Watchpoint debug event.
- Halting Step debug event.
- Halt Instruction debug event.
- Exception Catch debug event.
- Software Access debug event.
- Reset Catch debug event.

Each of these synchronous debug events are treated as a synchronous exception generated by an instruction, or by the taking of an exception or reset. That is, if halting is allowed, the synchronous debug event must be taken before any subsequent instructions are executed. Reset Catch debug events must be taken before the PE executes the instruction at the reset vector.

### ———— Note ————

- Reset Catch and Exception Catch debug events might be generated asynchronously, because they can result from an asynchronous exception. However, if halting is allowed after the reset or asynchronous exception has been processed, the Reset Catch or Exception Catch debug event is taken synchronously.
- The Halting Step debug event is generated by the instruction after the stepped instruction. Therefore, if the stepped instruction generates any other synchronous exceptions or debug events these are taken first.

If halting is prohibited then Halting Step debug events and Reset Catch debug events might be pended and taken asynchronously. OS Unlock Catch debug events are always pended and taken asynchronously. See [Pending Halting debug events on page H3-5494](#).

The architecture does not define when asynchronous debug events are taken, and therefore the prioritization of asynchronous debug events is IMPLEMENTATION DEFINED. See [Synchronization and Halting debug events on page H3-5494](#).

The following list shows how the synchronous debug events are prioritized, with -2 being the highest priority.

### ———— Note ————

The priority numbering is the same as the numbering for AArch64 synchronous exception priorities listed in [Synchronous exception types, routing and priorities on page D1-1826](#), and in particular [Prioritization and recognition of interrupts on page D1-1841](#). The Debug events in this section with a negative priority are a higher priority than any synchronous exception. The debug events with fractional priorities have a priority between two or more exceptions. This numbering has no global significance and, for example, does not correlate with the equivalent AArch32 list in [Exception prioritization for exceptions taken to AArch32 state on page G1-4344](#).

The priority for synchronous debug events is as follows:

- 2        Reset Catch debug event. See [Reset Catch debug events on page H3-5492](#).  
This debug event has a higher priority than the synchronous exceptions listed in [Synchronous exception types, routing and priorities on page D1-1826](#).
- 1        Exception Catch debug event. See [Exception Catch debug event on page H3-5487](#).  
This debug event can be assigned one of two priorities. When it has a priority of -1, it has a higher priority than the synchronous exceptions listed in the Exception model. See [Exception Catch debug event on page H3-5487](#).
- 0        Halting Step debug event. See [Halting Step debug events on page H3-5476](#).  
This debug event has a higher priority than the synchronous exceptions listed in the Exception model.
- 1        Software Step debug event. See [Software Step exceptions on page D2-1956](#).
- 1.5      Exception Catch debug event. See [Exception Catch debug event on page H3-5487](#).  
This debug event can be assigned one of two priorities, -1 or 1.5. See [Exception Catch debug event on page H3-5487](#).
- 2 - 3    These events are not debug events.
- 4        Breakpoint exception or debug event or Address Matching Vector Catch exception. See [Breakpoint exceptions on page D2-1921](#), and [Vector Catch exceptions on page G2-4510](#).  
These two debug events have the same priority.
- 5 - 13   These events are not debug events.
- 14      Halt Instruction debug event. See [Halt Instruction debug event on page H3-5486](#).
- 15 - 19   These events are not debug events.
- 19.5    Software Access debug event. See [Software Access debug event on page H3-5493](#).
- 20 - 21   These events are not debug events.
- 22      Watchpoint exception or debug event. See [Watchpoint exceptions on page D2-1940](#) for exceptions taken from AArch64 state, or [Watchpoint exceptions on page G2-4496](#) for exceptions taken from AArch32 state.
- 23      This event is not a debug event.

For Reset Catch debug events and Halting Step debug events the priorities listed in this section only apply when halting is allowed at the time the event is generated. This means that the event is taken synchronously and not pended.

For more information on the prioritization of exceptions see:

- [Synchronous exception types, routing and priorities on page D1-1826](#).
- [Prioritization and recognition of interrupts on page D1-1841](#).
- [Exception prioritization for exceptions taken to AArch32 state on page G1-4344](#).
- This section covers synchronous and asynchronous exceptions.

## Breakpoint debug events and Vector Catch exception

An Address Matching Vector Catch exception has the same priority as a Breakpoint debug event. See [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#).

The prioritization of these events is unchanged even if the breakpoint generates entry to Debug state instead of a Breakpoint exception. This means that if a single instruction generates both an Address Matching Vector Catch exception and a Breakpoint debug event, there is a CONSTRAINED UNPREDICTABLE choice of:

- The PE entering Debug state due to the Breakpoint debug event.
- A Vector Catch exception.

This only applies if all of the following are true:

- Halting debug is enabled.
- Halting is allowed.
- The OS Lock is unlocked.

An Exception Trapping Vector Catch exception must be generated immediately following the exception that generated it. This means that it does not appear in the priority table.

## H2.2.6 Imprecise entry to Debug state

Entry to Debug state is normally precise, meaning that the PE cannot enter Debug state if it can neither complete nor abandon all currently executing instructions and leave the PE in a precise state.

A debugger can write a value of 1 to [EDRCCR.CBRRQ](#) to allow imprecise entry to Debug state. An External Debug Request debug event must be pending before writing 1 to this bit. Support for this feature is OPTIONAL and it is IMPLEMENTATION DEFINED when it is effective at forcing entry to Debug state.

The PE ignores writes to this bit if either:

- External debugging is not enabled, meaning `ExternalInvasiveDebugEnabled() == FALSE`.
- Secure external debugging is not enabled, meaning `ExternalSecureInvasiveDebugEnabled() == FALSE`, and either:
  - EL3 is not implemented and the implemented Security state is Secure state.
  - EL3 is implemented.

[Example H2-1](#) shows how entry to Debug state can be forced.

### Example H2-1 Forcing entry to Debug state

The debugger pends an External Debug Request debug event through the CTI to halt a program that has stopped responding. However, the memory system is not responding and a memory access instruction cannot complete. This means that Debug state cannot be entered precisely. The debugger writes a value of 1 to [EDRCCR.CBRRQ](#). The PE cancels all outstanding memory accesses and enters Debug state. As some instructions might not have completed correctly, entry to Debug state is imprecise.

When Debug state is entered imprecisely, all memory access instructions executed through the ITR have UNPREDICTABLE behavior. The value of all registers is UNKNOWN, but might be useful for diagnostic purposes.

## H2.2.7 Summary of actions from debug events

[Table H2-1](#) shows the Software and Halting debug events. In [Table H2-1](#) the columns have the following meaning:

### Debug event type

This means the type of debug event where:

#### Other software

Means one of:

- [Software Step exceptions on page D2-1956](#).

- [Breakpoint Instruction exceptions](#) on page D2-1919.
- [Vector Catch exceptions](#) on page D2-1955 for AArch64 state or [Vector Catch exceptions](#) on page G2-4510 for AArch32 state.

#### Other Halting

Means one of the following:

- [Halting Step debug events](#) on page H3-5476.
- [External Debug Request debug event](#) on page H3-5490.
- [Reset Catch debug events](#) on page H3-5492.
- [OS Unlock Catch debug event](#) on page H3-5491.

Other debug events are referred to explicitly.

#### Authentication

This means halting is allowed by the IMPLEMENTATION DEFINED external authentication interface. It is the result of one of the following pseudocode functions:

**In Secure state** ExternalSecureInvasiveDebugEnabled().

**In Non-secure state** ExternalInvasiveDebugEnabled().

**DLK** This indicates whether the OS Double Lock is locked, DoubleLockStatus() == TRUE.

**OSLK** This is the value of OSLSR.OSLK. It indicates whether the OS Lock is locked.

**HDE** This is the value of EDSCR.HDE. It indicates whether Halting debug is enabled.

The letter X in [Table H2-1](#) indicates that the value can be either 0 or 1.

**Table H2-1 Debug authentication for external debug**

Debug event type	Authentication	DLK	OSLK	HDE	Behavior
Other software	X	X	X	X	Handled by the Exception model
Breakpoint or Watchpoint debug event	X	TRUE	X	X	Handled by the Exception model (ignored)
	X	FALSE	1	X	Handled by the Exception model (ignored)
	FALSE	FALSE	0	X	Handled by the Exception model
	TRUE	FALSE	0	0	Handled by the Exception model
	TRUE	FALSE	0	1	Entry to Debug state
Halt Instruction debug event	FALSE	X	X	X	UNDEFINED
	TRUE	TRUE	X	X	UNDEFINED
	TRUE	FALSE	X	0	UNDEFINED
	TRUE	FALSE	X	1	Entry to Debug state
Exception Catch debug event	FALSE	X	X	X	Ignored
	TRUE	TRUE	X	X	Ignored
	TRUE	FALSE	X	X	Entry to Debug state
Software Access debug event	FALSE	X	X	X	Ignored
	TRUE	TRUE	X	X	Ignored
	TRUE	FALSE	1	X	Ignored
	TRUE	FALSE	0	X	Entry to Debug state

Table H2-1 Debug authentication for external debug (continued)

Debug event type	Authentication	DLK	OSLK	HDE	Behavior
Other Halting	FALSE	X	X	X	Debug event is pended
	TRUE	TRUE	X	X	Debug event is pended
	TRUE	FALSE	X	X	Entry to Debug state

## H2.2.8 Pseudocode description of Halting on debug events

The `Halted()`, `Restarting()`, `HaltingAllowed()`, and `HaltOnBreakpointOrWatchpoint()` functions are described in the ARMv8 pseudocode.

## H2.3 Entering Debug state

On entry to Debug state, the preferred restart address and **PSTATE** are saved in **DLR** and **DSPSR**. The PE remains in the mode and security state from which it entered Debug state.

If **EDRCR.CBRRQ** has a value of 0, entry to Debug state is precise. If **EDRCR.CBRRQ** has a value of 1, then imprecise entry to Debug state is permitted.

If a Watchpoint debug event causes an entry to Debug state, the address of the access that generated the Watchpoint debug event is recorded in **EDWAR**.

See:

- [Determining the memory location that caused a Watchpoint exception on page D2-1948](#) for a debug event taken from AArch64 state.
- [Determining the memory location that caused a Watchpoint exception on page G2-4504](#) for a debug event taken from AArch32 state.

Other than the effect on **PSTATE** and **EDSCR**, entry to Debug state is not a *Context synchronization event*. The effects of entry to Debug state on **PSTATE** and **EDSCR** are synchronized.

### H2.3.1 Entering Debug state from AArch32 state

When entering Debug state from AArch32 state, the PE remains in AArch32 state. In AArch32 Debug state the PE executes T32 instructions, regardless of the value of **PSTATE.T** before entering Debug state.

To allow the debugger to determine the state of the PE, the current Execution state for all four Exception levels can be read from **EDSCR.RW**, and the current Exception level can be read from **EDSCR.EL**.

The current endianness state, **PSTATE.E**, is unchanged on entry to Debug state.

#### ————— Note —————

- If EL1 is using AArch32 state, the current endianness state can differ from that indicated by **SCTLR.EE**.
- If EL2 is using AArch32 state, the current endianness state can differ from that indicated by **HSCTLR.EE**.
- On entry to Debug state from AArch32 state, **PSTATE.SS** is copied to **DSPSR.SS**, even though the PE remains in AArch32 state.

See also [Effect of entering Debug state on PSTATE on page H2-5443](#).

### H2.3.2 Effect of Debug state entry on DLR and DSPSR

**DLR** is set to the preferred restart address for the debug event, that depends on the event type. The value of **PSTATE** is saved in **DSPSR**. For entry to Debug state from AArch32 state, the values saved in **DSPSR.IT** are always correct for the preferred restart address.

For synchronous Halting debug events, the preferred restart address is the address of the instruction that generated the debug event.

For asynchronous Halting debug events, including pending Halting debug events taken asynchronously, the preferred restart address is the address of the first instruction that must be executed on exit from Debug state.

This means that:

- For Breakpoint and Watchpoint debug events, the preferred restart address is the same as the preferred return address for a debug exception, as described in [Chapter D2 AArch64 Self-hosted Debug](#) and [Chapter G2 AArch32 Self-hosted Debug](#).
- For Halt Instruction debug events **DLR** is set to the address of the HLT instruction and **DSPSR.IT** is correct for the HLT instruction.

- For Software Access debug events, **DLR** is set to the address of the accessing instruction and **DSPSR.IT** is correct for this instruction.
  - For Halting Step debug events taken synchronously, **DLR** and **DSPSR** are set as the ELR and SPSPR would be set for a Software Step exception. This is usually the address of, and **PSTATE** for, the instruction after the one that was stepped.
  - For Exception Catch debug events:
    - If the debug event is generated on taking an exception to a trapped Exception level, the **DLR** is set to the address of the exception vector the PE would have started fetching from. This is UNKNOWN if the **VBAR** for the Exception level has never been initialized. The **DSPSR** records the value of **PSTATE** after taking the exception. The Exception Catch occurs after the **SPSR** and the Link register are set, and the debugger can use these registers to determine where in the application program the exception occurred.
- **Note** ————
- Depending on the target Exception level and Execution state for the exception, the Link register is one of **ELR\_EL1**, **ELR\_EL2**, **ELR\_EL3**, **ELR\_hyp**, or LR (R14).
- If the debug event is generated on an exception return to a trapped Exception level, the **DLR** is set to the target address of the exception return and the **DSPSR** records the value of **PSTATE** after the exception return.
  - Reset Catch debug events taken synchronously behave like Exception Catch debug events.
  - For Reset Catch debug events and Exception Catch debug events generated on reset to a trapped Exception level, the **DLR** is set to is set to the reset address and the **DSPSR** records the reset value of **PSTATE**.
  - For pending Halting debug events and External Debug Request debug events, **DLR** is set to the address of the first instruction that must be executed on exit from Debug state and **DSPSR.IT** is correct for this instruction. See *Pending Halting debug events on page H3-5494*.

Normally **DLR** is aligned according to the instruction set state indicated in **DSPSR**. However, a debug event might be taken at a point where the PC is not aligned.

### H2.3.3 Effect of Debug state entry on System registers, the Event register, and Exclusives monitors

Entering Debug state has no effect on System registers other than **DLR** and **DSPSR**. In particular, ESRs, FARs, and FSRs are not updated on entering Debug state. **SCR** is unchanged, even when entering Debug state from EL3.

Entering Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors.

#### ———— **Note** ————

Entry to Debug state might set the Event Register or clear the Exclusives monitors, or both. However, this is not a requirement, and debuggers must not rely on any implementation specific behavior.

Unless otherwise described in this reference manual, instructions executed in Debug state have their architecturally-defined effects on the System registers, the Event register, and Exclusives monitors.

### H2.3.4 Effect of entering Debug state on PSTATE

The effect of an entry to Debug state on **PSTATE** is described in *Entering Debug state on page H2-5442* and *Entering Debug state from AArch32 state on page H2-5442*.

**PSTATE**.{E, M, nRW, EL, SP} are unchanged on entry to Debug state.

**PSTATE.IL** is cleared to 0 on entry to Debug state, after being saved in **DSPSR\_EL0**.

**PSTATE.PAN** is saved in **DSPSR\_EL0.PAN**.

**PSTATE.UAO** is saved in **DSPSR\_EL0.UAO**.

The other [PSTATE](#) fields are ignored and not observable in Debug state:

- [PSTATE](#).{N, Z, C, V, Q, GE} are unchanged.
- [PSTATE](#).{IT, T, SS, D, A, I, F} are set to UNKNOWN values, after being saved in [DSPSR\\_EL0](#).

For more information see [Process state \(PSTATE\) in Debug state](#) on page H2-5445.

### H2.3.5 Entering Debug state during loads and stores

The PE can enter Debug state during instructions that perform a sequence of memory accesses, as opposed to a single single-copy atomic access, because of a Watchpoint debug event. The effect of entering Debug state on such an instruction is the same as taking a Data Abort exception during such an instruction.

In addition, when executing in AArch64 state, the PE can enter Debug state during instructions that perform a sequence of memory accesses because of an External Debug Request debug event. The effect of entering Debug state on such an instruction is the same as taking an interrupt exception during such an instruction.

This applies to all memory types.

### H2.3.6 Entering Debug state and Software Step

When Software Step is active, a debug event that causes entry to Debug state behaves like an exception taken to an Exception level above the debug target Exception level. That is:

- If the instruction that is stepped generates a synchronous debug event that causes entry to Debug state, or an asynchronous debug event is taken before the step completes, the PE enters Debug state with [DSPSR.SS](#) set to 1.
- A pending Halting debug event or an asynchronous debug event can be taken after the step has completed. In this case the PE enters Debug state with [DSPSR.SS](#) set to 0.

In addition:

- If the instruction that is stepped generates an exception trapped by an Exception Catch debug event, the PE enters Debug state at the exception vector with [DSPSR.SS](#) set to 0. This is because [PSTATE.SS](#) is set to 0 by taking the exception.
- If the PE is reset, [PSTATE.SS](#) is reset to 0. If the following debug events are enabled, the PE enters Debug state with [DSPSR.SS](#) set to 0:
  - Reset Catch debug event at the reset Exception level.
  - Exception Catch debug event at the reset Exception level.
  - Halting Step debug event.
- If Halting Step is also active, then Halting Step and Software Step operate in parallel and can both become active-pending. In this case Halting step has a higher priority than Software step. This means that the PE enters Debug state and [DSPSR.SS](#) is set to 0.

### H2.3.7 Pseudocode description of entering Debug state

The `DebugHalt` constants are described in [shared/debug/halting/DebugHalt](#) on page J1-6015 in the ARMv8 pseudocode. The `UpdateEDSCTFields()` and `Halt()` functions are described in [Chapter J1 ARMv8 Pseudocode](#).

## H2.4 Behavior in Debug state

Instructions are executed in Debug state from the Instruction Transfer Register, ITR. The debugger controls which instructions are executed in Debug state by writing the instructions to the External Debug Instruction Transfer register, [EDITR](#). The Execution state of the PE determines which instruction set is executed:

- If the PE is in AArch64 state it executes A64 instructions.
- If the PE is in AArch32 state it executes T32 instructions:
  - For a 32-bit T32 instruction, [EDITR](#)[15:0] specifies the first halfword and [EDITR](#)[31:16] specifies the second halfword.
  - For a 16-bit T32 instruction, [EDITR](#)[15:0] contains the instruction and [EDITR](#)[31:16] is ignored. All 16-bit T32 instructions are UNPREDICTABLE in debug state.

The PE does not execute A32 instructions in Debug state.

Some instructions are available only in Debug state. See [Debug state operations, DCPS, DRPS, MRS, MSR](#) on [page H2-5461](#). In Non-debug state these instructions are UNDEFINED.

The following sections describe behavior in Debug state:

- [Process state \(PSTATE\) in Debug state](#).
- [Executing instructions in Debug state](#) on [page H2-5446](#).
- [Decode tables](#) on [page H2-5457](#).
- [Security in Debug state](#) on [page H2-5460](#).
- [Privilege in Debug state](#) on [page H2-5461](#).
- [Debug state operations, DCPS, DRPS, MRS, MSR](#) on [page H2-5461](#).
- [Exceptions in Debug state](#) on [page H2-5465](#).
- [Accessing registers in Debug state](#) on [page H2-5467](#).
- [Accessing memory in Debug state](#) on [page H2-5470](#).

This section specifies the CONSTRAINED UNPREDICTABLE behaviors that apply in Debug state, but see [Changing the value of EDECR.SS when not in Debug state](#) on [page H3-5483](#) for a change in Non-debug state that causes CONSTRAINED UNPREDICTABLE behavior.

### H2.4.1 Process state (PSTATE) in Debug state

[PSTATE](#).{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F} are all ignored in Debug state:

- There are no conditional instructions in Debug state.
- In AArch32 state, the PE only executes T32 instructions and [PSTATE](#).IT is ignored.
- Asynchronous exceptions and debug events are ignored.
- Software step is inactive.

Instructions executed in Debug state indirectly read [PSTATE](#).{IL, E, M, nRW, EL, SP} as they would in Non-debug state.

On entry to Debug state from AArch64:

- [PSTATE](#).PAN is copied to [DSPSR\\_EL0](#).PAN.
- [PSTATE](#).UAO is copied to [DSPSR\\_EL0](#).UAO.

On exit from Debug state to AArch64:

- [DSPSR\\_EL0](#).PAN is copied to [PSTATE](#).PAN.
- [DSPSR\\_EL0](#).UAO is copied to [PSTATE](#).UAO.

On entry to Debug state from AArch32, [CPSR](#).PAN is copied to [DSPSR](#).PAN.

On exit from Debug state to AArch32, [DSPSR](#).PAN is copied to [CPSR](#).PAN.

In Debug state:

- **PSTATE.PAN** is set to 1 by:
  - A DCPS instruction to EL1 using AArch64 if **SCTLR\_EL1.SPAN** == 0.
  - A DCPS instruction to EL2 using AArch64 if **SCTLR\_EL2.SPAN** == 0.
- **SPSR\_ELx.PAN** is copied to:
  - **PSTATE.PAN** by the DRPS instruction to AArch64 from AArch64.
  - **CPSR.PAN** by the DRPS instruction to AArch32 from AArch64.

———— **Note** ————

A debugger can use a DRPS instruction to modify the PAN state bit.

- **PSTATE.UAO** is set to 0 by a DCPS instruction to AArch64.
- **SPSR\_ELx.UAO** is copied to **PSTATE.UAO** by the DRPS instruction to AArch64 from AArch64.
- **PSTATE.UAO** operates as in Non-debug state.

## H2.4.2 Executing instructions in Debug state

The instructions executed in Debug state must be either A64 instructions or T32 instructions, depending on the current Execution state.

Each instruction falls into one of the following groups:

- Debug state instructions. These are instructions that are changed in Debug state. See *A64 instructions that are changed in Debug state* and *T32 instructions that are changed in Debug state* on page H2-5452.
- Instructions that are unchanged in Debug state. See *A64 instructions that are unchanged in Debug state* on page H2-5447 and *T32 instructions that are unchanged in Debug state* on page H2-5452.
- Instructions that are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Debug state. See *A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-5449 and *T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-5454.

All T32 instructions are treated as unconditional, regardless of **PSTATE.IT**. See *Process state (PSTATE) in Debug state* on page H2-5445.

If **EDSCR.SDD** == 1 then an instruction executed in Non-secure state cannot cause entry into Secure state. See *Security in Debug state* on page H2-5460

### Executing A64 instructions in Debug state

The following sections describe the behavior of the A64 instructions in Debug state:

- *A64 instructions that are changed in Debug state.*
- *A64 instructions that are unchanged in Debug state* on page H2-5447.
- *A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-5449.

#### A64 instructions that are changed in Debug state

The following A64 instructions are defined in Debug state, but are UNDEFINED in Non-debug state:

- DCPS.

———— **Note** ————

DCPS can be UNDEFINED in certain conditions in Debug state. See *DCPS<n>* on page H2-5461.

- DRPS.
- MRS (**DLR\_EL0**), MRS (**DSPSR\_EL0**), MSR (**DLR\_EL0**), MSR (**DSPSR\_EL0**)

For more information see [Debug state operations, DCPS, DRPS, MRS, MSR](#) on page H2-5461.

### **A64 instructions that are unchanged in Debug state**

The following list shows the instructions that are unchanged in Debug state:

#### **Any instruction that is UNDEFINED in Non-debug state**

This list of instructions excludes:

- Any instruction listed in [A64 instructions that are changed in Debug state](#) on page H2-5446.
- Any instruction listed in [A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state](#) on page H2-5449 that is UNDEFINED because an enable or disable bit is not RES0 or RES1

#### **Instructions that move System or Special-purpose registers to or from a general-purpose register**

This list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes PSTATE access instructions.

These instructions are:

- MRS <special\_reg>, MSR <special\_reg>.

#### **Note**

This does not include NZCV, DAIF, DAIFSet, DAIFClr, SPSel, and CurrentEL.

- MRS <system\_reg>, MSR <system\_reg>.

#### **Floating-point moves between a SIMD&FP register and a general-purpose register**

These instructions are:

- FMOV (between a general-purpose register and a half-precision register).
- FMOV (between a general-purpose register and a single-precision register).
- FMOV (between a general-purpose register and a double-precision register).
- FMOV (between a general-purpose register and a SIMD element).

#### **SIMD moves between a SIMD&FP register and a general-purpose register**

These instructions are:

- INS (from a general-purpose register to a SIMD element).
- UMOV (from a SIMD element to a general-purpose register).

#### **Barriers**

These instructions are:

- ISB.
- DSB.
- DMB.

#### **Memory access instructions at various access sizes**

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
  - Unscaled (9-bit signed) immediate offset.
  - Immediate (9-bit signed) post-indexed.
  - Immediate (9-bit signed) pre-indexed.
  - Unprivileged (9-bit signed).
- Not literal.

- One of the following types:
  - (Single) register.
  - Exclusive.
  - Exclusive pair.
  - Acquire/Release.
  - Acquire/Release Exclusive.
  - Acquire/Release Exclusive pair.
- 32-bit and 64-bit target register variants.

These instructions are:

- LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW (immediate, not literal).
- LDUR, LDURB, LDURH, LDURSB, LDURSH, LDURSW (immediate).
- LDTR, LDTRB, LDTRH, LDTRSB, LDTRSH, LDTRSW (immediate).
- LDAR, LDARB, LDARH, LDXR, LDXRB, LDXRH, LDAXR, LDAXRB, LDAXRH.
- LDXP, LDAXP.
- STR, STRB, STRH (immediate).
- STUR, STURB, STURH (immediate).
- STTR, STTRB, STTRH (immediate).
- STLR, STLRB, STLRH, STXR, STXRB, STXRH, STLXR, STLXRB, STLXRH.
- STXP, STLXP.
- LDLAR, LDLARB, LDLARH - ARMv8.1 instructions.
- STLLR, STLLRB, STLLRH - ARMv8.1 instructions.
- CAS, CASB, CASH, CASP - ARMv8.1 instructions.
- SWP, SWPB, SWPH - ARMv8.1 instructions.
- LDADD, LDADDB, LDADDH - ARMv8.1 instructions.
- LDCLR, LDCLB, LDCLRH - ARMv8.1 instructions.
- LDEOR, LDEORB, LDEORH - ARMv8.1 instructions.
- LDSET, LDSETB, LDSETH - ARMv8.1 instructions.
- LDSMAX, LDSMAXB, LDSMAXH - ARMv8.1 instructions.
- LDSMIN, LDSMINB, LDSMINH - ARMv8.1 instructions.
- LDUMAX, LDUMAXB, LDUMAXH - ARMv8.1 instructions.
- LDUMIN, LDUMINB, LDUMINH - ARMv8.1 instructions.
- STADD, STADDB, STADDH - ARMv8.1 instructions.
- STCLR, STCLB, STCLRH - ARMv8.1 instructions.
- STEOR, STEORB, STEORH - ARMv8.1 instructions.
- STSET, STSETB, STSETH - ARMv8.1 instructions.
- STSMAX, STSMAXB, STSMAXH - ARMv8.1 instructions.
- STSMIN, STSMINB, STSMINH - ARMv8.1 instructions.
- STUMAX, STUMAXB, STUMAXH - ARMv8.1 instructions.
- STUMIN, STUMINB, STUMINH - ARMv8.1 instructions.

#### **Move immediate to general-purpose register**

These instructions are:

- MOVZ, MOVN, MOVK (immediate).
- MOV (between a general-purpose register and the stack pointer).

### System instructions, Send Event, NOP, and Clear Exclusive

In this context, the System instructions are the Cache maintenance instructions, TLB maintenance instructions, and the Address translation instructions.

These instructions are:

- IC.
- DC.
- TLBI.
- AT.
- SEV, SEVL.
- NOP.
- CLREX.

### A64 instructions that are **CONSTRAINED UNPREDICTABLE** in Debug state

This subsection describes all instruction not listed in either:

- [A64 instructions that are changed in Debug state on page H2-5446.](#)
- [A64 instructions that are unchanged in Debug state on page H2-5447.](#)

These instructions are **CONSTRAINED UNPREDICTABLE** in Debug state. In general, the permissible behaviors are:

- The instruction is **UNDEFINED**.
- The instruction executes as a **NOP**.
- If the instruction reads the PC or PSTATE, it uses an **UNKNOWN** value.
- If the instruction modifies the PC or PSTATE, other than by advancing the PC to the sequentially next instruction, it sets **DLR\_EL0** and **DSPSR\_EL0** to **UNKNOWN** values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for A64 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed. An example of this is **CCMP**.

### Exception-generating instructions

These instructions are:

- SVC.
- HVC.
- SMC.
- BRK.
- HLT.

These instructions behave in one of the following ways:

- They are **UNDEFINED**.
- They execute as a **NOP**.
- SVC behaves as **DCPS1**.
- HVC behaves as **DCPS2**.
- SMC behaves as **DCPS3**.
- They generate the exception that the instruction would generate in Non-debug state. The exception is taken as described in [Exceptions in Debug state on page H2-5465](#)

#### **Note**

SMC must not generate a Secure Monitor Call exception from Non-secure state if **EDSCR.SDD** is set to 1.

### Instructions that explicitly write to the PC (branches)

These instructions are:

- B, B.cond, BL, BLR, BR, CBZ, CBNZ, RET, TBZ, TBNZ.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching and set [DSPSR\\_ELO](#) and [DLR\\_ELO](#) to UNKNOWN values.

### Exception return and related instructions

These instructions are:

- ERET.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching. They set [DSPSR\\_ELO](#) and [DLR\\_ELO](#) to UNKNOWN values, and either:
  - Execute the DRPS operation instead of performing an exception return, using UNKNOWN SPSR values.
  - Not change the Exception level.

### Instructions that explicitly modify PSTATE, other than DCPS and DRPS

These instructions are:

- MSR DAIFSet (immediate), MSR DAIFClr (immediate), MSR SPSe1 (immediate).
- MSR NZCV (register), MSR DAIF (register), MSR SPSe1 (register).
- MSR PAN (immediate) - ARMv8.1 instruction.
- **MSR UAO (immediate) - ARMv8.2 instruction.**

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting [DSPSR\\_ELO](#) and [DLR\\_ELO](#) to UNKNOWN values.

### Instructions that request entry to a low-power state

These instructions are:

- WFE, WFI.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See [Configurable instruction enables and disables, and trap controls on page D1-1842](#).
- A WFE instruction clears the Event register if it is set.

#### ————— **Note** —————

This means that these instructions must not suspend execution.

### Instructions that read the PC

These instructions are:

- LDR (literal), LDRSW (literal).
- ADR, ADRP.
- PRFM (literal).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, using an UNKNOWN value for the PC operand.

### Instructions that read the PSTATE.{N, Z, C, V} or other PSTATE fields

These instructions are:

- CSEL, CSINC, CSINV, CSNEG, CCMN, CCMP, FCSEL, FCCMP, FCCMPE.
- ADC, ADCS, SBC, SBCS.
- MRS NZCV, MRS DAIF, MRS SPSEL, MRS CurrentEL.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state:
  - For the conditional operations and those using the PSTATE.C flag as an input, these instructions use an UNKNOWN value for the Condition flag.
  - For the MRS instruction, they return an UNKNOWN value.

### Instructions that explicitly modify the PSTATE. {N, Z, C, V, Q, GE}

These instructions are:

- ADDS, SUBS, ADCS, SBCS, ANDS, BICS, CCMN, CCMP.
- FCMPE, FCCMP, FCCMPE.
- MSR NZCV (register).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting [DPSR\\_EL0](#) and [DLR\\_EL0](#) to UNKNOWN values.

### All other instructions

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They have the same behavior as in Non-debug state.

#### Note

This includes instructions defined as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state. These instructions are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Debug state.

## Executing T32 instructions in Debug state

The following sections describe the behavior of the T32 instructions in Debug state:

- [T32 instructions that are changed in Debug state.](#)
- [T32 instructions that are unchanged in Debug state.](#)
- [T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-5454.](#)

### T32 instructions that are changed in Debug state

The following T32 instructions are defined in Debug state, but are UNDEFINED in Non-debug state:

- DCPS

#### Note

DCPS can be UNDEFINED in certain conditions in Debug state. See [DCPS<n> on page H2-5461](#).

- MRC p15,3,<Rt>,c4,c5,0 (DSPSR).
- MCR p15,3,<Rt>,c4,c5,0 (DSPSR).
- MRC p15,3,<Rt>,c4,c5,1 (DLR).
- MCR p15,3,<Rt>,c4,c5,1 (DLR).

In addition, ERET executes the DRPS operation in Debug state.

For more information see [Debug state operations, DCPS, DRPS, MRS, MSR on page H2-5461](#).

### T32 instructions that are unchanged in Debug state

The following list shows the instructions that are unchanged in Debug state. Any T32 instruction that uses the PC or APSR. {N, Z, C, V} as the source or destination register is not included in the list. Moreover, the list only includes the 32-bit T32 encodings.

#### Any instruction that is UNDEFINED in Non-debug state

The list of instructions:

- Excludes any instruction listed in [T32 instructions that are changed in Debug state.](#)
- Excludes any instruction listed in [T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-5454](#) that is UNDEFINED because an enable or disable bit is not RES0 or RES1

#### Instructions that move System or Special-purpose registers to or from a general-purpose register

The list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes APSR and CPSR access instructions.
- Excludes instructions for accessing banked registers for the current mode.

These instructions are:

- MRS <banked\_reg>, MSR <banked\_reg>.

#### Note

This does not apply to cases which are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state in the current mode.

- MRC, MCR.

#### Note

This includes all allocated System registers in the (coproc==0b111x) encoding space other than an MRC move to APSR\_nzcv.

- MRS SPSR, MSR SPSR.

- VMRS <vfp\_system\_reg>, VMSR <vfp\_system\_reg>.

---

**Note**

---

This includes all allocated Advanced SIMD and floating-point System registers, other than an a VMRS move to APSR\_nzcv.

---

### Floating-point moves between a SIMD&FP register and a general-purpose register

These instructions are:

- VMOV (between a general-purpose register and a single-precision register).
- VMOV (between a general-purpose register and a doubleword floating-point register).

### SIMD moves between a SIMD&FP register and a general-purpose register

These instructions are:

- VMOV (between a general-purpose register and a scalar).

### Barriers

These instructions are:

- ISB.
- DSB.
- DMB.

### Memory access instructions at various access sizes

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
  - Immediate (8-bit or 12-bit) offset.
  - Immediate (8-bit) post-indexed.
  - Immediate (8-bit) pre-indexed.
  - Unprivileged (8-bit).
- Not literal.
- One of the following types:
  - (Single) register.
  - Dual.
  - Exclusive.
  - Exclusive doubleword.
  - Acquire/Release.
  - Acquire/Release Exclusive.
  - Acquire/Release Exclusive doubleword.

These instructions are:

- LDR.W, LDRB.W, LDRH.W, LDRD, LDRSB.W, LDRSH.W (immediate, not literal).
- LDRT, LDRBT, LDRHT, LDRSBT, LDRSHT (immediate).
- LDREX, LDREXB, LDREXH, LDA, LDAB, LDAH, LDAEX, LDAEXB, LDAEXH.
- LDREXD, LDAEXD.
- STR.W, STRB.W, STRH.W, STRD (immediate).
- STRT, STRBT, STRHT (immediate).
- STREX, STREXB, STREXH, STL, STLB, STLH, STLEX, STLEXB, STLEXH.
- STREXD, STLEXD.

### Move to general-purpose register

These instructions are:

- MOVW, MOVT (immediate).

### System instructions, Send Event, NOP, and Clear Exclusive

The System instructions are Cache maintenance instructions, TLB maintenance instructions, and Address translation instructions. These are encoded in the (coproc==0b1111) System register encoding space.

These instructions are:

- [ICIALLU, ICIALLUIS, ICIMVAU.](#)
- [DCCIMVAC, DCCISW, DCCMVAC, DCCMVAU, DCCSW, DCIMVAC, DCISW.](#)
- [TLBIALL, TLBIALLH, TLBIALLHIS, TLBIALLIS, TLBIALLNSNH, TLBIALLNSNHIS, TLBIASID, TLBIASIDIS, TLBIIPAS2, TLBIIPAS2IS, TLBIIPAS2L, TLBIIPAS2LIS, TLBIMVA, TLBIMVAA, TLBIMVAAIS, TLBIMVAAL, TLBIMVAALIS, TLBIMVAH, TLBIMVAHIS, TLBIMVAIS, TLBIMVAL, TLBIMVALH, TLBIMVALHIS, TLBIMVALIS.](#)
- [ATS12NSOPR, ATS12NSOPW, ATS12NSOUR, ATS12NSOUW, ATS1CPR, ATS1CPW, ATS1CUR, ATS1CUW, ATS1HR, ATS1HW.](#)
- [BPIALL, BPIALLIS, BPIMVA.](#)
- [SEV.W, SEVL.W.](#)
- [NOP.W.](#)
- [CLREX.](#)

### T32 instructions that are **CONSTRAINED UNPREDICTABLE** in Debug state

This subsection describes all instruction not listed in either:

- [T32 instructions that are changed in Debug state on page H2-5452.](#)
- [T32 instructions that are unchanged in Debug state on page H2-5452.](#)

These instructions are CONSTRAINED UNPREDICTABLE in Debug state. In general, the permissible behaviors are:

- The instruction generates an Undefined Instruction exception.
- The instruction executes as a NOP.
- If the instruction reads the PC or PSTATE, it uses an UNKNOWN value.
- If the instruction modifies the PC or PSTATE, other than by advancing the PC to the sequentially next instruction, it sets [DLR](#) and [DSPSR](#) to UNKNOWN values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for T32 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed.

### Exception-generating instructions

These instructions are:

- [SVC.](#)
- [HVC.](#)
- [SMC.](#)
- [UDF.](#)
- [BKPT.](#)
- [HLT.](#)

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCPS1.

- HVC behaves as DCPS2.
- SMC behaves as DCPS3.
- They generate the exception the instruction would generate in Non-debug state. The exception is taken as described in [Exceptions in Debug state on page H2-5465](#)

———— **Note** ————

SMC must not generate a Secure Monitor Call exception from Non-secure state if EDSCR.SDD is set to 1.

**Instructions that explicitly write to the PC (branches)**

These instructions are:

- B, B (conditional), CBZ, CBNZ BL.
- BX, BLX (register or immediate).
- BXJ, TBB, TBH.
- MOV pc and related instructions.
- LDR pc, LDM (with a register list includes the PC), POP (with a register list that includes the PC).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching and set [DSPSR](#) and [DLR](#) to UNKNOWN values.

**Exception return and related instructions, other than ERET**

These instructions are:

- SRS, RFE, SUBS pc, 1r, and related instructions.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching, setting [DSPSR\\_EL0](#) and [DLR\\_EL0](#) to UNKNOWN values, and either:
  - Execute the DPRS operation instead of performing an exception return, using UNKNOWN SPSR values.
  - Not changing Exception level or PE mode.

**Instructions that explicitly modify PSTATE, other than DCPS and ERET**

These instructions are:

- CPS, SETEND, IT.
- MSR APSR, CPSR (register or immediate).
- SETPAN.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting [DSPSR\\_EL0](#) and [DLR\\_EL0](#) to UNKNOWN values.

**Instructions that request entry to a low-power state**

These instructions are:

- WFE, WFI.

These instructions behave in one of the following ways:

- They are UNDEFINED.

- They execute as a NOP.
- They generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See [Configurable instruction enables and disables, and trap controls on page G1-4418](#).
- A WFE instruction is permitted to clear the Event register if it is set.

———— **Note** ————

This means that these instructions must not suspend execution.

#### Instructions that read the PC

These instructions are:

- LDR (literal), LDRB (literal), LDRH (literal), LDRSB (literal), LDRSH (literal).
- ADR, ADRL, ADRH.
- PLD (literal), PLI (literal).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state using an UNKNOWN value for the PC operand.

#### Instructions that read PSTATE.{N, Z, C, V} or other PSTATE fields

These instructions are:

- SEL, VSEL.
- ADC, SBC, all instructions with an RRX shift.
- MRS CPSR.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state:
  - For the conditional operations and those using the PSTATE.C flag as an input, these instructions use an UNKNOWN value for the Condition flag.
  - For the MRS instruction, they return an UNKNOWN value

#### Instructions that explicitly modify PSTATE.{N, Z, C, V, Q, GE}

These instructions are:

- CMP, TST, TEQ, CMN.
- <opc>S.
- MRC p14, 0, APSR\_nzcv, c0, c1, 0 (DBGDSCRint).
- MSR CPSR, MSR APSR, (register or immediate).
- VMRS APSR\_nzcv, FPSCR.
- QADD, QDADD, QSUB, QDSUB.
- SMLABB, SMLABT, SMLATB, SMLATT, SMLAD, SMLAWB, SMLAWT, SMLSD, SMUAD.
- SSAT, SSAT16, USAT, USAT16.
- SADD, SADD8, SADD16, SASX, SSAX, SSUB, SSUB8, SSUB16.
- UADD, UADD8, UADD16, UASX, USAX, USAUB, USUN8, USUB16.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting [DSPSR\\_ELO](#) and [DLR\\_ELO](#) to UNKNOWN values.

### All other instructions

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They have the same behavior as in Non-debug state.

---

#### Note

This includes instructions defined as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state. These instructions are CONSTRAINED UNPREDICTABLE in Debug state. This includes some T32 instructions that specify R15 as a destination or source register.

[Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#) describes the CONSTRAINED UNPREDICTABLE behavior for these instructions. In Debug state these CONSTRAINED UNPREDICTABLE choices are further restricted:

- Instructions that specify R15 as a destination register:
    - Are not permitted to branch, because the architecture does not define a branch operation in Debug state.
    - Might set [DLR](#) and [DSPSR](#) to UNKNOWN values.
    - Might have any of the other permitted behaviors.
  - Instructions that specify R15 as a source operand:
    - Cannot use PC + offset, because there is no architecturally-defined PC in Debug state.
    - Might have any of the other permitted behaviors, including using an UNKNOWN value.
- 

## H2.4.3 Decode tables

The syntax in the tables is defined as follows:

<b>1</b>	The bit has a fixed value of 1.
<b>0</b>	The bit has a fixed value of 0.
<b>!=</b>	The field has any value other than the value or values specified. The field might be an encoding field in the instruction whose value is supplied by the debugger.

---

#### Note

The instruction encodings in [Chapter C6 A64 Base Instruction Descriptions](#) and [Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions](#) might show these bits as (0) or (1). A debugger must set these bits to 0 or 1, as appropriate.

---

Any other value indicates an encoding field in the instruction whose value is supplied by the debugger. Some values might be reserved or UNDEFINED, in which case the instruction is UNDEFINED or CONSTRAINED UNPREDICTABLE in Debug state, as it is in Non-debug state.

For more information about the instruction encodings, see:

- [Chapter C6 A64 Base Instruction Descriptions](#).
- [Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions](#).

For information about the syntax used in [Table H2-2 on page H2-5458](#), [Table H2-3 on page H2-5458](#), [Table H2-4 on page H2-5459](#), and [Table H2-5 on page H2-5460](#), see:

- [Common syntax terms on page C1-137](#).
- [Assembler symbols on page F2-2846](#).

Table H2-2 shows the A64 instructions that are modified in Debug state. For details of how these are packed in EDITR, see [EDITR, External Debug Instruction Transfer Register on page H9-5632](#).

**Table H2-2 Modified A64 instructions in Debug state**

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0	Description

## H2.4.4 Security in Debug state

If EL3 is implemented or the implemented Security state is Secure state, security in Debug state is governed by the Secure debug disabled flag, [EDSCR.SDD](#).

### On entry to Debug state

If entering in Secure state, [EDSCR.SDD](#) is set to 0. Otherwise [EDSCR.SDD](#) is set to the inverse of `ExternalSecureInvasiveDebugEnabled()`. That is:

- If `ExternalSecureInvasiveDebugEnabled() == TRUE`, [EDSCR.SDD](#) is set to 0.
- If `ExternalSecureInvasiveDebugEnabled() == FALSE`, [EDSCR.SDD](#) is set to 1.

### Note

Normally, if `ExternalSecureInvasiveDebugEnabled() == FALSE` then halting is prohibited and it is not possible to enter Debug state from Secure state. However, because changes to the authentication signals require a *Context synchronization event* to guarantee their effect, there is a period during which the PE might halt even though the authentication signals prohibit halting.

### In Debug state

The value of `EDSCR.SDD` does not change, even if `ExternalSecureInvasiveDebugEnabled()` changes.

---

#### Note

- `DBGAUTHSTATUS_EL1`.{SNID, SID, NSNID, NSID} are not frozen in Debug state.
  - If `EDSCR.SDD` set to 1 in Debug state, then there is no means to enter Secure state from Non-secure state. In this case it is impossible for the PE to be in Secure state. This is a general principle of behavior in Debug state.
- 

### In Non-debug state

`EDSCR.SDD` returns the inverse of `ExternalSecureInvasiveDebugEnabled()`. If the authentication signals that control `ExternalSecureInvasiveDebugEnabled()` change, a *Context synchronization event* is required to guarantee their effect.

---

#### Note

- In Non-debug state, `EDSCR.SDD` is unaffected by the Security state of the PE.
  - A *Context synchronization event* is also required to guarantee that changes in the authentication signals are visible in `DBGAUTHSTATUS_EL1`.{SNID, SID, NSNID, NSID}.
- 

If EL3 is not implemented and the implemented Security state is Non-Secure state, `EDSCR.SDD` is RES1.

## H2.4.5 Privilege in Debug state

The only additional privileges offered to Debug state are:

- The privilege to execute *Debug state operations*, *DCPS*, *DRPS*, *MRS*, *MSR*.
- The privilege to execute DTR access instructions regardless of the Exception level and traps.

The DTR access instructions can be executed at any Exception level, including EL0, regardless of any control register settings that might force these instructions to be UNDEFINED or trapped in Non-debug state. These instruction are:

- The MRS and MSR instructions that access `DBGDTR_EL0`, `DBGDTRTX_EL0`, and `DBGDTRRX_EL0` in AArch64 state.
- The MRC and MCR instructions that access `DBGDTRTXint` and `DBGDTRRXint` in AArch32 state.

All other instructions operate with the privilege determined by the current Exception level and security state. This applies to all Special-purpose and System registers accesses, memory accesses, and UNDEFINED instructions, and includes generating exceptions when the System registers trap or disable an instruction.

## H2.4.6 Debug state operations, DCPS, DRPS, MRS, MSR

ARMv8 defines operations to change between Exception levels in Debug state. These operations can also change the mode at the current Exception level.

### DCPS<n>

Executing a `DCPS<n>` instruction in Debug state moves the PE to a higher Exception level or to a specific mode at the current Exception level.

If the `DCPS<n>` instruction is executed in AArch32 state and the target Exception level is using AArch64:

- The current instruction set switches from T32 to A64.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for system calls in Non-debug state. See *Execution state* on page D1-1779.

Otherwise, the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- In AArch64 state the current endianness is determined by the value of [SCTLR\\_ELx.EE](#) for the target Exception level.
- In AArch32 state the current endianness is determined by the value of [SCTLR.EE](#) or [HSCTLR.EE](#) for the target Exception level.

The DCPS<n> instructions are:

#### In AArch64 state

- [DCPS1](#)
- [DCPS2](#)
- [DCPS3](#)

#### In AArch32 state, in the T32 instruction set only

- [DCPS1 variant](#)
- [DCPS2 variant](#)
- [DCPS3 variant](#)

The DCPS instructions are UNDEFINED in Non-debug state.

[Table H2-6](#) shows the target of the instruction. In [Table H2-6](#) the entries have the following meaning:

<b>EL1h/Svc</b>	This means that the target is: <ul style="list-style-type: none"> <li>• EL1h if EL1 is using AArch64.</li> <li>• EL1 and Supervisor mode if EL1 is using AArch32.</li> </ul>
<b>EL2h/Hyp</b>	This means that the target is: <ul style="list-style-type: none"> <li>• EL2h if EL2 is using AArch64.</li> <li>• EL2 and Hyp mode if EL2 is using AArch32.</li> </ul>
<b>EL3h/Monitor</b>	This means that the target is: <ul style="list-style-type: none"> <li>• EL3h if EL3 is using AArch64.</li> <li>• EL3 and Monitor mode if EL3 is using AArch32.</li> </ul>
<b>Svc</b>	Secure Supervisor mode, in EL3 using AArch32.
<b>Monitor</b>	Secure Monitor mode, in EL3 using AArch32.

**Table H2-6 Target for DCPS instructions in Debug state**

Instruction	Target when DCPS instruction executed at stated Exception level:				
	EL0	EL1	EL2	EL3 (AArch64)	EL3 (AArch32)
<a href="#">DCPS1</a>	EL1h/Svc	EL1h/Svc	EL2h/Hyp	EL3h	Svc, clears <a href="#">SCR.NS</a> to 0
<a href="#">DCPS2</a>	EL2h/Hyp	EL2h/Hyp	EL2h/Hyp	EL3h	UNDEFINED
<a href="#">DCPS3</a>	EL3h/Monitor	EL3h/Monitor	EL3h/Monitor	EL3h	Monitor, clears <a href="#">SCR.NS</a> to 0

In AArch32 Monitor mode, DCPS1 and DCPS3 clear [SCR.NS](#) to 0.

---

**Note**

---

In AArch64 state, at EL3, DCPS<n> does not change [SCR\\_EL3.NS](#).

---

However:

- [DCPS1](#) is UNDEFINED at EL0 in Non-secure state if either:
  - EL2 is implemented and using AArch64 and [HCR\\_EL2.TGE](#) == 1.
  - EL2 is implemented and using AArch32 and [HCR.TGE](#) == 1.
- [DCPS2](#) is UNDEFINED at all Exception levels if EL2 is not implemented.
- [DCPS2](#) is UNDEFINED at the following Exception levels if EL2 is implemented:
  - At EL0 and EL1 in Secure state.
  - At EL3 if EL3 is using AArch32.
- [DCPS3](#) is UNDEFINED at all Exception levels if either:
  - [EDSCR.SDD](#) == 1.
  - EL3 is not implemented.

---

**Note**

---

The references to [DCPS1](#), [DCPS2](#), and [DCPS3](#) in this section link to the descriptions of the instructions in the A64 instruction set. The DCPS<n> instructions are also defined in the T32 instruction set, see [DCPS1](#), [DCPS2](#), [DCPS3](#) on [page F5-3101](#). These instructions are not defined in the A32 instruction set, because A32 instructions cannot be executed in Debug state.

---

On executing a DCPS instruction:

- If the target Exception level is using AArch64:
  - [ELR\\_ELx](#) of the target Exception level becomes UNKNOWN.
  - [SPSR\\_ELx](#) of the target Exception level becomes UNKNOWN.
  - [ESR\\_ELx](#) of the target Exception level becomes UNKNOWN.
  - [DLR\\_EL0](#) and [DSPSR\\_EL0](#) become UNKNOWN.
- If the target Exception level is using AArch32 [DLR](#) and [DSPSR](#) become UNKNOWN and:
  - If the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become UNKNOWN.
  - If the target Exception level is EL2, then [ELR\\_hyp](#), [SPSR\\_hyp](#), and [HSR](#) become UNKNOWN.

If the target Exception level is using AArch32, and the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become UNKNOWN.

The [DCPSInstruction\(\)](#) function is described in [Chapter J1 ARMv8 Pseudocode](#).

## DRPS

Executing the DRPS operation in Debug state moves the PE to a lower Exception level, or to another PE mode at the current Exception level, by copying the current SPSR to [PSTATE](#).

If [DRPS](#) is executed in AArch64 state and the target Exception level is using AArch32:

- The current instruction set switches from A64 to T32.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for exception returns in Non-debug state. See [Execution state on page D1-1779](#).

Otherwise the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- If targeting an Exception level using AArch64, current endianness is set according to [SCTLR\\_ELx.EE](#), or [SCTLR\\_EL1.EOE](#) for the target Exception level.
- If targeting an Exception level using AArch32, current endianness is set by SPSR.E as appropriate.

The DRPS instructions are:

#### In AArch64 state

- [DRPS](#)

#### In AArch32 state, in the T32 instruction set only

- [ERET](#)

If the SPSR specifies an illegal exception return, then [PSTATE](#).{M, nRW, EL, SP} are unchanged and [PSTATE.IL](#) is set to 1. For further information on illegal exception returns, see *Illegal return events from AArch64 state* on page D1-1816.

[PSTATE](#).{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F} are ignored in Debug state. This means that the effect of the DRPS operation on these fields is to set them to an UNKNOWN value that might be the value from the SPSR. For more information see *Process state (PSTATE) in Debug state* on page H2-5445.

All other [PSTATE](#) fields are copied from SPSR.

[DRPS](#) is UNDEFINED at EL0 and in Non-debug state.

#### ———— Note ————

Unlike an exception return, the DRPS operation has no architecturally-defined effect on the Event Register and Exclusives monitors. DRPS might set the Event Register or clear the Exclusives monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

On executing a DRPS instruction:

- If the target Exception level is using AArch64:
  - [DLR\\_EL0](#) and [DSPSR\\_EL0](#) become UNKNOWN.
- If the target Exception level is using AArch32:
  - [DLR](#) and [DSPSR](#) become UNKNOWN.

The [DRPSInstruction\(\)](#) function is described in [Chapter J1 ARMv8 Pseudocode](#).

## MRS and MSR

The other Debug state instructions are used to read or write [DLR\\_EL0](#) and [DSPSR\\_EL0](#).

These instructions are:

#### In AArch64 state

- [MRS](#)
- [MSR \(register\)](#)

#### In AArch32 state

- [MRC](#)
- [MCR](#)

```
MRS <Xt>, DLR_EL0      ; Copy DLR_EL0 to <Xt>
MRS <Xt>, DSPSR_EL0    ; Copy DSPSR_EL0 to <Xt>
MSR DLR_EL0, <Xt>      ; Copy <Xt> to DLR_EL0
MSR DSPSR_EL0, <Xt>    ; Copy <Xt> to DSPSR_EL0
```

These instructions can be executed at any Exception level when in Debug state, including EL0. They are UNDEFINED in Non-debug state.

## H2.4.7 Exceptions in Debug state

The following sections describe how exceptions are handled in Debug state:

- [Generating exceptions when in Debug state.](#)
- [Taking exceptions when in Debug state.](#)
- [Reset in Debug state on page H2-5467.](#)

### Generating exceptions when in Debug state

In Debug state:

- Instruction Abort exceptions cannot happen because instructions are not fetched from memory.
- Interrupts, including SError and virtual interrupts are ignored and remain pending:
  - The pending interrupt remains visible in [ISR](#).
- Debug exceptions and debug events are ignored.
- [SCR.EA](#) is treated as if it were set to 0, regardless of its actual state, other than for the purpose of reading the bit.
- Any attempt to execute an instruction bit pattern that is an allocated instruction at the current Exception level, but is listed in [Executing instructions in Debug state on page H2-5446](#) as UNDEFINED in Debug state, generates an exception, that is taken to the current Exception level, or to EL1 if executing at EL0.

#### ———— Note ————

If the exception is taken to an Exception level that is using AArch32 then it is taken as an Undefined Instruction exception.

The priority and syndrome for these exceptions is the same as for executing an encoding that does not have an allocated instruction.

- Instructions executed at EL2, EL1 and EL0 that are configured by EL3 control registers to trap to EL3:
    - When the value of [EDSCR.SDD](#) is 0, generate the appropriate trap exception that is taken to EL3.
    - When the value of [EDSCR.SDD](#) is 1, are treated as UNDEFINED and generate an exception that is taken to the current Exception level, or to EL1 if the instruction is executed at EL0. If the exception is taken to an Exception level that is using AArch32 it is taken as an Undefined Instruction exception.
- If the exception is taken to an Exception level using AArch64 or to AArch32 Hyp mode, then it is reported with an EC value of 0x00.

Otherwise configurable traps, enables, and disables for instructions are unaffected by Debug state, and executing an affected instruction generates the appropriate exception.

Otherwise, synchronous exceptions, including Data Aborts, are generated as they would be in Non-debug state and taken to the appropriate Exception level in Debug state.

#### ———— Note ————

If [EDSCR.SDD](#) == 1 then an exception from Non-secure state is never taken to Secure state. See [Security in Debug state on page H2-5460](#).

### Taking exceptions when in Debug state

When the PE is in Debug state, all exceptions are synchronous. When an exception is generated, it is taken to Debug state. This means that:

- The target Exception level is as defined for the exception in Non-debug state.

- If the target Exception level is using AArch32 then the target PE mode is as defined for the exception in Non-debug state.
- The exception syndrome is reported as defined for the exception in Non-debug state, except for the case described in [Data Aborts in Memory access mode on page H4-5504](#) for which the reporting requirements are relaxed.

The exception syndrome is reported using the syndrome register or registers for the target Exception level. In AArch64 state, these are [ESR\\_ELx](#), and [FAR\\_ELx](#). In AArch32 state, these are [DFSR](#), [DFAR](#), [HSR](#), [HDFAR](#), and [HPFAR](#). For example:

- If a Data Abort exception is taken to Abort mode at EL1 or EL3 and the exception is taken from AArch32 state and using the Short-descriptor translation table format, the [DFSR](#) reports the exception using the Short-descriptor format fault encoding. For exceptions other than Data Abort exceptions taken to Abort mode, [DFSR](#) is not updated.
- If an instruction is trapped to an Exception level using AArch64 due to a configurable trap, disable, or enable, the exception code reported is the same as it would be in Non-debug state.

The effect on auxiliary syndrome registers, such as AFSR, is IMPLEMENTATION DEFINED.

#### ———— Note ————

Generally, the AArch32 Fault Address Registers (FARs) and Fault Status Registers (FSRs) are not described as *syndrome registers*, although the term is appropriate to their function.

- The PE remains in Debug state and changes to the target mode.
- If EL3 is using AArch32 and the exception is taken from Monitor mode, [SCR.NS](#) is cleared to 0.
- If the exception is taken to an Exception level using AArch32, the PE continues to execute T32 instructions, regardless of the TE bit in the System register for the target Exception level.
- The endianness switches to that indicated by the EE bit of the System register for the target Exception level.
- The SPSR for the target Exception level or mode is corrupted and becomes UNKNOWN.
- If the target Exception level is using AArch64, [ELR\\_ELx](#) for the target Exception level becomes UNKNOWN.
- If the target Exception level is EL2 using AArch32, [ELR\\_hyp](#) becomes UNKNOWN.
- If the target Exception level is EL1 or EL3 using AArch32, [LR\\_<mode>](#) for the target mode becomes UNKNOWN.
- [DLR](#) and [DSPSR](#) become UNKNOWN.
- The cumulative error flag, [EDSCR.ERR](#), is set to 1. See [Cumulative error flag on page H4-5508](#).
- [PSTATE.IL](#) is cleared to 0.
- [PSTATE](#).{IT, T, SS, D, A, I, F} are set to UNKNOWN values, and [PSTATE](#).{N, Z, C, V, Q, GE} are unchanged. However, these fields are ignored and are not observable in Debug state. For more information see [Process state \(PSTATE\) in Debug state on page H2-5445](#).

The debugger must save any state that can be corrupted by an exception before executing an instruction that might generate another exception.

### Pseudocode description of taking exceptions in Debug state

The pseudocode function [AArch64.TakeException\(\)](#) shows the behavior when the PE takes an exception to an Exception level using AArch64 in Non-debug state. In Debug state, this is replaced with the function [AArch64.TakeExceptionInDebugState\(\)](#).

The pseudocode functions `AArch32.EnterMode()`, `AArch32.EnterHypMode()`, and `AArch32.EnterMonitorMode()` show the behavior when the PE takes an exception to an Exception level using AArch32 in Non-debug state. In Debug state:

- `AArch32.EnterMode()` is replaced with the function `AArch32.EnterModeInDebugState()`.
- `AArch32.EnterHypMode()` is replaced with the function `AArch32.EnterHypModeInDebugState()`.
- `AArch32.EnterMonitorMode()` is replaced with `AArch32.EnterMonitorModeInDebugState()`.

### Reset in Debug state

If the PE is reset when in Debug state, it exits Debug state and enters Non-debug reset state. When the PE is in reset state, `EDSCR.STATUS == 0b000010` and writes to `EDITR` are ignored.

#### ———— Note ————

If `EDECR.RCE == 1`, meaning that a Reset Catch debug event is programmed, and if halting is allowed on exiting reset state, then on exiting reset state the PE halts and re-enters Debug state. See [Reset Catch debug events on page H3-5492](#). All PE registers have taken their reset values, which might be UNKNOWN.

## H2.4.8 Accessing registers in Debug state

Register accesses are unchanged in Debug state. The view of each register is determined by either the current Exception level or the mode, or both, and accesses might be disabled or trapped by controls at a higher Exception level.

### General-purpose register access, other than AArch64 state SP access

A single general-purpose register can be read by issuing an MSR instruction through the ITR to write `DBGDTR_EL0` in AArch64 state, or an MCR instruction through the ITR to write `DBGDTRTXint` in AArch32 state. The debugger can then read the DTR register or registers through the external debug interface. The reverse sequence writes to a general-purpose register.

[Figure H2-1 on page H2-5468](#) shows the reading and writing of general-purpose registers, other than SP, in Debug state in AArch64 state.

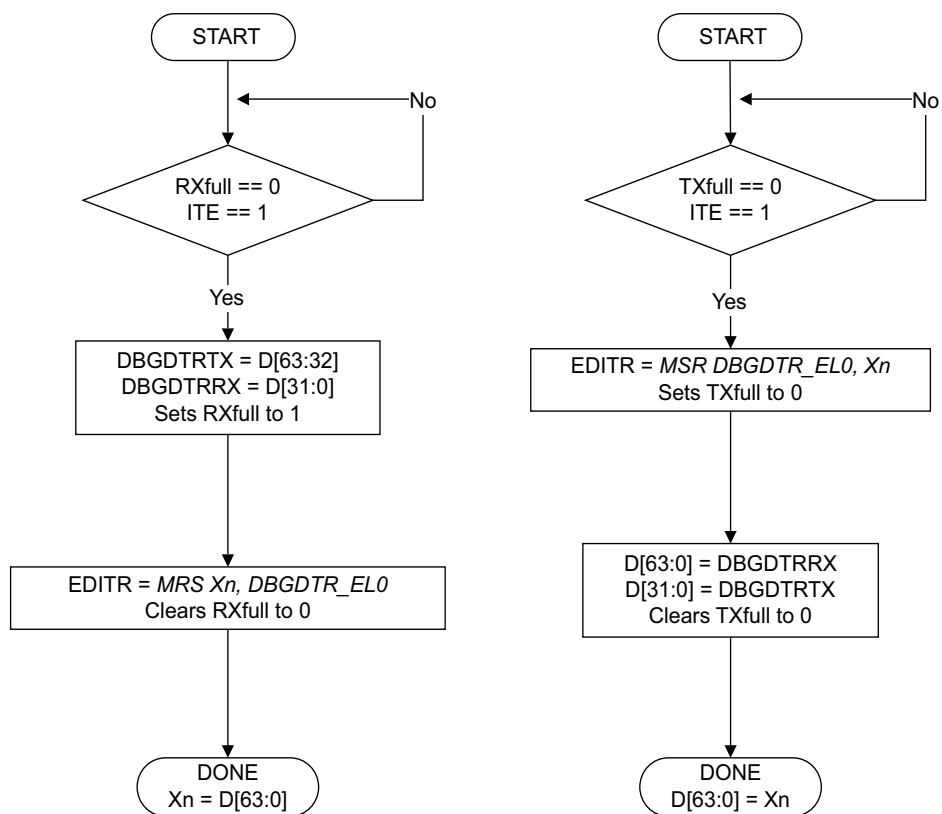

Figure H2-1 Reading and writing general-purpose registers, other than SP, in Debug state in AArch64 state

Figure H2-2 shows the reading and writing of general-purpose registers in Debug state in AArch32 state.

Figure H2-2 Reading and writing general-purpose registers in Debug state in AArch32 state

### SIMD and floating-point register, System register, and AArch64 state SP accesses

To read a SIMD and floating-point register or a System register, the debugger must first copy the value into a general-purpose register using:

- An FMOV instruction in AArch64 state or a VMOV instruction in AArch32 state for floating-point transfers to SIMD and FP registers.
- A UMOV instruction in AArch64 state or a VMOV instruction in AArch32 state for SIMD transfers to SIMD and FP registers.
- An MRS instruction in AArch64 state or an MRC instruction in AArch32 state for System registers.
- A MOV Xd,SP instruction for the SP register in AArch64 state.

The debugger can then read out the particular general-purpose register. The reverse sequence writes a register.

### PC and PSTATE access

The debugger reads the program counter and **PSTATE** of the process being debugged through the **DLR\_EL0** and **DSPSR\_EL0** System registers. The actual values of PC and **PSTATE** cannot be directly observed in Debug state:

- Instructions that are used for direct reads and writes of PC and **PSTATE** in Non-debug state are UNDEFINED in Debug state.
- On taking an exception, **ELR\_ELx** and **SPSR\_ELx** at the target Exception level are UNKNOWN. They do not record the PC and **PSTATE**.

**PSTATE**. {IL, E, M, nRW, EL, SP} are indirectly read by instructions executed in Debug state, but all other **PSTATE** fields are ignored and cannot be observed. See also:

- [Process state \(PSTATE\) in Debug state on page H2-5445.](#)
- [Executing instructions in Debug state on page H2-5446.](#)

- [Exceptions in Debug state on page H2-5465](#).

## H2.4.9 Accessing memory in Debug state

How the PE accesses memory is unchanged in Debug state. This includes:

- The operation of the MMU, including address translation, tagged address handling, access permissions, memory attribute determination, and the operation of any TLBs.
- The operation of any caches and coherency mechanisms.
- Alignment support.
- Endianness support.
- The Memory order model.

### Simple memory transfers

Simple memory accesses can be performed in Debug state by issuing memory access instructions through the ITR and passing data through the DTR registers. [Executing instructions in Debug state on page H2-5446](#) lists the memory access instructions that are supported in Debug state.

### Bulk memory transfers

Memory access mode can accelerate bulk memory transfers in Debug state. See [DCC and ITR access modes on page H4-5502](#).

## H2.5 Exiting Debug state

The PE exits Debug state when it receives a Restart request trigger event. If `EDSCR.ITE == 0` the behavior of any instruction issued through the ITR in Normal access mode or an operation issued by a DTR access in memory access mode that has not completed execution is **CONSTRAINED UNPREDICTABLE**, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state after the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an **UNKNOWN** state.

---

### Note

- Implementations can set `EDSCR.ITE` to 1 to indicate that further instructions can be accepted by ITR before the previous instructions have completed. If any previous instruction has not completed and `EDSCR.ITE == 1`, then the PE must complete these instructions in Debug state before executing the restart sequence. `EDSCR.ITE == 0` indicates that the PE is not ready to restart.
  - A debugger must observe that any instructions issued through `EDITR` that might generate a synchronous exception, as complete, before issuing a restart request. It can do this by observing the completion of a later instruction, as synchronous exceptions must occur in program order. For example, a debugger can observe that an instruction that reads or writes a DTR register is complete because of its effect on the `EDSCR.{TXfull, RXfull}` flags.
- 

On exiting Debug state, the PE sets the program counter to the address in `DLR`, where:

- If exiting to AArch32 state:
  - Bits[31:1] of the PC are set to the value of bits[31:1] of `DLR`.
  - Bit[0] of the PC is set to a **CONSTRAINED UNPREDICTABLE** choice of 0 or the value of bit[0] in `DLR`.
- If exiting to AArch64 state:
  - Bits[63:56] of `DLR_EL0` might be ignored as part of tagged address handling. See *Address tagging in AArch64 state on page D4-2006*.
  - Otherwise the PC is set from `DLR_EL0`.

---

### Note

Bits[63:32] of `DLR_EL0` are ignored when exiting to AArch32 state.

---

Exit from Debug state can give rise to a PC alignment fault exception when the program counter is used. Unlike an exception return, this might also happen when returning to AArch32 state. For more information, see *PC alignment checking on page D1-1793*.

On exiting Debug state, `PSTATE` is set from `DSPSR` in the same way that an exception return sets `PSTATE` from `SPSR_ELx`:

- The same illegal exception return checks that apply to an exception return also apply to exiting Debug state. If the return from Debug state is an illegal exception return then the effect on `PSTATE` and the PC is the same as for any other illegal exception return. See *Exception return on page D1-1815* and *Exception return to an Exception level using AArch32 on page G1-4360*.
- The checks on the `PSTATE.IT` bits that apply to exiting Debug state into AArch32 state are the same as those that apply to an exception return. See *Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors*.

- [PSTATE.SS](#) is copied from [DPSR.SS](#) if all of the following hold:
  - [MDSCR\\_EL1.SS](#) == 1.
  - The debug target Exception level is using AArch64.
  - Software step exceptions from the restart Exception level are enabled.

Otherwise [PSTATE.SS](#) is set to 0.

---

**Note**

Unlike a return using ERET, [PSTATE.SS](#) must be restored from [DPSR.SS](#) because otherwise it is UNKNOWN.

---

However, if [OSDLR.DLK](#) == 1 and [DBGPRCR.CORENPDRQ](#) == 0, meaning the OS Double Lock is locked in Non-debug state and therefore Software Step exceptions are disabled, but otherwise Software Step exceptions would be enabled from the restart Exception level, it is CONSTRAINED UNPREDICTABLE whether [PSTATE.SS](#) is copied from [DPSR.SS](#).

- [PSTATE.PAN](#) is copied from [DPSR\\_EL0.PAN](#).
- [PSTATE.UAO](#) is copied from [DPSR\\_EL0.UAO](#).

---

**Note**

- One important difference between Debug state exit and an exception return is that the PE can exit Debug state at EL0. Despite this, the behavior of an exit from Debug state is similar to an exception return. For example, [PSTATE.{D, A, I, F}](#) is updated regardless of the value of [SCTLR\\_EL1.UMA](#).
- Exit from Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors. An exit from Debug state might set the Event Register or clear the Exclusives monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

---

The [ExitDebugState\(\)](#) function is described in [Chapter J1 ARMv8 Pseudocode](#).

# Chapter H3

## Halting Debug Events

This chapter describes a particular class of debug events. It contains the following sections:

- [Introduction to Halting debug events](#) on page H3-5474.
- [Halting Step debug events](#) on page H3-5476.
- [Halt Instruction debug event](#) on page H3-5486.
- [Exception Catch debug event](#) on page H3-5487.
- [External Debug Request debug event](#) on page H3-5490.
- [OS Unlock Catch debug event](#) on page H3-5491.
- [Reset Catch debug events](#) on page H3-5492.
- [Software Access debug event](#) on page H3-5493.
- [Synchronization and Halting debug events](#) on page H3-5494.

---

**Note**

[Table K11-1](#) on page [K11-6282](#) disambiguates the general register references used in this chapter.

---

## H3.1 Introduction to Halting debug events

External debug defines Halting debug events. The following Halting debug events are available in ARMv8:

- [Halting Step debug events on page H3-5476](#).
- [Halt Instruction debug event on page H3-5486](#).
- [Exception Catch debug event on page H3-5487](#).
- [External Debug Request debug event on page H3-5490](#).
- [OS Unlock Catch debug event on page H3-5491](#).
- [Reset Catch debug events on page H3-5492](#).
- [Software Access debug event on page H3-5493](#).

If halting is allowed, a Halting debug event halts the PE. The PE enters Debug state.

In addition, breakpoints and watchpoints might halt the PE if halting is allowed. See [Breakpoint and Watchpoint debug events on page H2-5436](#). Because breakpoints and watchpoints can generate an exception or halt the PE, Breakpoint and Watchpoint debug events are not classified as Halting debug events.

For a definition of Debug state, see [Chapter H2 Debug State](#). For a definition of halting allowed, see [Halting allowed and halting prohibited on page H2-5435](#).

[Debug state entry and debug event prioritization on page H2-5437](#) describes the behavior when multiple debug events are generated by an instruction.

See also [Synchronization and Halting debug events on page H3-5494](#).

[Table H3-1](#) shows the behavior of Breakpoint, Watchpoint, and Halting debug events.

**Table H3-1 Summary of debug events and possible outcomes**

Debug event type	PE behavior when halting is:	
	Allowed	Prohibited
<a href="#">Breakpoint and Watchpoint debug events on page H2-5436</a>	Halt	See <a href="#">Table D2-1 on page D2-1908</a> and <a href="#">Table G2-1 on page G2-4457</a>
<a href="#">Halt Instruction debug event on page H3-5486</a>	Halt	UNDEFINED
<a href="#">Software Access debug event on page H3-5493</a>	Halt	Ignored
<a href="#">Exception Catch debug event on page H3-5487</a>	Halt	Ignored
<a href="#">Halting Step debug events on page H3-5476</a>	Halt	Pended
<a href="#">External Debug Request debug event on page H3-5490</a>	Halt	Pended
<a href="#">Reset Catch debug events on page H3-5492</a>	Halt	Pended
<a href="#">OS Unlock Catch debug event on page H3-5491</a>	Pended	Pended

[Table H3-2](#) shows where the pseudocode for each Halting debug event type is located.

## H3.2 Halting Step debug events

Halting Step is a debug resource that a debugger can use to make the PE step through code one instruction at a time. This section describes the Halting Step debug events. It is divided into the following sections:

- [Overview of a Halting Step debug event.](#)
- [The Halting Step state machine.](#)
- [Using Halting Step on page H3-5479.](#)
- [Detailed Halting Step state machine behavior on page H3-5479.](#)
- [Synchronization and the Halting Step state machine on page H3-5482.](#)
- [Stepping T32 IT instructions on page H3-5483.](#)
- [Disabling interrupts while stepping on page H3-5484.](#)
- [Syndrome information on Halting Step on page H3-5484.](#)
- [Pseudocode description of Halting Step debug events on page H3-5485.](#)

The architecture describes the behavior as a simple Halting Step state machine. See [The Halting Step state machine](#).

### H3.2.1 Overview of a Halting Step debug event

The behavior of Halting Step is defined by a state machine, shown in [Figure H3-1 on page H3-5478](#). A Halting Step debug event executes a single instruction and then returns control to the debugger. When the debugger software wants to execute a Halting Step:

1. With the PE in Debug state, the debugger activates Halting Step.
2. The debugger signals the PE to exit Debug state and return to the instruction that is to be stepped.
3. The PE executes that single instruction.
4. The PE enters Debug state before executing the next instruction.

However, an exception might be generated while the instruction is being stepped. That is either:

- A synchronous exception generated by the instruction being stepped.
- An asynchronous exception taken before or after the instruction being stepped.

Halting Step has its own enable control bit, [EDECR.SS](#) and [EDES.R.SS](#).

#### ———— Note ————

Because the Halting Step state machine states occur as a result of normal PE operation, the states can be described as both:

- PE states.
- Halting Step states.

### H3.2.2 The Halting Step state machine

The state machine states are:

- Inactive** Halting Step is inactive. No Halting Step debug events can be generated, therefore execution is not affected by Halting Step. The PE is in this state whenever either of the following is true:
- Halting Step is disabled. That is, [EDECR.SS](#) is set to 0 and [EDES.R.SS](#) is set to 0.
  - Halting is prohibited. See [Halting the PE on debug events on page H2-5435](#). In this state, if [EDECR.SS](#) is set to 1 then a Halting Step debug event is pending.

In [Figure H3-1 on page H3-5478](#) this state is shown in red.

**Active-not-pending**

Halting Step is enabled and active. This is the state in which the PE steps an instruction. [EDECR.SS](#) == 1 and [EDES.R.SS](#) == 0. Software must not set [EDECR.SS](#) to 1 unless the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE, as described in [Changing the value of EDECR.SS when not in Debug state on page H3-5483](#).

In [Figure H3-1 on page H3-5478](#) this state is shown in green.

### Active-pending

Halting Step is enabled and active. The step has completed, and the PE enters Debug state.  
`EDES.R.SS == 1`.

In [Figure H3-1 on page H3-5478](#) this state is shown in green.

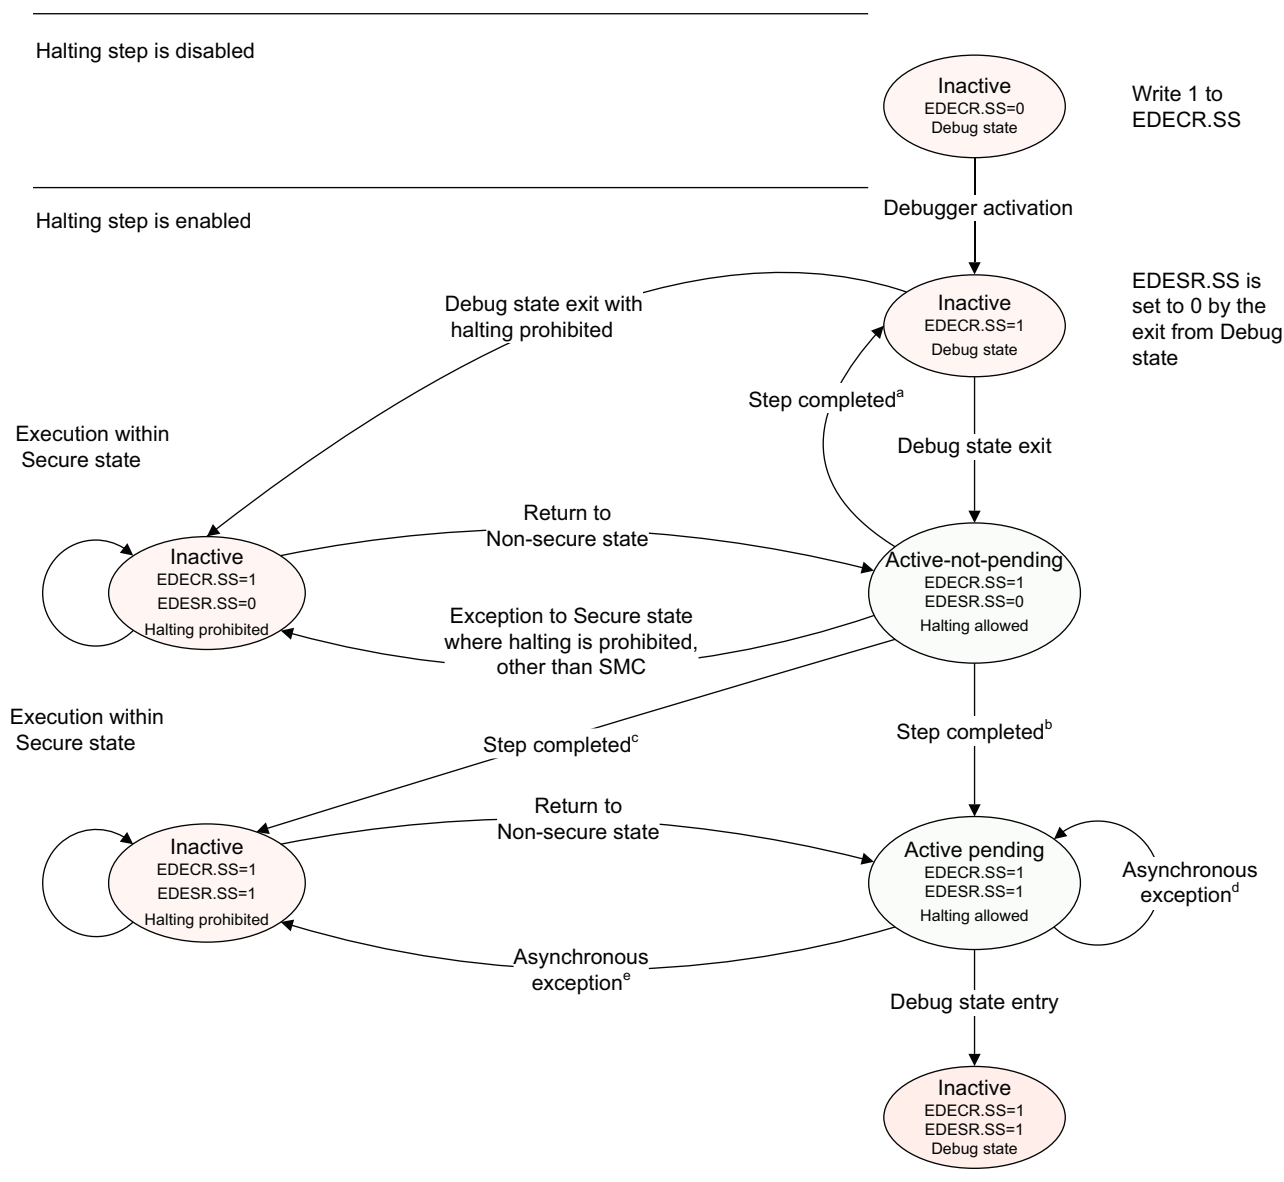

Whenever Halting Step is enabled and active, whether the state machine is in the active-not-pending state or in the active-pending state depends on `EDES.R.SS`. [Halting Step state machine states on page H3-5479](#) shows this.

In the simple sequential execution of the program the PE executes the Halting Step state machine, as follows:

1. Initially, Halting Step is inactive.
2. After exiting Debug state, Halting Step is active-not-pending.
3. The PE executes an instruction and Halting Step is active-pending.
4. The pending Debug state entry is taken on the next instruction and the step is complete.

Exceptions and other changes to the PE context can interrupt this sequence.

Figure H3-1 shows a Halting Step state machine.

- a. Step completed occurs when:
- A debug event, other than a Halting Step debug event, causes entry into Debug state.
- b. Step completed occurs when:
- An instruction is executed without taking an exception.
  - An exception is taken to a state where halting is allowed.
  - A reset.
- c. Step completed occurs when:
- An SMC exception is taken to Secure state where halting is prohibited.
- d. An asynchronous exception taken to a state where halting is allowed.
- e. An asynchronous exception taken to Secure state where halting is prohibited.

Figure H3-1 Halting Step state machine

---

**Note**

---

Figure H3-1 on page H3-5478 only describes state transitions to and from the inactive state by exit from Debug state, executing an exception return, or taking an exception. Other changes to the PE context, including writes to registers such as [EDECR](#) and [OSDLR](#) and changes to the authentication interface can also cause changes to the Halting Step state machine. These can lead to UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior. See [Synchronization and the Halting Step state machine on page H3-5482](#).

The following bits control the state machine, as shown in [Table H3-3](#):

- [EDECR](#).SS. This is the Halting Step enable bit.

---

**Note**

---

- The [EDECR](#) value is preserved over powerdown, meaning that the step active state is maintained over a powerdown event.
- A debugger must only change the value of [EDECR](#).SS when the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE as described in [Changing the value of EDECR.SS when not in Debug state on page H3-5483](#).

- [EDES](#)R.SS. This is the Halting Step debug event pending bit.

[Table H3-3](#) shows the Halting Step state machine states. The letter X in a register column means that the relevant bit can be set to either zero or one.

**Table H3-3 Halting Step state machine states**

Halting	<a href="#">EDECR</a> .SS	<a href="#">EDES</a> R.SS	Halting Step state
Prohibited	X	X	Inactive (Halting Step debug even not pending)
Prohibited	X	1	Inactive (Halting Step debug event pending).
Allowed	0	0	Inactive
Allowed	1	0	Active-not-pending
Allowed	X	1	Active-pending

### H3.2.3 Using Halting Step

To step a single instruction the PE must be in Debug state:

1. The debugger sets [EDECR](#).SS to 1 to enable Halting step.
2. The debugger signals the PE to exit Debug state with [DLR](#) set to the address of the instruction being stepped. The PE clears [EDES](#)R.SS to 0 and the Halting Step state machine enter the active-not-pending state.
3. The PE executes the instruction being stepped.  
If an exception is taken to a state where halting is prohibited, then [EDES](#)R.SS is always correct for the preferred return address of the exception.
4. The PE enters Debug state before executing the next instruction and the step is complete.

### H3.2.4 Detailed Halting Step state machine behavior

The behavior of the Halting Step state machine is described in the following sections:

- [Entering the active-not-pending state on page H3-5480](#).
- [PE behavior in the active-not-pending state on page H3-5480](#).
- [Entering the active-pending state on page H3-5481](#).
- [PE behavior in the active-pending state on page H3-5482](#).
- [PE behavior in the inactive state when in Non-debug state on page H3-5482](#).
- [PE behavior in Debug state on page H3-5482](#).

## Entering the active-not-pending state

The PE enters the active-not-pending state:

- By exiting Debug state with `EDECR.SS == 1`.
- By an exception return from a state where halting is prohibited to a state where halting is allowed with `EDECR.SS == 1` and `EDES.R.SS == 0`.
- As described in *Synchronization and the Halting Step state machine* on page H3-5482.

## PE behavior in the active-not-pending state

When the PE is in the active-not-pending state it does one of the following:

- It executes one instruction and does one of the following:
  - Completes it without generating a synchronous exception.
  - Generates a synchronous exception.
  - Generates a debug event that causes entry to Debug state.
- It takes an asynchronous exception without executing any instruction.
- It takes an asynchronous debug event into Debug state.

### ***If no exception or debug event is generated***

If no exception or debug event is generated the PE sets `EDES.R.SS` to 1. This means that the Halting Step state machine advances to the active-pending state.

### ***If an exception or debug event is generated***

The PE sets `EDES.R.SS` according to all of the following:

- The type of exception.
- The target Exception level of the exception.
- If the exception is taken to Secure state, whether halting is prohibited in Secure state.
  - This is determined by the result of `ExternalSecureInvasiveDebugEnabled()`.

If an exception or debug event is generated, the PE sets `EDES.R.SS` to 1 if one of the following applies:

- A synchronous exception is generated by the instruction and one of the following applies:
  - The exception is taken to EL1 or EL2.
  - The exception is taken to EL3, it is not an SMC exception, and `ExternalSecureInvasiveDebugEnabled() == TRUE`.
  - The exception is an SMC exception.
- An asynchronous exception is generated before executing an instruction and this is either:
  - Taken to EL1 or EL2.
  - Taken to EL3 and `ExternalSecureInvasiveDebugEnabled() == TRUE`.
- A PE reset occurs.

Otherwise `EDES.R.SS` is unchanged. This happens when:

- No instruction is executed because either:
  - An asynchronous exception is taken to EL3 and `ExternalSecureInvasiveDebugEnabled() == FALSE`.
  - An asynchronous debug event causes entry to Debug state.
- An instruction is executed and either:
  - Generates a synchronous exception other than an SMC exception which is taken to EL3, and `ExternalSecureInvasiveDebugEnabled() == FALSE`.

- Generates a synchronous debug event and causes entry to Debug state.

If halting is prohibited after taking the exception or debug event, then the Halting Step state machine advances to the inactive state. Otherwise the Halting Step state machine advances to the active-pending state.

———— **Note** ————

The underlying criteria for the value of [EDES.R.SS](#) on an exception are:

- Whether halting is allowed at the target of the exception. If halting is allowed, the PE must step into the exception. If halting is prohibited, the PE must step over the exception.
- Whether the preferred return address of the exception is the instruction itself or the next instruction, if the PE steps over the exception.

[Table H3-4](#) shows the behavior of the active-not-pending state. The letter X indicates that `ExternalSecureInvasiveDebugEnabled()` can be either TRUE or FALSE.

**Table H3-4 Summary of active-not-pending state behavior**

Event	Target Exception level	<code>ExternalSecureInvasiveDebugEnabled()</code>	Value written to <a href="#">EDES.R.SS</a>
No exception or debug event	Not applicable	X	1
SMC exception	EL3	X	1
Reset	Highest	X	1
Exception, other than SMC exception	EL1	X	1
	EL2	X	1
	EL3	TRUE	1
		FALSE	Unchanged
Debug event	Debug state	X	Unchanged

### Entering the active-pending state

The PE enters the active-pending state by one of the following:

- From the active-not-pending state by:
  - Executing an instruction without taking an exception.
  - Taking an exception so that the PE remains in a state where halting is allowed.
- An exception return from a state where halting is prohibited when [EDES.R.SS](#) == 1.

———— **Note** ————

That is, an exception return from Secure state with `ExternalSecureInvasiveDebugEnabled() == FALSE` to Non-secure state with `ExternalInvasiveDebugEnabled() == TRUE`.

- A reset when the value of [EDECR.SS](#) == 1, regardless of the state the PE was in before the reset occurred.
- From the active-pending state by taking an asynchronous exception to a state where halting is allowed.
- Following the description in [Synchronization and the Halting Step state machine on page H3-5482](#).

### PE behavior in the active-pending state

When the PE is in the active-pending state, it enters Debug state before executing an instruction.

The entry into Debug state has higher priority than all other types of synchronous debug event and synchronous exception. However, the architecture does not define the prioritization of this Debug state entry with respect to any unmasked pending asynchronous exception. If an asynchronous exception is prioritized over the entry to Debug state, then EDESR.SS is unchanged.

For more information on the prioritization of debug events, see [Debug state entry and debug event prioritization on page H2-5437](#).

### PE behavior in the inactive state when in Non-debug state

EDESR.SS is not updated by the execution of an instruction or the taking of an exception when Halting Step is inactive. This means that EDESR.SS is not changed by an exception handled in a state where halting is prohibited.

On return to a state where halting is allowed, the Halting Step state machine is restored either to the active-pending state or the active-not-pending state, depending on the value of EDESR.SS. The return to a state where halting is allowed is normally by an exception return, which is a [Context synchronization event](#).

See also [Synchronization and the Halting Step state machine](#).

### PE behavior in Debug state

Halting Step is inactive in Debug state because halting is prohibited, see [Halting allowed and halting prohibited on page H2-5435](#).

Entry to Debug state does not change EDESR.SS.

EDESR.SS is cleared to 0 on exiting Debug state as the result of a restart request. If EDECR.SS == 1, Halting Step enters the active-not-pending state.

#### ———— Note ————

This means that EDESR.SS is never cleared to 0 by the execution of an instruction in Debug state, or by taking an exception when in Debug state as described in [PE behavior in the active-not-pending state on page H3-5480](#), because the Halting Step state machine is not in the active-not-pending state. EDESR.SS can be cleared by a write to EDESR, see the register description.

However, if the PE exits Debug state as the result of a PE reset and EDECR.SS == 1, then Halting Step immediately enters the active-pending state, as EDESR.SS is set to the value of EDECR.SS.

## H3.2.5 Synchronization and the Halting Step state machine

The Halting Step state machine also changes state if:

- Halting becomes allowed or prohibited other than by exit from Debug state, an exception return, or taking an exception. This means that halting becomes allowed or prohibited because:
  - The security state changes without an exception return. See [State and mode changes without explicit context synchronization events on page G2-4519](#).
  - The external authentication interface changes.
  - The OS Double Lock status, DoubleLockStatus(), changes.
- A write to EDECR when the PE is in Non-debug state changes the value of EDECR.SS.

#### ———— Note ————

Behavior is CONSTRAINED UNPREDICTABLE if the value of EDECR.SS is changed when the PE is in Non-debug state, see [Changing the value of EDECR.SS when not in Debug state on page H3-5483](#).

- A write to [EDES.R](#) when the PE is in Non-debug state clears [EDES.R](#).SS to 0.

These operations are guaranteed to take effect only after a [Context synchronization event](#). If the instruction being stepped generates a [Context synchronization event](#), then the PE might use the old or new state.

The PE must perform the required behavior of the new state before or immediately following the next [Context synchronization event](#), but it is not required to do so immediately. This means that the PE can perform the required behavior of the old state before the next [Context synchronization event](#). This is illustrated in [Example H3-1](#) and [Example H3-2](#).

#### Example H3-1 Synchronization requirements 1

[EDEC.R](#).SS is set to 1 in Debug state, requesting the active-not-pending state on exit from Debug state. On exit from Debug state the PE immediately takes an exception to Secure state. `ExternalSecureInvasiveDebugEnabled() == FALSE`, meaning that halting is prohibited in Secure state. The PE does not step any instructions but executes the software in Secure state as normal. [EDES.R](#).SS remains set to 0. If `ExternalSecureInvasiveDebugEnabled()` subsequently becomes TRUE, meaning that halting is now allowed, the PE must perform the required behavior of the active-not-pending state before or immediately following the next [Context synchronization event](#), but it is not required to do so immediately.

#### Example H3-2 Synchronization requirements 2

[EDEC.R](#).SS is set to 1 in Debug state. On exit from Debug the PE executes an MSR instruction that sets [OSDLR\\_EL1.DLK](#) to 1 and `DoubleLockStatus()` becomes TRUE. This change requires a [Context synchronization event](#) to guarantee its effect, meaning it is CONSTRAINED UNPREDICTABLE whether:

- Halting is allowed:
  - The PE enters Debug state on the next instruction.
- Halting is prohibited:
  - The PE does not enter Debug state.

The value in [EDES.R](#).SS depends on whether halting was allowed or prohibited when the write to [OSDLR\\_EL1.DLK](#) completed, and so it might be 0 or 1. If a second MSR instruction clears [OSDLR\\_EL1.DLK](#) to 0, the PE must perform the required behavior of the state indicated by [EDES.R](#).SS before or immediately following the next [Context synchronization event](#), but it is not required to do so immediately.

See also [Synchronization and Halting debug events on page H3-5494](#).

### Changing the value of [EDEC.R](#).SS when not in Debug state

If software changes the value of [EDEC.R](#).SS when the PE is not in Debug state then behavior is CONSTRAINED UNPREDICTABLE, and one or more of the following behaviors occurs:

- The value of [EDEC.R](#).SS becomes UNKNOWN.
- The state of the Halting Step state machine becomes UNKNOWN.
- On a reset of the PE, the value of [EDEC.R](#).SS and the state of the Halting Step state machine are UNKNOWN.

## H3.2.6 Stepping T32 IT instructions

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and another 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

For the purpose of stepping an item, it is IMPLEMENTATION DEFINED whether:

- The PE considers such a pair of instructions to be one instruction.

- The PE considers such a pair of instructions be two instructions.

It is IMPLEMENTATION DEFINED whether this behavior depends on the value of the applicable ITD bit. For example:

- The debug logic might consider such a pair of instructions as one instruction, regardless of the state of the applicable ITD field.
- The debug logic might consider such a pair of instructions as two instructions, regardless of the state of the applicable ITD field.
- The debug logic might consider such a pair of instructions as one instruction when the value of the applicable ITD field is 1, and as two instructions when the value of the ITD field is 0.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

The ITD control fields are:

**HSCTLR.ITD** Applies to execution at EL2 when EL2 is using AArch32.

**SCTLR.ITD** Applies to execution at EL0 or EL1 when EL1 is using AArch32.

**SCTLR\_EL1.ITD**

Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

### H3.2.7 Disabling interrupts while stepping

When using Halting Step, the sequence of entering Debug state, interacting with the debugger, and then exiting Debug state for each instruction reduces the rate at which the PE executes instructions. However, the rate at which certain interrupts, such as timer interrupts, are generated might be fixed by the system. This means it might be necessary to disable interrupts while using Halting Step by setting **EDSCR.INTdis**, to allow the code being debugged to make forward progress.

### H3.2.8 Syndrome information on Halting Step

Three **EDSCR.STATUS** encodings record different scenarios for entering Debug state on a Halting Step debug event:

#### Halting Step, normal

An instruction other than a Load-Exclusive instruction was stepped.

#### Halting Step, exclusive

A Load-Exclusive instruction was stepped.

#### Halting Step, no syndrome

The syndrome data is not available.

If the PE enters Debug state due to a Halting Step debug event immediately after stepping an instruction in the active-not-pending state, **EDSCR.STATUS** is set to either:

- Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
- Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.

If the stepped instruction was a conditional Load-Exclusive instruction that failed its Condition code check, **EDSCR.STATUS** is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, normal, or Halting Step, exclusive.

Otherwise the PE enters Debug state without stepping an instruction. This means that the Halting Step state machine enters the active-pending state directly from the inactive state, without going through active-not-pending state. In this case, **EDSCR.STATUS** is set to Halting Step, no syndrome. This happens when:

- The PE enters directly into the active-pending state on an exception return to Non-secure state from EL3 when Halting is prohibited in Secure state.
- The active-pending state is entered for other reasons. See *Synchronization and the Halting Step state machine* on page H3-5482

In addition, `EDSCR.STATUS` is set to one of a CONSTRAINED UNPREDICTABLE choice if:

- The instruction being stepped generated a synchronous exception, or a pending asynchronous exception was taken before the instruction was executed.

In this case `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of:

- Halting Step, no syndrome, or Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
- Halting Step, no syndrome, or Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.

- The instruction that was stepped was an exception return instruction or an ISB. As these instructions are not in the Load-Exclusive instructions, `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.
- The PE enters directly into the active-pending state on reset because `EDECR.SS` is set to 1. `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.

In all cases, if `EDSCR.STATUS` is not set to Halting Step, no syndrome, then it must indicate whether the stepped instruction was a Load-Exclusive instruction by setting `EDSCR.STATUS` to Halting Step, normal or Halting Step, exclusive.

———— **Note** —————

In an implementation that always sets `EDSCR.STATUS` to Halting Step, no syndrome is not compliant.

### H3.2.9 Pseudocode description of Halting Step debug events

There are two pseudocode functions for Halting Step debug events:

- `RunHaltingStep()`. This is called after an instruction has executed and any exception generated by the instruction is taken. It is also called after taking a reset before executing any instructions. That is, reset is treated like an asynchronous exception, even if `EDECR.RCE == 1`. `RunHaltingStep()` affects the next instruction.
- `CheckHaltingStep()`. This is called before the next instruction is executed. If a step is pending, it generates the debug event.

## H3.3 Halt Instruction debug event

A Halt Instruction debug event is generated when `EDSCR.HDE == 1`, halting is allowed, and the PE executes the Halt instruction, HLT.

The pseudocode for Halt Instruction debug events is described in [HLT on page C6-628](#) for A64 and [HLT on page F5-3121](#) for A32 and T32.

HLT never generates a debug exception. It is treated as UNDEFINED if `EDSCR.HDE == 0`, or if halting is prohibited.

---

### ———— Note ————

A debugger can replace a program instruction with a Halt instruction to generate a Halt Instruction debug event. Debuggers that use the HLT instruction must be aware of the ARMv8-A rules for concurrent modification of executable code, CMODX. The rules for concurrent modification and execution of instructions do not allow one thread of execution or an external debugger to replace an instruction with an HLT instruction when these same instructions are being executed by a different thread of execution. See [Concurrent modification and execution of instructions on page B2-84](#).

---

The T32 HLT instruction is unconditionally executed inside an IT block, even when it is treated as UNDEFINED. The A32 HLT instruction is CONSTRAINED UNPREDICTABLE if the Condition code field is not `0b1110`, with the set of behaviors the same as for BKPT. See [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

---

### ———— Note ————

The HLT instruction is part of the external debug solution for ARMv8-A. As such, the presence of the HLT instruction is not indicated in the ID registers. In particular, the AArch32 System register `ID_ISAR0`. Debug does not indicate the presence of the HLT instruction.

---

### H3.3.1 HLT instructions as the first instruction in a T32 IT block

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and certain other 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

The T32 HLT instruction cannot be combined with an IT instruction in this way. In an implementation that supports the ITD control, if the first instruction in an IT block is an HLT instruction, then the behavior of the instruction depends on the value of the applicable ITD field:

- If the value of the ITD field is 1, then the combination is treated as UNDEFINED and an Undefined Instruction exception is generated either by the IT instruction or by the HLT instruction.
- If the value of the ITD field is 0, then the HLT instruction unconditionally executed.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

To set an Halt Instruction debug event on the first instruction of an IT block, debuggers must replace the IT instruction with an HLT instruction to ensure consistent behavior.

The ITD control fields are:

**HSCTLR.ITD** Applies to execution at EL2 when EL2 is using AArch32.

**SCTLR.ITD** Applies to execution at EL0 or EL1 when EL1 is using AArch32.

**SCTLR\_EL1.ITD**

Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

---

### ———— Note ————

An HLT instruction is always unconditional, even within an IT block.

---

## H3.4 Exception Catch debug event

Exception Catch debug events:

- Are generated when the corresponding bit in the Exception Catch Control Register, [EDECCR](#), is set to 1 on all entries to a given Exception level. This means:
  - Exceptions taken to the Exception level.
  - Exception returns to the Exception level.
- Are taken synchronously, after entry to the Exception level.
- Ignore the Execution state of the target Exception level.
- Are ignored if halting is prohibited.

From ARMv8.2 the definition is extended to include generation of Exception Catch debug events on reset entry, see [Exception Catch debug events from ARMv8.2 on page H3-5489](#).

The [EDECCR](#) contains two sets of fields:

- One set for Non-secure state.
- One set for Secure state.

Each set of fields control generation of Exception Catch debug events:

- On exception entry [and, from ARMv8.2, on reset entry](#).
- On exception return.

Each field within each set contains one bit for each Exception level in that state. Bits corresponding to Exception levels that are not implemented are RES0. See [EDECCR, External Debug Exception Catch Control Register on page H9-5622](#).

### ———— Note ————

- [EDECCR](#) does not replace [DBGVCR](#):
  - [DBGVCR](#) is retained in AArch32 state for backwards compatibility.
  - [DBGVCR](#) is ignored in AArch64 state and never generates entries to Debug state.
  - [DBGVCR](#) cannot be accessed by the external debug interface.
- [EDECCR](#) is only visible as [OSECCR\\_EL1](#) by System register instructions in AArch64 state, and as [DBGOSECCR](#) by System register access instructions in AArch32 state, when the OS Lock is locked to allow software to save and restore it over a powerdown.
- Exception Catch debug events are not disabled when the OS Lock is locked.

For an Exception Catch debug event generated after taking an exception to a trapped Exception level:

- The PE must not fetch instructions from the vector address before entering Debug state, if address translation is disabled in the translation regime at the target Exception level.
- On entering Debug state:
  - The current Exception level is the target Exception level of the exception.
  - The ELR, SPSR, ESR, and other syndrome registers contain information about the exception.
  - [DLR](#) contains the exception vector address [or, from ARMv8.2, the reset address](#).

### H3.4.1 Prioritization of Exception Catch debug events

The following rules define the prioritization of Exception Catch debug events:

- It is IMPLEMENTATION DEFINED whether Exception Catch debug events are higher or lower priority than each of [Software Step exceptions](#) and [Halting Step debug events](#).

- Exception Catch debug events are higher priority than all synchronous exceptions other than [Software Step exceptions](#).
- Exception Catch debug events are lower priority than [Reset Catch debug events](#).

---

**Note**

As described in [Synchronous exception prioritization for exceptions taken to AArch64](#) on page D1-1827, an exception trapping form of a Vector Catch debug event might generate a second debug exception as part of the exception entry, before the Exception Catch debug event is taken. See [Vector Catch exceptions](#) on page D2-1955 or [Vector Catch exceptions](#) on page G2-4510.

A second unmasked asynchronous exception can be taken before the PE enters Debug state. If this second exception does not generate an Exception Catch debug event, the exception handler executed at the higher Exception level later returns to the trapped Exception level, causing the Exception Catch debug event to be generated again.

See also [Debug state entry and debug event prioritization](#) on page H2-5437.

From ARMv8.2, when an Exception Catch debug event is generated on exception entry, the PE must enter Debug state as part of the exception entry:

- After the exception entry has updated the program counter, PSTATE and syndrome registers for the exception.
- Before the first instruction at the handler is executed.
- Before any asynchronous or lower priority synchronous exception or debug event is taken at the first instruction in the exception handler.

From ARMv8.2, when an Exception Catch debug event is generated on exception return, the PE must enter Debug state:

- After the exception return has updated the program counter and PSTATE.
- Before the execution of the first instruction at the return address is completed.

---

**Note**

From ARMv8.2, there is no prioritization between asynchronous exceptions, asynchronous debug events, and an Exception Catch debug event generated on an exception return.

### H3.4.2 CONSTRAINED UNPREDICTABLE generation of Exception Catch debug events

When [ARMv8.2-Debug is not implemented](#), the PE is executing code at a given Exception level, and the corresponding [EDECCR](#) bit is 1, it is CONSTRAINED UNPREDICTABLE whether an Exception Catch debug event is generated.

---

**Note**

It is possible to generate Exception Catch debug events:

- As a trap on all instruction fetches from the trapped Exception level as part of an instruction fetch.
- On entry to the Exception level, as described in [Detailed Halting Step state machine behavior](#) on page H3-5479.

This is similar to the implementation options allowed for Vector Catch debug events. The architecture does not require that the event is generated following an ISB operation executed at the Exception level.

Examples of this are:

- If the debugger writes to [EDECCR](#) so that the current Exception level is trapped.
- If the OS restore code writes to [OSECCR](#) so that the current Exception level is trapped.

- If the code executing in AArch32 state changes the Exception level or security state other than by an exception return, and the target Exception level is trapped. See [State and mode changes without explicit context synchronization events](#) on page G2-4519.

When ARMv8.2-Debug is implemented, there are no CONSTRAINED UNPREDICTABLE cases that are permitted to generate Exception Catch debug events.

### H3.4.3 Exception Catch debug events from ARMv8.2

From ARMv8.2, the definition of Exception Catch debug events is extended so that Exception Catch debug events can be generated from:

- Exception entry.
- Reset entry.
- Exception return.

It is IMPLEMENTATION DEFINED whether a reset into an Exception level generates an Exception Catch debug event.

Exception catch debug events are taken synchronously, after the exception or reset entry or the exception return has been processed by the PE.

For exception returns, the final Exception level of the exception return determines whether an Exception Catch debug event is generated. On an illegal exception return an Exception Catch debug event is generated only if EDECCR is programmed to generate an Exception Catch debug event for an exception return to the current Exception level.

### H3.4.4 Examples of Exception Catch debug events

If `EDECCR == 0x20`, meaning that the Exception Catch debug event is enabled for Non-secure EL1, then the following exceptions generate Exception Catch debug events:

- An exception taken from Non-secure EL0 to Non-secure EL1.
- An exception return from EL2 to Non-secure EL1.
- An exception return from EL3 to Non-secure EL1.

For example, on taking a Data Abort exception from Non-secure EL0 to Non-secure EL1, using AArch64:

- `ELR_EL1` and `SPSR_EL1` are written with the preferred return address and PE state for a return to EL0.
- `ESR_EL1` and `FAR_EL1` are written with the syndrome information for the exception.
- `DLR_EL0` is set to `VBAR_EL1 + 0x400`, the synchronous exception vector.
- `DSPSR_EL0` is written with the PE state for an exit to EL1.

The following do not generate Exception Catch debug events:

- An exception taken from Non-secure EL0 to EL2 or EL3.
- An exception return from EL2 to Non-secure EL0.
- An exception taken from Secure EL0 to Secure EL1.
- An exception return from EL3 to Secure EL1.

### H3.4.5 Pseudocode description of Exception Catch debug events

The pseudocode function `CheckExceptionCatch()` is described in [Chapter J1 ARMv8 Pseudocode](#).

## H3.5 External Debug Request debug event

External Debug Request debug events are asynchronous debug events.

An External Debug Request debug event is generated when signaled by the embedded cross-trigger. See [Chapter H5 The Embedded Cross-Trigger Interface](#).

---

### ———— Note ————

ARMv8-A requires the implementation of an embedded cross-trigger.

---

An implementation might also support IMPLEMENTATION DEFINED ways of generating an External Debug Request debug event.

### H3.5.1 Synchronization and External Debug Request debug events

An External Debug Request debug event that is asserted before a [Context synchronization event](#) is taken and the PE enters Debug state before the first instruction following the [Context synchronization event](#) completes its execution, provided that halting is allowed after completion of the [Context synchronization event](#).

An External Debug Request debug event that is being asserted when the PE comes out of reset is taken, and the PE enters Debug state before the first instruction after the reset completes its execution, provided that halting is allowed when the PE exits reset state.

If the first instruction after the [Context synchronization event](#) or after coming out of reset generates a synchronous exception then the architecture does not define the order in which the debug event and the exception or exceptions are taken.

Otherwise, when halting is allowed, External Debug Request debug events must be taken in finite time, without requiring the synchronization of any necessary change to the external authentication interface.

---

### ———— Note ————

These rules are based on the rules that apply when taking asynchronous exceptions. See [Asynchronous exception types, routing, masking and priorities](#) on page D1-1834.

---

If an unmasked External Debug Request debug event was pending but is changed to not pending before it is taken, then the architecture permits the External Debug Request debug event to be taken, but does not require this to happen. If the External Debug Request debug event is taken then it must be taken before the first [Context synchronization event](#) after the External Debug Request debug event was changed to not pending.

[Example H3-3](#) shows an example of the synchronization requirements.

#### Example H3-3 Synchronization requirements

---

Secure software locks up in a tight loop, so it executes indefinitely without any synchronization operations. An External debug request must be able to break the PE out of that loop. This is a requirement even if **DBGEN** or **SPIDEN** or both are LOW on entry to the loop, meaning that halting is prohibited, and are only asserted HIGH later.

---

### H3.5.2 Pseudocode description of External Debug Request debug events

The `ExternalDebugRequest()` function is described in [Chapter J1 ARMv8 Pseudocode](#).

## H3.6 OS Unlock Catch debug event

An OS Unlock Catch debug event is generated when `EDECR.OSUCE == 1` and the state of the OS Lock changes from locked to unlocked.

When the OS Lock is unlocked, the PE sets `EDESR.OSUC` to 1 if `EDECR.OSUCE` is set to 1 and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. However, this is an indirect write to `EDESR.OSUC`, meaning the OS Unlock Catch debug event is not guaranteed to be taken before a subsequent context synchronization event. If the PE enters Debug state or `EDECR.OSUCE` is cleared to 0 before `EDESR.OSUC` becomes set to 1, then `EDESR.OSUC` might not be set.

OS Unlock Catch debug events are not generated if the OS Lock is unlocked when the PE is in Debug state. See also:

- [Synchronization and Halting debug events on page H3-5494.](#)
- [EDECR, External Debug Execution Control Register on page H9-5626.](#)
- [EDESR, External Debug Event Status Register on page H9-5628.](#)

`EDESR.OSUC` is cleared to 0 on a Warm reset and on exiting Debug state.

### H3.6.1 Using the OS Unlock Catch debug event

If the debugger attempts to access a debug register when the Core power down domain is completely off or in a low-power state in which the core power domain registers cannot be accessed, and that access returns an error, then the debugger must retry the access. However, if the Core power domain is regularly powered down, this can lead to unreliable debugger behavior.

The debugger can program a Reset Catch debug event to halt the PE when it has powered up, and can program the debug registers from Debug state. However, if the PE boot software restores the debug registers, as described in [Debug OS Save and Restore sequences on page H6-5541](#), then newly written values are overwritten by the restore sequence.

The debugger can program an OS Unlock Catch debug event to halt the PE after the restore sequence has completed, and program the debug registers from Debug state.

### H3.6.2 Pseudocode description of OS Unlock Catch debug event

The `CheckOSUnlockCatch()` function is called when the OS Lock is unlocked.

The `CheckPendingOSUnlockCatch()` function is called before an instruction is executed. If an OS Unlock Catch is pending, it generates the debug event.

## H3.7 Reset Catch debug events

A Reset Catch debug event is generated when `EDECR.RCE == 1` and the PE exits reset state. When the Reset Catch debug event is generated, it is recorded by setting `EDESR.RC` to 1.

If halting is allowed when the event is generated, the Reset Catch debug event is taken immediately and synchronously. On entering Debug state, `DLR` has the address of the reset vector. The PE must not fetch any instructions from memory.

Otherwise, the Reset Catch debug event is pended and taken when halting is allowed. See also:

- [Synchronization and Halting debug events](#) on page H3-5494.
- [EDECR, External Debug Execution Control Register](#) on page H9-5626.
- [EDESR, External Debug Event Status Register](#) on page H9-5628.

This means that `EDESR.RC` is set to the value of `EDECR.RCE` on a Warm reset. `EDESR.RC` is cleared to 0 on exiting Debug state.

### H3.7.1 Pseudocode description of Reset Catch debug event

The `CheckResetCatch()` function is called after reset before executing any instruction.

The `CheckPendingResetCatch()` function is called before an instruction is executed. If a Reset Catch is pending, it generates the Reset Catch debug event.

## H3.8 Software Access debug event

When the value of [EDSCR.TDA](#) == 1, software access to the following debug AArch64 and AArch32 System registers cause a trap to Debug state:

- The Breakpoint Value Registers, [DBGBVR](#).
- The Breakpoint Control Registers, [DBGBCR](#).
- The Watchpoint Value Registers, [DBGWVR](#).
- The Watchpoint Control Registers, [DBGWCR](#).

However, [EDSCR.TDA](#) is ignored if one of:

- The value of [OSLSR.OSLK](#) == 1, meaning that the OS Lock is locked.
- Halting is prohibited. See *Halting allowed and halting prohibited* on page H2-5435.
- The register access generates an exception.

---

### Note

- [DBGPRCR.CORENPDRQ](#) (Core No-powerdown Request), DCC registers, and CLAIM tag bits are also shared, but are deliberately excluded from this list.
  - The only accesses that generate a trap are:
    - Accesses to System registers in AArch64 state.
    - Accesses to System registers in the (coproc==0b1110) encoding space in AArch32 state.Accesses to the external debug interface by a PE are not trapped.
- 

### H3.8.1 Pseudocode description of Software Access debug event

The [CheckSoftwareAccessToDebugRegisters\(\)](#) function is described in [Chapter J1 ARMv8 Pseudocode](#).

## H3.9 Synchronization and Halting debug events

The behavior of external debug depends on:

- Indirect reads of:
  - External debug registers.
  - System registers, including system debug registers.
  - Special-purpose registers.
- The state of the external authentication interface.

For some registers, all read and write accesses that update the register occur in program order, without any additional synchronization, but others require an explicit *Context synchronization event*. For more information on the synchronization of register updates see:

- *Synchronization requirements for AArch64 System registers* on page D7-2191.
- *Synchronization of changes to the external debug registers* on page H8-5554.
- *State and mode changes without explicit context synchronization events* on page G2-4519.

Changes to the external authentication interface do not require explicit synchronization to affect External Debug Request debug events. See *Synchronization and External Debug Request debug events* on page H3-5490.

For changes that require explicit synchronization, it is CONSTRAINED UNPREDICTABLE whether instructions between the change and the *Context synchronization event* observe the old state or the new state.

This means that any change to these registers or the external authentication interface requires explicit synchronization by a *Context synchronization event* before the change takes effect. This ensures that for instructions appearing in program order after the change, the change affects the following:

- The generation and behavior of Breakpoint and Watchpoint debug events. See *Synchronization and debug exceptions* on page D2-1970 for exceptions taken from AArch64 state, or *Synchronization and debug exceptions* on page G2-4518 for exceptions taken from AArch32 state.
- The generation of all Halting debug events by instructions.
- Taking a pending Halting debug event or other asynchronous Debug event. See:
  - *Pending Halting debug events*.
  - *Synchronization and External Debug Request debug events* on page H3-5490.
- The behavior of the Halting Step state machine. See *Synchronization and the Halting Step state machine* on page H3-5482.

### H3.9.1 Pending Halting debug events

A Halting debug event might be pending:

1. If Halting Step of an instruction sets EDESR.SS is set to 1, and halting is prohibited following the step, then the Halting Step state machine is inactive but a Halting Step debug event is pending.
2. If a Reset Catch debug event sets EDESR.RC to 1, and halting is prohibited following reset, then a Reset Catch debug event is pending.
3. If an OS Unlock Catch debug event sets EDESR.OSUC to 1, then an OS Unlock Catch debug event is pending.

Pending Halting debug events are taken asynchronously when halting is allowed.

Pending Halting debug events are discarded by a Cold reset. The debugger can also force a pending event to be dropped by writing to EDESR.

Any Halting debug event that is observed as pending in the EDESR before a *Context synchronization event* is taken and the PE enters Debug state before the first instruction following the *Context synchronization event* completes its execution. This is only possible if halting is allowed after completion of the *Context synchronization event*.

If the first instruction after the *Context synchronization event* generates a synchronous exception then the architecture does not define the order in which the debug event and the exception or exceptions are taken, unless both:

- A Halting Step debug event is pending. `EDESR.SS == 1`.
- The *Context synchronization event* is an exception return from a state where halting is prohibited to a state where halting is allowed.

---

**Note**

This applies to an exception return from Secure state with `ExternalSecureInvasiveDebugEnabled() == FALSE` to Non-secure state with `ExternalInvasiveDebugEnabled() == TRUE`.

---

In this case the order in which the debug events are handled is specified to avoid a double-step. See *Entering the active-pending state* on page H3-5481.

If an asynchronous exception is also pending after the *Context synchronization event* then the architecture does not define the order in which the debug event and the exception or exceptions are taken.

---

**Note**

These rules are based on the rules that apply to taking asynchronous exceptions. See *Asynchronous exception types, routing, masking and priorities* on page D1-1834.

---

# Chapter H4

## The Debug Communication Channel and Instruction Transfer Register

This chapter describes communication between a debugger and the implemented debug logic, using the *Debug Communications Channel* (DCC) and the *Instruction Transfer Register* (ITR), and associated control flags. It contains the following sections:

- [Introduction on page H4-5498.](#)
- [DCC and ITR registers on page H4-5499.](#)
- [DCC and ITR access modes on page H4-5502.](#)
- [Flow control of the DCC and ITR registers on page H4-5506.](#)
- [Synchronization of DCC and ITR accesses on page H4-5509.](#)
- [Interrupt-driven use of the DCC on page H4-5514.](#)
- [Pseudocode description of the operation of the DCC and ITR registers on page H4-5515.](#)

---

### Note

---

Where necessary [Table K11-1 on page K11-6282](#) disambiguates the general register references used in this chapter.

---

## H4.1 Introduction

The *Debug Communications Channel*, DCC, is a channel for passing data between the PE and an external agent, such as a debugger. The DCC provides a communications channel between:

- An external debugger, described as the *debug host*.
- The debug implementation on the PE, described as the *debug target*.

The DCC can be used:

- As a 32-bit full-duplex channel.
- As a 64-bit half-duplex channel.

The DCC is an essential part of Debug state operation and can also be used in Non-debug state.

The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state.

The PE includes flow-control mechanisms for both the DCC and ITR.

## H4.2 DCC and ITR registers

The DCC comprises *data transfer registers*, the DTRs, and associated flow-control flags. The data transfer registers are DTRRX and DTRTX.

The ITR comprises a single register, [EDITR](#), and associated flow-control flags.

In AArch64 state, software can access the data transfer registers as:

- A receive and transmit pair for 32-bit full duplex operation:
  - The write-only [DBGDTRTX\\_EL0](#) register to transmit data.
  - The read-only [DBGDTRRX\\_EL0](#) register to receive data.
- A single 64-bit read/write register, [DBGDTR\\_EL0](#), for 64-bit half-duplex operation.
- The read/write [OSDTRTX\\_EL1](#) and [OSDTRRX\\_EL1](#) registers for save and restore.

In AArch32 state, software can only access the data transfer registers as:

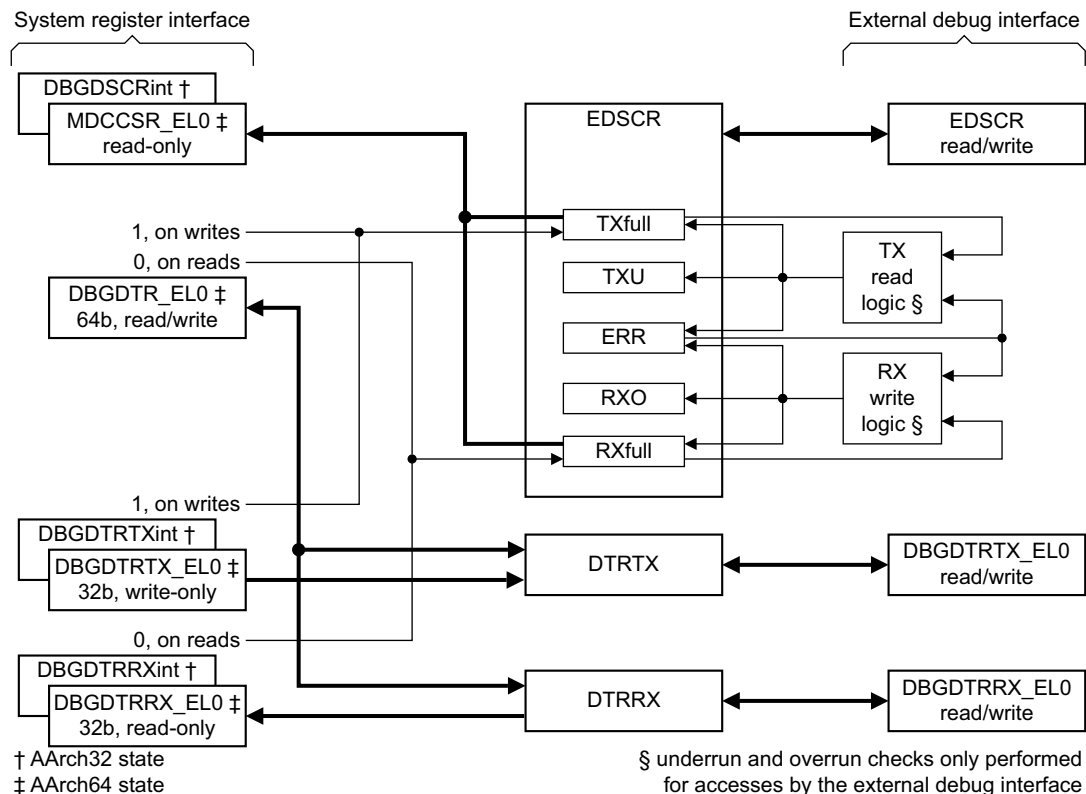

- A receive and transmit pair, for 32-bit full duplex operation:
  - The write-only [DBGDTRTXint](#) register to transmit data.
  - The read-only [DBGDTRRXint](#) register to receive data.
- The read/write [DBGDTRTXext](#) and [DBGDTRRXext](#) registers for save and restore.

The data transfer registers are also accessible by the external debug interface as a pair of 32-bit registers, [DBGDTRRX\\_EL0](#) and [DBGDTRTX\\_EL0](#). Both registers are read/write, allowing both 32-bit full-duplex and 64-bit half-duplex operation.

The DCC flow-control flags are [EDSCR](#). {RXfull, TXfull, RXO, TXU}:

- The RXfull and TXfull ready flags are used for flow-control and are visible to software in the debug System registers in [DCCSR](#).
- The RX overrun flag, RXO, and the TX underrun flag, TXU, report flow-control errors.
- The flow-control flags are also accessible by software as simple read/write bits for saving and restoring over a powerdown when the OS Lock is locked in [DSCR](#).
- The flow-control flags are accessible from the external debug interface in [EDSCR](#).

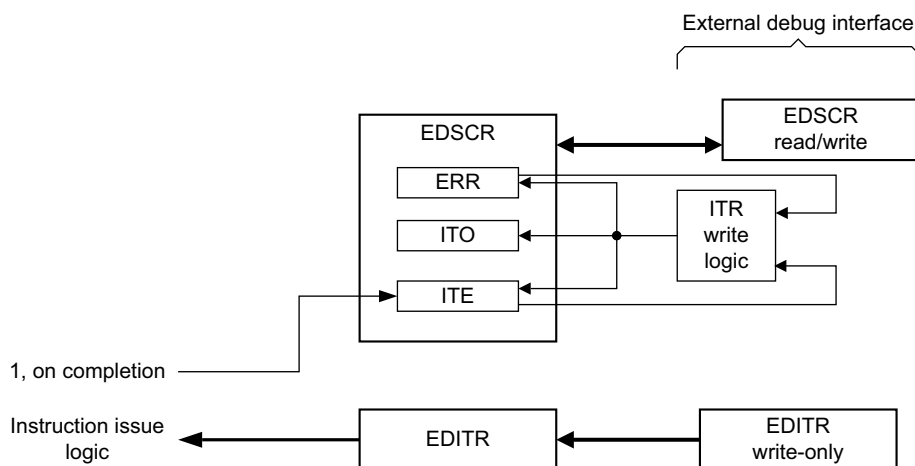

[Figure H4-1 on page H4-5500](#) shows the System register and external debug interface views of the [EDSCR](#) and DTR registers in both AArch64 state and AArch32 state. These figures do not include the save and restore views.

**Figure H4-1 System register and external debug interface views of EDSCR and DTR registers, Normal access mode**

**EDITR** and the ITR flow-control flags, **EDSCR**.{ITE, ITO} are accessible only by the external debug interface:

- The **EDITR** specifies an instruction to execute in Debug state.
- The ITR empty flag, ITE, is used for flow-control.
- The ITR overrun flag, ITO, reports flow-control errors.

**Figure H4-2 External debug interface views of EDSCR and EDITR registers, Normal access mode**

The sticky overflow flag, **EDSCR**.ERR, is used by both the DCC and ITR to report flow-control errors.

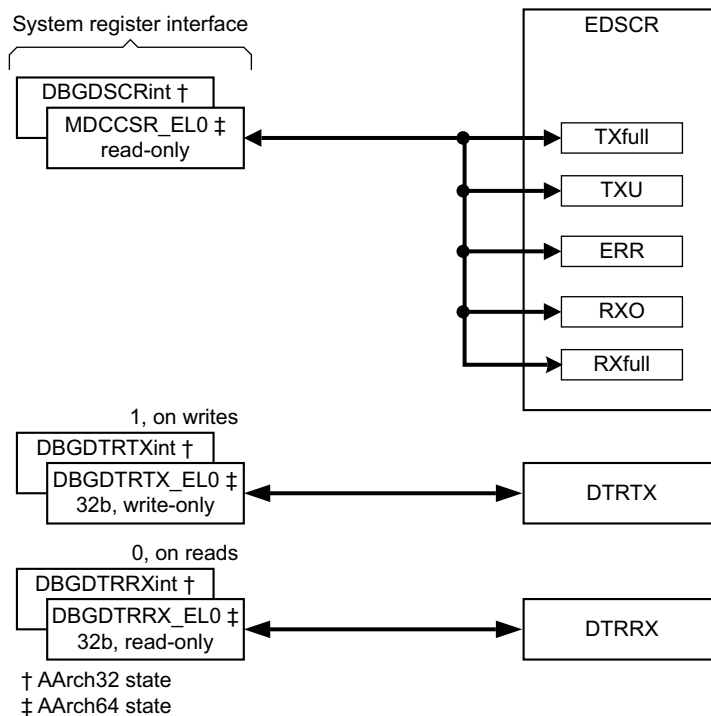

To save and restore the DCC registers for an external debugger over powerdown, software uses:

- The **MDSCR\_EL1**, **OSDTRTX\_EL1**, and **OSDTRRX\_EL1** registers in AArch32 state.

- The [DBGDSCRext](#), [DBGDTRTXext](#), and [DBGDTRRXext](#) registers in AArch64 state.

———— **Note** ————

There is no save and restore mechanism for the ITR registers as the ITR is only used in Debug state.

**Figure H4-3 System register views of EDSCR and DTR registers for save and restore**

## H4.3 DCC and ITR access modes

The DCC and ITR support two access modes:

DCC and ITR access mode, links to description	Applies when:
<a href="#">Normal access mode</a>	<code>EDSCR.MA == 0</code> or the PE is in Non-debug state
<a href="#">Memory access mode on page H4-5503</a>	<code>EDSCR.MA == 1</code> and the PE is in Debug state

### H4.3.1 Normal access mode

The Normal access mode allows use of the DCC as a communications channel between target and host. It also allows the use of the ITR for issuing instructions to the PE in Debug state.

In Normal access mode, if there is no overrun or underrun, the following occurs:

**For accesses by software:**

- Direct writes to [DBGDTRTX](#) update the value in DTRTX and indirectly write 1 to TXfull.
- Direct reads from [DBGDTRRX](#) return the value in DTRRX and indirectly write 0 to RXfull.
- In AArch64 state, direct writes to [DBGDTR\\_EL0](#) update both DTRTX and DTRRX, indirectly write 1 to TXfull, and do not change RXfull:
  - DTRTX is set from bits[31:0] of the transfer register.
  - DTRRX is set from bits[63:32] of the transfer register.
- In AArch64 state, direct reads from [DBGDTR\\_EL0](#) return the concatenation of DTRRX and DTRTX, indirectly write 0 to RXfull, and do not change TXfull:
  - Bits[31:0] of the transfer register are set from DTRRX.
  - Bits[63:32] of the transfer register are set from DTRTX.

#### Note

For [DBGDTR\\_EL0](#), the word order is reversed for reads with respect to writes.

Software reads TXfull and RXfull using [DCCSR](#).

**For accesses by the external debug interface:**

- Writes to [EDITR](#) trigger the instruction to be executed if the PE is in Debug state:
  - If the PE is in AArch64 state, this is an A64 instruction.
  - If the PE is in AArch32 state, this is a T32 instruction. The T32 instruction is a pair of halfwords where the first halfword is taken from the lower 16-bits, and the second halfword is taken from the upper 16-bits.
- Reads of [DBGDTRTX\\_EL0](#) return the value in DTRTX and indirectly write 0 to TXfull.
- Writes to [DBGDTRTX\\_EL0](#) update the value in DTRTX and do not change TXfull.
- Reads of [DBGDTRRX\\_EL0](#) return the value in DTRRX and do not change RXfull.
- Writes to [DBGDTRRX\\_EL0](#) update the value in DTRRX and indirectly write 1 to RXfull.

TXfull and RXfull are visible to the external debug interface in [EDSCR](#).

The PE detects overrun and underrun by the external debug interface, and records errors in [EDSCR](#). {TXU, RXO, ITO, ERR}. See [Flow control of the DCC and ITR registers on page H4-5506](#).

See also [Synchronization of DCC and ITR accesses on page H4-5509](#).

## H4.3.2 Memory access mode

When the PE is in Debug state, *Memory access mode* can be selected to accelerate word-aligned block reads or writes of memory by an external debugger. Memory access mode can only be enabled in Debug state, and no instructions can be issued directly by the debugger when in Memory access mode.

If there is no overrun or underrun when in Memory access mode, an access by the external debug interface results in the following:

- External reads from [DBGDTRTX\\_ELO](#) cause:
  1. The existing value in DTRTX to be returned. This clears [EDSCR.TXfull](#) to 0.
  2. The equivalent of LDR W1, [X0], #4, if in AArch64 state, or LDR R1, [R0], #4, if in AArch32 state, to be executed.
  3. The equivalent of the MSR DBGDTRTX\_ELO, X1 instruction, if in AArch64 state, or the MCR p14, 0, R1, c0, c5, 0 instruction, if in AArch32 state, to be executed.
  4. [EDSCR.{TXfull, ITE}](#) to be set to {1, 1}, and X1 or R1 to be set to an UNKNOWN value.
- External writes to [DBGDTRRX\\_ELO](#) cause:
  1. The value in DTRRX to be updated. This sets [EDSCR.RXfull](#) to 1.
  2. The equivalent of the instruction MRS X1, DBGDTRRX\_ELO, if in AArch64 state, or MRC p14, 0, R1, c0, c5, 0 if in AArch32 state, to be executed.
  3. The equivalent of the instruction STR W1, [X0], #4, if in AArch64 state, or STR R1, [R0], #4, if in AArch32 state, to be executed.
  4. [EDSCR.{RXfull, ITE}](#) to be set to {0, 1}, and X1 or R1 to be set to an UNKNOWN value.
- External reads from [DBGDTRRX\\_ELO](#) return the last value written to DTRRX.
- External writes to [EDITR](#) generate an overrun error.

During these accesses, [EDSCR.{TXfull, RXfull, ITE}](#) are used for flow control.

The architecture does not require precisely when these flags are set or cleared by the sequence of operations outlined in this section. For example, in the case of an external write to [DBGDTRRX\\_ELO](#), in AArch64 state, RXfull might be cleared after step 2, or it might not be cleared until after step 3, as an implementation is free to fuse these steps into a single operation. The architecture does require that the flags are set as at step 4 when the PE is ready to accept a further read or write without causing an overrun error or an underrun error.

The process outlined in this section represents a simple sequential execution model of Memory access mode. An implementation is free to pipeline, buffer, and re-order instructions and transactions, as long as the following remain true:

- Data items are transferred into and out of the DTR in order and without loss of data, other than as a result of an overrun or an underrun.
- Data Aborts occur in order.
- The constraints of the memory type are met.
- In the list describing *External reads from DBGDTRTX\_ELO*:
  - The MSR equivalent operation at step 3 of the sequence reads the value loaded by step 2.
  - If the list is performed in a loop, for all but the first iteration of this list, the value read by step 1 returns the values written by the MSR equivalent operation at the previous iteration of step 3.
- In the list describing *External writes to DBGDTRRX\_ELO*:
  - The MRS equivalent operation at step 2 of the sequence returns the value written at step 1.
  - The STR equivalent at step 3 of the sequence writes the value read at step 2.
- If the PE cannot accept a read or write, as applicable, during the sequence, then the flags are updated to indicate an overrun or underrun

See *Flow control of the DCC and ITR registers* on page H4-5506 for more information on overrun and underrun.

## Ordering, access sizes and effect on Exclusives monitors

For the purposes of memory ordering, access sizes, and effect on the Exclusives monitor, accesses in Memory access mode are consistent with Load/Store word instructions executed by the PE.

The simple sequential access model of Memory-access mode, as stated in [Memory access mode on page H4-5503](#), must also be ordered with respect to instructions executed as a result of explicit writes to [EDITR](#) in Normal mode both before and after accesses to the DTR registers in Memory-access mode.

## Data Aborts in Memory access mode

If a memory access generates a Data Abort, then:

- The Data Abort exception is taken. See [Exceptions in Debug state on page H2-5465](#):
  - This means [EDSCR.ERR](#) is set to 1, see [Cumulative error flag on page H4-5508](#).
  - If the Data Abort occurs on stage 2 of an address translation, then the values returned in the ISV field and in bits[23:14] of the ISS are UNKNOWN.  
If this Data Abort is taken to EL2 using AArch64, the ISS is returned by [ESR\\_EL2. ISS encoding for an exception from a Data Abort on page D7-2277](#) describes the usual encoding of this ISS.  
If EL2 is using AArch32 and this Data Abort is taken to Hyp mode, the ISS is returned by [HSR. ISS encoding for an exception from a Data Abort on page G6-4960](#) describes the usual encoding of this ISS.
- Register R0 retains the address that generated the abort.
- Register R1 is set to an UNKNOWN value.
- [EDSCR.TXfull](#), for a load, or [EDSCR.RXfull](#), for a store, is set to an UNKNOWN value.
- DTRTX, for a load, or DTRRX, for a store, is set to an UNKNOWN value.
- [EDSCR.ITE](#) is set to 1.

## Illegal Execution state exception

If PSTATE.IL is set to 1 when [EDSCR.MA](#) == 1, then on an external write access to [DBGDTRRX\\_EL0](#) or an external read from [DBGDTRTX\\_EL0](#), it is CONSTRAINED UNPREDICTABLE whether the PE:

- Takes an Illegal Execution state exception without performing any operations. In this case:
    - [EDSCR.ERR](#) is set to 1, see [Cumulative error flag on page H4-5508](#).
    - Register R0 is unchanged.
    - Register R1 is set to an UNKNOWN value.
    - [EDSCR.TXfull](#) or [EDSCR.RXfull](#), as applicable, is set to an UNKNOWN value.
    - DTRTX or DTRRX, as applicable, is set an UNKNOWN value.
    - [EDSCR.ITE](#) is set to 1.
- See also [Exceptions in Debug state on page H2-5465](#).
- Ignores [PSTATE.IL](#).

### ———— Note —————

The typical usage model for Memory access mode involves executing instructions in Normal access mode to set up X0 before setting [EDSCR.MA](#) to 1. These instructions generate an Illegal state exception if [PSTATE.IL](#) is set to 1.

### Alignment constraints

If the address in R0 is not aligned to a multiple of four, the behavior is as follows:

- For each external DTR access a CONSTRAINED UNPREDICTABLE choice of:
  1. The PE makes an unaligned memory access to R0. If alignment checking is enabled for the memory access, this generates an Alignment fault.
  2. The PE makes a memory access to  $\text{Align}(X[0], 4)$  in AArch64 state, or  $\text{Align}(R[0], 4)$  in AArch32 state.
  3. The PE generates an Alignment fault, regardless of whether alignment checking is enabled.
  4. The PE does nothing.
- Following each memory access, if there is no Data Abort, R0 is updated with an UNKNOWN value.
- For external writes to [DBGDTRRX\\_EL0](#), if the PE writes to memory, an UNKNOWN value is written.
- For external reads of [DBGDTRTX\\_EL0](#) an UNKNOWN value is returned.
- The RXfull and TXfull flags are left in an UNKNOWN state, meaning that a [DBGDTRTX\\_EL0](#) read can trigger a TX underrun, and a [DBGDTRTX\\_EL0](#) write can trigger an RX overrun.

#### H4.3.3 Memory-mapped accesses to the DCC and ITR

Writes to the flags in [EDSCR](#) by external debug interface accesses to the DCC and the ITR registers are indirect writes, because they are a side-effect of the access. The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see [Register access permissions for memory-mapped accesses](#) on page H8-5558.

## H4.4 Flow control of the DCC and ITR registers

This sub-section describes the flow-control of the DCC and ITR registers:

- [Ready flags](#).
- [Buffering writes to EDITR](#).
- [Overflow and underflow flags](#) on page H4-5507.
- [Cumulative error flag](#) on page H4-5508.

### H4.4.1 Ready flags

In Normal access mode:

- For the DTR registers there are two ready flags:
  - `EDSCR.RXfull` == 1 indicates that `DBGDTRRX_EL0` contains a valid value that has been written by the external debugger and not yet read by software running on the target.
  - `EDSCR.TXfull` == 1 indicates that `DBGDTRTX_EL0` contains a valid value that has been written by software running on the target and not yet read by an external debugger.
- For the ITR register there is a single ready flag:
  - `EDSCR.ITE` == 1 indicates that the PE is ready to accept an instruction to the ITR.

———— **Note** ————

The architecture permits a PE to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, as long as those instructions are discarded if `EDSCR.ERR` is set, either by an underflow or overflow or by any of the other error conditions described in this architecture, such as an instruction generating an abort.

In Memory access mode:

- `EDSCR.{RXfull, ITE}` == {0,1} indicates that `DBGDTRRX_EL0` is empty and the PE is ready to accept a word external write to `DBGDTRRX_EL0`.
- `EDSCR.{TXfull, ITE}` == {1,1} indicates that `DBGDTRTX_EL0` is full and the PE is ready to accept a word external read from `DBGDTRTX_EL0`.

All other values indicate that the PE is not ready, and result in a DTR overflow or underflow error, an ITR overflow error, or both, as defined in [Overflow and underflow flags](#) on page H4-5507.

`EDSCR.{ITE, RXfull, TXfull}` shows the status of the ITR and DCC registers. It ignores the question of whether a read or write cannot be accepted because, for example, `EDSCR.ERR` is set or the OPTIONAL Software Lock is locked for memory-mapped accesses (`EDLSR.SLK` == 1).

### H4.4.2 Buffering writes to EDITR

The architecture permits a processor to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, provided that:

- Those instructions are discarded if `EDSCR.ERR` is set to 1, either by an underflow or an overflow, or by any other error conditions described in this architecture, such as an instruction generating an abort.
- The PE maintains the simple sequential execution model with the order of instructions determined by the order in which the PE accepts the EDITR writes. In particular, the buffered instructions must be executed in the Execution state consistent with a simple sequential execution of the instructions, even if one of the previous instructions is a state changing operation, such as DCPS or DRPS.

### H4.4.3 Overrun and underrun flags

Each of the ready flags has a corresponding overrun or a corresponding underrun flag. These are sticky status flags that are set if the register is accessed using the external debug interface when the corresponding ready flag is not in the ready state.

If the PE is in Debug state and Memory access mode, the corresponding error flag is also set if the PE is not ready to accept an operation because a previous load or store is still in progress. The sticky status flag remains set until cleared by writing 1 to [EDSCR.CSE](#).

#### ————— Note —————

The architecture permits a PE to continue to accept and buffer data to write to memory in Memory access mode.

[Table H4-1](#) shows DCC and ITR ready flags and the overrun and underrun flags associated with them.

**Table H4-1 DCC and ITR ready flags and the associated overrun/underrun flags**

External debug interface access	Overrun/Underrun condition	EDSCR flag
Write <a href="#">DBGDTRRX_EL0</a>	$\text{EDSCR.RXfull} == '1' \mid (\text{Halted}() \ \&\& \ \text{EDSCR.MA} == '1' \ \&\& \ \text{EDSCR.ITE} == '0')$	RXO
Read <a href="#">DBGDTRTX_EL0</a>	$\text{EDSCR.TXfull} == '0' \mid (\text{Halted}() \ \&\& \ \text{EDSCR.MA} == '1' \ \&\& \ \text{EDSCR.ITE} == '0')$	TXU
Write <a href="#">EDITR</a>	$\text{Halted}() \ \&\& \ (\text{EDSCR.ITE} == '0' \mid \text{EDSCR.MA} == '1')$	ITO

When an overrun or underrun flag is set to 1, the cumulative error flag, [EDSCR.ERR](#), described in [Cumulative error flag on page H4-5508](#), is also set to 1.

In the event of an external write to [DBGDTRRX\\_EL0](#) or [EDITR](#) generating an overrun, or an external read from [DBGDTRTX\\_EL0](#) generating an underrun:

- For a write, the written value is ignored.
- For a read, an UNKNOWN value is returned.
- [EDSCR.TXfull](#), [EDSCR.RXfull](#) or [EDSCR.ITE](#), as applicable, are not updated.

There is no overrun or underrun detection on external reads of [DBGDTRRX\\_EL0](#) or external writes of [DBGDTRTX\\_EL0](#).

There is no overrun or underrun detection of direct reads and direct writes of the DTR System registers by software:

- If  $\text{RXfull} == 0$ , a direct read of [DBGDTRRX](#) or [DBGDTR\\_EL0](#) returns UNKNOWN.
- If  $\text{TXfull} == 1$ , a direct write of:
  - [DBGDTRTX](#) sets DTRTX to UNKNOWN.
  - [DBGDTR\\_EL0](#) sets DTRRX and DTRTX to UNKNOWN.

See [DCC accesses in Non-debug state on page H4-5510](#) for more information.

### Accessing 64-bit data

In AArch64 state, a software access to the [DBGDTR\\_EL0](#) register and an external debugger access to both [DBGDTRRX\\_EL0](#) and [DBGDTRTX\\_EL0](#) can perform a 64-bit half-duplex operation.

However, there is only overrun and underrun detection on one of the external debug registers. That is:

- If software directly writes a 64-bit value to [DBGDTR\\_EL0](#), only TXfull is set to 1, meaning:
  - A subsequent external write to [DBGDTRRX\\_EL0](#) would not be detected as an overrun.
  - If the external debugger reads [DBGDTRTX\\_EL0](#) first, software might observe [MDCCSR\\_EL0.TXfull](#) == 0 and send a second value before the external debugger reads [DBGDTRRX\\_EL0](#), leading to an undetected overrun.

- On external writes to both [DBGDTRRX\\_EL0](#) and [DBGDTRTX\\_EL0](#) only RXfull is set to 1, meaning:
  - A subsequent direct write of [DBGDTRTX\\_EL0](#) would not be detected as an overrun.
  - If the external debugger writes to [DBGDTRRX\\_EL0](#) first, software might observe [MDCCSR\\_EL0.RXfull](#) == 1 and read a full 64-bit value, before the external debugger writes to [DBGDTRTX\\_EL0](#), leading to an undetected underrun.

To avoid this, debuggers need to be aware of the data size used by software for transfers and ensure that 64-bit data is read or written in the correct order. If the PE is in Non-debug state, this order is as follows:

- The external debugger must check [EDSCR](#).{RXfull, TXfull} before each transfer.
- To receive a 64-bit value from the target, the external debugger must read [DBGDTRRX\\_EL0](#) before reading [DBGDTRTX\\_EL0](#).
- To send a 64-bit value to the target, the external debugger must write to [DBGDTRTX\\_EL0](#) before writing [DBGDTRRX\\_EL0](#).

Because three accesses are required to transfer 64 bits of data, 64-bit transfers are not recommended for regular communication between host and target. The use of underrun and overrun detection means that only one access is required for 32 bits of data when using 32-bit transfers.

In Debug state, the debugger controls the instructions executed by the PE, so these limitations do not apply. 64-bit transfers provide a means to transfer a 64-bit general register between the host and the target in Debug state.

#### H4.4.4 Cumulative error flag

The cumulative error flag, [EDSCR](#).ERR, is set to 1:

- On taking an exception from Debug state.
- On any signaled overrun or underrun in the DCC or ITR.

When [EDSCR](#).ERR == 1:

- External reads of [DBGDTRTX\\_EL0](#) do not have any side-effects.
- External writes to [DBGDTRRX\\_EL0](#) are ignored.
- External writes to [EDITR](#) are ignored.
- No further instructions can be issued in Debug state. This includes any instructions previously accepted as external writes to [EDITR](#) that occur in program order after the instruction or access that caused the error.

This allows a debugger to stream data, or, in Debug state, instructions, to the target without having to:

- Check [EDSCR](#).{RXfull, TXfull, ITE} before each access.
- Check [EDSCR](#).{ITO, RXO, TXU} following each access, for overrun or underrun.
- Check [PSTATE](#) or other syndrome registers, or both, for an exception following each instruction executed in Debug state that might generate a synchronous exception.

The cumulative error flag remains set until cleared by writing 1 to [EDRCR](#).CSE. See [EDRCR](#), *External Debug Reserve Control Register* on page H9-5660.

For overruns and underruns, [EDSCR](#).{ITO, RXO, TXU} record the error type.

#### Pseudocode description of clearing the error flag

The [ClearStickyErrors\(\)](#) pseudocode function is described in [Chapter J1 ARMv8 Pseudocode](#).

## H4.5 Synchronization of DCC and ITR accesses

In addition to the standard synchronization requirements for register accesses, the following subsections describe additional requirements that apply for the DCC and ITR registers:

- [Summary of System register accesses to the DCC.](#)
- [DCC accesses in Non-debug state on page H4-5510.](#)

In these sections, accesses by the external debug interface are referred to as external reads and external writes. Accesses to System registers are referred to as direct reads, direct writes, indirect reads, and indirect writes.

### ———— Note ————

In [Synchronization requirements for AArch64 System registers on page D7-2191](#) external reads and external writes are described as forms of indirect access. This whole section uses more explicit terminology.

The DTR registers and the DCC flags, TXfull and RXfull, form a communication channel, with one end operating asynchronously to the other. Implementations must respect the ordering of accesses to these registers in order to maintain the correct behavior of the channel.

External reads of, and external writes to [DBGDTRRX\\_EL0](#) and [DBGDTRTX\\_EL0](#) are asynchronous to direct reads of, and direct writes to, [DBGDTRRX](#), [DBGDTRTX](#), and in AArch64 state [DBGDTR\\_EL0](#), made by software using System register access instructions. The direct reads and direct writes indirectly write to the DCC flags. The external reads and external writes indirectly read the DCC flags to check for underrun and overrun.

Throughout this section:

- |                  |  |
|------------------|--|
| <b>DCC flags</b> | Means any or all of the following: <ul style="list-style-type: none"> <li>• The <a href="#">EDSCR</a>.{RXfull.TXfull} ready flags.</li> <li>• The <a href="#">EDSCR</a>.RXO overrun flag.</li> <li>• The <a href="#">EDSCR</a>.TXU underrun flag.</li> <li>• The <a href="#">EDSCR</a>.ERR cumulative error flag.</li> </ul> |
| <b>ITR flags</b> | Means any or all of the following: <ul style="list-style-type: none"> <li>• The <a href="#">EDSCR</a>.ITE ready flag.</li> <li>• The <a href="#">EDSCR</a>.ITO overrun flag.</li> <li>• The <a href="#">EDSCR</a>.ERR cumulative error flag.</li> </ul>  |

### H4.5.1 Summary of System register accesses to the DCC

System register accesses to the DTR registers are direct reads and writes of those registers, as shown in [Table H4-2 on page H4-5510](#). Several of these instructions access the same registers using different encodings.

With the exception of the read and write bits, [DBGDTRRX](#) and [DBGDTRTX](#) are the same encoding, with exception of the read/write bits, but use different registers. The ARMv8 architecture governs the order of these instructions, as described in [Synchronization requirements for AArch64 System registers on page D7-2191](#). For more details, see the description of the individual register in the relevant chapter, [Chapter D7 AArch64 System Register Descriptions](#) or [Chapter G6 AArch32 System Register Descriptions](#).

Table H4-2 shows a summary of System register accesses to the DCC.

**Table H4-2 Summary of System register accesses to the DCC**

Operation	OS Lock	AArch64 (MRS/MSR)	AArch32 (MRC/MCR)	Description
Read	-	DBGDTRRX_EL0	DBGDTRRXint	Direct read of DTRRX Indirect write to the <a href="#">DCC flags</a>
Write	-	DBGDTRTX_EL0	DBGDTRTXint	Direct read of DTRTX Indirect write to the <a href="#">DCC flags</a>
Read/write	-	DBGDTR_EL0	-	Direct read/write of both DTRRX and DTRTX Indirect write to the <a href="#">DCC flags</a>
Read	-	MDCCSR_EL0	DBGDSCRint	Direct read of the <a href="#">DCC flags</a>
Read/write	-	OSDTRRX_EL1	DBGDTRRXext	Direct read/write of DTRRX
Read/write	-	OSDTRTX_EL1	DBGDTRTXext	Direct read/write of DTRTX
Read	Unlocked	MDSCR_EL1	DBGDSCRext	Direct read of <a href="#">DCC flags</a>
Read/write	Locked	MDSCR_EL1	DBGDSCRext	Direct read/write of <a href="#">DCC flags</a>

#### H4.5.2 DCC accesses in Non-debug state

In Non-debug state DCC accesses are as described in [Normal access mode on page H4-5502](#):

- If a direct read of [DCCSR](#) returns  $RXfull == 1$ , then a following direct read of [DBGDTRRX](#), or in AArch64 state of [DBGDTR\\_EL0](#), returns valid data and indirectly writes 0 to [DCCSR.RXfull](#) as a side-effect.
- If a direct read of [DCCSR](#) returns  $TXfull == 0$ , then a following direct write to [DBGDTRTX](#), or in AArch64 state to [DBGDTR\\_EL0](#), writes the intended value, and indirectly writes 1 to [DCCSR.TXfull](#) as a side-effect.

No [Context synchronization event](#) is required between these two instructions. Overrun and underrun detection prevents intervening external reads and external writes affecting the outcome of the second instruction.

The indirect write to the [DCC flags](#) as part of the DTR access instruction is made atomically with the DTR access.

Because a direct read of [DBGDTRRX](#) is an indirect write to [DCCSR.RXfull](#), it must occur in program order with respect to the direct read of [DCCSR](#), meaning it must not return a speculative value for DTRTX that predates the  $RXfull$  flag returned by the read of [DCCSR](#). The direct write to [DBGDTRTX](#) must not be executed speculatively.

Direct reads of [DBGDTRRX](#), or in AArch64 state [DBGDTR\\_EL0](#), and [DCCSR](#), must occur in program order with respect to other direct reads of the same register using the same encoding.

The following accesses have an implied order within the atomic access:

- In the simple sequential execution of the program the indirect write of the [DCC flags](#) occurs immediately after the direct DTR access.

———— **Note** ————

For an access to [DBGDTR\\_EL0](#), this means the indirect write happens after both [DBGDTRRX\\_EL0](#) and [DBGDTRTX\\_EL0](#) have been accessed.

- In the simple sequential execution model, for an external read of `DBGDTRTX_EL0` or an external write of `DBGDTRRX_EL0`:
  - The check of the **DCC flags** for overrun or underrun occurs immediately before the access.
  - If there is no underrun or overrun, the update of the **DCC flags** occurs immediately after the access.
  - If there is underrun or overrun, the update of the DCC underrun or overrun flags occurs immediately after the access.

All observers must observe the same order for accesses.

———— **Note** ————

These requirements do not create order where order does not otherwise exist. It applies only for ordered accesses.

Without explicit synchronization following external writes and external reads:

- The value written by the external write to `DBGDTRRX_EL0` that does not overrun, must be observable to direct reads of `DBGDTRRX` and `DBGDTR_EL0` in finite time.
- The **DCC flags** that are updated as a side-effect of the external write or external read must be observable:
  - To subsequent external reads of `EDSCR`.
  - To subsequent external reads of `DBGDTRRX_EL0` when checking for underrun.
  - To subsequent external writes to `DBGDTRTX_EL0` when checking for overrun.
  - To direct reads of `DCCSR` in finite time.

However, explicit synchronization is required to guarantee that a direct read of `DCCSR` returns up-to-date **DCC flags**. This means that if a signal is received from another agent that indicates that `DCCSR` must be read, an ISB is required to ensure that the direct read of `DCCSR` occurs after the signal has been received. This also synchronizes the value in `DBGDTRRX`, if applicable. However, if that signal is an interrupt exception triggered by `COMMIRQ`, `COMMTX`, or `COMMRX`, the exception entry is sufficient synchronization. See *Synchronization of DCC interrupt request signals* on page H4-5513.

Explicit synchronization is required following a direct read or direct write:

- To ensure that a value directly written to `DBGDTRTX` is observable to external reads of `DBGDTRTX_EL0`.
- To ensure that a value directly written to `DBGDTR_EL0` is observable to external reads of `DBGDTRTX_EL0` and `DBGDTRRX_EL0`.
- To guarantee that the indirect writes to the **DCC flags** that were a side-effect of the direct read or direct write have occurred, and therefore that the updated values are:
  - Observable to external reads of `EDSCR`.
  - Observable to external reads of `DBGDTRRX_EL0` when checking for underrun.
  - Observable to external writes of `DBGDTRTX_EL0` when checking for overrun.
  - Returned by a following direct read of `DCCSR`.

See also *Memory-mapped accesses to the DCC and ITR* on page H4-5505 and *Synchronization of changes to the external debug registers* on page H8-5554.

———— **Note** ————

These ordering rules mean that software:

- Must not read `DBGDTRRX` without first checking `DCCSR.RXfull` or if the previously-read value of `DCCSR.RXfull` is 0.  
It is not sufficient to read both registers and then later decide whether to discard the read value, as there might be an intervening write from the external debug interface.

- Must not write **DBGDTRTX** without first checking **DCCSR.TXfull** or if the previously-read value of **DCCSR.TXfull** is 1.  
The write to **DBGDTRTX** overwrites the value in **DTRTX**, and the external debugger might or might not have read this value.
  - Must ensure there is an explicit *Context synchronization event* following a DTR access, even if not immediately returning to read **DCCSR** again. This synchronization operation can be an exception return.
- 

### Derived requirements

The rules for DCC accesses in Non-debug state are as follows:

- Following a direct read of **DBGDTRRX** when **RXfull** is 1:
  - If an external write to **DBGDTRRX** checks the **RXfull** flag for overrun and observes that the value of **RXfull** is 0, the value returned by the previous direct read must not be affected by the external write.
  - If an external read of **EDSCR** returns a **RXfull** value of 0, then the value returned by the previous direct read must not be affected by a following external write to **DBGDTRRX**, and the following external write does not overrun.
- Following a direct read of **DBGDTR\_EL0**, when **RXfull** is 1:
  - If an external write to **DBGDTRRX** checks the **RXfull** flag for overrun and observes that the value of **RXfull** is 0, the value returned by the previous direct read must not be affected by the external write nor by a following direct write to **DBGDTRTX**.
  - If an external read of **EDSCR** returns a **RXfull** value of 0, then the value returned by the previous direct read must not be affected by subsequent external writes to **DBGDTRRX** and **DBGDTRTX** in any order, and the following external write of **DBGDTRRX** will not overrun.
- Following a direct write to **DBGDTRTX**, when **TXfull** is 0:
  - If an external read of **DBGDTRTX** checks the **TXfull** flag for underrun and observes that the value of **TXfull** is 1, the value returned by the external read must be the value written by the previous direct write.
  - If an external read of **EDSCR** returns a **TXfull** value of 1, then the value returned by a following external read of **DBGDTRRX** must be the value written by the previous direct read, and the subsequent external read will not underrun.
- Following a direct write to **DBGDTR\_EL0**, when **TXfull** is 0:
  - If an external read of **DBGDTRTX** checks the **TXfull** flag for underrun and observes that the value of **TXfull** is 1, the values returned by the external read and by a subsequent external read of **DBGDTRRX** must be the value written by the previous direct write.
  - If an external read of **EDSCR** returns a **TXfull** value of 1, then the value returned by subsequent external reads of **DBGDTRRX** and **DBGDTRTX**, in any order, must be the value written by the previous direct read, and the subsequent external read of **DBGDTRTX** does not underrun.
- Following an external read of **DBGDTRTX** that does not underrun, if a direct read of **DCCSR** returns a **TXfull** value of 0, then the value returned by the external read must not be affected by a following direct write to **DBGDTRTX**.
- Following a first external read **DBGDTRRX** and a following second external read of **DBGDTRTX** that does not underrun, if a direct read of **DCCSR** returns a **TXfull** value of 0, then the values returned by the external reads must not be affected by a following direct write to **DBGDTR\_EL0**.
- Following an external write to **DBGDTRRX** that does not overrun, if a direct read of **DCCSR** returns an **RXfull** value of 1, then the value returned by a following direct read of **DBGDTRRX** or **DBGDTR\_EL0** must be the value written by the previous external write.

- Following a first external write to **DBGDTRTX** and a following second external write to **DBGDTRRX** that does not overrun, if a direct read of **DCCSR** returns an **RXfull** value of 1, then the value returned by a subsequent direct read of **DBGDTR\_EL0** must return the values written by the previous external writes.

### H4.5.3 Synchronization of DCC interrupt request signals

Following an external read or external write access to the DTR registers, the interrupt request signals, **COMMIQ**, **COMMTX**, and **COMMRX**, must be updated in finite time without explicit synchronization.

The updated values must be observable to a direct read of **DCCSR** or **DBGDTRRX**, or a direct write of **DBGDTRTX** executed after taking an interrupt exception generated by the interrupt request. The updated values must also be observable to a direct write of **DBGDTRTX** executed after taking an interrupt exception generated by the interrupt request.

Following a direct read of **DBGDTRRX** or a direct write to **DBGDTRRX**, software must execute a *Context synchronization event* to guarantee the interrupt request signals have been updated in finite time. This synchronization operation can be an exception return.

### H4.5.4 DCC and ITR access in Debug state

In Debug state, stricter observability rules apply for instructions issued through the ITR, to maintain communication between a debugger and the PE, without requiring excessive explicit synchronization.

In Normal access mode, without explicit synchronization:

- A direct read or direct write of the DTR registers by an instruction written to **EDITR** must be observable to an external write or an external read in finite time:
  - A direct read of **DBGDTRRX** must be observable to an external write of **DBGDTRRX\_EL0**.
  - A direct read of **DBGDTR\_EL0** must be observable to an external write of **DBGDTRRX\_EL0** and **DBGDTRTX\_EL0**.
  - A direct write of **DBGDTRTX** must be observable to an external read of **DBGDTRTX\_EL0**.
  - A direct write of **DBGDTR\_EL0** must be observable to an external read of **DBGDTRRX\_EL0** and **DBGDTRTX\_EL0**.

This includes the indirect write to the **DCC flags** that occurs atomically with the access as described in *DCC accesses in Non-debug state* on page H4-5510.

The subsequent external write or external read must observe either the old or the new values of both the DTR contents and **DCC flags**. If the old values are observed, this typically results in overrun or underrun, assuming the old values of the **DCC flags** indicate an overrun or underrun condition, as would normally be the case.

This means the debugger can observe the direct read or direct write without explicit synchronization and without explicitly testing the **DCC flags** in **EDSCR**, because it can rely on overrun and underrun tests.

- External reads of **DBGDTRTX\_EL0** that do not underrun and external writes to **DBGDTRRX\_EL0** that do not overrun must be observable to an instruction subsequently written to **EDITR** on completion of the first external access. This includes the indirect write to the **DCC flags**.

This means that without explicit synchronization and without the need to first check the **DCC flags** in **DCCSR**:

- If the instruction is a direct read of **DBGDTRRX**, it observes the external write.
- If the instruction is a direct write of **DBGDTRTX**, it observes the external read.
- Writes to **EDITR** that do not overrun commit an instruction for execution immediately. The instruction must complete execution in finite time without requiring any further operation by the debugger.
- After an external write to the **EDITR**, the **ITR flags** that are updated as a side effect of that write must be observable by:
  - An external read of the **EDSCR** that follows the external write to the **EDITR**.
  - When checking for overrun, another external write to the **EDITR** that follows the original external write to the **EDITR**.

In Memory access mode, these requirements shift to the instructions implicitly executed by external reads and external writes of the DTR registers, as described in *Memory access mode* on page H4-5503.

## H4.6 Interrupt-driven use of the DCC

ARM recommends implementations provide a level-sensitive DCC interrupt request through the IMPLEMENTATION DEFINED interrupt controller as a private peripheral interrupt for the originating PE.

———— **Note** ————

- In addition to connection to the interrupt controller ARM also recommends **COMMIRQ**, **COMMTX**, and **COMMRX** signals that might be implemented for use by any legacy system peripherals.
- GICv3 reserves a private peripheral interrupt number for the **COMMIRQ** interrupt.

The **DCCINT** register provides a first level of interrupt masking within the PE, meaning only a single interrupt source, **COMMIRQ**, is needed at the interrupt controller.

See also [Synchronization of DCC interrupt request signals on page H4-5513](#).

## H4.7 Pseudocode description of the operation of the DCC and ITR registers

The basic operation of the DCC and ITR registers is shown by the following pseudocode functions. These functions do not cover the behavior when `OSLSR.OSLK == 1`, meaning that the OS lock is locked:

- `DBGDTR_EL0[]`.
- `DBGDTRRX_EL0[]`.
- `DBGDTRTX_EL0[]`.
- `EDITR[]`.
- `CheckForDCCInterrupts()`.

For the definition of the DTR Registers, see [shared/debug/dccanditr/DTR](#) on page J1-6013.

# Chapter H5

## The Embedded Cross-Trigger Interface

This chapter describes the embedded cross-trigger interface. It contains the following sections:

- *About the Embedded Cross-Trigger (ECT) on page H5-5518.*
- *Basic operation on the ECT on page H5-5520.*
- *Cross-triggers on a PE in an ARMv8 implementation on page H5-5524.*
- *Description and allocation of CTI triggers on page H5-5525.*
- *CTI registers programmers' model on page H5-5529.*
- *Examples on page H5-5530.*

## H5.1 About the Embedded Cross-Trigger (ECT)

The *Embedded Cross-Trigger*, ECT, allows a debugger to:

- Send trigger events to a PE. For example, this might be done to halt the PE.
- Send a trigger event to one or more PEs when a trigger event occurs on another PE. For example, this might be done to halt all PEs when one individual PE halts.

Figure H5-1 shows the logical structure of an ECT.

**Figure H5-1 Structure of an embedded cross-trigger**

The ECT can deliver many types of trigger events, which are described in the following sections:

- [Debug request trigger event on page H5-5526.](#)
- [Restart request trigger event on page H5-5526.](#)
- [Cross-halt trigger event on page H5-5526.](#)
- [Performance Monitors overflow trigger event on page H5-5527.](#)
- [Generic trace external input trigger events on page H5-5527.](#)
- [Generic trace external output trigger events on page H5-5527.](#)
- [Generic CTI interrupt trigger event on page H5-5527.](#)

An ARMv8-A implementation must:

- Include a cross-trigger interface, CTI.
- Implement at least the input and output triggers defined in this architecture.

See [Cross-triggers on a PE in an ARMv8 implementation on page H5-5524.](#)

In addition, ARM recommends that the cross-trigger includes:

- The ability to route trigger events between Trace macrocells:  
These typically have advanced event triggering logic.
- An output trigger to the interrupt controller.

### ————— Note —————

The ECT and CTI must only signal trigger events for external debugging. They must not route software events, such as interrupts. For example, the Performance Monitors overflow input trigger is provided to allow entry to Debug state on a counter overflow, and the output trigger to the interrupt controller is provided to generally allow events from the external debug sub-system to be routed to a software agent. However, the combination of the two must not be used as a mechanism to route Performance Monitors overflows to an interrupt controller.

## H5.1.1 Implementation with a CoreSight CTI

For details of the recommended connections in an ARMv8-A implementation, see [Appendix K2 Recommended External Debug Interface](#). See also *CoreSight™ SoC Technical Reference Manual*.

## H5.2 Basic operation on the ECT

The ECT comprises a Cross-Trigger Matrix, CTM, and one Cross-Trigger Interface, CTI, for each PE. The CTM passes events between the CTI blocks over channels. The CTM can have a maximum of 32 channels.

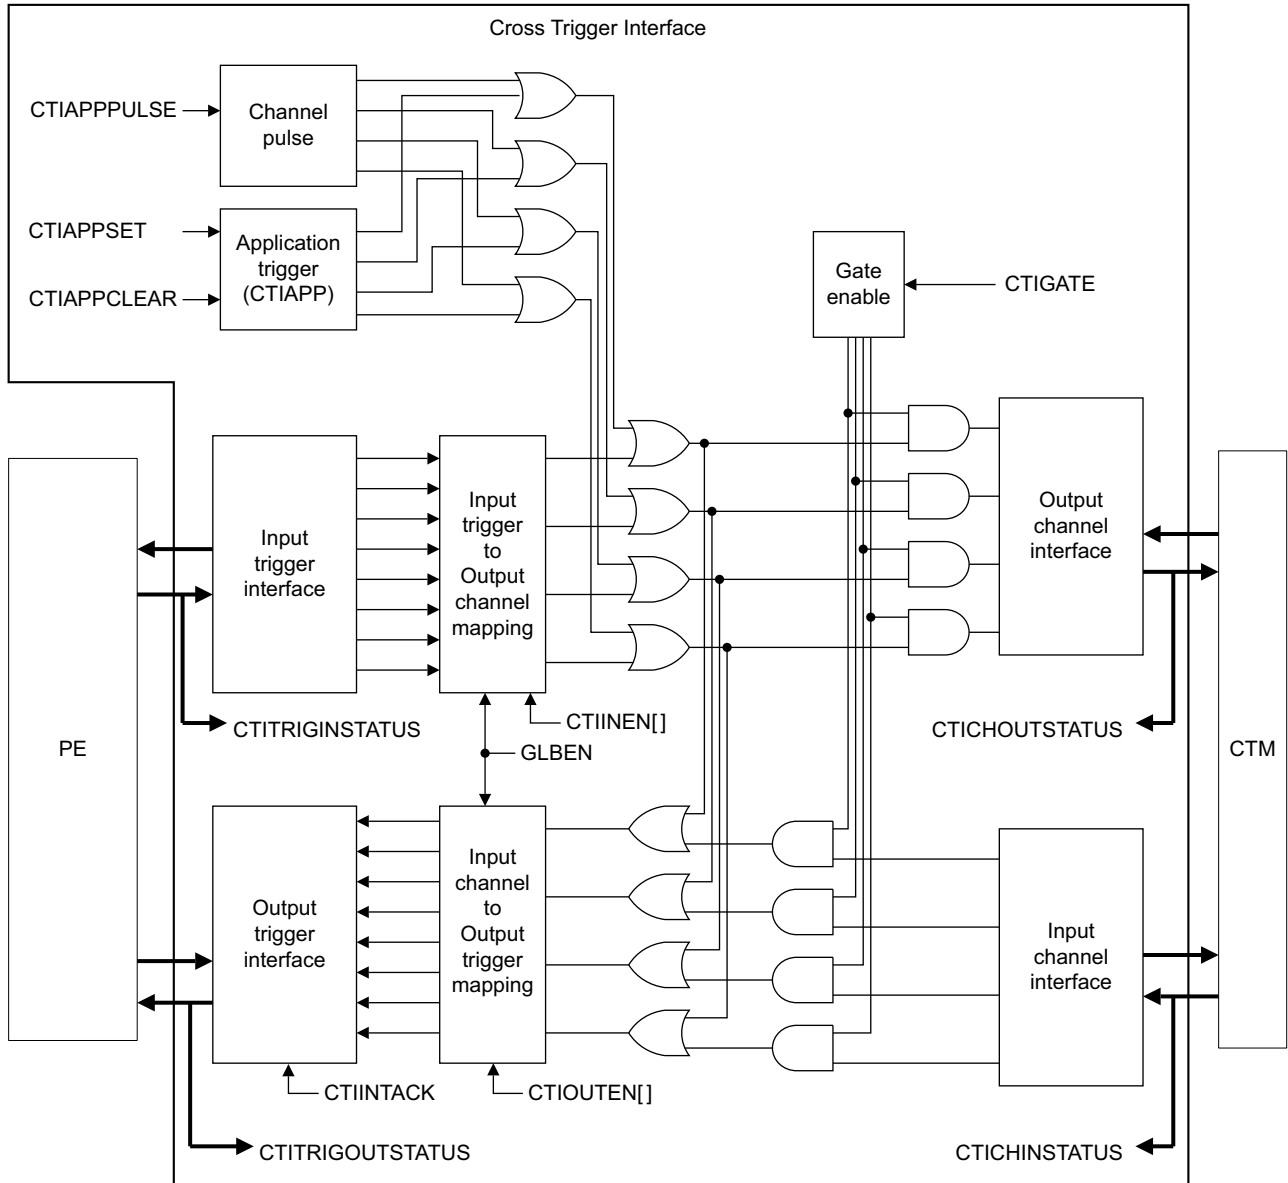

The main interfaces of the cross-trigger interface, CTI, are:

- The input triggers:
  - These are trigger event inputs from the PE to the CTI.
- The output triggers:
  - These are trigger event outputs from the CTI to the PE.
- The input channels:
  - These are channel event inputs from the cross-trigger matrix, CTM, to the CTI.
- The output channels:
  - These are channel event outputs from the CTI to the CTM.

Each CTI block has:

- Up to 32 input triggers that come from the PE:
  - The input triggers are numbered 0-31.
- Up to 32 output triggers that go to the PE:
  - The output triggers are numbered 0-31.

[Figure H5-2 on page H5-5521](#) shows the logical internal structure of a CTI.

**Figure H5-2 Structure of a cross-trigger interface**

**Note**

- The number of triggers is IMPLEMENTATION DEFINED. [Figure H5-2](#) shows eight input and eight output triggers.
- The number of channels is IMPLEMENTATION DEFINED. [Figure H5-2](#) shows four channels.
- In [Figure H5-2](#) the input channel gate function is a CTIv2 feature.

When the CTI receives an input trigger event, this generates channel events on one or more internal channels, according to the *mapping function* defined by the *Input trigger→output channel mapping registers*, [CTIINEN<n>](#).

The CTI also contains an *application trigger* and *channel pulse* to allow a debugger to create channel events directly on internal channels by writing to the CTI control registers.

Channel events on each internal channel are passed to a corresponding output channel that is controlled by a *channel gate*. The channel gate can block propagation of channel events from an internal channel to an output channel.

The output channels from a CTI are combined, using a logical OR function, with the output channels from all other CTIs to form the input channels on other CTIs. The input channels of this CTI are the logical OR of the output channels on all other CTIs. This is the *cross-trigger matrix*, CTM. Therefore, the number of input channels must equal the number of output channels.

---

**Note**

The number of input triggers and output triggers is not required to be the same.

---

The internal channels form an internal cross-trigger matrix within the CTI. This delivers events directly from the input triggers to the output triggers. Therefore the number of internal channels is the same as the number of input and output channels on the external CTM, and there is a direct mapping between the two.

Channel events received on each input channel are passed to the corresponding internal channel. It is IMPLEMENTATION DEFINED whether the cross-trigger gate also blocks propagation of channel events from input channels to internal channels.

When the CTI receives a channel event on an internal channel this generates trigger events on one or more output triggers, according to the mapping function defined by the *Input channel → output trigger mapping registers*, [CTIOUTEN<n>](#).

The CTI contains the input and output trigger interfaces to the PE and the interface of the cross-trigger matrix. The architecture does not define the signal protocol used on the trigger interfaces, and:

- It is IMPLEMENTATION DEFINED whether the CTI supports multicycle input trigger events.
- It is IMPLEMENTATION DEFINED whether the CTM supports multicycle channel events.

See [Multicycle events](#).

However, an output trigger is asserted until acknowledged. The output trigger can be:

- Self-acknowledging. This means that no further action is required from the debugger.
- Acknowledged by the debugger writing 1 to the corresponding bit of [CTIINTACK](#).

The time taken to propagate a trigger event from the first PE, through its CTI, across the CTM to another CTI, and thereby to a second PE is IMPLEMENTATION DEFINED.

---

**Note**

ARM recommends that this path is not longer than the shortest software communication path between those PEs. This is because if the first PE halts, the Cross-halt trigger event can propagate through the ECT and halt the second PE without causing software on the second PE to malfunction because the first PE is in Debug state and is not responding.

---

## H5.2.1 Multicycle events

A multicycle event is one with a continuous state that might persist over many cycles, as opposed to a discrete event. A typical implementation of a multicycle event is a level-based signal interface, whereas a discrete event might be implemented as a pulse signal or message.

CTI support for multicycle trigger events is IMPLEMENTATION DEFINED. Use of multicycle trigger events is deprecated. Of the architecturally defined input trigger events, the Performance Monitors overflow trigger event and Generic trace external output trigger events can be multicycle input triggers.

CTM support for multicycle channel events is IMPLEMENTATION DEFINED. A CTM that does not support multicycle channel events cannot propagate a multicycle trigger event between CTIs.

---

**Note**

A full ECT might comprise a mix of CTIs, some of which can support multicycle trigger events. In bridging these components, multicycle channel events become single channel events at the boundary between the CTIs.

---

## An ECT that supports multicycle trigger events

When an ECT supports multicycle trigger events, an input trigger event to the CTI continuously asserts channel events on all output channels mapped to it until either:

- The input trigger event is removed.
- The channel mapping function is disabled.

This means that an input trigger that is asserted for multiple cycles causes any channels that are mapped to it to become active for multiple cycles. Consequently, any output triggers mapped from that channel are asserted for multiple cycles.

---

### Note

The output trigger remains asserted for at least as long as the channel remains active. This means that even if the output trigger is acknowledged, it remains asserted until the channel deactivates.

---

The CTI does not guarantee that these events have precisely the same duration, as the triggers and channels can cross between clock domains.

[CTIAPPSET](#) and [CTIAPPCLEAR](#) can set a channel active for multiple cycles. [CTIAPPULSE](#) generates a single channel event. [CTICHINSTATUS](#) and [CTICHOUTSTATUS](#) can report whether a channel is active.

## An ECT that does not support multicycle trigger events

When an ECT does not support multicycle trigger events, an input trigger event to the CTI generates a single channel event on all output channels mapped to it, regardless of how long the input trigger event is asserted.

This means that an input trigger event that is asserted for multiple cycles generates a single channel event on any channels mapped to it. Consequently any self-acknowledging output triggers mapped from those channels are single trigger events.

---

### Note

A single event is typically a single cycle, but there is no guarantee that this is always the case.

---

[CTIAPPSET](#) and [CTIAPPCLEAR](#) can only generate a single channel event. [CTIAPPULSE](#) generates a single channel event. If the ECT does not support multicycle channel events, use of [CTIAPPSET](#) and [CTIAPPCLEAR](#) is deprecated, and the debugger must only use [CTIAPPULSE](#). [CTICHINSTATUS](#) and [CTICHOUTSTATUS](#) must be treated as UNKNOWN.

## H5.3 Cross-triggers on a PE in an ARMv8 implementation

An ARMv8 PE must include a cross-trigger interface, and the implementation must include at least the input and output triggers defined in this architecture. The number of channels in the cross-trigger matrix is IMPLEMENTATION DEFINED, but there must be a minimum of three. Software can read CTIDEVID.NUMCHAN to discover the number of implemented channels.

The CTM must connect to all PEs in the same Inner Shareability domain as the ARMv8-A PE, but can also connect to additional PEs. ARM strongly recommends that the CTM connects all PEs implementing a CTI in the system. This includes ARMv7-A PEs and other PEs that can be connected using a CoreSight CTI module.

---

### **Note**

---

In a uniprocessor system the CTM is OPTIONAL. The CTM might be connected other CTI modules for non-PEs, such as triggers for system visibility components. ARM recommends that the CTM is implemented.

---

Any CTI connected to a PE that is not an ARMv8-A PE must implement at least:

- The Debug request trigger event.
- The Restart trigger event.
- The Cross-halt trigger event.

For more information about the CTI, see the *CoreSight™ SoC Technical Reference Manual*. ARMv8-A refines the generic CTI by defining roles for each of the implemented input and output triggers.

## H5.4 Description and allocation of CTI triggers

Table H5-1 shows the output trigger events defined by the architecture and the related trigger numbers.

**Table H5-1 Allocation of CTI output trigger events**

Number	Source	Destination	Event description
0	CTI	PE	<i>Debug request trigger event on page H5-5526</i>
1	CTI	PE	<i>Restart request trigger event on page H5-5526</i>
2	CTI	IRQ controller	<i>Generic CTI interrupt trigger event on page H5-5527</i>
3	-	-	Reserved
4 - 7	CTI	Trace macrocell	OPTIONAL <i>Generic trace external input trigger events on page H5-5527</i>

———— **Note** ————

Output triggers from the CTI are inputs to other blocks.

Table H5-2 shows the input trigger events defined by the architecture and the related trigger numbers.

**Table H5-2 Allocation of CTI input trigger events**

Number	Source	Destination	Event description
0	PE	CTI	<i>Cross-halt trigger event on page H5-5526</i>
1	PE	CTI	<i>Performance Monitors overflow trigger event on page H5-5527</i>
2 - 3	-	-	Reserved
4 - 7	Trace macrocell	CTI	OPTIONAL <i>Generic trace external output trigger events on page H5-5527</i>

———— **Note** ————

Input triggers to the CTI are outputs from other blocks.

Table H5-1 and Table H5-2 show the minimum set of trigger events defined by the architecture. However:

- The Generic trace external input and output trigger events are only required if the OPTIONAL Trace macrocell is implemented. If the OPTIONAL Trace macrocell is not implemented, these trigger events are reserved.
- Support for the generic CTI interrupt trigger event is IMPLEMENTATION DEFINED because details of interrupt handling in the system, including any interrupt controllers, are IMPLEMENTATION DEFINED. Details regarding how the CTI interrupt is connected to an interrupt controller and its allocated interrupt number lie outside the scope of the architecture. ARM strongly recommends that implementations provide a means to generate interrupts based on external debug events.
- The other trigger events are required by the architecture.

An ARMv8-A implementation can extend the CTI with additional triggers. These start with the number eight.

### H5.4.1 Debug request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to force the PE into Debug state. The trigger event is asserted until acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to [CTIINTACK](#)[0].

---

**Note**

A debugger must poll [CTITRIGOUTSTATUS](#)[0] until it reads as 0, to confirm that the output trigger has been deasserted before generating any event that must be ordered after the write to [CTIINTACK](#), such as a write to [CTIAPPPULSE](#) to activate another trigger.

---

If the PE is already in Debug state, the PE ignores the trigger event, but the CTI continues to assert it until it is removed by the debugger. See also [External Debug Request debug event on page H3-5490](#).

### H5.4.2 Restart request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to request the PE to exit Debug state. If the PE is in Non-debug state, the request is ignored by the PE.

If a Restart request trigger event is received at or about the same time as the PE enters Debug state, it is CONSTRAINED UNPREDICTABLE whether:

- The request is ignored by the PE. In this case the PE enters Debug state and remains in Debug state.
- The PE enters Debug state and then immediately restarts.

Debuggers must program the CTI to send Restart request trigger events only to PEs that are halted. To enable the PE to disambiguate discrete Restart request trigger events, after sending a Restart request trigger event, the debugger must confirm that the PE has restarted and halted before sending another Restart request trigger event. Debuggers can use [EDPRSR](#).{SDR, HALTED} to determine the Execution state of the PE.

---

**Note**

Before generating a Restart request trigger event for a PE, a debugger must ensure any Debug request trigger event targeting that PE is cleared. [Debug request trigger event](#) describes how to do this.

---

The trigger event is self-acknowledging, meaning that the debugger requires no further action to remove the trigger event. The trigger event is acknowledged even if the request is ignored by the PE. See also [Exiting Debug state on page H2-5471](#).

### H5.4.3 Cross-halt trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted by a PE when it is entering Debug state.

---

**Note**

To reduce the latency of halting, ARM recommends that an implementation issues the Cross-halt trigger event early in the committed process of entering Debug state. This means that there is no requirement to wait until all aspects of entry to Debug state have completed before issuing the trigger event. Speculative emission of Cross-halt trigger events is not allowed. The Cross-halt trigger event must not be issued early enough for a subsequent Debug request trigger event, that might be derived from the Cross-halt trigger event, to be recorded in the [EDSCR](#).STATUS field. This applies to Debug request trigger events that are acting as inputs to the PE.

---

#### H5.4.4 Performance Monitors overflow trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted each time the PE asserts a new Performance Monitors counter overflow interrupt request. See [Chapter D5 The Performance Monitors Extension](#).

If the CTI supports multicycle trigger events, then the trigger event remains asserted until the overflow is cleared by a write to [PMOVSCLR\\_EL0](#). Otherwise, the trigger event is asserted when the value of [PMOVSCLR\\_EL0](#) changes from zero to a non-zero value.

---

**Note**

- This does not replace the recommended connection of Performance Monitors overflow trigger event to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI.
  - Events can be counted when [ExternalNoninvasiveDebugEnabled\(\)](#)==FALSE, and, in Secure state, when [ExternalSecureNoninvasiveDebugEnabled\(\)](#)==FALSE. Secure software must be aware that overflow trigger events are nevertheless visible to the CTI.
- 

#### H5.4.5 Generic trace external input trigger events

These are output trigger events from the CTI, and input trigger events to the OPTIONAL Trace macrocell, that are used in conjunction with the Generic trace external output trigger events to pass trigger events between:

- The PE and the OPTIONAL Trace macrocell.
- The OPTIONAL Trace macrocell and any other component attached to the CTM, including other Trace macrocells.

There are four Generic trace external input trigger events.

The trigger events are self-acknowledging. This means that the debugger does not have to take any further action to remove the events.

#### H5.4.6 Generic trace external output trigger events

These are input trigger events to the CTI, and output trigger events from the OPTIONAL Trace macrocell, used in conjunction with the Generic trace external input trigger events to pass trigger events between:

- The PE and the OPTIONAL Trace macrocell.
- The OPTIONAL Trace macrocell and any other component attached to the CTM, including other Trace macrocells.

There are four Generic trace external output trigger events.

#### H5.4.7 Generic CTI interrupt trigger event

This is an output trigger event from the CTI, and an input to an IMPLEMENTATION DEFINED interrupt controller, and can transfer trigger events from the PE, Trace macrocell, or any other component attached to the CTI and CTM to software as an interrupt. The Generic CTI interrupt trigger event must be connected to the interrupt controller as an interrupt that can target the originating PE.

---

**Note**

- ARM recommends that the Generic CTI interrupt trigger event is a private peripheral interrupt, but implementations might instead make this trigger event available as a shared peripheral interrupt or a local peripheral interrupt.
  - GICv3 reserves a private peripheral interrupt number for this interrupt.
-

It is IMPLEMENTATION DEFINED whether this trigger event is:

- Self-acknowledging. This means that the debugger is not required to take any further action, and that the interrupt controller must treat the trigger event as a pulse or edge-sensitive interrupt.
- Acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to [CTIINTACK](#)[2]. This means that the interrupt controller must treat the trigger event as a level-sensitive interrupt.

ARM recommends that the Generic CTI interrupt trigger event is a self-acknowledging trigger event.

## H5.5 CTI registers programmers' model

The CTI registers programmers' model is described in [Chapter H8 About the External Debug Registers](#). The following sections contain information specific to the CTI:

- [External debug register resets on page H8-5572](#).
- [External debug interface register access permissions on page H8-5561](#).
- [Cross-trigger interface registers on page H8-5570](#).
- The individual register descriptions in [Cross-Trigger Interface registers on page H9-5677](#).

See also [Memory-mapped accesses to the external debug interface on page H8-5558](#).

### H5.5.1 CTI reset

An External Debug reset resets the CTI. See [External debug register resets on page H8-5572](#) for details of CTI register resets. All CTI output triggers and output channels are deasserted on an External Debug reset.

---

**Note**

An indirect read of an output trigger might not observe the deasserted state until the processor is Cold reset. For more information, see [Synchronization of changes to the external debug registers on page H8-5554](#).

---

### H5.5.2 CTI authentication

The CTI ignores the state of the IMPLEMENTATION DEFINED authentication interface. This means that:

- [CTITRIGINSTATUS](#) shows the status of the input triggers and [CTICHINSTATUS](#) shows the status of the input channels, regardless of the value of `ExternalNoninvasiveDebugEnabled()`.

---

**Note**

The PE does not generate the Cross-halt trigger event and the Trace macrocell does not generate Generic trace external output trigger events when `ExternalNoninvasiveDebugEnabled()==FALSE`. However, the PE can generate Performance Monitors overflow trigger events.

---

- The CTI can generate external triggers regardless of the value of `ExternalInvasiveDebugEnabled()`.

---

**Note**

The PE ignores Debug request and Restart request trigger events when `ExternalInvasiveDebugEnabled()==FALSE`. The Trace macrocell ignores Generic trace external input trigger events when `ExternalNoninvasiveDebugEnabled()==FALSE`. The behavior of Generic CTI interrupt requests is part of the IMPLEMENTATION DEFINED handling of these interrupts, but it is permissible for an interrupt controller to receive these requests even when `ExternalInvasiveDebugEnabled()==FALSE`.

---

## H5.6 Examples

The CTI is fully programmable and allows for flexible cross-triggering of events within a PE and between PEs in a multiprocessor system. For example:

- The Cross-halt trigger event and the Debug request trigger event can be used for cross-triggering in a multiprocessor system.
- The Cross-halt trigger event and the Generic interrupt trigger event can be used for event-driven debugging in a multiprocessor system.
- The Performance Monitors overflow trigger event and the Debug request trigger event can force entry to Debug state on overflow of a Performance Monitors event counter, for event-driven profiling.

---

**Note**

This does not replace the recommended connection of Performance Monitors overflow trigger events to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI. ARM recommends that the Performance Monitors overflow signal is directly available as a local interrupt source.

---

- The Generic trace external input and Generic trace external output trigger events can pass trace events into and out of the event logic of the Trace macrocell. They can do this:
  - To pass trace events between Trace macrocells.
  - In conjunction with the Performance Monitors overflow trigger event, to couple the Performance Monitors to the Trace macrocell.
  - In conjunction with the Debug request trigger event, to trigger entry to Debug state on a trace event.
  - In conjunction with other CTIs, to signal a trace trigger event onto a CoreSight trace interconnect.

The following sections describe some examples in more detail:

- [Halting a single PE.](#)
- [Halting all PEs in a group when any one PE halts on page H5-5531.](#)
- [Synchronously restarting a group of PEs on page H5-5531.](#)
- [Halting a single PE on Performance Monitors overflow on page H5-5532.](#)

### Example H5-1 Halting a single PE

---

To halt a single PE, set:

1. [CTIGATE\[0\]](#) to 0, so that the CTI does not pass channel events on internal channel 0 to the CTM.
2. [CTIOUTEN0\[0\]](#) to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 0.

---

**Note**

The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instance of [CTIOUTEN<n>](#) for which <n> is 0.

---

3. [CTIAPPULSE\[0\]](#) to 1, to generate a channel event on channel 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to [CTIINTACK\[0\]](#), before restarting the PE.

---

### Example H5-2 Halting all PEs in a group when any one PE halts

To program a group of PEs so that when one PE in the group halts, all of the PEs in that group halt, set the following registers for each PE in the group:

1. `CTIGATE[2]` to 1, so that each CTI passes channel events on internal channel 2 to the CTM.
2. `CTIINEN0[2]` to 1, so that each CTI generates a channel event on channel 2 in response to a Cross-halt trigger event.
3. `CTIOUTEN0[2]` to 1, so that each CTI generates a Debug request trigger event in response to an channel event on channel 2.

**Note**

The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instances of `CTIINEN<n>` and `CTIOUTEN<n>` for which `<n>` is 0.

When a PE has halted, clear the Debug request trigger event by writing a value of 1 to `CTIINTACK[0]`, before restarting the PE.

### Example H5-3 Synchronously restarting a group of PEs

To restart a group of PEs, for each PE in the group:

1. If the PE was halted because of a Debug request trigger event, the debugger must ensure the trigger event is deasserted. It can do this by:
  - a. Writing 1 to `CTIINTACK[0]` to clear the Debug request trigger event.
  - b. Polling `CTITRIGOUTSTATUS[0]`, until it reads as 0, to confirm that the trigger event has been deasserted.
2. Set `CTIGATE[1]` to 1, so that each CTI passes channel events on internal channel 1 to the CTM.
3. Set `CTIOUTEN1[1]` to 1, so that each CTI generates a Restart request trigger event in response to a channel event on channel 1.

**Note**

This example must use the instance of `CTIOUTEN<n>` for which `<n>` is 1.

4. Set `CTIAPPULSE[1]` to 1 on any one PE in the group, to generate a channel event on channel 1.

#### Example H5-4 Halting a single PE on Performance Monitors overflow

---

To halt a single PE on a Performance Monitors overflow set:

1. [CTIGATE](#)[3] to 0, so that the CTI does not pass channel events on internal channel 3 to the CTM.
2. [CTIINEN1](#)[3] to 1, so that the CTI generates a channel event on channel 3 in response to a Performance Monitors overflow trigger event.

———— **Note** ————

This step of this example must use the instance of [CTIINEN<n>](#) for which <n> is 1.

---

3. [CTIOUTEN0](#)[3] to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 3.

———— **Note** ————

This step of this example must use the instance of [CTIOUTEN<n>](#) for which <n> is 0.

---

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to [CTIINTACK](#)[0], before restarting the PE. Clear the overflow status by writing to [PMOVSCCLR\\_EL0](#).

---

# Chapter H6

## Debug Reset and Powerdown Support

This chapter describes the reset and powerdown support in the Debug architecture. It contains the following sections:

- *About Debug over powerdown* on page H6-5534.
- *Power domains and debug* on page H6-5535.
- *Core power domain power states* on page H6-5536.
- *Emulating low-power states* on page H6-5539.
- *Debug OS Save and Restore sequences* on page H6-5541.
- *Reset and debug* on page H6-5545.

---

**Note**

Where necessary, [Table K11-1 on page K11-6282](#) disambiguates the general register references used in this chapter.

---

## H6.1 About Debug over powerdown

Debug over powerdown is a facility for an operating system to save and restore the PE state on behalf of a self-hosted or external debugger or both.

For external debug over powerdown, the architecture defines the OS Lock, OS Double Lock, and the logical split of the hardware on which a PE executes into the *Core power domain* and the *Debug power domain*. See:

- [Power domains and debug on page H6-5535.](#)
- [Core power domain power states on page H6-5536.](#)

## H6.2 Power domains and debug

The external debug component of ARMv8-A has two logical power domains, each with its own reset:

- The debug power domain contains the interface between the PE and the external debugger, and is powered up whenever an external debugger is connected to the SoC. It remains powered up while the external debugger is connected. Registers in this domain are reset by an external debug reset.
- The core power domain contains the rest of the PE, and is allowed to power up and power down independently of the Debug power domain.

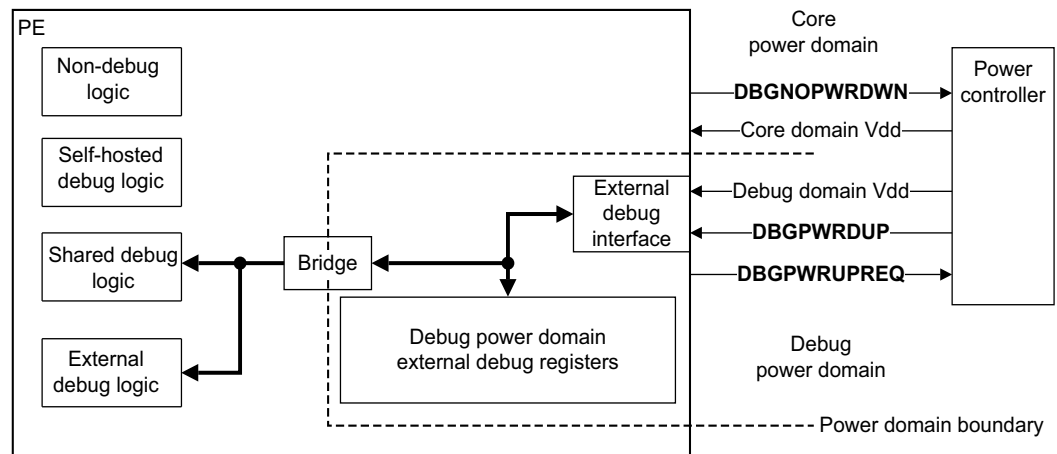

The core power domain contains several types of registers:

- Non-debug logic refers to all registers and logic that are not associated with debug.
- Self-hosted debug logic refers to registers and logic associated solely with the self-hosted debug aspects of the architecture.
- Shared debug logic refers to registers and logic associated with both the self-hosted and external debug aspects of the architecture.
- External debug logic refers to registers and logic associated solely with the external debug aspects of the architecture.

### ————— Note —————

- The model of two logical power domains has an impact on the reset and access permission requirements of the debug programmers' model.
- The power domains are described as logical because the architecture defines the requirements but does not require two physical power domains. Any power domain split that meets the requirements of the programmers' model is a valid implementation.

Figure H6-1 shows the recommended power domain split. The signals **DBGPWRUPREQ**, **DBGNOPWRDWN**, and **DBGPWRDUP** shown in Figure H6-1 provide an interface between the power controller and the PE debug logic that is in the debug power domain. They are part of the recommended interface. See [Appendix K2 Recommended External Debug Interface](#).

**Figure H6-1 Recommended power domain split between core and debug power domains**

## H6.3 Core power domain power states

The ARM architecture does not define the power states of the PE as these are not normally visible to software. However, they are visible to the external debugger. The Debug architecture uses a four logical power states model for the core power domain. The four logical power states are as follows:

- Normal** The core power domain is fully powered up and the debug registers are accessible.
- Standby** The core power domain is on, but there are measures to reduce energy consumption. In a typical implementation, the PE enters standby by executing a WFI or WFE instruction, and exits on a wake-up event. There can be other IMPLEMENTATION DEFINED measures the OS can take to enter standby.
- The PE preserves the PE state, including the debug logic state. Changing from standby to normal operation does not involve a reset of the PE.
- Standby is the least invasive OS energy saving state. Standby implies only that the PE is unavailable and does not clear any debug settings. For standby, the Debug architecture requires only the following:
- An External Debug Request debug event is a wake-up event when halting is allowed. This means that the PE must exit standby to handle the debug event. If the PE executed a WFE or a WFI instruction to enter standby, then it retires that instruction,
  - If the external debug interface is accessed, the PE must respond to that access. ARM recommends that, if the PE executed a WFI or WFE instruction to enter standby, then it does not retire that instruction.
- Standby is transparent, meaning that to software and to an external debugger it is indistinguishable from normal operation.
- Retention** The OS takes some measures, including IMPLEMENTATION DEFINED code sequences and registers, to reduce energy consumption. The PE state, including debug settings, is preserved in low-power structures, allowing the core power domain to be at least partially turned off.
- Changing from low-power retention to normal operation does not involve a reset of the PE. The saved PE state is restored on changing from low-power retention state to normal operation. If software has to use an IMPLEMENTATION DEFINED code sequence before entering, or after leaving, a retention state, this is referred to as a *software-visible retention state*. It is IMPLEMENTATION DEFINED whether the value of `DBGPRCR.CORENPDRQ` is set to the value of `EDPRCR.COREPURQ` on leaving the software-visible retention state.
- External Debug Request debug events stay pending and debug registers in the core power domain cannot be accessed.
- **Note** ————
- This model of retention does not include implementations where the PE exits the state in response to a debug register access. From the Debug architecture perspective, implementations like this are forms of standby.
- Powerdown** The OS takes some measures to reduce energy consumption by turning the core power domain off. These measures must include the OS saving any PE state, including the debug settings, that must be preserved over powerdown. Changing from powerdown to normal operation must include:
- A Cold reset of the PE after the power level has been restored.
  - The OS restoring the saved PE state.
- External Debug Request debug events stay pending and debug registers in the core power domain cannot be accessed.

An implementation might support enabling and disabling threads, either dynamically or once at reset time. Threads that are disabled in this way must appear to the external debugger as either:

- Powered off, meaning they are either:
  - In a powerdown state.
  - In a retention state.
- Held in reset state.

The Debug architecture uses a simpler two states model for the Debug power domain. The two states are:

- Off**                The debug power domain is turned off.  
**On**                The debug power domain is turned on.

The available power states, including the cross-product of core power domain and debug power domain power states is IMPLEMENTATION DEFINED. Implementations are not required to implement all of these states and might include additional states. These additional states must appear to the debugger as one of the logical power states defined by this model. The control of power states is IMPLEMENTATION DEFINED.

———— **Note** ————

As a result, it is IMPLEMENTATION DEFINED whether it is possible for the debug power domain to be on when the core power domain is off.

### H6.3.1 EDPRSR.{DLK, SPD, PU} and the Core power domain

Software interprets EDPRSR.{DLK, SPD, PU} to determine whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read.

**Table H6-1 Interpretation of the EDPRSR.{DLK, SPD, PU} bits**

EDPRSR			Core power domain			Notes
DLK	SPD	PU	Power	Accesses	State lost	
0	0	1	On	OK	No	-
0	1	1	On	OK	Yes	SPD is cleared to 0 following the read.
1	X	1	On	Error	Not known	OS double-lock is locked. Software locks the OS double-lock before removing power.
X	1	0	Off	Error	Yes	A Cold reset will be asserted on exiting powerdown state, but not on exiting low-power retention state.
X	0	0	Not known	Error	Not known	

If the Core power domain is powered up and DoubleLockStatus() == TRUE, then:

- When ARMv8.2-Debug is not implemented, EDPRSR.{DLK, SPD, PU} can read either {1, UNKNOWN, 1} or {UNKNOWN, 0, 0}.
- When ARMv8.2-Debug is implemented, EDPRSR.{DLK, SPD, PU} can only read {UNKNOWN, 0, 0}.

### H6.3.2 EDPRSR.SPD when the Core domain is in either retention or powerdown state

When the Core power domain is in either the retention or powerdown state, EDPRSR.SPD is not cleared following a read of EDPRSR and it is IMPLEMENTATION DEFINED whether:

- EDPRSR.SPD shows whether the state of the debug registers in the Core power domain has been lost since the last time that EDPRSR was read. This means that:
  - When the Core power domain is in the powerdown state, EDPRSR.SPD is RAO, this indicates that the state of the debug registers has been lost.
  - When the Core power domain is in the retention state, EDPRSR.SPD indicates whether the state of the debug registers was lost before the Core power domain entered retention state.
- EDPRSR.SPD is RAZ, and:
  - On leaving the powerdown state, EDPRSR.SPD is set to 1 which indicates that the state of the debug registers has been lost.

— On leaving the retention state, `EDPRSR.SPD` reverts the value it had on entering the retention state.

———— **Note** —————

ARM recommends that an implementation makes `EDPRSR.SPD` fixed as RAO when in the power-down state, particularly if it does not support a low-power retention state.

### H6.3.3 `EDPRSR`.{DLK, R} and reset state

`EDPRSR.R` is UNKNOWN when `DoubleLockStatus() == TRUE`. `OSDLR_EL1.DLK` is cleared to 0 by a reset. If the Core power domain is powered up and entered reset state with the OS double-lock locked, it is CONSTRAINED UNPREDICTABLE whether a read of `EDPRSR` while the PE is in reset state returns:

- `EDPRSR`.{DLK, R, PU} == {1, UNKNOWN, 1} indicating that the OS double-lock is locked. **This is not permitted from ARMv8.2.**
- `EDPRSR`.{DLK, R, PU} == {0, 1, 1} indicating that the PE is in reset state.
- `EDPRSR`.{DLK, R, PU} == {UNKNOWN, UNKNOWN, 0} indicating that the registers in the Core power domain cannot be accessed because the OS double-lock is locked.

If the PE was powered up and the OS double-lock was unlocked when the PE was reset, then `EDPRSR`.{DLK, R, PU} reads as {0, 1, 1} while the PE is in reset state.

On leaving reset state, `EDPRSR`.{DLK, R} reads as {0, 0}.

## H6.4 Emulating low-power states

The control registers [DBGPRCR.CORENPDRQ](#) and [EDPRCR.COREPURQ](#) provide an interface between the power controller and the PE. They typically map directly to signals in the recommended external debug interface. With this interface the external debugger can request the power controller to:

- Emulate states where the core power domain is completely off or in a low-power state where the core power domain registers cannot be accessed. This simplifies the requirements on software by sacrificing entirely realistic behavior.
- Restore full power to the core power domain.

[EDPRSR](#).{SPD, PU} indicates the core power domain power state. For more information see:

- [DBGPRCR\\_EL1, Debug Power Control Register on page D7-2576](#) and [DBGPRCR, Debug Power Control Register on page G6-5298](#).
- [EDPRCR, External Debug Power/Reset Control Register on page H9-5649](#).
- [EDPRSR, External Debug Processor Status Register on page H9-5652](#).
- [Appendix K2 Recommended External Debug Interface](#).

The measures to emulate powerdown are IMPLEMENTATION DEFINED. The ability of the debugger to access the state of the PE and the system might be limited as a result of the measures adopted.

In an emulated powerdown state, the debugger must be able to access all debug, PMU, CTI, and trace unit registers that are accessible on the external debug interface and are in one of:

- The debug power domain.
- The core power domain.
- When a trace unit with a separate trace unit core power domain is implemented, and the trace unit core power domain is powered on, the trace unit core power domain.

That is, the debugger must be able to read and write to such registers without receiving errors. This allows an external debugger to debug the powerup sequence.

ARM recommends that any IMPLEMENTATION DEFINED registers that are on the external debug interface and in either the core power domain or the debug power domain are also accessible in an emulated powerdown state.

To stop the OS Double Lock preventing access to debug registers when powerdown is being emulated, `DoubleLockStatus() == FALSE` when [DBGPRCR.CORENPDRQ](#) == 1.

Otherwise, the behavior of the PE in emulated powerdown must be similar to that in a real powerdown state. In particular, the PE must not respond to other system stimuli, such as interrupts.

[Example H6-1](#) and [Example H6-2](#) are examples of two approaches to emulating powerdown.

### Example H6-1 An example of emulating powerdown

The PE is held in Standby state, isolated from any system stimuli. It is IMPLEMENTATION DEFINED whether the PE can respond to debug stimuli such as an External Debug Request debug event.

If the PE can enter Debug state, then the external debugger is able to use the ITR to execute instructions, such as loads and stores. This causes the external debugger to interact with the system. If the external debugger restarts the PE, the PE leaves Standby state and restarts fetching instructions from memory.

### Example H6-2 Another example of emulating powerdown

The PE is held in Warm reset. This limits the ability of an external debugger to access the resources of the PE. For example, the PE cannot be put into Debug state.

On exit from emulated powerdown the PE is reset. However, the debug registers that are only reset by a Cold reset must not be reset. Typically this means that a Warm reset is substituted for the Cold reset. As such, the effect of accessing any register that is reset by a Warm reset while the PE is in the emulated powerdown state will have an IMPLEMENTATION DEFINED effect on that register.

---

**Note**

---

- Warm reset and Cold reset have different effects apart from resetting the debug registers. In particular, [RMR\\_ELx](#) is reset by a Cold reset and controls the reset state on a Warm reset. This means that if a Cold reset is substituted by a Warm reset, the behavior of the reset code might be different.
  - The timing effects of powering down are typically not factored in the powerdown emulation. Examples of these timing effects are clock and voltage stabilization.
  - Emulation does not model the state lost during powerdown, meaning that it might mask errors in the state storage and recovery routines.
-

## H6.5 Debug OS Save and Restore sequences

In ARMv8-A, the following registers provide the OS Save and restore mechanism:

- The *OS Lock Access Register*, [OSLAR](#), locks the OS Lock to restrict access to debug registers before starting an OS Save sequence, and unlocks the OS Lock after an OS Restore sequence.
- The *OS Lock Status Register*, [OSLSR](#), shows the status of the OS Lock.
- The *External Debug Execution Control Register*, [EDECR](#), can be configured to generate a debug event when the OS Lock is unlocked.
- The *OS Double Lock Register*, [OSDLR](#), locks out an external debug interface entirely. This is only used immediately before a powerdown sequence.

See also:

- [Reset and debug on page H6-5545](#)
- [Appendix K7 Example OS Save and Restore Sequences](#)

### H6.5.1 Debug registers to save over powerdown

[Table H6-2](#) shows the different requirements for self-hosted debug over powerdown and external debug over powerdown:

- The column labeled Self-hosted lists registers that software must preserve over powerdown so that it can support self-hosted debug over powerdown. This does not require use of the OS Save and Restore mechanism.
- The column labeled External lists registers that software must preserve over powerdown so that it can support external debug over powerdown. This requires use of the OS Save and Restore mechanism:
  - Some external debug registers are not normally accessible to software executing on the PE. Additional debug registers are provided that give software the required access to save and restore these external debug registers when [OSLSR](#).OSLK is locked. These registers include [OSECCR](#), [OSDTRRX](#), and [OSDTRTX](#).
- Some registers might only present in some implementations, or might not be accessible at all Exception levels or in Non-secure state. [DBGVCR32\\_EL2](#) and [SDER32\\_EL3](#) are only required to support AArch32.

[Table H6-2](#) does not include registers for the OPTIONAL Trace and Performance Monitor extensions.

**Table H6-2 Debug registers to save over powerdown**

Register in AArch64 state	Register in AArch32 state	Self-hosted	External
<a href="#">MDSCR_EL1</a>	<a href="#">DBGDSCRExt</a>	Yes	Yes <sup>a</sup>
<a href="#">DBGBVR&lt;n&gt;_EL1</a>	<a href="#">DBGBVR&lt;n&gt;</a>	Yes	Yes
<a href="#">DBGBCR&lt;n&gt;_EL1</a>	<a href="#">DBGBCR&lt;n&gt;</a>	Yes	Yes
<a href="#">DBGWVR&lt;n&gt;_EL1</a>	<a href="#">DBGWVR&lt;n&gt;</a>	Yes	Yes
<a href="#">DBGWCR&lt;n&gt;_EL1</a>	<a href="#">DBGWCR&lt;n&gt;</a>	Yes	Yes
<a href="#">DBGVCR32_EL2</a>	<a href="#">DBGVCR</a>	Yes	-
<a href="#">MDCR_EL2</a>	<a href="#">HDCR</a>	Yes	-
<a href="#">SDER32_EL3</a>	<a href="#">SDER</a>	Yes	-
<a href="#">MDCR_EL3</a>	<a href="#">SDCR</a>	Yes <sup>b</sup>	-
<a href="#">MDCCINT_EL1</a>	<a href="#">DBGDCCINT</a>	-	Yes <sup>b</sup>

**Table H6-2 Debug registers to save over powerdown (continued)**

Register in AArch64 state	Register in AArch32 state	Self-hosted	External
DBGCLAIMSET_EL1 DBGCLAIMCLR_EL1	DBGCLAIMSET, DBGCLAIMCLR	-	Yes <sup>c</sup>
OSECCR_EL1	DBGOSECCR	-	Yes <sup>ab</sup>
OSDTRRX_EL1 OSDTRTX_EL1	DBGDTRRXext DBGDTRTXext	-	Yes

- The OS Lock must be locked to save and restore for external debug. When the OS Lock is locked, [DSCR](#) is part of the software save and restore mechanism for external debug. It provides a mechanism for an operating system to access some fields of [EDSCR](#) that are otherwise read-only or not visible to software. This allows the operating system to save and restore these settings over a powerdown for the external debugger.
- This register is new in ARMv8-A. Sequences written for ARMv7 do not preserve the register over powerdown.
- Read [DBGCLAIMCLR](#) to save, write [DBGCLAIMSET](#) to restore.

## H6.5.2 OS Save sequence

To preserve the debug logic state over a powerdown, the state must be saved to nonvolatile storage. This means the OS Save sequence must:

- Lock the OS Lock by:
  - Writing the key value 0xC5ACCE55 to the [DBGOSLAR](#) in AArch32 state.
  - Writing 1 to [OSLAR\\_EL1.OSLK](#) in AArch64 state.
- Execute an ISB instruction.
- Walk through the debug registers listed in [Debug registers to save over powerdown on page H6-5541](#) and save the values to the nonvolatile storage.

Before removing power from the core power domain, software must:

- Lock the OS Double Lock by writing 1 to [OSDLR\\_EL1.DLK](#).
- Execute a [Context synchronization event](#).

## H6.5.3 OS Restore sequence

After a powerdown, the OS Restore sequence must perform the following steps to restore the debug logic state from the non-volatile storage:

- Lock the OS Lock, as described in [OS Save sequence](#). The OS Lock is generally locked by the Cold reset, but this step ensures that it is locked.
- Execute an ISB instruction.
- To ensure that, if an external debugger clears the OS Lock before the end of this sequence, no debug exceptions are generated:
  - Write 0 to [MDSCR\\_EL1](#) if executing in AArch64 state.
  - Write 0 to [DBGDSCRext](#) if executing in AArch32 state.
- Walk through the debug registers listed in [Debug registers to save over powerdown on page H6-5541](#), and restore the values from the nonvolatile storage. The last register to be restored must be:
  - [MDSCR\\_EL1](#) if executing in AArch64 state.
  - [DBGDSCRext](#) if executing in AArch32 state.
- Execute an ISB instruction.

6. Unlock the OS Lock by:
  - Writing any non-key value to [DBGOSLAR](#) if executing in AArch32 state.
  - Writing 0 to [OSLAR\\_EL1.OSLK](#) if executing in AArch64 state.
7. Execute a [Context synchronization event](#).

---

**Note**

The OS Restore sequence overwrites the debug registers with the values that were saved. If there are valid values in these registers immediately before the restore sequence, then those values are lost.

---

#### H6.5.4 Debug behavior when the OS Lock is locked

The main purpose of the OS Lock is to prevent updates to debug registers during an OS Save or OS Restore operation. The OS Lock is locked on a Cold reset.

When the OS Lock is locked:

- Access to debug registers through the System register interface is mainly unchanged except that:
  - Certain registers are read and written without side-effects.
  - Fields in [DSCR](#) and [OSECCR](#) that are normally read-only become read/write.This allows the state to be saved or restored. For more information, see the relevant register description in [Chapter H9 External Debug Register Descriptions](#).
- Access to debug registers by the external debug interface is restricted to prevent an external debugger modifying the registers that are being saved or restored. For more information see [External debug interface register access permissions summary](#) on page H8-5563.
- Debug exceptions, other than Breakpoint Instruction exceptions are not generated.
- Breakpoint and Watchpoint debug events are not generated. The OS Lock has no effect on Breakpoint Instruction exceptions and other debug events.

#### H6.5.5 Debug behavior when the OS Lock is unlocked

When the OS Lock is unlocked, the PE sets [EDES.OSUC](#) to 1 if [EDES.OUCE](#) is set to 1 and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. See [OS Unlock Catch debug event](#) on page H3-5491.

#### H6.5.6 Debug behavior when the OS Double Lock is locked

The OS Double Lock is locked immediately before a powerdown sequence. The OS Double Lock ensures that it is safe to remove core power by forcing the debug interfaces to be quiescent.

When `DoubleLockStatus() == TRUE`:

- The external debug interface only has restricted access to the debug registers, so that it is quiescent before removing power. See [External debug interface register access permissions summary](#) on page H8-5563.
- Debug exceptions, other than Breakpoint Instruction exceptions, are not generated.
- Halting is prohibited. See [Halting allowed and halting prohibited](#) on page H2-5435.

---

**Note**

Pending Halting debug events might be lost when core power is removed.

---

- No asynchronous debug events are WFI or WFE wake-up events.

Software must synchronize the update to [OSDLR](#) before it indicates to the system that core power can be removed. The interface between the PE and its power controller is IMPLEMENTATION DEFINED.

Typically software indicates that core power can be removed by entering the Wait For Interrupt state. This means that software must explicitly synchronize the **OSDLR** update before issuing the WFI instruction.

**OSDLR**.DLK is ignored and `DoubleLockStatus() == FALSE` if either:

- The PE is in Debug state.
- **DBGPRCR**.CORENPDRQ is set to 1.

---

**Note**

It is possible to enter Debug state with **OSDLR**.DLK set to 1. This is because a *Context synchronization event* is required to ensure the OS Double Lock is locked, meaning that Debug state might be entered before the **OSDLR** update is synchronized.

---

Because **OSDLR**.DLK is ignored when **DBGPRCR**.CORENPDRQ is set to 1, and an external debugger can write to **DBGPRCR**.CORENPDRQ, software must not rely on using the OS Double Lock to disable debug exceptions or to prohibit halting, or both. ARM deprecates use of the OS Double Lock for these purposes, and instead recommends that software:

- Uses the OS Lock to disable debug exceptions during save or restore sequences.
- Uses the debug authentication interface to prohibit halting and external debug access to debug registers at times other than immediately prior to removing power.

As the purpose of the OS Double Lock is to ensure that it is safe to remove core power, it is important to avoid race conditions that defeat this purpose. ARM recommends that:

- Once the write to **OSDLR**.DLK has been synchronized by a *Context synchronization event* and `DoubleLockStatus() == TRUE`, a PE must:
  - Not allow a debug event generated before the *Context synchronization event* to cause an entry to Debug state or act as a wake-up event for a WFI or WFE instruction after the *Context synchronization event* has completed.
  - Complete any external debug access started before the *Context synchronization event* by the time the *Context synchronization event* completes.

---

**Note**

A debug register access might be in progress when software sets **OSDLR**.DLK to 1. An implementation must not permit the synchronization of locking the OS Double Lock to stall indefinitely while waiting for that access to complete. This means that any debug register access that is in progress when software sets **OSDLR**.DLK to 1 must complete or return an error in finite time.

- 
- If a write to **DBGPRCR** or **EDPRCR** made when **OSDLR**.DLK == 1 changes **DBGPRCR**.CORENPDRQ or **EDPRCR**.CORENPDRQ from 1 to 0, meaning `DoubleLockStatus()` changes from FALSE to TRUE, then before signaling to the system that the CORENPDRQ field has been cleared and emulation of powerdown is no longer requested, meaning the system can remove core power, the PE must ensure that all the requirements for `DoubleLockStatus() == TRUE` listed in this section are met.

In the standard OS Save sequence, the OS Lock is locked before the OS Double Lock is locked. This means that writes to CORENPDRQ are ignored by the time the OS Double Lock is locked. However, if `DoubleLockStatus() == FALSE`, an external debugger can clear the OS Lock at any time, and then write to **EDPRCR**.

## H6.6 Reset and debug

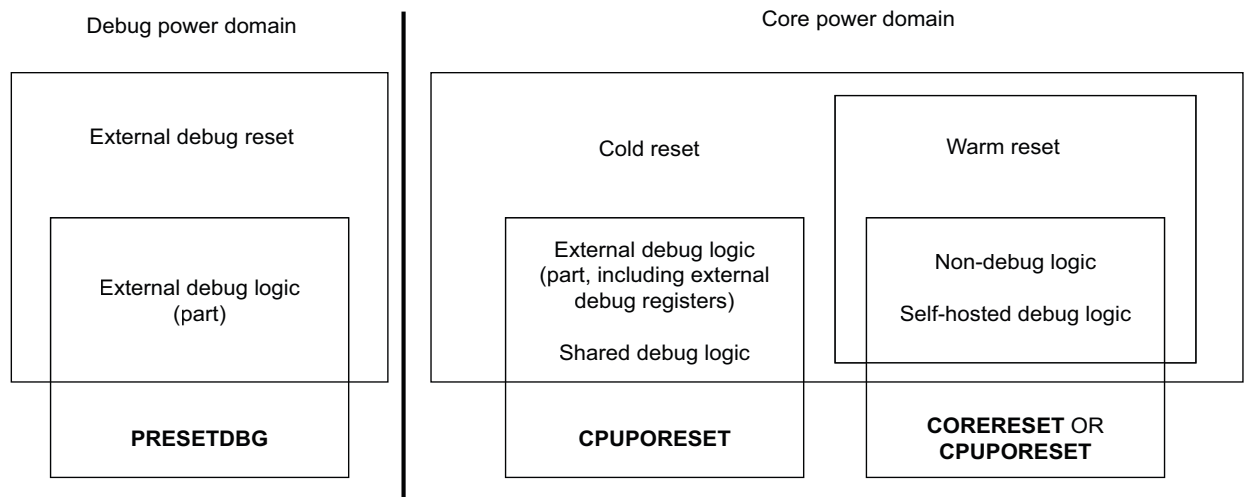

All registers in the Core power domain are reset either by a Warm reset or a Cold reset, as described in [Reset on page D1-1795](#), including external debug logic registers.

All registers in the Debug power domain are reset by an External Debug reset.

[Figure H6-2](#) shows this reset scheme. The following three reset signals are an example implementation of the reset scheme:

- **CORERESET**, which must be asserted for a Warm reset.
- **CPUPORESET**, which must be asserted for a Cold reset.
- **PRESETDBG**, which must be asserted for an External Debug reset.

As shown in the figure, the external debug logic is split between the Debug power domain and the Core power domain.

**Figure H6-2 Power and reset domains**

For more information about power domains and power states, see [Power domains and debug on page H6-5535](#).

When power is first applied to the Debug power domain, **PRESETDBG** must be asserted.

When power is first applied to the Core power domain, **CPUPORESET** must be asserted.

### ———— Note ————

In this scheme, logic in the Warm reset domain is reset by asserting either **CORERESET** or **CPUPORESET**. This implies a particular implementation style that permits these approaches.

**CPUPORESET** is not normally asserted on moving from a low-power state, where power has not been removed, to a full-power state. This can occur, for example, on exiting a low-power retention state. See also [Emulating low-power states on page H6-5539](#) and [EDPRSR, External Debug Processor Status Register on page H9-5652](#).

### H6.6.1 External debug interface accesses to registers in reset

If a reset signal is asserted and the external debug interface:

- Writes a register, or indirectly writes a register or register field as a side-effect of an access:
  - Then, if the register or register field is reset by that reset signal, it is **CONSTRAINED UNPREDICTABLE** whether the register or register field takes the reset value or the value written. The reset value might be **UNKNOWN**.
  - Otherwise the register or register field takes the value that is written.

- Reads a register, or indirectly reads a register or register field, as part of an access:
  - Then, if the register or register field is reset by that reset signal, the value returned is UNKNOWN.
  - Otherwise, the value of the register or register field is returned.

It is IMPLEMENTATION DEFINED whether any register can be accessed when External Debug reset is being asserted.  
The result of these accesses is IMPLEMENTATION DEFINED.

# Chapter H7

## The PC Sample-based Profiling Extension

This chapter describes the OPTIONAL PC Sample-based Profiling Extension that provides a non-invasive external debug component.

It contains the following section:

- [About the PC Sample-based Profiling Extension on page H7-5548.](#)

## H7.1 About the PC Sample-based Profiling Extension

The PC Sample-based Profiling Extension provides coarse-grained, non-invasive profiling by an external debugger. See also [Non-invasive behavior on page D5-2140](#).

PC Sample-based Profiling creates samples so that tools can populate a statistical model of the performance of software executing on the PE.

Under normal operating conditions, the sample must reference an instruction that was committed for execution, including its context, and must not reference instructions that are fetched but not committed for execution.

It must be possible to sample references to branch targets. It is IMPLEMENTATION DEFINED whether references to other instructions can be sampled. The branch target for a conditional branch instruction that fails its condition check is the instruction that follows the conditional branch instruction. The branch target for an exception is the exception vector address.

To keep the implementation and validation cost low, a reasonable degree of inaccuracy in the sampled data is acceptable. ARM does not define *a reasonable degree of inaccuracy* but recommends the following guidelines:

- In exceptional circumstances, such as a change in Security state or other boundary condition, it is acceptable for the sample to represent an instruction that was not committed for execution.
- Under unusual non-repeating pathological cases, the sample can represent an instruction that was not committed for execution. These cases are likely to occur as a result of asynchronous exceptions, such as interrupts, where the chance of a systematic error in sampling is very unlikely.

### ———— Note ————

In the ARMv7 PC Sample-based Profiling Extension, an offset was applied to the sampled program counter value and this offset and the instruction set state indicated in bits [1:0] of the sampled value. In the ARMv8 PC Sample-based Profiling Extension, the sampled value is the address of an instruction that has executed, with no offset and no indication of the instruction set state.

### H7.1.1 Controlling the PC Sample-based Profiling Extension

PC Sample-based Profiling is controlled by the IMPLEMENTATION DEFINED authentication interface [ExternalNoninvasiveDebugEnabled\(\)](#).

PC Sample-based Profiling is prohibited unless both:

- Allowed by the IMPLEMENTATION DEFINED authentication interface [ExternalNoninvasiveDebugEnabled](#).
- Any one of
  - The PE is executing in Non-secure state.
  - EL3 is not implemented.
  - EL3 is implemented, the PE is executing in Secure state, and allowed by the IMPLEMENTATION DEFINED authentication interface [ExternalSecureNoninvasiveDebugEnabled\(\)](#).
  - EL3 is implemented, EL3 or EL1 is using AArch32, the PE is executing at EL0 in Secure state, and the value of [SDER.SUNIDEN](#) is 1.

The state of the IMPLEMENTATION DEFINED authentication interface is visible through [DBGAUTHSTATUS\\_EL1](#). See [Recommended authentication interface on page K2-6140](#).

### H7.1.2 Registers implemented by the PC Sample-based Profiling Extension

If PC Sample-based Profiling is implemented but not with [ARMv8.2-PCSample](#), [EDDEVID.PCSample](#) and [EDDEVID1.PCSROffset](#) define the level of profiling and the offset.

If PC Sample-based Profiling is implemented but not with [ARMv8.2-PCSample](#) and [ARMv8.1-VHE](#) is implemented, [EDSCR.SC2](#) controls what PC Sample-based Profiling samples.

If PC Sample-based Profiling is implemented but not with [ARMv8.2-PCSample](#), the following external debug registers can be implemented:

- [EDCIDSR](#).
- [EDPCSR](#).
- [EDVIDSR](#).

See [External debug interface register map](#) on page H8-5565.

If PC Sample-based Profiling is implemented and ARMv8.2-PCSample is implemented, PMDEVID.PCSample identifies the level of profiling. The following registers can be implemented in the Performance Monitors external debug page:

- [PMCID1SR](#) and [PMCID2SR](#).
- [PMPCSR](#).
- [PMVIDSR](#).

See [Performance Monitors external register views](#) on page I3-5746.

In a full ARMv8.2 implementation if the Performance Monitors Extension is not implemented but the PC Sample-based Profiling is implemented with ARMv8.2-PCSample, then the PC Sample-based Profiling Extension is implemented in a separate external debug page. In the memory maps of the ARMv8-A architecture profile, this page is located at the location that is reserved for the Performance Monitors, see Table H7-1. For CoreSight compliance, the management registers are defined as in Table K2-3 on page K2-6141 and the support for PC Sample-based profiling is defined in the following registers:

- [PMDEVTYPE.MAJOR](#) has the value 0x0.
- [PMDEVARCH.ARCHID](#) has the value 0x0A10.

**Table H7-1 PC Sample-based Profiling register offsets without the Performance Monitors Extension**

Offset	Description
0x200	PMPCSR[31:0]
0x204	PMPCSR[63:32]
0x208	PMCID1SR
0x20C	PMVIDSR
0x220	PMPCSR[31:0] (alias)
0x224	PMPCSR[63:32] (alias)
0x228	PMCID1SR (alias)
0x22C	PMCID2SR
0x600-0x6FC	IMPLEMENTATION DEFINED
0xE80-0xEFC	IMPLEMENTATION DEFINED for CoreSight compliance
0xFF0-0xFFC	Management and CoreSight compliance registers

### H7.1.3 Pseudocode description of PC Sample-based Profiling

When PC Sample-based Profiling is implemented but not with [ARMv8.2-PCSample](#), the functionality is described by the pseudocode functions:

- [CreatePCSample\(\)](#), which populates a variable of type [PCSample](#).
- [EDPCSRto\[\]](#), which writes a PC sample to the [EDPCSR](#) and associated registers.

# Chapter H8

## About the External Debug Registers

This chapter provides some additional information about the external debug registers. It contains the following sections:

- [\*Relationship between external debug and System registers on page H8-5552.\*](#)
- [\*Endianness and supported access sizes on page H8-5553.\*](#)
- [\*Synchronization of changes to the external debug registers on page H8-5554.\*](#)
- [\*Memory-mapped accesses to the external debug interface on page H8-5558.\*](#)
- [\*External debug interface register access permissions on page H8-5561.\*](#)
- [\*External debug interface registers on page H8-5565.\*](#)
- [\*Cross-trigger interface registers on page H8-5570.\*](#)
- [\*External debug register resets on page H8-5572.\*](#)

---

**Note**

Where necessary [\*Table K11-1 on page K11-6282\*](#) disambiguates the general register references used in this chapter.

---

## H8.1 Relationship between external debug and System registers

Table H8-1 shows the relationship between external debug registers and System registers. Where no relationship exists, the registers are not listed.

**Table H8-1 Equivalence between external debug and System registers**

External debug register	System register		Notes
	AArch64	AArch32	
DBGDTRRX_EL0	DBGDTRRX_EL0	DBGDTRRXint	See also <i>Summary of System register accesses to the DCC</i> on page H4-5509
DBGDTRTX_EL0	DBGDTRTX_EL0	DBGDTRTXint	
OSLAR_EL1	OSLAR_EL1	DBGOSLAR	-
DBGBVR<n>_EL1[31:0]	DBGBVR<n>_EL1[31:0]	DBGBVR<n>	-
DBGBVR<n>_EL1[63:32]	DBGBVR<n>_EL1[63:32]	DBGBXVR<n>	
DBGBCR<n>_EL1	DBGBCR<n>_EL1	DBGBCR<n>	-
DBGWVR<n>_EL1[31:0]	DBGWVR<n>_EL1[31:0]	DBGWVR<n>	-
DBGWVR<n>_EL1[63:32]	DBGWVR<n>_EL1[63:32]		
DBGWCR<n>_EL1	DBGWCR<n>_EL1	DBGWCR<n>	-
DBGCLAIMSET_EL1	DBGCLAIMSET_EL1	DBGCLAIMSET	-
DBGCLAIMCLR_EL1	DBGCLAIMCLR_EL1	DBGCLAIMCLR	-
DBGAUTHSTATUS_EL1	DBGAUTHSTATUS_EL1	DBGAUTHSTATUS	Read-only
EDSCR	MDSCR_EL1	DBGDSCRext	Only some fields map
EDECCR	OSECCR_EL1	DBGOSECCR	Applies when the OS Lock is locked.
MIDR_EL1	MIDR_EL1	MIDR	Read-only copies of Processor ID Registers
EDDEVAFF0	MPIDR_EL1[31:0] <sup>a</sup>	MPIDR	Read-only copies of system ID registers
EDDEVAFF1	MPIDR_EL1[63:32] <sup>a</sup>		

a. This is a word of a 64-bit register.

In addition:

- **EDSCR**.{TXfull, RXfull} are read-only aliases for **DCCSR**.{TXfull, RXfull}.
- **EDPRCR**.CORENPDRQ is a read/write alias for **DBGPRCR**.CORENPDRQ.
- **EDPRSR**.OSLK is a read-only alias for **OSLSR**.OSLK.
- **EDPRSR**.DLK is a read-only function of **OSDLR**.DLK.

## H8.2 Endianness and supported access sizes

The debug registers, Performance Monitor registers, and CTI registers are implemented as memory-mapped peripherals. The ARM architecture requires memory-mapped peripherals to be little-endian.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the debug registers, Performance Monitor registers, and CTI registers, implementations must support:

- Word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations.
- Doubleword-aligned 64-bit accesses to access 64-bit registers mapped to a doubleword-aligned pair of adjacent 32-bit locations.

---

**Note**

This means that a system implementing the debug registers using a 32-bit bus, such as a AMBA APB3, with a wider system interconnect must implement a bridge between the system and the debug bus that can split 64-bit accesses.

---

All registers are only single-copy atomic at word granularity. This means that for 64-bit accesses to a 64-bit register, the system might generate a pair of 32-bit accesses. The order in which the two halves are accessed is not specified.

The following accesses are not supported:

- Byte.
- Halfword.
- Unaligned word. These accesses are not word single-copy atomic.
- Unaligned doubleword. These accesses are not doubleword single-copy atomic.
- Doubleword accesses to a pair of 32-bit locations that are not a doubleword-aligned pair forming a 64-bit register.
- Quadword or higher.
- Exclusive accesses.

For each of these access types, it is CONSTRAINED UNPREDICTABLE whether:

- The access generates an external abort or not.
- The defined side-effects of a read occur or not. A read returns UNKNOWN data.
- A write is ignored or sets the accessed register or registers to UNKNOWN.

For accesses from the external debug interface, the size of an access is determined by the interface. For an access from an ADiv5-compliant Memory Access Port, MEM-AP, this is specified by the MEM-AP CSW register.

See [Access sizes for memory-mapped accesses on page H8-5559](#).

## H8.3 Synchronization of changes to the external debug registers

This section describes the synchronization requirements for the external debug interface.

For more information on how these requirements affect debug, see:

- [Synchronization and debug exceptions on page D2-1970](#) for exceptions taken from AArch64 state, or [Synchronization and debug exceptions on page G2-4518](#) for exceptions taken from AArch32 state.
- [Synchronization and Halting debug events on page H3-5494](#).
- [Synchronization of DCC and ITR accesses on page H4-5509](#).

This section refers to accesses from the external debug interface as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads, and indirect writes.

### ———— Note ————

[Synchronization requirements for AArch64 System registers on page D7-2191](#) defines direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads, and external writes as indirect writes.

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. With the exception of [DBGBCR<n>\\_EL1](#), [DBGBVR<n>\\_EL1](#), [DBGWCR<n>\\_EL1](#), and [DBGWVR<n>\\_EL1](#), external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

[Synchronization of DCC and ITR accesses on page H4-5509](#) describes the synchronization requirements for the DCC and ITR.

Changes to the IMPLEMENTATION DEFINED authentication interface are external writes to the authentication status registers by the master of the authentication interface. See [Synchronization and the authentication interface on page H8-5555](#).

Explicit synchronization is not required for an external read or an external write by an external agent to be observable to a following external read or external write by that agent to the same register using the same address, and so is never required for registers that are accessible only in the external debug interface.

Some registers are guaranteed to be observable to all observers in finite time, without explicit synchronization. For more information, see [Synchronization requirements for AArch64 System registers on page D7-2191](#) or [Synchronization of changes to AArch32 System registers on page G6-4768](#). Otherwise, explicit synchronization is normally required following an external write to any register for that write to be observable by:

- A direct access.
- An indirect read by an instruction.
- An external read of the register using a different address.

This means that an external write by an external agent is guaranteed to have an effect on subsequent instructions executed by the PE only if all of the following are true:

- The write has completed.
- The PE has executed a [Context synchronization event](#).
- The [Context synchronization event](#) was executed after the write completed.

The order and synchronization of direct reads and direct writes of System registers is defined by [Synchronization requirements for AArch64 System registers on page D7-2191](#).

The external agent must be able to guarantee completion of a write. For example by:

- Marking the memory as Device-nGnRnE and executing a DSB barrier, if the system supports this property.
- Reading back the value written.
- Some guaranteed property of the connection between the PE and the external agent.

---

**Note**

For an external Debug Access Port, this is an IMPLEMENTATION DEFINED property. For a CoreSight system using APB-AP to access a debug APB, a write is guaranteed to complete before the APB-AP allows a second APB transaction to complete.

---

The external agent and PE can guarantee ordering by, for example, passing messages in an ordered way with respect to the external write and the [Context synchronization event](#), and relying on the memory ordering rules provided by the memory model.

External reads and external writes complete in the order in which they arrive at the PE. For accesses to different register locations the external agent must create this order by:

- Marking the memory as Device-nGnRnE or Device-nGnRE.
- Using the appropriate memory barriers.
- Some guaranteed property of the connection between the PE and the external agent.

---

**Note**

For an external Debug Access Port, this is an IMPLEMENTATION DEFINED property. For a CoreSight system using APB-AP to access a debug APB, accesses complete in order.

---

However, the external agent cannot force synchronization of completed writes without halting the PE. Executing an ISB instruction, either in Debug state or in Non-debug state, and exiting from Debug state forces synchronization. If the PE is in Debug state, executing an ISB instruction is guaranteed to explicitly synchronize any external reads, external writes, and changes to the authentication interface that are ordered before the external write to [EDITR](#).

For any given observer, external writes to the following register groups are guaranteed to be observable in the same order in which they complete:

- The breakpoint registers, [DBGBCR<n>\\_EL1](#) and [DBGBVR<n>\\_EL1](#).
- The watchpoint registers, [DBGWCR<n>\\_EL1](#) and [DBGWVR<n>\\_EL1](#).

This guarantee only applies to external writes to registers within one of these groups. There is no guarantee regarding the ordering of the observability of external writes within these groups with respect to external writes to registers, for example [EDSCR](#), or between breakpoints and watchpoints, including watchpoints linked to context matching breakpoints.

---

**Note**

This means that a debugger can rely on the external writes to be observed in the same order in which they complete. It does not mean that a debugger can rely on the external writes being observed in finite time.

---

In a simple sequential execution an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

If two or more interfaces simultaneously access a register, the behavior must be as if the accesses occurred atomically and in any order. This is described in [Examples of the synchronization of changes to the external debug registers on page H8-5556](#).

Some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means that simultaneous writes must be merged. Registers that have this property and support both external debug and System register access include [DBGCLAIMSET\\_EL1](#), [DBGCLAIMCLR\\_EL1](#), [PMCR\\_EL0](#).{C,P}, [PMOVSSET\\_EL0](#), [PMOVSCLR\\_EL0](#), [PMCNTENSET\\_EL0](#), [PMCNTENCLR\\_EL0](#), [PMINTENSET\\_EL1](#), [PMINTENCLR\\_EL1](#), and [PMSWINC\\_EL0](#). This last register is OPTIONAL and deprecated in the external debug interface.

### H8.3.1 Synchronization and the authentication interface

Changes to the authentication interface are indirect writes to the Authentication Status registers by the master of the authentication interface. For each of these Authentication Status registers, it is IMPLEMENTATION DEFINED whether a change on the authentication interface is guaranteed to be observable to an external debug interface read of the register only after a [Context synchronization event](#) or in finite time.

For `DBGAUTHSTATUS_EL1`, a change on the authentication interface is guaranteed to be observable to a System register read of `DBGAUTHSTATUS_EL1` only after a *Context synchronization event*.

### H8.3.2 Examples of the synchronization of changes to the external debug registers

[Example H8-1](#), [Example H8-2](#), and [Example H8-3](#) show the synchronization of changes to the external debug registers.

---

#### Example H8-1 Order of synchronization of Breakpoint and Watchpoint register writes

---

Initially `DBGBVR<n>_EL1` is `0x8000` and `DBGBCR<n>_EL1` is `0x0181`. This means that a breakpoint is enabled on the halfword T32 instruction at address `0x8000`.

A sequence of external writes occurs in the following order:

1. `0x0000` is written to `DBGBCR<n>_EL1`, disabling the breakpoint.
2. `0x9000` is written to `DBGBVR<n>_EL1[31:0]`.
3. `0x0061` is written to `DBGBCR<n>_EL1`, enabling a breakpoint on the halfword at address `0x9002`.

The external writes must be observable to indirect reads in the same order as the external writes complete. This means that at no point is there a breakpoint enabled on either of the halfwords at address `0x8002` and `0x9000`.

Similarly a breakpoint or watchpoint must be disabled:

- If both halves of a 64-bit address have to be updated.
  - If any of the `DBGBCR<n>_EL1` or `DBGWCR<n>_EL1` fields are modified at the same time as updating the address.
- 

#### Example H8-2 Simultaneous accesses to DTR registers

---

Initially `EDSCR.{TXfull, TXU, ERR}` are 0. Then:

- `0x0DCCDA7A` is directly written to `DBGDTRTX_EL0` by an MSR instruction.
- `DBGDTRTX_EL0` is indirectly read by the external debug interface.

These accesses might happen at the same time and in any order.

If the direct write of `0x0DCCDA7A` to `DBGDTRTX_EL0` is handled first, then:

- The external debug interface read of `DBGDTRTX_EL0` clears `EDSCR.TXfull` to 0.
- `EDSCR.{TXU, ERR}` are unchanged.
- The external debug interface read returns `0x0DCCDA7A`.

If the indirect read of `DBGDTRTX_EL0` by the external debug interface is handled first, then:

- The external debug interface read of `DBGDTRTX_EL0` causes an underrun and as a result `EDSCR.{TXU, ERR}` are both set to 1.
  - The external debug interface returns an UNKNOWN value.
  - Writing `0x0DCCDA7A` to `DBGDTRTX_EL0` sets `DTRTX` to `0x0DCCDA7A` and `EDSCR.TXfull` to 1.
- 

#### Example H8-3 Simultaneous writes to CLAIM registers

---

Initially all CLAIM tag bits are 0. Then:

- `0x01` is written to `DBGCLAIMSET_EL1` by a direct write, followed by an explicit *Context synchronization event*.
- `0x02` is written to `DBGCLAIMSET_EL1` by an external write.

These events might happen at the same time and in either order.

After this:

- [DBGCLAIMCLR\\_EL1](#) is read by a direct read.
- [DBGCLAIMCLR\\_EL1](#) is read by an external read.

In this case, a direct read can return either 0x01 or 0x03, and the external read can return either 0x02 or 0x03.

The only permitted final result for the CLAIM tags is the value 0x03, because this would be the result regardless of whether 0x01 or 0x02 is written first. This is because the external write is guaranteed to be observable to a direct read in finite time. See [Synchronization requirements for AArch64 System registers](#) on page D7-2191.

It is not possible for a direct read to return 0x01 and the external read to return 0x02, because the writes to [DBGCLAIMCLR\\_EL1](#) are serialized.

In the following scenario, there is only one permitted result. Both observers observe the value 0x03, and then, at the same time, two writes occur:

- 0x04 is written to [DBGCLAIMSET\\_EL1](#) by a direct write, followed by an explicit [Context synchronization event](#).
- 0x01 is written to [DBGCLAIMCLR\\_EL1](#) by an external write.

In this case only permitted final result for the CLAIM tags is the value 0x06.

---

## H8.4 Memory-mapped accesses to the external debug interface

Support for memory-mapped access to the external debug interface is OPTIONAL. When memory-mapped access to the external debug interface is supported, the external debug interface is accessed as a little-endian memory-mapped peripheral.

If the external debug interface is CoreSight compliant, then an OPTIONAL Software Lock can be implemented for memory-mapped accesses to each component.

The Software Lock is OPTIONAL and deprecated. If it is not implemented, the behavior is as if it is unlocked. The Software Locks are controlled by [EDLSR](#) and [EDLAR](#), [PMLSR](#) and [PMLAR](#), and [CTILSR](#) and [CTILAR](#). See *Management registers and CoreSight compliance* on page K2-6141.

With the exception of these registers and the effect of the Software Lock, the behavior of the memory-mapped accesses is the same as for other accesses to the external debug interface.

### ———— Note ————

The recommended memory-mapped accesses to the external debug interface are not compatible with the memory-mapped interface defined in ARMv7. In particular:

- The memory map is different.
- Memory-mapped accesses do not behave differently to Debug Access Port accesses when [OSLSR.OSLK](#) == 1, meaning that the OS Lock is locked.

### H8.4.1 Register access permissions for memory-mapped accesses

It is IMPLEMENTATION DEFINED whether unprivileged memory-mapped accesses are allowed. Privileged software is responsible for controlling memory-mapped accesses using the MMU.

If memory-mapped accesses are made through an ADiv5 interface, the Debug Access Port can block the access using [DBGSWENABLE](#). This is outside the scope of the ARMv8-A architecture. See *ARM® Debug Interface Architecture Specification ADiv5.0 to ADiv5.2*.

#### Effect of the OPTIONAL Software Lock on memory-mapped access

For memory-mapped accesses, if other controls permit access to a register, the OPTIONAL Software Lock is implemented, and [EDLSR.SLK](#), [PMLSR.SLK](#), or [CTILSR.SLK](#) is set to 1, meaning the Software Lock is locked, then with the exception of the LAR itself:

- If other controls permit access to a register, then writes are ignored. That is:
  - Read/write (RW) registers become read-only, writes ignored (RO/WI).
  - Write-only (WO) registers become writes ignored (WI).
- Reads and writes have no side-effects. A side-effect is where a direct read or a direct write of a register creates an indirect write of the same or another register. When the Software Lock is locked, the indirect write does not occur.
- Writes to [EDLAR](#), [PMLAR](#), and [CTILAR](#) are unaffected.

This behavior must also apply to all IMPLEMENTATION DEFINED registers.

For example, if [EDLSR.SLK](#) is set to 1:

- [EDSCR](#).{TXfull, TXU, ERR} are unchanged by a memory-mapped read from [DBGDTRTX\\_EL0](#).
- [EDSCR](#).{RXfull, RXO, ERR} are unchanged by a memory-mapped write to [DBGDTRRX\\_EL0](#) that is ignored.
- [EDSCR](#).{ITE, ITO, ERR} are unchanged by a memory-mapped write to [EDITR](#) that is ignored.
- [OSLSR.OSLK](#) is unchanged by a memory-mapped write to [OSLAR\\_EL1](#) that is ignored.

- [EDPCSR\[63:32\]](#), [EDCIDSR](#), and [EDVIDSR](#) are unchanged by a memory-mapped read from [EDPCSR\[31:0\]](#).

———— **Note** ————

Updating [EDVIDSR](#), [EDCIDSR](#), and [EDPCSRhi](#) are side-effects of reading [EDPCSRlo](#), such that these registers contain the matching context for [EDPCSRlo](#). The process that updates [EDPCSRlo](#) with PC samples is not a side-effect of the access. Reads of [EDPCSRlo](#) made when the Software Lock is locked can be used to profile software.

- [PMPCSR\[63:32\]](#), [PMCID1SR/PMCID2SR](#), and [PMVIDSR](#) are unchanged by a memory-mapped read from [PMPCSR\[31:0\]](#).

———— **Note** ————

Updating [PMVIDSR](#), [PMCID1SR/PMCID2SR](#), and [PMPCSR\[31:0\]](#) are side-effects of reading [PMPCSR\[63:32\]](#), such that these registers contain the matching context for [PMPCSR\[63:32\]](#). The process that updates [PMPCSR\[63:32\]](#) with PC samples is not a side-effect of the access. Reads of [PMPCSR\[63:32\]](#) made when the Software Lock is locked can be used to profile software.

- [EDPRSR](#).{SDR, SPMAD, SDAD, SR, SPD} are unchanged by a memory-mapped read from [EDPRSR](#).
- [EDPRSR.SDAD](#) is not set if an error response is returned due to a memory-mapped read or write of any debug register as the result of the value of the EDAD field.
- The CLAIM tags are unchanged by memory-mapped writes to [DBGCLAIMSET\\_EL1](#) and [DBGCLAIMCLR\\_EL1](#) which are ignored.

Similarly, if [PMLSR.SLK](#) is set to 1, then [EDPRSR.SPMAD](#) is not set if an error response is returned to a memory-mapped read or write of any Performance Monitors register due to the value of the EPMAD field.

### Behavior of a not permitted memory-mapped access

Where the architecture requires that an external debug interface access generates an error response, a memory-mapped access must also generate an error response. However, it is IMPLEMENTATION DEFINED how the error response is handled, as this depends on the system.

ARM recommends that the error is returned as either:

- A synchronous external Data Abort.
- An SError interrupt.

## H8.4.2 Synchronization of memory-mapped accesses to external debug registers

The synchronization requirements for memory-mapped accesses to the external debug interface is described in [Synchronization of changes to the external debug registers on page H8-5554](#).

The synchronization requirements between different routes to the external debug interface, that is, between Debug Access Port accesses and memory-mapped accesses are IMPLEMENTATION DEFINED.

## H8.4.3 Access sizes for memory-mapped accesses

For memory-mapped accesses from a PE that complies with an ARM architecture, the single-copy atomicity rules for the instruction, the type of instruction, and the type of memory accessed, determine the size of the access made by an instruction. [Example H8-4 on page H8-5560](#) shows this.

#### Example H8-4 Access sizes for memory-mapped accesses

---

Two Load Doubleword instructions made to consecutive doubleword-aligned locations generate a pair of single-copy atomic doubleword reads. However, if the accesses are made to Normal memory or Device-GRE memory they might appear as a single quadword access that is not supported by the peripheral.

---

ARMv8 does not require the size of each element accessed by a multi-register load or store instruction to be identifiable by the memory system beyond the PE. Any memory-mapped access to a debug register is defined to be beyond the PE.

Software must use a Device-nGRE or stronger memory-type and use only single register load and store instructions to create memory accesses that are supported by the peripheral. For more information, see [Memory types and attributes on page B2-107](#).

## H8.5 External debug interface register access permissions

Some external accesses to debug registers and Performance Monitor registers are not permitted and return an error response if:

- The Core power domain is powered down or is in low-power state where the registers cannot be accessed.
- [OSLSR.OSLK](#) == 1. The OS Lock is locked.
- [DoubleLockStatus\(\)](#) == TRUE. The OS Double Lock is locked.
- Access by the external debug interface is disabled by the authentication interface or secure monitor.

Not all registers are affected in all of these cases. For details, see [External debug interface register access permissions summary](#) on page H8-5563.

———— **Note** —————

[OSLSR.OSLK](#) is visible through [EDPRSR](#).

### H8.5.1 External debug over powerdown and locks

Accessing registers using the external debug interface is not possible when the Debug power domain is off. In this case all accesses return an error.

External accesses to debug and Performance Monitors registers in the Core power domain are not permitted and return an error response if:

- The Core power domain is off or in low-power state where the registers cannot be accessed.
- [OSLSR.OSLK](#) == 1, meaning that the OS Lock is locked. This allows software to prevent external debugger modification of the registers while it saves and restores them over powerdown.
- [DoubleLockStatus\(\)](#) == TRUE. This means that the OS Double Lock is locked. The OS Double Lock ensures that it is safe to remove Core power by forcing the debug interface to be quiescent.

It is IMPLEMENTATION DEFINED whether the ID registers that describe the PE to the debugger are in the Debug power domain or the Core power domain.

———— **Note** —————

This applies only to the [MIDR\\_EL1](#), [EDPFR](#), [EDDFR](#), and [EDAA32PFR](#) registers. It does not include the CoreSight ID registers in the management register address range.

The OS lock condition does not apply to the following debug registers:

- [OSLAR\\_EL1](#). This means that an external debugger can override this lock.
- [EDES](#). This means that an external debugger can program a debug event for when software unlocks the OS lock. See [OS Unlock Catch debug event](#) on page H3-5491.
- The ID registers that describe the PE to the debugger.

See also [Debug registers to save over powerdown](#) on page H6-5541.

### H8.5.2 External access disabled

Accesses are further controlled by the external authentication interface. An untrusted external debugger cannot program the breakpoint and watchpoint registers to generate spurious debug exceptions. If external invasive debugging is not enabled, these external accesses to the registers are disabled. If EL3 is implemented, then [SDCR](#) provides additional external access disable controls for those registers if Secure external invasive debugging is disabled.

The disable applies to:

- [DBGBVR<n>\\_EL1](#), *Debug Breakpoint Value Registers, n = 0 - 15* on page H9-5584.
- [DBGBCR<n>\\_EL1](#), *Debug Breakpoint Control Registers, n = 0 - 15* on page H9-5580.

- [DBGWVR<n>\\_EL1](#), *Debug Watchpoint Value Registers*,  $n = 0 - 15$  on page H9-5600.
- [DBGWCR<n>\\_EL1](#), *Debug Watchpoint Control Registers*,  $n = 0 - 15$  on page H9-5597.
- From ARMv8.2, [OSLAR\\_EL1](#), *OS Lock Access Register* on page H9-5675.

In ARMv8.0 and ARMv8.1 implementations, it is IMPLEMENTATION DEFINED whether the disable applies to [OSLAR\\_EL1](#).

The external debug interface cannot access these registers if either:

- External debugging is not enabled, meaning [ExternalInvasiveDebugEnabled\(\)](#) == FALSE.
- Secure external debugging is not enabled, meaning [ExternalSecureInvasiveDebugEnabled\(\)](#) == FALSE, and any of the following:
  - EL3 is not implemented and the implemented Security state is Secure state.
  - EL3 is implemented and [SDCR.EDAD](#) == 1.

The [AllowExternalDebugAccess\(\)](#) pseudocode function describes these accessibility rules.

PEs might also provide an OPTIONAL external debug interface to the Performance Monitor registers. The authentication interface and [SDCR](#) provide similar external access disable controls for those registers.

The external debug interface cannot access the Performance Monitor registers if either:

- External non-invasive debug is not enabled. [ExternalNoninvasiveDebugEnabled\(\)](#) == FALSE.
- Secure external non-invasive debugging is not enabled, [ExternalSecureNoninvasiveDebugEnabled\(\)](#) == FALSE, and any of:
  - EL3 is not implemented and the implemented Security state is Secure state.
  - EL3 is implemented and [SDCR.EPMAD](#) == 1.

The [AllowExternalPMUAccess\(\)](#) pseudocode function describes these accessibility rules.

———— **Note** —————

- ARM recommends that secure software that is not making use of debug hardware does not lock out the external debug interface.
- ARMv8-A does not provide the equivalent control over access to Trace extension registers.

### H8.5.3 Behavior of a not permitted access

For an external debug interface access by a Debug Access Port, the Debug Access Port receives the error response and must signal this to the external debugger. For an ADIv5 implementation of a Debug Access Port, the error sets a sticky error flag in the Debug Access Port that the debugger can poll, and that suppresses further accesses until it is explicitly cleared.

When an error is returned because external access is disabled, and this is the highest priority error condition, a sticky error flag in [EDPRSR](#) is indirectly written to 1 as a side-effect of the access:

- For a debug register access when [AllowExternalDebugAccess\(\)](#) == FALSE, [EDPRSR.SDAD](#) is indirectly written to 1.
- For Performance Monitor register access when [AllowExternalPMUAccess\(\)](#) == FALSE, [EDPRSR.SPMAD](#) is indirectly written to 1.

The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see [Register access permissions for memory-mapped accesses](#) on page H8-5558.

If no error is returned, or the error is returned because of a higher priority error condition, the flag in [EDPRSR](#) is unchanged.

See also [Behavior of a not permitted memory-mapped access](#) on page H8-5559.

For more information, see *ARM® Debug Interface Architecture Specification*.

## H8.5.4 Trapping software access to debug registers

When `EDSCR.TDA == 1`, software access to the breakpoint and watchpoint registers generate a Halting debug event and entry to Debug state. For more information see [Software Access debug event on page H3-5493](#).

## H8.5.5 External debug interface register access permissions summary

For accesses to:

- IMPLEMENTATION DEFINED registers, see [IMPLEMENTATION DEFINED registers](#).
- OPTIONAL registers for CoreSight compliance, see [OPTIONAL CoreSight management registers](#).
- Reserved, unallocated, or unimplemented registers, writes to read-only registers, and reads of write-only registers, see [Reserved and unallocated registers](#).

For all other external debug interface, CTI, and Performance Monitor registers, [Table H8-3 on page H8-5568](#), [Table H8-4 on page H8-5570](#) and [Table I2-1 on page I2-5740](#), show the response of the PE to accesses by the external debug interface.

## H8.5.6 IMPLEMENTATION DEFINED registers

For debug registers, Performance Monitors registers, CTI registers, IMPLEMENTATION DEFINED register access permissions are IMPLEMENTATION DEFINED. The power domain in which these registers are implemented is also IMPLEMENTATION DEFINED.

If OPTIONAL memory-mapped access to the external debug interface is supported, there are additional constraints on memory-mapped accesses to registers. These constraints must also apply to IMPLEMENTATION DEFINED registers. In particular, if the OPTIONAL Software Lock is locked, writes are ignored and accesses have no side-effects. For more information see [Register access permissions for memory-mapped accesses on page H8-5558](#).

## H8.5.7 OPTIONAL CoreSight management registers

Compliance with CoreSight architecture requires additional registers in the range `0xF00 - 0xFFC` that are always accessible. See [Management registers and CoreSight compliance on page K2-6141](#).

## H8.5.8 Reserved and unallocated registers

The following information relates to certain types of reserved accesses:

- Reads and writes of unallocated locations. These accesses are reserved for the architecture.
- Reads and writes of locations for features that are not implemented, including:
  - OPTIONAL features that are not implemented.
  - Breakpoints and watchpoints that are not implemented.
  - Performance Monitors counters that are not implemented.
  - CTI triggers that are not implemented.

These accesses are reserved.

- Reads of WO locations. These accesses are reserved for the architecture.
- Writes to RO locations. These accesses are reserved for the architecture.

Reserved accesses normally RAZ/WI. However, software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

---

**Note**

---

Reads of WO and writes to RO refers to the default access permissions for a register. For example, when the SLK field is set, meaning that the relevant registers become RO, a memory-mapped write to a RW register is ignored, and not treated as a reserved access.

---

The following reserved registers are RES0 in all conditions, other than when debug power is off:

- If the implementation is CoreSight architecture compliant, all reserved registers in the range 0xF00 - 0xFFC. See [Management register access permissions on page K2-6142](#).
- All reserved CTI registers.

Otherwise, the architecture defines that:

1. If debug power is off, all register accesses, including reserved accesses, return an error.
2. For reserved debug registers and Performance Monitors registers, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0, when any of the following hold:  
**Off** The Core power domain is either completely off or in a low-power state in which the Core power domain registers cannot be accessed.  
**DLK** DoubleLockStatus() == TRUE. The OS Double Lock is locked.  
**OSLK** OSLSR.OSLK == 1. The OS Lock is locked.
3. In addition, for reserved debug registers in the address ranges 0x400 - 0x4FC and 0x800 - 0x8FC, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:  
**EDAD** AllowExternalDebugAccess() == FALSE. External debug is disabled.

---

**Note**

---

See also [Behavior of a not permitted access on page H8-5562](#).

---

4. In addition, for reserved Performance Monitors registers in the address ranges 0x000 - 0x0FC and 0x400 - 0x47C, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:  
**EPMAD** AllowExternalPMUAccess() == FALSE. External Performance Monitor access is disabled.

---

**Note**

---

See also [Behavior of a not permitted access on page H8-5562](#).

---

## H8.6 External debug interface registers

The external debug interface register map is described by:

- [Performance Monitors external register views on page I3-5746.](#)
- [Cross-trigger interface registers on page H8-5570.](#)
- [External debug interface register map.](#)

- Supported only if the OPTIONAL PC Sample-Based Profiling is implemented but ARMv8.2-PCSample is not implemented. See Chapter H7 *The PC Sample-based Profiling Extension*.  
Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented.
- A 64-bit register mapped to a pair of 32-bit locations. Doubleword accesses to this register are not guaranteed to be 64-bit single copy atomic. See *Endianness and supported access sizes on page H8-5553*. Software must ensure a breakpoint or watchpoint is disabled before altering the value register.
- Implemented breakpoints and watchpoints only. *n* is the breakpoint or the watchpoint number.

**Note**  
All other locations are reserved.

## H8.6.1 Access permissions for the External debug interface registers

Table H8-3 on page H8-5568 shows the access permissions for the external debug interface registers in an ARMv8-A Debug implementation. The terms are defined as follows:

<b>Domain</b>	This describes the power domain in which the register is logically implemented. Registers described as implemented in the Core power domain might be implemented in the Debug power domain, as long as they exhibit the required behavior.
<b>Conditions</b>	<p>This lists the conditions under which the access is attempted.</p> <p>To determine the access permissions for a register, read these columns from left to right, and stop at first column which lists the condition as being true.</p> <p>The conditions are:</p> <p><b>Off</b> <a href="#">EDPRSR.PU</a> == 0. The Core power domain is completely off, or in low-power state. In these cases the Core power domain registers cannot be accessed.</p> <hr/> <p style="text-align: center;"><b>Note</b></p> <hr/> <p>If debug power is off, then all external debug interface accesses return an error.</p> <hr/> <p><b>DLK</b> <code>DoubleLockStatus()</code> == TRUE. The OS Double Lock is locked.</p> <p><b>OSLK</b> <a href="#">OSLSR.OSLK</a> == 1. The OS Lock is locked.</p> <p><b>EDAD</b> <code>AllowExternalDebugAccess()</code> == FALSE. External debug access is disabled. See also <a href="#">Behavior of a not permitted access on page H8-5562</a>.</p> <p><b>EPMAD</b> <code>AllowExternalPMUAccess()</code> == FALSE. Access to the external Performance Monitors is disabled. See also <a href="#">Behavior of a not permitted access on page H8-5562</a>.</p> <p><b>SLK</b> This provides the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software Lock is locked. See <a href="#">Register access permissions for memory-mapped accesses on page H8-5558</a>. For all other accesses, this column is ignored.</p> <p><b>Default</b> This provides the default access permissions, if there are no conditions that prevent access to the register.</p>

The access permissions are:

-	This means that the default access permission applies. See the Default column, or the SLK column, if applicable.
<b>RO</b>	<p>This means that the register or field is read-only, and:</p> <ul style="list-style-type: none"> <li>Unless the register description states otherwise, a RO field in an RW register ignores writes.</li> <li>Where the <b>SLK</b> control makes a RW register RO, the register ignores writes.</li> </ul>
<b>RW</b>	This means that the register or field is read/write. Individual fields within the register might be RO or WO. See the relevant register description for details.
<b>RC</b>	This means that a read of the register bit clears the field to 0.
<b>WO</b>	This means that the register or field is write-only. Unless the register description states otherwise, a WO field in a RW register returns an UNKNOWN value on a read of the register.
<b>WI</b>	This means that the register or field ignores writes.
<b>IMP DEF</b>	This means that the access permissions are IMPLEMENTATION DEFINED.

If OPTIONAL memory-mapped access to the external debug interface is supported, there might be additional constraints on memory-mapped accesses. See [Register access permissions for memory-mapped accesses on page H8-5558](#).

**Table H8-3 Access permissions for the external debug interface registers**

Conditions (priority from left to right)								
Offset	Register	Domain	Off	DLK	OSLK	EDAD	Default	SLK
0x020	EDESR	Core	Error	Error	-	-	RW	RO
0x024	EDECR	Debug	-	-	-	-	RW	RO
0x030	EDWAR[31:0]	Core	Error	Error	Error	-	RO	-
0x034	EDWAR[63:32]							
0x080	DBGDTRRX_EL0	Core	Error	Error	Error	-	RW	RO
0x084	EDITR	Core	Error	Error	Error	-	WO	WI
0x088	EDSCR	Core	Error	Error	Error	-	RW	RO
0x08C	DBGDTRTX_EL0	Core	Error	Error	Error	-	RW	RO
0x090	EDRCR	Core	Error	Error	Error	-	WO	WI

- a. Implemented only if the PC Sample-based profiling Extension is implemented.
- b. It is IMPLEMENTATION DEFINED whether an error is returned. See [External access disabled on page H8-5561](#). If no error is returned, the access is permitted.
- c. Some control bits are in the Core power domain. These bits ignore writes when Core power domain registers cannot be accessed as shown.
- d. Some status bits are fetched from the Core power domain. These bits read UNKNOWN when Core power domain registers cannot be accessed as shown.
- e. Implemented breakpoints and watchpoints only. *n* is the breakpoint or watchpoint number.
- f. It is IMPLEMENTATION DEFINED whether an error is returned. See [External debug over powerdown and locks on page H8-5561](#). If no error is returned, the access is permitted.

For the reset values for the external debug interface registers, see [Table H8-6 on page H8-5572](#).

## H8.7 Cross-trigger interface registers

The embedded Cross-trigger Interface, CTI, is located within its own block of the external debug memory map. There must be one such block for each PE.

If the CTI of a PE does not implement the [CTIDEVAFF0](#) or [CTIDEVAFF1](#) registers it must be located 64KB above the debug registers in the external debug interface.

[Table H8-4](#) shows the CTI register map.

**Table H8-4 Cross-trigger interface map**

0xFC8	<a href="#">CTIDEVID</a>	Debug	-	-	-	-	RO	RO

a. Implemented triggers only (including triggers that are not connected). *n* is the trigger number.

For the reset values of the CTI registers, see [Table H8-7 on page H8-5574](#).

## H8.8 External debug register resets

Each register or field has a defined reset domain:

- Registers and fields in the Warm reset domain are also reset by a Cold reset and unchanged by an External Debug reset that is not coincident with a Cold reset or a Warm reset.
- Registers and fields in the Cold reset domain are unchanged by a Warm reset or an External Debug reset that is not coincident with a Cold reset.
- Registers and fields in the External Debug reset domain are unchanged by a Cold reset or a Warm reset that is not coincident with an External Debug reset.

A reset might change the value of a register. Specific rules apply to the observability of registers in the External Debug reset domain by indirect reads from the Core power domain when an External Debug reset is asserted without a coincident Cold reset. For more information, see [Synchronization of changes to the external debug registers on page H8-5554](#).

[Table H8-6](#) and [Table H8-7 on page H8-5574](#) show the external debug register and CTI register resets. For other debug registers and Performance Monitors registers, see [Management register resets on page K2-6146](#) and [Power domains and Performance Monitors registers reset on page I2-5741](#).

### ———— Note ————

By reference to [Figure H6-2 on page H6-5545](#) the power domain can be deduced from the reset domain. [Table K2-7 on page K2-6146](#) also shows reset power domains.

[Table H8-6](#) and [Table H8-7 on page H8-5574](#) do not include:

- Read-only identification registers, such as Processor ID Registers and [PMCFGR](#), that have a fixed value from reset.
- Read-only status registers, such as [EDSCR.RW](#), that are evaluated each time the register is read and that have no meaningful reset value.
- Write-only registers, such as [EDRCR](#), that only have an effect on writes, and have no meaningful reset value.
- Read/write registers, such as breakpoint and watchpoint registers, and [EDPRCR.CORENPDRQ](#), that alias other registers. The reset values are described by the descriptions of those other registers.
- IMPLEMENTATION DEFINED registers. The reset values and reset domains of these registers are also IMPLEMENTATION DEFINED and might be UNKNOWN.

All other fields in the registers are set to an IMPLEMENTATION DEFINED value, that can be UNKNOWN. The register is in the specified reset domain.

### ———— Note ————

An IMPLEMENTATION DEFINED reset value, which can be UNKNOWN, means that hardware is not required to reset the register on the specified reset, but software must not rely on the register being preserved over reset.

**Table H8-6 Summary of external debug register resets, debug registers**

Register	Reset domain	Field	Value	Description
<a href="#">EDES</a>	Warm	SS	<a href="#">EDECR.SS</a>	Halting Step debug event pending
		RC	<a href="#">EDECR.RCE</a>	Reset Catch debug event pending
		OSUC	0	OS Unlock Catch debug event pending

**Table H8-6 Summary of external debug register resets, debug registers (continued)**

Register	Reset domain	Field	Value	Description
EDECR	External debug	SS	0	Halting Step debug event enable
		RCE	0	Reset Catch debug event enable
		OSUCE	0	OS Unlock Catch debug event enable
EDWAR	Cold	-	-	All fields
EDSCR	Cold	RXfull	0	DTRRX register full
		TXfull	0	DTRTX register full
		RXO	0	DTRRX overrun
		TXU	0	DTRTX underrun
		INTdis	0	Interrupt disable
		TDA	0	Trap debug register accesses to Debug state
		MA	0	Memory access mode in Debug state
		HDE	0	Halting debug mode enable
		ERR	0	Cumulative error flag
EDECCR	Cold	NSE[2:1]	0b00	Coarse-grained Non-secure Exception Catch
		SE[3,1]	0b00	Coarse-grained Secure Exception Catch
EDPCSR	Cold	-	-	All fields
EDCIDSR	Cold	-	-	All fields
EDVIDSR	Cold	-	-	All fields
EDPRCR	External debug	COREPURQ <sup>a</sup>	0	Core powerup request
EDPRSR	Warm	SDR	-	Sticky debug restart
	Cold	SPMAD	0	Sticky EPMAD error
		SDAD	0	Sticky EDAD error
	Warm	SR	1	Sticky reset status
	Cold	SPD	1	Sticky powerdown status

- a. On a cold reset into AArch64 state, [DBGPRCR\\_EL1](#).CORENPRDRQ resets to the value of [EDPRCR](#).COREPURQ. On a cold reset into AArch32 state, [DBGPRCR](#).CORENPRDRQ resets to the value of [EDPRCR](#).COREPURQ. If an External Debug reset and a Cold reset coincide, both [EDPRCR](#).COREPURQ and the CORENPRDRQ field of the appropriate System register are reset to 0.

Table H8-7 shows the reset values for the CTI registers

**Table H8-7 Summary of external debug register resets, CTI registers**

Register	Reset domain	Field	Value	Description
<a href="#">CTICONTROL</a>	External debug	GLBEN	0	CTI global enable

# Chapter H9

## External Debug Register Descriptions

This chapter provides a description of the external debug registers.

It contains the following sections:

- [About the debug registers on page H9-5576.](#)
- [External debug registers on page H9-5577.](#)
- [Cross-Trigger Interface registers on page H9-5677.](#)

## H9.1 About the debug registers

The following sections describe the registers that are accessible through the external debug interface:

- [External debug registers on page H9-5577.](#)
- [Cross-Trigger Interface registers on page H9-5677.](#)

## **H9.2 External debug registers**

This section describes the debug registers that are accessible through the external debug interface and are used for external debug.

This section lists the registers that are accessible through the external debug interface.

H9.2.1 DBGAUTHSTATUS\_EL1, Debug Authentication Status register

The DBGAUTHSTATUS\_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Usage constraints

This register is accessible as follows:

Default
RO

Configurations

External register DBGAUTHSTATUS\_EL1 is architecturally mapped to AArch64 System register [DBGAUTHSTATUS\\_EL1](#).

External register DBGAUTHSTATUS\_EL1 is architecturally mapped to AArch32 System register [DBGAUTHSTATUS](#).

DBGAUTHSTATUS\_EL1 is in the Debug power domain.

Attributes

DBGAUTHSTATUS\_EL1 is a 32-bit register.

Field descriptions

The DBGAUTHSTATUS\_EL1 bit assignments are:

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

Secure non-invasive debug. Possible values of this field are:

00 Not implemented. EL3 is not implemented and the implemented Security state is Non-secure state.

10 Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.

11 Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

SID, bits [5:4]

Secure invasive debug. Possible values of this field are:

00 Not implemented. EL3 is not implemented and the implemented Security state is Non-secure state.

10 Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.

11 Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

Other values are reserved.

#### NSNID, bits [3:2]

Non-secure non-invasive debug. Possible values of this field are:

- 00 Not implemented. EL3 is not implemented and the implemented Security state is Secure state.
- 10 Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
- 11 Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

#### NSID, bits [1:0]

Non-secure invasive debug. Possible values of this field are:

- 00 Not implemented. EL3 is not implemented and the implemented Security state is Secure state.
- 10 Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
- 11 Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

Other values are reserved.

### Accessing the DBGAUTHSTATUS\_EL1:

DBGAUTHSTATUS\_EL1 can be accessed through the external debug interface:

Component	Offset
Debug	0xFB8

## H9.2.2 DBGBCR<n>\_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>\_EL1 characteristics are:

### Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>\\_EL1](#).

### Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	EDAD	SLK	Default
Error	Error	Error	Error	RO	RW

### Configurations

External register DBGBCR<n>\_EL1 is architecturally mapped to AArch64 System register [DBGBCR<n>\\_EL1](#).

External register DBGBCR<n>\_EL1 is architecturally mapped to AArch32 System register [DBGBCR<n>](#).

DBGBCR<n>\_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If breakpoint n is not implemented then this register is unallocated.

### Attributes

DBGBCR<n>\_EL1 is a 32-bit register.

### Field descriptions

The DBGBCR<n>\_EL1 bit assignments are:

When the E field is zero, all the other fields in the register are ignored.

### Bits [31:24]

Reserved, RES0.

### BT, bits [23:20]

Breakpoint Type. Possible values are:

0000	Unlinked instruction address match.
0001	Linked instruction address match.
0010	Unlinked Context ID match.
0011	Linked Context ID match.
0100	Unlinked instruction address mismatch.
0101	Linked instruction address mismatch.

0110	Unlinked <a href="#">CONTEXTIDR_EL1</a> match (introduced in ARMv8.1).
0111	Linked <a href="#">CONTEXTIDR_EL1</a> match (introduced in ARMv8.1).
1000	Unlinked VMID match.
1001	Linked VMID match.
1010	Unlinked VMID and Context ID match.
1011	Linked VMID and Context ID match.
1100	Unlinked <a href="#">CONTEXTIDR_EL2</a> match (introduced in ARMv8.1).
1101	Linked <a href="#">CONTEXTIDR_EL2</a> match (introduced in ARMv8.1).
1110	Unlinked Full Context ID match (introduced in ARMv8.1).
1111	Linked Full Context ID match (introduced in ARMv8.1).

The field breaks down as follows:

- BT[3:1]: Base type.
 

000	Match address. <a href="#">DBGBVR&lt;n&gt;_EL1</a> is the address of an instruction.
001	Match Context ID. <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> when <a href="#">ARMv8.1-VHE</a> is not implemented, or not in a Host OS or a Host Application. When <a href="#">ARMv8.1-VHE</a> is implemented, and in a Host OS or Host Application, the Context ID is compared against <a href="#">CONTEXTIDR_EL2</a> .
010	Mismatch address. <a href="#">DBGBVR&lt;n&gt;_EL1</a> is the address of an instruction to be stepped.
011	Match <a href="#">CONTEXTIDR_EL1</a> . <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> .
100	Match VMID. <a href="#">DBGBVR&lt;n&gt;_EL1</a> .VMID is a VMID compared against <a href="#">VTTBR_EL2</a> .VMID.
101	Match VMID and Context ID. <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> , and <a href="#">DBGBVR&lt;n&gt;_EL1</a> .VMID is a VMID compared against <a href="#">VTTBR_EL2</a> .VMID.
110	Match <a href="#">CONTEXTIDR_EL2</a> . <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID2 is a Context ID compared against <a href="#">CONTEXTIDR_EL2</a> .
111	Match Full Context ID. <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID is compared against <a href="#">CONTEXTIDR_EL1</a> , and <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID2 is compared against <a href="#">CONTEXTIDR_EL2</a> .
- BT[0]: Enable linking.

Constraints on breakpoint programming mean some values are reserved under certain conditions. For more information, see [Reserved DBGBCR<n>\\_EL1.BT values on page D2-1935](#).

This field resets to a value that is architecturally UNKNOWN.

#### LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of [DBGBCR<n>\\_EL1.E](#) is 0.

This field resets to a value that is architecturally UNKNOWN.

### SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint *n* is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see [Reserved DBGBCR<n>\\_EL1.{SSC, HMC, PMC} values on page D2-1936](#).

This field resets to a value that is architecturally UNKNOWN.

### HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint *n* is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see [DBGBCR<n>\\_EL1.SSC](#) description.

This field resets to a value that is architecturally UNKNOWN.

### Bits [12:9]

Reserved, RES0.

### BAS, bits [8:5]

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64-only implementation, this field is reserved, RES1.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0011	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for T32 instructions.
1100	<a href="#">DBGBVR&lt;n&gt;_EL1+2</a>	Use for T32 instructions.
1111	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for A64 and A32 instructions.

All other values are reserved.

For more information, see [Using the BAS field in Address Match breakpoints on page G2-4483](#).

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Step instruction at	Constraint for debuggers
0000	-	Use for a match anywhere breakpoint.
0011	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for stepping T32 instructions.
1100	<a href="#">DBGBVR&lt;n&gt;_EL1+2</a>	Use for stepping T32 instructions.
1111	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for stepping A64 and A32 instructions.

For more information, see [Using the BAS field in Address Match breakpoints on page G2-4483](#).

For Context matching breakpoints, this field is RES1 and ignored.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

### Bits [4:3]

Reserved, RES0.

**PMC, bits [2:1]**

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint *n* is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the [DBGBCR<n>\\_EL1](#).SSC description.

This field resets to a value that is architecturally UNKNOWN.

**E, bit [0]**

Enable breakpoint [DBGBVR<n>\\_EL1](#). Possible values are:

0 Breakpoint disabled.

1 Breakpoint enabled.

This field resets to a value that is architecturally UNKNOWN.

**Accessing the DBGBCR<n>\_EL1:**

DBGBCR<n>\_EL1 can be accessed through the external debug interface:

Component	Offset
Debug	$0x408 + 16n$

### H9.2.3 DBGBVR<n>\_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>\_EL1 characteristics are:

#### Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>\\_EL1](#).

#### Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	EDAD	SLK	Default
Error	Error	Error	Error	RO	RW

#### Configurations

External register DBGBVR<n>\_EL1 is architecturally mapped to AArch64 System register [DBGBVR<n>\\_EL1](#).

External register DBGBVR<n>\_EL1[31:0] is architecturally mapped to AArch32 System register [DBGBVR<n>](#).

If the breakpoint is context-aware and EL2 is implemented then External register [DBGBVR<n>\\_EL1](#) [63:32] is architecturally mapped to AArch32 System register [DBGBXVR<n>](#). Otherwise there is no External register access to [DBGBVR<n>\\_EL1](#)[63:32] from AArch32 state.

DBGBVR<n>\_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If breakpoint n is not implemented then this register is unallocated.

#### Attributes

How this register is interpreted depends on the value of [DBGBCR<n>\\_EL1](#).BT.

- When [DBGBCR<n>\\_EL1](#).BT is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>\\_EL1](#).BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b100x, this register holds a VMID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>\\_EL1](#).BT, this register is RES0.

#### Field descriptions

The DBGBVR<n>\_EL1 bit assignments are:

**When [DBGBCR<n>\\_EL1](#).BT==0b0x0x:**

#### RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

#### VA[52:49], bits [52:49]

##### *In ARMv8.2*

Extension to VA[48:2]. See VA[48:2] for more details.

This field resets to a value that is architecturally UNKNOWN.

##### *In ARMv8.1 and ARMv8.0.*

Extension to RESS[14:4]. See RESS[14:4] for more details.

#### VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.
- When [ARMv8.2-LVA](#) is implemented, and 52-bit addresses and a 64KB translation granule are in use, VA[52:49] form the upper part of the address value. Otherwise, VA[52:49] are RESS.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

This field resets to a value that is architecturally UNKNOWN.

#### Bits [1:0]

Reserved, RES0.

**When  $DBGBCR\langle n \rangle\_EL1.BT == 0b001x$ :**

#### Bits [63:32]

Reserved, RES0.

#### ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR](#) and [CONTEXTIDR\\_EL1](#) in the following cases:

- The PE is in Secure state.
- EL2 is using AArch32.
- When [ARMv8.1-VHE](#) is not implemented.
- When [ARMv8.1-VHE](#) is implemented, [HCR\\_EL2.E2H](#) is 0 and the PE is in Non-secure EL0, EL1 or EL2.
- When [ARMv8.1-VHE](#) is implemented, [HCR\\_EL2](#).{E2H, TGE} is {1, 0} and the PE is in Non-secure EL0 or EL1.

When [ARMv8.1-VHE](#) is implemented, [HCR\\_EL2.E2H](#) is 1, the value is compared against [CONTEXTIDR\\_EL2](#) in the following cases:

- The PE is executing at EL2.
- [HCR\\_EL2.TGE](#) is 1 and the PE is in Non-secure EL0.

This field resets to a value that is architecturally UNKNOWN.

**When [DBGBCR<n>\\_EL1.BT==0b011x](#):**

**Bits [63:32]**

Reserved, RES0.

**ContextID, bits [31:0]**

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

This field resets to a value that is architecturally UNKNOWN.

**When [DBGBCR<n>\\_EL1.BT==0b100x](#) and [EL2](#) implemented:**

**Bits [63:48]**

Reserved, RES0.

**VMID[15:8], bits [47:40]**

***In [ARMv8.2](#) and [ARMv8.1](#)***

Extension to VMID[7:0]. See VMID[7:0] for more details.

This field resets to a value that is architecturally UNKNOWN.

***In [ARMv8.0](#).***

Reserved, RES0.

**VMID[7:0], bits [39:32]**

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- [ARMv8.1-VMID16](#) is not implemented.

When [ARMv8.1-VMID16](#) is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- [VTCR\\_EL2.VS](#) has a value of 0.
- EL2 is using AArch32.

This field resets to a value that is architecturally UNKNOWN.

#### Bits [31:0]

Reserved, RES0.

**When  $DBGBCR<n>\_EL1.BT==0b101x$  and EL2 implemented:**

#### Bits [63:48]

Reserved, RES0.

#### VMID[15:8], bits [47:40]

*In ARMv8.2 and ARMv8.1*

Extension to VMID[7:0]. See VMID[7:0] for more details.

This field resets to a value that is architecturally UNKNOWN.

*In ARMv8.0.*

Reserved, RES0.

#### VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- [ARMv8.1-VMID16](#) is not implemented.

When [ARMv8.1-VMID16](#) is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- [VTCR\\_EL2.VS](#) has a value of 0.
- EL2 is using AArch32.

This field resets to a value that is architecturally UNKNOWN.

#### ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

This field resets to a value that is architecturally UNKNOWN.

**When  $DBGBCR<n>\_EL1.BT==0b110x$  and EL2 implemented:**

#### ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR\\_EL2](#).

This field resets to a value that is architecturally UNKNOWN.

#### Bits [31:0]

Reserved, RES0.

When  $DBGBCR\langle n \rangle\_EL1.BT == 0b111x$  and  $EL2$  implemented:

**ContextID2, bits [63:32]**

Context ID value for comparison against `CONTEXTIDR_EL2`.  
This field resets to a value that is architecturally UNKNOWN.

**ContextID, bits [31:0]**

Context ID value for comparison against `CONTEXTIDR_EL1`.  
This field resets to a value that is architecturally UNKNOWN.

**Accessing the  $DBGBVR\langle n \rangle\_EL1$ :**

$DBGBVR\langle n \rangle\_EL1[31:0]$  can be accessed through the external debug interface:

Component	Offset
Debug	$0x400 + 16n$

$DBGBVR\langle n \rangle\_EL1[63:32]$  can be accessed through the external debug interface:

Component	Offset
Debug	$0x404 + 16n$

H9.2.4 DBGCLAIMCLR\_EL1, Debug Claim Tag Clear register

The DBGCLAIMCLR\_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear these bits to 0.  
The architecture does not define any functionality for the CLAIM tag bits.

———— **Note** ————

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET\\_EL1](#) register.

Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	SLK	Default
Error	Error	Error	RO	RW

Configurations

External register DBGCLAIMCLR\_EL1 is architecturally mapped to AArch64 System register [DBGCLAIMCLR\\_EL1](#).  
External register DBGCLAIMCLR\_EL1 is architecturally mapped to AArch32 System register [DBGCLAIMCLR](#).  
DBGCLAIMCLR\_EL1 is in the Core power domain.  
See the CLAIM field description for the effect of a Cold reset on the value returned by this register.  
This register is not affected by a Warm reset, and is not affected by an External debug reset.  
An implementation must include 8 CLAIM tag bits.

Attributes

DBGCLAIMCLR\_EL1 is a 32-bit register.

Field descriptions

The DBGCLAIMCLR\_EL1 bit assignments are:

Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.  
Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.  
Writing 0 to one of these bits has no effect.  
A cold reset clears the CLAIM tag bits to 0.

### Accessing the DBGCLAIMCLR\_EL1:

DBGCLAIMCLR\_EL1 can be accessed through the external debug interface:

Component	Offset
Debug	0xFA4

## H9.2.5 DBGCLAIMSET\_EL1, Debug Claim Tag Set register

The DBGCLAIMSET\_EL1 characteristics are:

### Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

### Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR\\_EL1](#) register.

### Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	SLK	Default
Error	Error	Error	RO	RW

### Configurations

External register DBGCLAIMSET\_EL1 is architecturally mapped to AArch64 System register [DBGCLAIMSET\\_EL1](#).

External register DBGCLAIMSET\_EL1 is architecturally mapped to AArch32 System register [DBGCLAIMSET](#).

DBGCLAIMSET\_EL1 is in the Core power domain.

An implementation must include 8 CLAIM tag bits.

### Attributes

DBGCLAIMSET\_EL1 is a 32-bit register.

### Field descriptions

The DBGCLAIMSET\_EL1 bit assignments are:

31	8	7	0
RAZ/SBZ			CLAIM

### Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

### CLAIM, bits [7:0]

Set CLAIM tag bits. RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

A cold reset clears the CLAIM tag bits to 0.

### Accessing the DBGCLAIMSET\_EL1:

DBGCLAIMSET\_EL1 can be accessed through the external debug interface:

Component	Offset
Debug	0xFA0

H9.2.6 DBGDTRRX\_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX\_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. It is a component of the Debug Communications Channel.

Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	SLK	Default
Error	Error	Error	RO	RW

If [EDSCR.ITE](#) == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

Configurations

External register DBGDTRRX\_EL0 is architecturally mapped to AArch64 System register [DBGDTRRX\\_EL0](#).

External register DBGDTRRX\_EL0 is architecturally mapped to AArch32 System register [DBGDTRRXint](#).

DBGDTRRX\_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Attributes

DBGDTRRX\_EL0 is a 32-bit register.

Field descriptions

The DBGDTRRX\_EL0 bit assignments are:

Bits [31:0]

Update DTRRX.

If RXfull is set to 0, then writes to this register update the value in DTRRX and set RXfull to 1.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

This field resets to a value that is architecturally UNKNOWN.

### Accessing the DBGDTRRX\_EL0:

DBGDTRRX\_EL0 can be accessed through the external debug interface:

Component	Offset
Debug	0x080

### H9.2.7 DBGDTRTX\_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX\_EL0 characteristics are:

## Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. It is a component of the Debug Communication Channel.

## Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	SLK	Default
Error	Error	Error	RO	RW

If **EDSCR.ITE** == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is **CONSTRAINED UNPREDICTABLE**, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

## Configurations

External register `DBGDTRTX_EL0` is architecturally mapped to AArch64 System register `DBGDTRTX_EL0`.

External register DBGDTRTX\_EL0 is architecturally mapped to AArch32 System register [DBGDTRTX<sub>int</sub>](#).

DBGDTRTX\_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

### Attributes

DBGDTRTX\_EL0 is a 32-bit register.

## Field descriptions

The DBGDTRTX EL0 bit assignments are:

**Bits [31:0]**

Return DTRTX.

If TXfull is set to 1, then reads of this register return the value in DTRTX and clear TXfull to 0.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

This field resets to a value that is architecturally UNKNOWN.

### Accessing the DBGDTRTX\_EL0:

DBGDTRTX\_EL0 can be accessed through the external debug interface:

Component	Offset
Debug	0x08C

## H9.2.8 DBGWCR<n>\_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>\_EL1 characteristics are:

### Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>\\_EL1](#).

### Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	EDAD	SLK	Default
Error	Error	Error	Error	RO	RW

### Configurations

External register DBGWCR<n>\_EL1 is architecturally mapped to AArch64 System register [DBGWCR<n>\\_EL1](#).

External register DBGWCR<n>\_EL1 is architecturally mapped to AArch32 System register [DBGWCR<n>](#).

DBGWCR<n>\_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If breakpoint n is not implemented then this register is unallocated.

### Attributes

DBGWCR<n>\_EL1 is a 32-bit register.

### Field descriptions

The DBGWCR<n>\_EL1 bit assignments are:

When the E field is zero, all the other fields in the register are ignored.

#### Bits [31:29]

Reserved, RES0.

#### MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

- 00000 No mask.
- 00001 Reserved.
- 00010 Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn\_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

This field resets to a value that is architecturally UNKNOWN.

#### Bits [23:21]

Reserved, RES0.

#### WT, bit [20]

Watchpoint type. Possible values are:

0 Unlinked data address match.

1 Linked data address match.

This field resets to a value that is architecturally UNKNOWN.

#### LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

This field resets to a value that is architecturally UNKNOWN.

#### SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

This field resets to a value that is architecturally UNKNOWN.

#### HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

This field resets to a value that is architecturally UNKNOWN.

#### BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>\\_EL1](#) is being watched.

BAS	Description
xxxxxx1	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a>
xxxxxx1x	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+1</a>
xxxxx1xx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+2</a>
xxxx1xxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+3</a>

In cases where [DBGWVR<n>\\_EL1](#) addresses a double-word:

BAS	Description, if <a href="#">DBGWVR&lt;n&gt;_EL1[2] == 0</a>
xxx1xxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+4</a>
xx1xxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+5</a>
x1xxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+6</a>
1xxxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+7</a>

If `DBGWVR<n>_EL1[2] == 1`, only `BAS[3:0]` is used. ARM deprecates setting `DBGWVR<n>_EL1[2] == 1`.

The valid values for `BAS` are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See [Reserved `DBGWCR<n>\_BAS` values on page G2-4507](#).

This field resets to a value that is architecturally UNKNOWN.

#### LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

- 01 Match instructions that load from a watchpointed address.
- 10 Match instructions that store to a watchpointed address.
- 11 Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field resets to a value that is architecturally UNKNOWN.

#### PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint `n` is generated. This field must be interpreted along with the `SSC` and `HMC` fields.

This field resets to a value that is architecturally UNKNOWN.

#### E, bit [0]

Enable watchpoint `n`. Possible values are:

- 0 Watchpoint disabled.
- 1 Watchpoint enabled.

This field resets to a value that is architecturally UNKNOWN.

### Accessing the `DBGWCR<n>_EL1`:

`DBGWCR<n>_EL1` can be accessed through the external debug interface:

Component	Offset
Debug	$0x808 + 16n$

## H9.2.9 DBGWVR<n>\_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>\_EL1 characteristics are:

### Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>\\_EL1](#).

### Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	EDAD	SLK	Default
Error	Error	Error	Error	RO	RW

### Configurations

External register DBGWVR<n>\_EL1 is architecturally mapped to AArch64 System register [DBGWVR<n>\\_EL1](#).

External register DBGWVR<n>\_EL1[31:0] is architecturally mapped to AArch32 System register [DBGWVR<n>](#).

DBGWVR<n>\_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

If breakpoint n is not implemented then this register is unallocated.

### Attributes

DBGWVR<n>\_EL1 is a 64-bit register.

### Field descriptions

The DBGWVR<n>\_EL1 bit assignments are:

#### RESS[14:4], bits [63:53]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

#### VA[52:49], bits [52:49]

##### In ARMv8.2

Extension to VA[48:2]. See VA[48:2] for more details.

This field resets to a value that is architecturally UNKNOWN.

##### In ARMv8.1 and ARMv8.0.

Extension to RESS[14:4]. See RESS[14:4] for more details.

#### VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When [ARMv8.2-LVA](#) is implemented, and 52-bit addresses and a 64KB translation granule are in use, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

ARM deprecates setting [DBGWVR<n>\\_EL1\[2\]](#) == 1.

This field resets to a value that is architecturally UNKNOWN.

#### Bits [1:0]

Reserved, RES0.

#### Accessing the DBGWVR<n>\_EL1:

DBGWVR<n>\_EL1[31:0] can be accessed through the external debug interface:

Component	Offset
Debug	0x800 + 16n

DBGWVR<n>\_EL1[63:32] can be accessed through the external debug interface:

Component	Offset
Debug	0x804 + 16n

H9.2.10 EDAA32PFR, External Debug AArch32 Processor Feature Register

The EDAA32PFR characteristics are:

Purpose

Provides information about implemented PE features.  
For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

Usage constraints

This register is accessible as follows:

Off	DLK	Default
IMP DEF	IMP DEF	RO

Configurations

It is IMPLEMENTATION DEFINED whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.  
EDAA32PFR is only accessible in an implementation that only supports execution in AArch32 state. If AArch64 state is supported at any Exception level, EDAA32PFR is RES0.

Attributes

EDAA32PFR is a 64-bit register.

Field descriptions

The EDAA32PFR bit assignments are:

Bits [63:16]

Reserved, RES0.

EL3, bits [15:12]

AArch32 EL3 Exception level handling. Defined values are:  
0000 EL3 is not implemented.  
0001 EL3 can be executed in AArch32 state only.  
When the value of [EDPFR.EL3](#) is non-zero, this field must be 0000.  
All other values are reserved.

**Note**  
[EDPFR.{EL1, EL0}](#) indicate whether EL1 and EL0 can only be executed in AArch32 state.

EL2, bits [11:8]

AArch32 EL2 Exception level handling. Defined values are:  
0000 EL2 is not implemented.  
0001 EL2 can be executed in AArch32 state only.  
When the value of [EDPFR.EL2](#) is non-zero, this field must be 0000.

All other values are reserved.

---

**Note**

---

[EDPFR](#). {EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

---

**PMSA, bits [7:4]**

Indicates support for a PMSA. Defined values are:

0000 PMSA not supported.

0100 Support for an ARMv8-R PMSAv8-32.

All other values are reserved. In ARMv8-A, the only permitted value is 0000.

**VMSA, bits [3:0]**

Indicates support for a VMSA. When the PMSA field is nonzero, determines support for a VMSA. When the PMSA field is 0000, VMSA is supported. Defined values are:

0000 VMSA not supported.

All other values are reserved. In ARMv8-A, the only permitted value is 0000.

**Accessing the EDAA32PFR:**

EDAA32PFR can be accessed through the external debug interface:

Component	Offset
Debug	0xD60

## H9.2.11 EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

### Purpose

Allows implementations to support IMPLEMENTATION DEFINED controls.

### Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	SLK	Default
IMP DEF	IMP DEF	IMP DEF	RO	RW

### Configurations

It is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

If the EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when [OSLSR\\_EL1.OSLK](#) = 1 (OS lock is locked) and when the Core is powered off.

### Attributes

EDACR is a 32-bit register.

### Field descriptions

The EDACR bit assignments are:

#### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field resets to a value that is architecturally UNKNOWN.

### Accessing the EDACR:

EDACR can be accessed through the external debug interface:

Component	Offset
Debug	0x094

## H9.2.12 EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

### Purpose

Provides information to identify an external debug component.

For more information see [About the Component Identification scheme on page K2-6149](#).

### Usage constraints

This register is accessible as follows:

Default
RO

### Configurations

EDCIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

### Attributes

EDCIDR0 is a 32-bit register.

### Field descriptions

The EDCIDR0 bit assignments are:

#### Bits [31:8]

Reserved, RES0.

#### PRMBL\_0, bits [7:0]

Preamble. Must read as 0x0D.

### Accessing the EDCIDR0:

EDCIDR0 can be accessed through the external debug interface:

Component	Offset
Debug	0xFF0

H9.2.13 EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.  
For more information see [About the Component Identification scheme on page K2-6149](#).

Usage constraints

This register is accessible as follows:

Default
RO

Configurations

EDCIDR1 is in the Debug power domain.  
Implementation of this register is OPTIONAL.  
This register is required for CoreSight compliance.

Attributes

EDCIDR1 is a 32-bit register.

Field descriptions

The EDCIDR1 bit assignments are:

31	8	7	4	3	0
RES0				CLASS	PRMBL_1

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class. Reads as 0x9, debug component.

PRMBL\_1, bits [3:0]

Preamble. RAZ.

Accessing the EDCIDR1:

EDCIDR1 can be accessed through the external debug interface:

Component	Offset
Debug	0xFF4

## H9.2.14 EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

### Purpose

Provides information to identify an external debug component.

For more information see [About the Component Identification scheme on page K2-6149](#).

### Usage constraints

This register is accessible as follows:

Default
RO

### Configurations

EDCIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

### Attributes

EDCIDR2 is a 32-bit register.

### Field descriptions

The EDCIDR2 bit assignments are:

#### Bits [31:8]

Reserved, RES0.

#### PRMBL\_2, bits [7:0]

Preamble. Must read as 0x05.

### Accessing the EDCIDR2:

EDCIDR2 can be accessed through the external debug interface:

Component	Offset
Debug	0xFF8

**H9.2.15 EDCIDR3, External Debug Component Identification Register 3**

The EDCIDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.  
For more information see [About the Component Identification scheme on page K2-6149](#).

**Usage constraints**

This register is accessible as follows:

Default
RO

**Configurations**

EDCIDR3 is in the Debug power domain.  
Implementation of this register is OPTIONAL.  
This register is required for CoreSight compliance.

**Attributes**

EDCIDR3 is a 32-bit register.

**Field descriptions**

The EDCIDR3 bit assignments are:

31	8	7	0
RES0			PRMBL_3

**Bits [31:8]**

Reserved, RES0.

**PRMBL\_3, bits [7:0]**

Preamble. Must read as 0xB1.

**Accessing the EDCIDR3:**

EDCIDR3 can be accessed through the external debug interface:

Component	Offset
Debug	0xFFC

**H9.2.16 EDCIDSR, External Debug Context ID Sample Register**

The EDCIDSR characteristics are:

**Purpose**

Contains the sampled value of the Context ID, captured on reading [EDPCSR](#)[31:0].

**Usage constraints**

This register is accessible as follows:

Off	DLK	OSLK	Default
Error	Error	Error	RO

**Configurations**

EDCIDSR is in the Core power domain.

Fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented but not with [ARMv8.2-PCSample](#). If [ARMv8.2-PCSample](#) is implemented, this register is RES0 and the architecture defines the functionality in [PMCID1SR](#) and [PMCID2SR](#).

**Attributes**

EDCIDSR is a 32-bit register.

**Field descriptions**

The EDCIDSR bit assignments are:

**When ARMv8.2-PCSample is not implemented:**

**CONTEXTIDR, bits [31:0]**

Context ID. The value of [CONTEXTIDR](#) that is associated with the most recent [EDPCSR](#) sample.

- If EL1 is using AArch64, then the Context ID is held in [CONTEXTIDR\\_EL1](#).
- If EL1 is using AArch32, then the Context ID is held in [CONTEXTIDR](#).
- If EL3 is implemented and is using AArch32, then [CONTEXTIDR](#) is a banked register, and EDCIDSR samples the current banked copy of [CONTEXTIDR](#) for the Security state that is associated with the most recent EDPCSR sample.

Because the value written to EDCIDSR is an indirect read of [CONTEXTIDR](#), therefore it is CONSTRAINED UNPREDICTABLE whether EDCIDSR is set to the original or new value if a read of [EDPCSR](#)<sub>lo</sub> samples:

- An instruction that writes to [CONTEXTIDR\\_EL1](#).
- The next Context synchronization event.
- Any instruction executed between these two instructions.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**When ARMv8.2-PCSample is implemented:**

**Bits [31:0]**

Reserved, RES0.

**Accessing the EDCIDSR:**

EDCIDSR can be accessed through the external debug interface:

Component	Offset
Debug	0x0A4

H9.2.17 EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR\\_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Usage constraints

This register is accessible as follows:

Default
RO

Configurations

EDDEVAFF0 is in the Debug power domain.  
Implementation of this register is OPTIONAL.

Attributes

EDDEVAFF0 is a 32-bit register.

Field descriptions

The EDDEVAFF0 bit assignments are:

Bits [31:0]

[MPIDR\\_EL1](#) low half. Read-only copy of the low half of [MPIDR\\_EL1](#), as seen from the highest implemented Exception level.

Accessing the EDDEVAFF0:

EDDEVAFF0 can be accessed through the external debug interface:

Component	Offset
Debug	0xFA8

**H9.2.18 EDDEVAFF1, External Debug Device Affinity register 1**

The EDDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE [MPIDR\\_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

**Usage constraints**

This register is accessible as follows:

Default
RO

**Configurations**

EDDEVAFF1 is in the Debug power domain.  
Implementation of this register is OPTIONAL.

**Attributes**

EDDEVAFF1 is a 32-bit register.

**Field descriptions**

The EDDEVAFF1 bit assignments are:

**Bits [31:0]**

[MPIDR\\_EL1](#) high half. Read-only copy of the high half of [MPIDR\\_EL1](#), as seen from the highest implemented Exception level.

**Accessing the EDDEVAFF1:**

EDDEVAFF1 can be accessed through the external debug interface:

Component	Offset
Debug	0xFAC

H9.2.19 EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Usage constraints

This register is accessible as follows:

Default

RO

Configurations

EDDEVARCH is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

The EDDEVARCH bit assignments are:

ARCHITECT, bits [31:21]

Defines the architecture of the component. For debug, this is ARM Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in ARMv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For debug, the revision defined by ARMv8 is 0x0.

All other values are reserved.

ARCHID, bits [15:0]

Defines this part to be an ARMv8 debug component. For architectures defined by ARM this is further subdivided.

For debug:

- Bits [15:12] are the architecture version.
  - In an ARMv8.0 implementation, the only permitted value is 0x6.

- In an ARMv8.1 implementation that includes [ARMv8.1-VHE](#), the only permitted value is 0x7.
- In an ARMv8.1 implementation that does not include [ARMv8.1-VHE](#), the permitted values are 0x6 and 0x7.
- In an ARMv8.2 implementation, the only permitted value is 0x8.
- Bits [11:0] are the architecture part number, 0xA15.

This corresponds to the ARMv8 debug architecture version.

### Accessing the EDDEVARCH:

EDDEVARCH can be accessed through the external debug interface:

Component	Offset
Debug	0xFBC

H9.2.20 EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Usage constraints

This register is accessible as follows:

Default

RO

Configurations

EDDEVID is in the Debug power domain.

Attributes

EDDEVID is a 32-bit register.

Field descriptions

The EDDEVID bit assignments are:

31	28 27	24 23		4 3	0
RES0	AuxRegs	RES0			PCSample

Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Permitted values for this field are:

- 0000 None supported.
  - 0001 Support for External Debug Auxiliary Control Register, [EDACR](#).
- All other values are reserved.

Bits [23:4]

Reserved, RES0.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Permitted values of this field are:

- 0000 Architecture-defined form of PC Sample-based Profiling not implemented using external debug registers.
  - 0010 Only [EDPCSR](#) and [EDCIDS](#) are implemented. This option is only permitted if EL3 and EL2 are not implemented.
  - 0011 [EDPCSR](#), [EDCIDS](#), and [EDVIDSR](#) are implemented.
- All other values are reserved.

From ARMv8.2 onwards, the only permitted value is 0b0000. The architecture defines the functionality in a different set of registers, see [PMDEVID](#).

### Accessing the EDDEVID:

EDDEVID can be accessed through the external debug interface:

Component	Offset
Debug	0xFC8

## H9.2.21 EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

### Purpose

Provides extra information for external debuggers about features of the debug implementation.

### Usage constraints

This register is accessible as follows:

Default
RO

### Configurations

EDDEVID1 is in the Debug power domain.

### Attributes

EDDEVID1 is a 32-bit register.

### Field descriptions

The EDDEVID1 bit assignments are:

### Bits [31:4]

Reserved, RES0.

### PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of [EDPCSR](#). Permitted values of this field in ARMv8 are:

0000 [EDPCSR](#) not implemented.

0010 [EDPCSR](#) implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

From ARMv8.2 onwards, the only permitted value is 0b0000. The architecture defines the functionality in a different set of registers, see [PMDEVID](#).

### Accessing the EDDEVID1:

EDDEVID1 can be accessed through the external debug interface:

Component	Offset
Debug	0xFC4

H9.2.22 EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Usage constraints

This register is accessible as follows:

Default
RO

Configurations

EDDEVID2 is in the Debug power domain.

Attributes

EDDEVID2 is a 32-bit register.

Field descriptions

The EDDEVID2 bit assignments are:

Bits [31:0]

Reserved, RES0.

Accessing the EDDEVID2:

EDDEVID2 can be accessed through the external debug interface:

Component	Offset
Debug	0xFC0

## H9.2.23 EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

### Purpose

Indicates to a debugger that this component is part of a PE's debug logic.

### Usage constraints

This register is accessible as follows:

Default
RO

### Configurations

EDDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

### Attributes

EDDEVTYPE is a 32-bit register.

### Field descriptions

The EDDEVTYPE bit assignments are:

31								8	7				4	3				0
RES0									SUB			MAJOR						

#### Bits [31:8]

Reserved, RES0.

#### SUB, bits [7:4]

Subtype. Must read as 0x1 to indicate this is a component within a PE.

#### MAJOR, bits [3:0]

Major type. Must read as 0x5 to indicate this is a debug logic component.

### Accessing the EDDEVTYPE:

EDDEVTYPE can be accessed through the external debug interface:

Component	Offset
Debug	0xFCC

### H9.2.24 EDDFR, External Debug Feature Register

The EDDFR characteristics are:

**Purpose**

Provides top level information about the debug system.

**Note**

Debuggers must use [EDDEVARCH](#) to determine the Debug architecture version.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

**Usage constraints**

This register is accessible as follows:

Off	DLK	Default
IMP DEF	IMP DEF	RO

**Configurations**

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

EDDFR is a 64-bit register.

**Field descriptions**

The EDDFR bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**CTX\_CMPs, bits [31:28]**

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64DFR0\\_EL1](#).CTX\_CMPs.

**Bits [27:24]**

Reserved, RES0.

**WRPs, bits [23:20]**

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64DFR0\\_EL1](#).WRPs.

**Bits [19:16]**

Reserved, RES0.

### BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID\_AA64DFR0\_EL1.BRPs.

### PMUVer, bits [11:8]

Performance Monitors Extension version. Indicates whether System register interface to Performance Monitors extension is implemented. Defined values are:

0000	Performance Monitors Extension System registers not implemented.
0001	Performance Monitors Extension System registers implemented, PMUv3.
0100	Performance Monitors Extension System registers implemented, PMUv3, with a 16-bit evtCount field, and if EL2 is implemented, the addition of the MDCR_EL2.HPMD bit.
1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported.

All other values are reserved.

In ARMv8.0 the permitted values are 0b0000, 0b0001 and 0b1111.

From ARMv8.1 the permitted values are 0b0000, 0b0100 and 0b1111.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID\_AA64DFR0\_EL1.PMUVer.

### TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a trace macrocell is implemented. Defined values are:

0000	Trace macrocell System registers not implemented.
0001	Trace macrocell System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a trace macrocell is implemented. A trace macrocell might nevertheless be implemented without a System register interface.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID\_AA64DFR0\_EL1.TraceVer.

### UNKNOWN, bits [3:0]

Reserved, UNKNOWN.

### Accessing the EDDFR:

EDDFR[31:0] can be accessed through the external debug interface:

Component	Offset
Debug	0xD28

EDDFR[63:32] can be accessed through the external debug interface:

Component	Offset
Debug	0xD2C

## H9.2.25 EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

### Purpose

Controls Exception Catch debug events.

### Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	SLK	Default
Error	Error	Error	RO	RW

### Configurations

External register EDECCR is architecturally mapped to AArch64 System register [OSECCR\\_EL1](#).

External register EDECCR is architecturally mapped to AArch32 System register [DBGOSECCR](#).

EDECCR is in the Core power domain. Some or all RW fields of this register have defined reset values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

### Attributes

EDECCR is a 32-bit register.

### Field descriptions

The EDECCR bit assignments are:

31	16	15	12	11	8	7	4	3	0
RES0				NSR<n>	SR<n>	NSE<n>		SE<n>	

#### Bits [31:16]

Reserved, RES0.

#### NSR<n>, bits [15:12]

##### *In ARMv8.2*

Controls Non-secure exception catch on exception return to EL<n> in conjunction with NSE<n>. If EL3 and EL2 are not implemented and the PE behaves as if [SCR\\_EL3.NS](#) is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:

- 0 If the corresponding NSE<n> bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level <n>.  
If the corresponding NSE<n> bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level <n>.
- 1 If the corresponding NSE<n> bit is 0, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level <n>.  
If the corresponding NSE<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level <n>.

#### **Note**

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

NSR[3] is RES0.

If EL2 is not implemented, NSR[2] is RES0.

A value that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If this field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSR<n> by a read of EDECCR is UNKNOWN.

When this register has an architecturally-defined reset value, this field resets to 0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

**SR<n>, bits [11:8]**

**In ARMv8.2**

Controls Secure exception catch on exception return to EL<n> in conjunction with SE<n>. If EL3 is not implemented and the PE behaves as if [SCR\\_EL3.NS](#) is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:

- |   |  |
|---|--|
| 0 | If the corresponding SE<n> bit is 0, then Exception Catch debug events are disabled for Secure Exception level <n>.<br><br>If the corresponding SE<n> bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level <n>.   |
| 1 | If the corresponding SE<n> bit is 0, then Exception Catch debug events are enabled for exception returns to Secure Exception level <n>.<br><br>If the corresponding SE<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level <n>. |

**Note**

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

SR[2] is RES0.

If EL3 is not implemented, SR[3] is RES0.

A value that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If this field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SR<n> by a read of EDECCR is UNKNOWN.

If ExternalSecureInvasiveDebugEnabled() == FALSE, then this field is ignored.

When this register has an architecturally-defined reset value, this field resets to 0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

**NSE<n>, bits [7:4]**

**In ARMv8.2**

Coarse-grained Non-secure exception catch for EL<n>. This controls whether Exception Catch debug events are enabled for Non-secure EL<n>. This also controls:

- The behavior of exception catch on exception entry to EL<n>.
- The behavior of exception catch on exception return to EL<n> in conjunction with NSR<n>.

If EL3 and EL2 are not implemented and the PE behaves as if [SCR\\_EL3.NS](#) is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:

- |   |   |
|---|---|
| 0 | Exception Catch debug events are disabled for Non-secure Exception level <n>. |
|---|---|

1 Exception Catch debug events are enabled for Non-secure Exception level <n>. NSE[3,0] are RES0.

A value that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If this field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE<n> by a read of EDECCR is UNKNOWN.

When this register has an architecturally-defined reset value, this field resets to 0.

**In ARMv8.1 and ARMv8.0.**

Coarse-grained Non-secure exception catch. If EL3 and EL2 are not implemented and the PE behaves as if SCR\_EL3.NS is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:

0000 Exception Catch debug event disabled for Non-secure Exception levels.  
0010 Exception Catch debug event enabled for Non-secure EL1.  
0100 Exception Catch debug event enabled for Non-secure EL2.  
0110 Exception Catch debug event enabled for Non-secure EL1 and EL2.

All other values are reserved. A value that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If this field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is UNKNOWN.

SE<n>, bits [3:0]

**In ARMv8.2**

Coarse-grained Secure exception catch for EL<n>. This field controls whether Exception Catch debug events are enabled for Secure EL<n>.

- The behavior of exception catch on exception entry to EL<n>.
- The behavior of exception catch on exception return to EL<n> in conjunction with SR<n>.

If EL3 is not implemented and the PE behaves as if SCR\_EL3.NS is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:

0 Exception Catch debug events are disabled for Secure Exception level <n>.  
1 Exception Catch debug events are enabled for Secure Exception level <n>.

SE[2,0] are RES0.

If EL3 is not implemented, SE[3] is RES0.

A value that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If this field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE<n> by a read of EDECCR is UNKNOWN.

If ExternalSecureInvasiveDebugEnabled() == FALSE, then this field is ignored.

When this register has an architecturally-defined reset value, this field resets to 0.

**In ARMv8.1 and ARMv8.0.**

Coarse-grained Secure exception catch. If EL3 is not implemented and the PE behaves as if SCR\_EL3.NS is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:

0000 Exception Catch debug event disabled for Secure Exception levels.  
0010 Exception Catch debug event enabled for Secure EL1.  
1000 Exception Catch debug event enabled for Secure EL3.

1010 Exception Catch debug event enabled for Secure EL1 and EL3.

All other values are reserved. A value that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If this field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is UNKNOWN.

The NSR<n>, SR<n>, NSE<n>, and SE<n> fields combine to control Exception Catch as follows:

(N)SR<n>	(N)SE<n>	Behavior on exception return to ELn	Behavior on exception taken to ELn
0	0	No action	No action
0	1	Halt if allowed	Halt if allowed
1	0	Halt if allowed	No action
1	1	No action	Halt if allowed

### Accessing the EDECCR:

EDECCR can be accessed through the external debug interface:

Component	Offset
Debug	0x098

H9.2.26 EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose

Controls Halting debug events.

Usage constraints

This register is accessible as follows:

SLK	Default
RO	RW

Configurations

EDECR is in the Debug power domain. Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

Attributes

EDECR is a 32-bit register.

Field descriptions

The EDECR bit assignments are:

Bits [31:3]

Reserved, RES0.

SS, bit [2]

Halting step enable. Possible values of this field are:

- 0 Halting step debug event disabled.
- 1 Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in [Changing the value of EDECR.SS when not in Debug state on page H3-5483](#).

When this register has an architecturally-defined reset value, this field resets to 0.

RCE, bit [1]

Reset Catch enable. Possible values of this field are:

- 0 Reset Catch debug event disabled.
- 1 Reset Catch debug event enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

**OSUCE, bit [0]**

OS Unlock Catch enabled. Possible values of this field are:

- 0 OS Unlock Catch debug event disabled.
- 1 OS Unlock Catch debug event enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

**Accessing the EDECR:**

EDECR can be accessed through the external debug interface:

Component	Offset
Debug	0x024

H9.2.27 EDESR, External Debug Event Status Register

The EDESR characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

Usage constraints

This register is accessible as follows:

Off	DLK	SLK	Default
Error	Error	RO	RW

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is CONSTRAINED UNPREDICTABLE whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

Configurations

EDESR is in the Core power domain. Some or all RW fields of this register have defined reset values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.

Attributes

EDESR is a 32-bit register.

Field descriptions

The EDESR bit assignments are:

Bits [31:3]

Reserved, RES0.

SS, bit [2]

Halting step debug event pending. Possible values of this field are:

- 0 Reading this means that a Halting step debug event is not pending. Writing this means no action.
- 1 Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

When this register has an architecturally-defined reset value, this field resets to the value of [EDECR.SS](#).

RC, bit [1]

Reset Catch debug event pending. Possible values of this field are:

- 0 Reading this means that a Reset Catch debug event is not pending. Writing this means no action.

- 1            Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

When this register has an architecturally-defined reset value, this field resets to the value of [EDECR.RCE](#).

#### **OSUC, bit [0]**

OS Unlock Catch debug event pending. Possible values of this field are:

- 0            Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.
- 1            Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.

When this register has an architecturally-defined reset value, this field resets to 0.

#### **Accessing the EDESR:**

EDESR can be accessed through the external debug interface:

Component	Offset
Debug	0x020

**H9.2.28 EDITCTRL, External Debug Integration mode Control register**

The EDITCTRL characteristics are:

**Purpose**

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Usage constraints**

This register is accessible as follows:

Off	DLK	OSLK	Default
IMP DEF	IMP DEF	IMP DEF	RW

**Configurations**

It is IMPLEMENTATION DEFINED whether EDITCTRL is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Implementation of this register is OPTIONAL.

**Attributes**

EDITCTRL is a 32-bit register.

**Field descriptions**

The EDITCTRL bit assignments are:

**Bits [31:1]**

Reserved, RES0.

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

- 0 Normal operation.
- 1 Integration mode enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the EDITCTRL:

EDITCTRL can be accessed through the external debug interface:

Component	Offset
Debug	0xF00

## H9.2.29 EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

### Purpose

Used in Debug state for passing instructions to the PE for execution.

### Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	SLK	Default
Error	Error	Error	WI	WO

If `EDSCR.ITE == 0` when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.

### Configurations

EDITR is in the Core power domain.

### Attributes

EDITR is a 32-bit register.

## Field descriptions

The EDITR bit assignments are:

### When in AArch32 state:

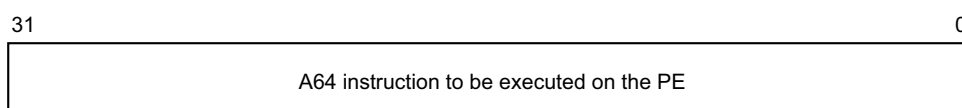

#### T32Second, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information see [Behavior in Debug state on page H2-5445](#)

#### T32First, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

### When in AArch64 state:

**Bits [31:0]**

A64 instruction to be executed on the PE.

**Accessing the EDITR:**

EDITR can be accessed through the external debug interface:

Component	Offset
Debug	0x084

H9.2.30 EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface.

Usage constraints

This register is accessible as follows:

Default
WO

Configurations

EDLAR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software Lock can be implemented as part of CoreSight compliance.

EDLAR ignores writes if the Software Lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses EDLAR to set or clear the lock, and [EDLSR](#) to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

The EDLAR bit assignments are:

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Accessing the EDLAR:

EDLAR can be accessed through a memory-mapped interface access to the external debug interface:

Component	Offset
Debug	0xFB0

H9.2.31 EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

Purpose

Indicates the current status of the software lock for external debug registers.

Usage constraints

This register is accessible as follows:

Default

RO

Configurations

EDLSR is in the Debug power domain. Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software Lock can be implemented as part of CoreSight compliance.

EDLSR is RAZ if the Software Lock is not implemented and is RAZ for other accesses to the external debug interface.

The Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLSR is a 32-bit register.

Field descriptions

The EDLSR bit assignments are:

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

- 0 Lock clear. Writes are permitted to this component's registers.
- 1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

When this register has an architecturally-defined reset value, this field resets to 1.

#### SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED.

Permitted values are:

- 0 Software Lock not implemented or not memory-mapped access.
- 1 Software Lock implemented and memory-mapped access.

#### Accessing the EDLSR:

EDLSR can be accessed through a memory-mapped interface access to the external debug interface:

Component	Offset
Debug	0xFB4

## H9.2.32 EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

### Purpose

Holds a sampled instruction address value.

### Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	SLK	Default
Error	Error	Error	RO	RO

### Configurations

EDPCSR is in the Core power domain.

Fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented and [ARMv8.2-PCSample](#) is not implemented. If [ARMv8.2-PCSample](#) is implemented, this register is RES0 and the architecture defines the functionality in [PMPCSR](#).

### Attributes

EDPCSR is a pair of 32-bit registers.

If [ARMv8.1-VHE](#) is implemented, the format of this register differs depending on the value of [EDSCR.SC2](#).

### Field descriptions

The EDPCSR bit assignments are:

#### When ARMv8.1-VHE is not implemented:

#### Bits [63:32]

PC Sample high word, EDPCSRhi. If [EDVIDSR.HV](#) == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from [EDVIDSR](#).{NS,E2,E3}.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

#### Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from [EDVIDSR](#).{NS,E2,E3}.

- For a read of EDPCSR[31:0] from the memory-mapped interface, if [EDLSR.SLK](#) == 1, meaning the OPTIONAL Software Lock is locked, then the access has no side-effects.
- In any other cases, a read of EDPCSR[31:0] has the side-effect of indirectly writing to EDPCSRhi, [EDCIDS](#), and [EDVIDSR](#):
  - If the PE is in Debug state, or PC Sample-based profiling is prohibited, EDPCSRlo reads as 0xFFFFFFFF, and EDPCSRhi, [EDCIDS](#), and [EDVIDSR](#) become UNKNOWN.

- If the PE is in Reset state, the sampled value is UNKNOWN and EDPCSRhi, [EDCIDS](#), and [EDVIDSR](#) become UNKNOWN.
- If no instruction has been retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited, the sampled value is UNKNOWN, and EDPCSRhi, [EDCIDS](#), and [EDVIDSR](#) become UNKNOWN.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**When ARMv8.1-VHE is implemented and EDSCR.SC2 == 0:**

**Bits [63:32]**

PC Sample high word, EDPCSRhi. If [EDVIDSR.HV](#) == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from [EDVIDSR](#).{NS,E2,E3}.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**Bits [31:0]**

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from [EDVIDSR](#).{NS,E2,E3}.

- For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the access has no side-effects.
- In any other cases, a read of EDPCSR[31:0] has the side-effect of indirectly writing to EDPCSRhi, [EDCIDS](#), and [EDVIDSR](#):
  - If the PE is in Debug state, or PC Sample-based profiling is prohibited, EDPCSRlo reads as 0xFFFFFFFF, and EDPCSRhi, [EDCIDS](#), and [EDVIDSR](#) become UNKNOWN.
  - If the PE is in Reset state, the sampled value is UNKNOWN and EDPCSRhi, [EDCIDS](#), and [EDVIDSR](#) become UNKNOWN.
  - If no instruction has been retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited, the sampled value is UNKNOWN, and EDPCSRhi, [EDCIDS](#), and [EDVIDSR](#) become UNKNOWN.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**When ARMv8.1-VHE is implemented and EDSCR.SC2 == 1:**

**NS, bit [63]**

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

#### EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample.

00	Sample is from EL0.
01	Sample is from EL1.
10	Sample is from EL2.
11	Sample is from EL3.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

#### Bits [60:56]

Reserved, RES0.

#### Bits [55:32]

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

#### Bits [31:0]

PC Sample low word, EDPCSRlo. Bits[31:0] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from [EDVIDSR](#).{NS,E2,E3}.

- For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the access has no side-effects.
- In any other cases, a read of EDPCSR[31:0] has the side-effect of indirectly writing to EDPCSR[63:32], [EDCIDSR](#), and [EDVIDSR](#):
  - If the PE is in Debug state, or PC Sample-based profiling is prohibited, EDPCSR[31:0] reads as 0xFFFFFFFF, and EDPCSR[63:32], [EDCIDSR](#), and [EDVIDSR](#) become UNKNOWN.
  - If the PE is in Reset state, the sampled value is UNKNOWN and EDPCSR[63:32], [EDCIDSR](#), and [EDVIDSR](#) become UNKNOWN.
  - If no instruction has been retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited, the sampled value is UNKNOWN, and EDPCSR[63:32], [EDCIDSR](#), and [EDVIDSR](#) become UNKNOWN.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

#### When ARMv8.2-PCSample is implemented:

#### Bits [63:0]

Reserved, RES0.

### Accessing the EDPCSR:

EDPCSR[31:0] can be accessed through the external debug interface:

Component	Offset
Debug	0x0A0

EDPCSR[63:32] can be accessed through the external debug interface:

Component	Offset
Debug	0x0AC

### H9.2.33 EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

#### Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

#### Usage constraints

This register is accessible as follows:

Off	DLK	Default
IMP DEF	IMP DEF	RO

#### Configurations

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

#### Attributes

EDPFR is a 64-bit register.

#### Field descriptions

The EDPFR bit assignments are:

#### Bits [63:36]

Reserved, RES0.

#### SVE, bits [35:32]

##### *In ARMv8.2 and ARMv8.1*

Present only if [SVE](#) is implemented.

Scalable Vector Extension. Defined values are:

0000 Scalable Vector Extension is not implemented.

0001 Scalable Vector Extension is implemented.

All other values are reserved.

If [SVE](#) is not implemented, this field is RES0.

##### *In ARMv8.0.*

Reserved, RES0.

#### UNK, bits [31:28]

This field is UNKNOWN.

#### GIC, bits [27:24]

System register GIC interface support. Defined values are:

0000 No System register interface to the GIC is supported.

0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.  
All other values are reserved.  
In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1.GIC](#).

#### AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

0000 Advanced SIMD is implemented, including support for the following SISP and SIMD operations:

- Integer byte, halfword, word and doubleword element operations.
- Single-precision and double-precision floating-point arithmetic.
- Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.

0001 As for 0000, and also includes support for half-precision floating-point arithmetic.

1111 Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0000 in an implementation with Advanced SIMD support, that does not include the [ARMv8.2-FP16](#) extension.
- 0001 in an implementation with Advanced SIMD support, that includes the [ARMv8.2-FP16](#) extension.
- 1111 in an implementation without Advanced SIMD support.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1.AdvSIMD](#).

#### FP, bits [19:16]

Floating-point. Defined values are:

0000 Floating-point is implemented, and includes support for:

- Single-precision and double-precision floating-point types.
- Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.

0001 As for 0000, and also includes support for half-precision floating-point arithmetic.

1111 Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0000 in an implementation with floating-point support, that does not include the [ARMv8.2-FP16](#) extension.
- 0001 in an implementation with floating-point support, that includes the [ARMv8.2-FP16](#) extension.
- 1111 in an implementation without floating-point support.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1.FP](#).

#### EL3, bits [15:12]

AArch64 EL3 Exception level handling. Defined values are:

0000 EL3 is not implemented or cannot be executed in AArch64 state.

0001 EL3 can be executed in AArch64 state only.

0010 EL3 can be executed in either AArch64 or AArch32 state.

When the value of [EDAA32PFR.EL3](#) is non-zero, this field must be 0000.

All other values are reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1.EL3](#).

#### EL2, bits [11:8]

AArch64 EL2 Exception level handling. Defined values are:

0000 EL2 is not implemented or cannot be executed in AArch64 state.

0001 EL2 can be executed in AArch64 state only.

0010 EL2 can be executed in either AArch64 or AArch32 state.

When the value of [EDAA32PFR.EL2](#) is non-zero, this field must be 0000.

All other values are reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1.EL2](#).

#### EL1, bits [7:4]

AArch64 EL1 Exception level handling. Defined values are:

0000 EL1 can be executed in AArch32 state only.

0001 EL1 can be executed in AArch64 state only.

0010 EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1.EL1](#).

#### EL0, bits [3:0]

AArch64 EL0 Exception level handling. Defined values are:

0000 EL0 can be executed in AArch32 state only.

0001 EL0 can be executed in AArch64 state only.

0010 EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

In an ARMv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1.EL0](#).

### Accessing the EDPFR:

EDPFR[31:0] can be accessed through the external debug interface:

Component	Offset
Debug	0xD20

EDPFR[63:32] can be accessed through the external debug interface:

Component	Offset
Debug	0xD24

H9.2.34     **EDPIDR0, External Debug Peripheral Identification Register 0**

The EDPIDR0 characteristics are:

**Purpose**

Provides information to identify an external debug component.  
For more information see [About the Peripheral identification scheme on page K2-6146](#).

**Usage constraints**

This register is accessible as follows:

Default
RO

**Configurations**

EDPIDR0 is in the Debug power domain.  
Implementation of this register is OPTIONAL.  
This register is required for CoreSight compliance.

**Attributes**

EDPIDR0 is a 32-bit register.

**Field descriptions**

The EDPIDR0 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PART\_0, bits [7:0]**

Part number, least significant byte.

**Accessing the EDPIDR0:**

EDPIDR0 can be accessed through the external debug interface:

Component	Offset
Debug	0xFE0

H9.2.35    **EDPIDR1, External Debug Peripheral Identification Register 1**

The EDPIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.  
For more information see [About the Peripheral identification scheme on page K2-6146](#).

**Usage constraints**

This register is accessible as follows:

Default
RO

**Configurations**

EDPIDR1 is in the Debug power domain.  
Implementation of this register is OPTIONAL.  
This register is required for CoreSight compliance.

**Attributes**

EDPIDR1 is a 32-bit register.

**Field descriptions**

The EDPIDR1 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**DES\_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is 0b1011.

**PART\_1, bits [3:0]**

Part number, most significant nibble.

**Accessing the EDPIDR1:**

EDPIDR1 can be accessed through the external debug interface:

Component	Offset
Debug	0xFE4

### H9.2.36 EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

## Purpose

Provides information to identify an external debug component.

For more information see [About the Peripheral identification scheme](#) on page K2-6146.

## Usage constraints

This register is accessible as follows:

---

**Default**

---

RO

## Configurations

EDPIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

### Attributes

EDPIDR2 is a 32-bit register.

## Field descriptions

The EDPIDR2 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

**JEDEC, bit [3]**

RAO. Indicates a JEP106 identity code is used.

**DES\_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is 0b011.

### Accessing the EDPIR2:

EDPIDR2 can be accessed through the external debug interface:

Component	Offset
Debug	0xFE8

### H9.2.37 EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

#### Purpose

Provides information to identify an external debug component.

For more information see [About the Peripheral identification scheme on page K2-6146](#).

#### Usage constraints

This register is accessible as follows:

Default
RO

#### Configurations

EDPIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

#### Attributes

EDPIDR3 is a 32-bit register.

#### Field descriptions

The EDPIDR3 bit assignments are:

31	8	7	4	3	0
RES0				REVAND	CMOD

#### Bits [31:8]

Reserved, RES0.

#### REVAND, bits [7:4]

Part minor revision. Parts using [EDPIDR2.REVISION](#) as an extension to the Part number must use this field as a major revision number.

#### CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

#### Accessing the EDPIDR3:

EDPIDR3 can be accessed through the external debug interface:

Component	Offset
Debug	0xFEC

H9.2.38      **EDPIDR4, External Debug Peripheral Identification Register 4**

The EDPIDR4 characteristics are:

**Purpose**

Provides information to identify an external debug component.  
For more information see [About the Peripheral identification scheme on page K2-6146](#).

**Usage constraints**

This register is accessible as follows:

Default
RO

**Configurations**

EDPIDR4 is in the Debug power domain.  
Implementation of this register is OPTIONAL.  
This register is required for CoreSight compliance.

**Attributes**

EDPIDR4 is a 32-bit register.

**Field descriptions**

The EDPIDR4 bit assignments are:

31	8	7	4	3	0
RES0				SIZE	DES_2

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. Log<sub>2</sub> of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES\_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For ARM Limited, this field is 0b0100.

**Accessing the EDPIDR4:**

EDPIDR4 can be accessed through the external debug interface:

Component	Offset
Debug	0xFD0

## H9.2.39 EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

### Purpose

Controls the PE functionality related to powerup, reset, and powerdown.

### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RW

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

### Configurations

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

For RW fields see the field description for a description of the behavior of the field on a reset that applies to its power domain. However:

- Fields that are in the Core power domain are not affected by a warm reset and are not affected by an External debug reset.
- Fields that are in the Debug power domain reset to their defined reset values on an External debug reset, and are not affected by a Warm reset and are not affected by a Cold reset.

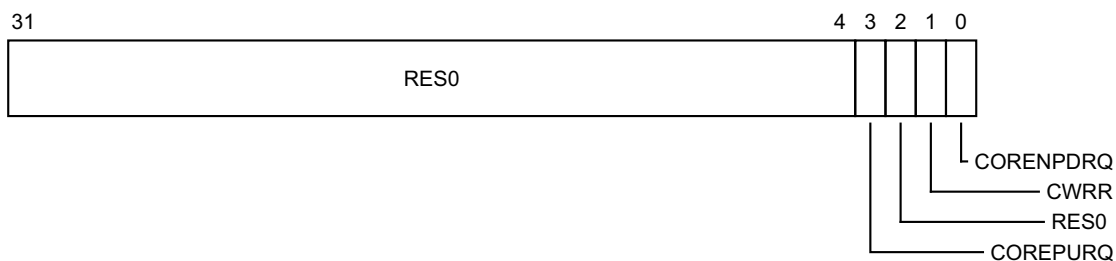

CORENPDRQ is the only field that is mapped between the EDPRCR and DBGPRCR and DBGPRCR\_EL1.

### Attributes

EDPRCR is a 32-bit register.

### Field descriptions

The EDPRCR bit assignments are:

### Bits [31:4]

Reserved, RES0.

### COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain. The actions on writing to this bit are:

- 0 Do not request power up of the Core power domain.

1 Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

Typically, this request is passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off. On an External debug reset this field resets to 0.

The power controller must not allow the Core power domain to switch off while this bit is 1.

When this register has an architecturally-defined reset value, this field resets to 0.

This field is accessible as shown below:

SLK	Default
RO	RW

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### Bit [2]

Reserved, RES0.

#### CWRR, bit [1]

Warm reset request. Write only bit that reads as zero. The actions on writing to this bit are:

0 No action.

1 Request Warm reset.

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and one of the following is true:
  - EL3 is implemented.
  - The implemented Security state is Secure state.
- The Core power domain is either off or in a low-power state where the Core power domain registers cannot be accessed.
- DoubleLockStatus() == TRUE (OS Double Lock is set).
- OSLSR.OSLK == 1 (OS lock is locked).

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

#### ———— Note ————

Although the ARM architecture permits the first option from the above list, ARM recommends that either of the other options is implemented.

When this register has an architecturally-defined reset value, this field resets to 0.

This field is accessible as shown below:

Off	DLK	OSLK	SLK	Default
WI	WI	WI	WI	WO

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown. Possible values of this bit are:

- 0 If the system responds to a powerdown request, it powers down Core power domain.
- 1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

This bit is UNKNOWN, and the PE ignores writes to this bit if any of the following are true:

- The Core power domain is either off or in a low-power state where the Core power domain registers cannot be accessed.
- DoubleLockStatus() == TRUE (OS Double Lock is set).
- OSLSR.OSLK == 1 (OS lock is locked).

Permitted accesses to this field map to the [DBGPRCR.CORENPDRQ](#) and [DBGPRCR\\_EL1.CORENPDRQ](#) fields.

This field is in the Core reset domain. See the descriptions of the [DBGPRCR.CORENPDRQ](#) and [DBGPRCR\\_EL1.CORENPDRQ](#) fields for information about the effect of a Cold reset on the value returned by a permitted read of this field.

This field is accessible as shown below:

Off	DLK	OSLK	SLK	Default
WI	WI	WI	RO	RW

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### Accessing the EDPRCR:

EDPRCR can be accessed through the external debug interface:

Component	Offset
Debug	0x310

## H9.2.40 EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

### Purpose

Holds information about the reset and powerdown state of the PE.

### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RO

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up ( $\text{EDPRSR.PU} == 1$ ), then following a read of EDPRSR:

- If  $\text{DoubleLockStatus()} == \text{FALSE}$ , then:
  - $\text{EDPRSR}\{ \text{SDR}, \text{SPMAD}, \text{SDAD}, \text{SPD} \}$  are cleared to 0.
  - $\text{EDPRSR.SR}$  is cleared to 0 if the non-debug logic of the PE is not in reset state ( $\text{EDPRSR.R} == 0$ ).
- Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If the Core power domain is powered down ( $\text{EDPRSR.PU} == 0$ ), then:

- $\text{EDPRSR}\{ \text{SDR}, \text{SPMAD}, \text{SDAD}, \text{SR} \}$  are all UNKNOWN, and are either reset or restored on being powered up.
- $\text{EDPRSR.SPD}$  is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

### Configurations

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

Some of the fields in the Core power domain are in the Cold reset domain and others are in the Warm reset domain. See the field descriptions for more information. However:

- Fields that are in the Cold reset domain are not affected by a warm reset and are not affected by an External debug reset.
- Fields in the Warm reset domain are also reset by a Cold reset but are not affected by an External debug reset.
- Fields in the Debug power domain are not affected by a Warm reset and are not affected by a Cold reset.

### Attributes

EDPRSR is a 32-bit register.

### Field descriptions

The EDPRSR bit assignments are:

#### Bits [31:12]

Reserved, RES0.

#### SDR, bit [11]

Sticky debug restart. Set to 1 when the PE exits Debug state.

This bit is UNKNOWN on reads if any of the following are true:

- DoubleLockStatus() == TRUE. The OS double-lock is locked.
- EDPRSR.R == 1. The PE is in Reset state.
- EDPRSR.PU == 0. The Core power domain is powered down.

Otherwise permitted values are:

- 0 The PE has not restarted since EDPRSR was last read.
- 1 The PE has restarted since EDPRSR was last read.

#### ———— Note ————

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If EDPRSR.PU reads as 1, which means that the Core power domain is in a powerup state, then following a read of EDPRSR:

- If DoubleLockStatus() == FALSE this bit clears to 0.
- If DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain and the Warm reset domain. On a Warm or Cold reset it resets to an UNKNOWN value.

This field resets to a value that is architecturally UNKNOWN.

This field is accessible as shown below:

Off	DLK	SLK	Default
UNK	UNK	RO	RC

*Access permissions for the External debug interface registers on page H8-5567 describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.*

### SPMAD, bit [10]

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because AllowExternalPMUAccess() == FALSE.

This bit is UNKNOWN on reads if any of the following are true:

- DoubleLockStatus() == TRUE
- EDPRSR.{OSLK, R} is 1.
- EDPRSR.PU is 0.

Otherwise permitted values are:

- |   |   |
|---|---|
| 0 | No accesses to the external Performance Monitors registers have failed since EDPRSR was last read.        |
| 1 | At least one access to the external Performance Monitors registers has failed since EDPRSR was last read. |

If the Core power domain is powered up, then, following a read of EDPRSR:

- If DoubleLockStatus() == FALSE this bit clears to 0.
- If DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

The write to SPMAD is an indirect write to EDPRSR that is a side effect of the access. The indirect write might not occur for a memory-mapped access to the external debug interface.

This field is in the Core power domain and the Cold reset domain. On a Cold reset it resets to 0.

When this register has an architecturally-defined reset value, this field resets to 0.

This field is accessible as shown below:

Off	DLK	OSLK	SLK	Default
UNK	UNK	UNK	RO	RC

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

### EPMAD, bit [9]

External Performance Monitors access disable status.

This bit is UNKNOWN on reads if any of the following is true:

- DoubleLockStatus() == TRUE
- EDPRSR.{OSLK, R} is 1.
- EDPRSR.PU is 0.

Otherwise permitted values are:

- |   |   |
|---|---|
| 0 | External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.   |
| 1 | External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE. |

If external performance monitors access is not implemented, EPMAD is RAO.

This field is in the Core power domain.

This field is accessible as shown below:

Off	DLK	OSLK	EPMAD	Default
UNK	UNK	UNK	RAO	RO

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### SDAD, bit [8]

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because `AllowExternalDebugAccess() == FALSE`.

This bit is UNKNOWN on reads if any of the following are true:

- `DoubleLockStatus() == TRUE`
- `EDPRSR.R` is 1.
- `EDPRSR.PU` is 0.
- `EDPRSR.OSLK` is 1 and external debug writes to [OSLAR\\_EL1](#) do not return an error when `AllowExternalDebugAccess() == FALSE`.

Otherwise permitted values are:

0	No accesses to the external debug registers have failed since <code>EDPRSR</code> was last read.
1	At least one access to the external debug registers has failed since <code>EDPRSR</code> was last read.

If the Core power domain is powered up, then, following a read of `EDPRSR`:

- If `DoubleLockStatus() == FALSE` this bit clears to 0.
- If `DoubleLockStatus() == TRUE`, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

The write to `SDAD` is an indirect write to `EDPRSR` that is a side effect of the access. The indirect write might not occur for a memory-mapped access to the external debug interface.

This field is in the Core power domain and the Cold reset domain. On a Cold reset it resets to 0.

When this register has an architecturally-defined reset value, this field resets to 0.

This field is accessible as shown below:

Off	DLK	OSLK	SLK	Default
UNK	UNK	See text	RO	RC

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### EDAD, bit [7]

External debug access disable status.

This bit is UNKNOWN on reads if any of the following are true:

- `DoubleLockStatus() == TRUE`
- `EDPRSR.R` is 1.
- `EDPRSR.PU` is 0.
- `EDPRSR.OSLK` is 1 and external debug writes to [OSLAR\\_EL1](#) do not return an error when `AllowExternalDebugAccess() == FALSE`.

Otherwise permitted values are:

0	External debug access enabled. <code>AllowExternalDebugAccess() == TRUE</code> .
1	External debug access disabled. <code>AllowExternalDebugAccess() == FALSE</code> .

This field is in the Core power domain.

This field is accessible as shown below:

Off	DLK	OSLK	EDAD	Default
UNK	UNK	See text	RAO	RAZ

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### DLK, bit [6]

OS Double Lock status bit. Returns the result of the pseudocode function DoubleLockStatus().

This bit is UNKNOWN on reads if EDPRSR.PU is 0.

Otherwise reads as zero if any of the following are true, that is when DoubleLockStatus() == FALSE:

- [OSDLR\\_EL1](#).DLK == 0.
- [DBGPRCR\\_EL1](#).CORENPDRQ == 1.
- The PE is in Debug state.

In ARMv8.0 and ARMv8.1, if the Core power domain is powered up and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
- EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.

From ARMv8.2, if the Core power domain is powered up and DoubleLockStatus() == TRUE, then EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.

If the Core power domain is powered up and entered reset state with the OS double-lock locked this bit has a CONSTRAINED UNPREDICTABLE value, for more information see [EDPRSR.{DLK, R} and reset state on page H6-5538](#)

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see [EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-5537](#)

#### ———— Note —————

Use of this bit by debuggers is deprecated from ARMv8.2.

This field is in the Core power domain.

This field is accessible as shown below:

Off	DLK	Default
UNK	See text	RAZ

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### OSLK, bit [5]

OS lock status bit.

This bit is UNKNOWN on reads if either:

- DoubleLockStatus() == TRUE
- EDPRSR.R is 1.
- EDPRSR.PU is 0.

A read of this bit returns the value of [OSLSR\\_EL1.OSLK](#).

This field is in the Core power domain.

This field is accessible as shown below:

Off	DLK	OSLK	Default
UNK	UNK	RAO	RAZ

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### HALTED, bit [4]

Halted status bit.

This bit is UNKNOWN on reads if EDPRSR.PU is 0.

Otherwise permitted values are:

0 PE is in Non-debug state.

1 PE is in Debug state.

Because the OS Double Lock is never set when the PE is in Debug state, this bit is always RAZ when DoubleLockStatus() == TRUE.

This field is in the Core power domain.

This field is accessible as shown below:

Off	DLK	Default
UNK	See text	RO

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### SR, bit [3]

Sticky core reset status bit.

This bit is UNKNOWN on reads if either:

- DoubleLockStatus() == TRUE
- EDPRSR.PU is 0.

Otherwise permitted values are:

0 The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.

1 The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If DoubleLockStatus() == FALSE this bit clears to 0.
- If DoubleLockStatus() == TRUE, it is UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain and the Warm reset domain. On a Warm or Cold reset it resets to 1.

When this register has an architecturally-defined reset value, this field resets to 1.

This field is accessible as shown below:

Off	DLK	SLK	Default
UNK	UNK	RO	RC

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### R, bit [2]

PE reset status bit.

This bit is UNKNOWN on reads if either:

- DoubleLockStatus() == TRUE
- EDPRSR.PU is 0.

Otherwise permitted values are:

- 0 The non-debug logic of the PE is not in reset state.
- 1 The non-debug logic of the PE is in reset state.

If the Core power domain is powered up and entered reset state with the OS double-lock locked this bit has a CONSTRAINED UNPREDICTABLE value, for more information see [EDPRSR.{DLK, R} and reset state on page H6-5538](#)

This field is in the Core power domain.

This field is accessible as shown below:

Off	DLK	Default
UNK	UNK	RO

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### SPD, bit [1]

Sticky core powerdown status bit.

This bit is UNKNOWN on reads if EDPRSR.PU is 1 and DoubleLockStatus() == TRUE .

Otherwise, permitted values are:

- 0 If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost.  
If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.
- 1 The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If DoubleLockStatus() == FALSE this bit clears to 0.
- If DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

When the value of EDPRSR.PU is 0 indicating that the Core power domain is in either retention or powerdown state, EDPRSR.SPD reads as 0. For more information, see [EDPRSR.SPD when the Core domain is in either retention or powerdown state on page H6-5537](#).

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see [EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-5537](#).

This field is in the Core power domain and the Cold reset domain. On a Cold reset it resets to 1.

When this register has an architecturally-defined reset value, this field resets to 1.

This field is accessible as shown below:

Off	DLK	SLK	Default
RO	UNK	RO	RC

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### PU, bit [0]

Core powerup status bit. Indicates whether the Core power domain debug registers can be accessed.

When the Core power domain is powered-up and OS double-lock is locked, then:

- When [ARMv8.2-Debug](#) is implemented, the value of EDPRSR.PU reads as 0.
- When [ARMv8.2-Debug](#) is not implemented, the value of EDPRSR.PU is IMPLEMENTATION DEFINED.

See the description of DLK for more information.

Otherwise, permitted values are:

- 0 Core is in a low-power or powerdown state where the debug registers cannot be accessed.
- 1 Core is in a powerup state where the debug registers can be accessed.

If the Core power domain is powered up and entered reset state with the OS double-lock locked this bit has a CONSTRAINED UNPREDICTABLE value, for more information see [EDPRSR.{DLK, R} and reset state on page H6-5538](#)

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see [EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-5537](#)

This field is accessible as shown below:

Off	DLK	Default
RAZ	See text	RAO

[Access permissions for the External debug interface registers on page H8-5567](#) describes the conditions shown in this table. These conditions are prioritized, with the leftmost condition having the highest priority and priority decreasing from left to right.

#### Accessing the EDPRSR:

EDPRSR can be accessed through the external debug interface:

Component	Offset
Debug	0x314

H9.2.41 EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

Purpose

This register is used to allow imprecise entry to Debug state and clear sticky bits in [EDSCR](#).

Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	SLK	Default
Error	Error	Error	WI	WO

Configurations

EDRCR is in the Core power domain.

Attributes

EDRCR is a 32-bit register.

Field descriptions

The EDRCR bit assignments are:

Bits [31:5]

Reserved, RES0.

CBRRQ, bit [4]

Allow imprecise entry to Debug state. The actions on writing to this bit are:

- 0 No action.
  - 1 Allow imprecise entry to Debug state, for example by canceling pending bus accesses.
- Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.
- This feature is optional. If this feature is not implemented, writes to this bit are ignored.

CSPA, bit [3]

Clear Sticky Pipeline Advance. This bit is used to clear the [EDSCR](#).PipeAdv bit to 0. The actions on writing to this bit are:

- 0 No action.
- 1 Clear the [EDSCR](#).PipeAdv bit to 0.

**CSE, bit [2]**

Clear Sticky Error. Used to clear the [EDSCR](#) cumulative error bits to 0. The actions on writing to this bit are:

- 0 No action.
- 1 Clear the [EDSCR](#).{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the [EDSCR.ITO](#) bit, to 0.

**Bits [1:0]**

Reserved, RES0.

**Accessing the EDRCR:**

EDRCR can be accessed through the external debug interface:

Component	Offset
Debug	0x090

H9.2.42 EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	SLK	Default
Error	Error	Error	RO	RW

Configurations

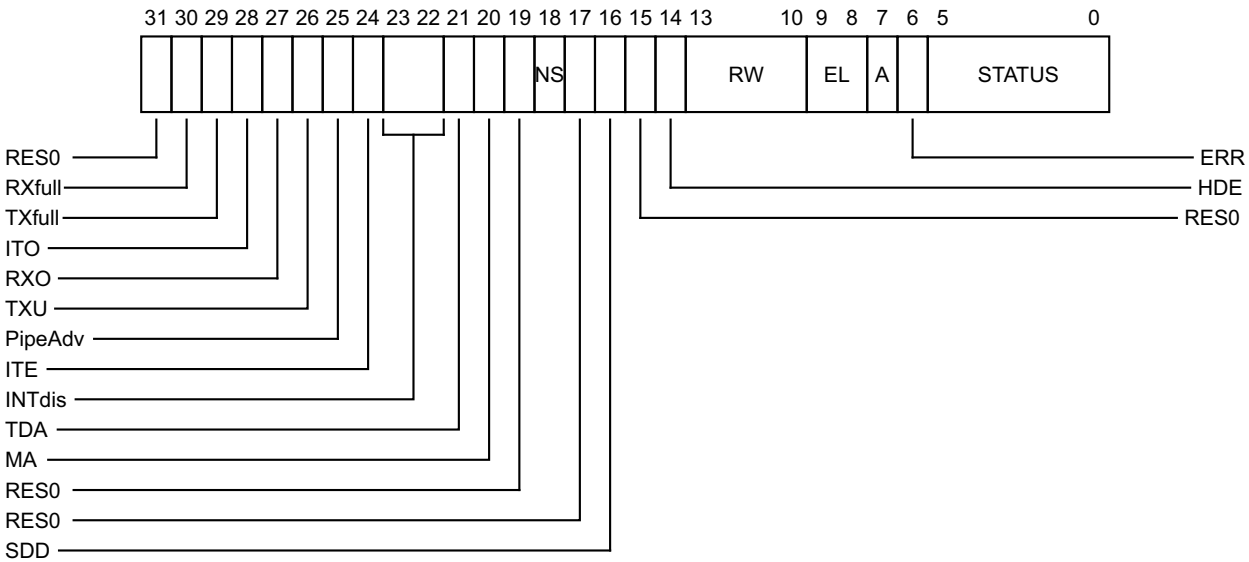

EDSCR is in the Core power domain. Some or all RW fields of this register have defined reset values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Attributes

EDSCR is a 32-bit register.

Field descriptions

The EDSCR bit assignments are:

Bit [31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. This bit is RO.

When this register has an architecturally-defined reset value, this field resets to 0.

TXfull, bit [29]

DTRTX full. This bit is RO.

When this register has an architecturally-defined reset value, this field resets to 0.

#### ITO, bit [28]

ITR overrun. This bit is RO.

If the PE is in Non-debug state, this bit is UNKNOWN. ITO is set to 0 on entry to Debug state.

#### R XO, bit [27]

DTRRX overrun. This bit is RO.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TXU, bit [26]

DTRTX underrun. This bit is RO.

When this register has an architecturally-defined reset value, this field resets to 0.

#### PipeAdv, bit [25]

Pipeline advance. This bit is RO. Set to 1 every time the PE pipeline retires one or more instructions. Cleared to 0 by a write to [EDRCR.CSPA](#).

The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.

#### ITE, bit [24]

ITR empty. This bit is RO.

If the PE is in Non-debug state, this bit is UNKNOWN. It is always valid in Debug state.

#### INTdis, bits [23:22]

Interrupt disable. Disables taking interrupts (including virtual interrupts and System Error interrupts) in Non-Debug state.

If ExternalInvasiveDebugEnabled() = FALSE, the value of this field is ignored.

If ExternalInvasiveDebugEnabled() = TRUE, the possible values of this field are:

- |    |  |
|----|--|
| 00 | Do not disable interrupts.   |
| 01 | Disable interrupts taken to Non-secure EL1.  |
| 10 | Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If external secure invasive debug is enabled, also disable interrupts taken to Secure EL1. |
| 11 | Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If external secure invasive debug is enabled, also disable all other interrupts.           |

The value of INTdis does not affect whether an interrupt is a WFI wake-up event, but can mask an interrupt as a WFE wake-up event.

If EL3 and EL2 are not implemented, the values 0b01 and 0b10 are reserved. If programmed with a reserved value the PE behaves as if INTdis has been programmed with a defined value, other than for a direct read of EDSCR, and the value returned by a read of EDSCR.INTdis is UNKNOWN.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TDA, bit [21]

Traps accesses to the following Debug System registers:

- AArch64: [DBGBCR<n>\\_EL1](#), [DBGBVR<n>\\_EL1](#), [DBGWCR<n>\\_EL1](#), [DBGWVR<n>\\_EL1](#).
- AArch32: [DBGBCR<n>](#), [DBGBVR<n>](#), [DBGXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).

The possible values of this field are:

- |   |  |
|---|--|
| 0 | Accesses to Debug System registers do not generate a Software Access debug event.  |
| 1 | Accesses to Debug System registers generate a Software Access debug event, if OSLSR.OSLK is 0 and if halting is allowed. |

When this register has an architecturally-defined reset value, this field resets to 0.

#### MA, bit [20]

Memory access mode. Controls use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

- 0 Normal access mode.
- 1 Memory access mode.

#### SC2, bit [19]

##### *In ARMv8.1*

Sample CONTEXTIDR\_EL2. Controls whether the Sample-based Profiling Extension samples CONTEXTIDR\_EL2 or VTTBR\_EL2.VMID.

- 0 Sample VTTBR\_EL2.VMID.
- 1 Sample CONTEXTIDR\_EL2.

If the PC Sample-based Profiling Extension is not implemented, then this field is RES0.

##### *In ARMv8.2 and ARMv8.0.*

Reserved, RES0.

#### NS, bit [18]

Non-secure status. Read-only. When in Debug state, gives the current Security state:

- 0 Secure state, IsSecure() == TRUE.
- 1 Non-secure state, IsSecure() == FALSE.

In Non-debug state, this bit is UNKNOWN.

#### Bit [17]

Reserved, RES0.

#### SDD, bit [16]

Secure debug disabled. This bit is RO.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:

- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

#### Bit [15]

Reserved, RES0.

#### HDE, bit [14]

Halting debug enable. The possible values of this field are:

- 0 Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
- 1 Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

When this register has an architecturally-defined reset value, this field resets to 0.

#### RW, bits [13:10]

Exception level Execution state status. Read-only. In Debug state, each bit gives the current Execution state of each EL:

RW	Meaning
1111	All Exception levels are using AArch64.
1110	EL0 is using AArch32. All other Exception levels are using AArch64.
110x	EL0 and EL1 are using AArch32. All other Exception levels are using AArch64. Never seen if EL2 is not implemented in the current Security state.
10xx	EL0, EL1, and, if implemented in the current Security state, EL2 are using AArch32. All other Exception levels are using AArch64.
0xxx	All Exception levels are using AArch32.

However:

- The value of 1110 is only permitted at EL0.
- The values 110x are not permitted if either:
  - EL2 is not implemented.
  - EL3 is implemented and SCR\_EL3.NS/SCR.NS == 0.
- The values 10xx are not permitted if EL3 is not implemented.

In Non-debug state, this field is RAO.

#### EL, bits [9:8]

Exception level. Read-only. In Debug state, this gives the current EL of the PE.

In Non-debug state, this field is RAZ.

#### A, bit [7]

System Error interrupt pending. Read-only. In Debug state, indicates whether a SError interrupt is pending:

- If [HCR\\_EL2](#).{AMO, TGE} = {1, 0} and in Non-secure EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

0 No SError interrupt pending.

1 SError interrupt pending.

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

UNKNOWN in Non-debug state.

#### ERR, bit [6]

Cumulative error flag. This field is RO. It is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

When this register has an architecturally-defined reset value, this field resets to 0.

#### STATUS, bits [5:0]

Debug status flags. This field is RO.

The possible values of this field are:

000010 PE is in Non-debug state.

000001 PE is restarting, exiting Debug state.

000111	Breakpoint.
010011	External debug request.
011011	Halting step, normal.
011111	Halting step, exclusive.
100011	OS Unlock Catch.
100111	Reset Catch.
101011	Watchpoint.
101111	HLT instruction.
110011	Software access to debug register.
110111	Exception Catch.
111011	Halting step, no syndrome.
All other values of STATUS are reserved.	

### Accessing the EDSCR:

EDSCR can be accessed through the external debug interface:

Component	Offset
Debug	0x088

H9.2.43 EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading [EDPCSR](#)[31:0].

Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	Default
Error	Error	Error	RO

Configurations

EDVIDSR is in the Core power domain.

Fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented and [ARMv8.2-PCSample](#) is not implemented. If [ARMv8.2-PCSample](#) is implemented, this register is RES0 and the architecture defines the functionality in [PMPCSR](#), [PMCID2SR](#), and [PMVIDSR](#).

If EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

Attributes

If [ARMv8.1-VHE](#) is implemented, the format of this register differs depending on the value of [EDSCR.SC2](#).

Field descriptions

The EDVIDSR bit assignments are:

**When ARMv8.1-VHE is not implemented:**

NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent [EDPCSR](#) sample.

If EL3 is not implemented, this bit indicates the Effective value of [SCR.NS](#).

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

E2, bit [30]

Exception level 2 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL2.

If EL2 is not implemented, this bit is RES0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

#### E3, bit [29]

Exception level 3 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL3 using AArch64.

If EDVIDSR.NS == 1 or the PE was in AArch32 state when EDPCSRlo ([EDPCSR](#)[31:0]) was read, this bit is 0.

If EL3 is not implemented, this bit is RES0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

#### HV, bit [28]

EDPCSRhi ([EDPCSR](#)[63:32]) valid. Indicates whether bits [63:32] of the most recent [EDPCSR](#) sample might be nonzero:

0 Bits[63:32] of the most recent EDPCSR sample are zero.

1 Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

#### Bits [27:8]

Reserved, RES0.

#### VMID, bits [7:0]

VMID sample. The VMID associated with the most recent EDPCSRlo ([EDPCSR](#)[31:0]) sample.

If the value of EDVIDSR.NS is 0 or the value of EDVIDSR.E2 is 1 this field is RES0.

If EL2 is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

#### When ARMv8.1-VHE is implemented and EDSCR.SC2 == 0:

#### NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent [EDPCSR](#) sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample.

If EL3 is not implemented, this bit has a fixed read-only value that indicates the Effective value of [SCR.NS](#).

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

#### E2, bit [30]

Exception level 2 status sample. Indicates whether the most recent [EDPCSR](#) sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample, was associated with EL2.

If EDVIDSR.NS == 0, this bit is 0.

If EL2 is not implemented, this bit is RES0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

### E3, bit [29]

Exception level 3 status sample. Indicates whether the most recent [EDPCSR](#) sample or, when it is read as a single atomic 64-bit read, was associated with EL3 using AArch64.

If EDVIDSR.NS == 1 or the PE was in AArch32 state when EDPCSRlo ([EDPCSR](#)[31:0]) was read, this bit is 0.

If EL3 is not implemented, this bit is RES0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

### HV, bit [28]

EDPCSRhi ([EDPCSR](#)[63:32]) valid. Indicates whether bits [63:32] of the most recent [EDPCSR](#) sample might be nonzero:

0 Bits[63:32] of the most recent EDPCSR sample are zero.

1 Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi ([EDPCSR](#)[63:32]) does not need to be read.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

### Bits [27:16]

Reserved, RES0.

### VMID, bits [15:0]

VMID sample. The VMID associated with the most recent EDPCSRlo ([EDPCSR](#)[31:0]) sample.

If the value of EDVIDSR.NS is 0 or the value of EDVIDSR.E2 is 1 this field is RES0.

If EL2 is not implemented, then this field is RES0.

If EL2 is implemented and is using AArch64, the VMID is held in [VTTBR\\_EL2](#).VMID.

If EL2 is implemented and is using AArch32, the VMID is held in [VTTBR](#).VMID.

If 16-bit VMIDs are not supported, EDVIDSR.VMID[15:8] is RES0.

If 16-bit VMIDs are supported, but VTTBRx.VMID[15:8] are not used, EDVIDSR.VMID[15:8] is set to 0.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

### When ARMv8.1-VHE is implemented and EDSCR.SC2 == 1:

### CONTEXTIDR\_EL2, bits [31:0]

Context ID.

- If EL2 is using AArch64, the value of [CONTEXTIDR\\_EL2](#) as associated with the most recent [EDPCSR](#) sample.
- If [EDPCSR](#).NS == 0, then this field is set to an UNKNOWN value.

- Otherwise this field is set to an UNKNOWN value.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

**When ARMv8.2-PCSample is implemented:**

**Bits [31:0]**

Reserved, RES0.

### Accessing the EDVIDSR:

EDVIDSR can be accessed through the external debug interface:

Component	Offset
Debug	0x0A8

H9.2.44 EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	Default
Error	Error	Error	RO

Configurations

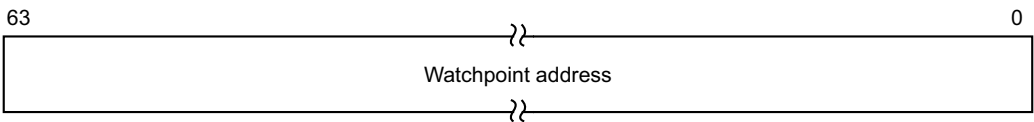

EDWAR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.

Attributes

EDWAR is a 64-bit register.

Field descriptions

The EDWAR bit assignments are:

Bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the [DC ZVA](#) block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See [Determining the memory location that caused a Watchpoint exception on page D2-1948](#)

This field resets to a value that is architecturally UNKNOWN.

Accessing the EDWAR:

EDWAR[31:0] can be accessed through the external debug interface:

Component	Offset
Debug	0x030

EDWAR[63:32] can be accessed through the external debug interface:

Component	Offset
Debug	0x034

## H9.2.45 MIDR\_EL1, Main ID Register

The MIDR\_EL1 characteristics are:

### Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

### Usage constraints

This register is accessible as follows:

Off	DLK	Default
IMP DEF	IMP DEF	RO

### Configurations

External register MIDR\_EL1 is architecturally mapped to AArch64 System register [MIDR\\_EL1](#).

External register MIDR\_EL1 is architecturally mapped to AArch32 System register [MIDR](#).

It is IMPLEMENTATION DEFINED whether MIDR\_EL1 is implemented in the Core power domain or in the Debug power domain.

### Attributes

MIDR\_EL1 is a 32-bit register.

### Field descriptions

The MIDR\_EL1 bit assignments are:

### Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

Hex representation	ASCII representation	Implementer
0x41	A	ARM Limited
0x42	B	Broadcom Corporation
0x43	C	Cavium Inc.
0x44	D	Digital Equipment Corporation
0x49	I	Infineon Technologies AG
0x4D	M	Motorola or Freescale Semiconductor Inc.
0x4E	N	NVIDIA Corporation
0x50	P	Applied Micro Circuits Corporation

Hex representation	ASCII representation	Implementer
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

#### Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

#### Architecture, bits [19:16]

The permitted values of this field are:

0001	ARMv4
0010	ARMv4T
0011	ARMv5 (obsolete)
0100	ARMv5T
0101	ARMv5TE
0110	ARMv5TEJ
0111	ARMv6
1111	Architectural features are individually identified in the ID_* registers, see <a href="#">Identification registers, functional group on page G4-4727</a> .

All other values are reserved.

#### PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

#### Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

### Accessing the MIDR\_EL1:

MIDR\_EL1 can be accessed through the external debug interface:

Component	Offset
Debug	0xD00

H9.2.46 OSLAR\_EL1, OS Lock Access Register

The OSLAR\_EL1 characteristics are:

Purpose

Used to lock or unlock the OS lock.

Usage constraints

This register is accessible as follows:

Off	DLK	EDAD	SLK	Default
Error	Error	IMP DEF	WI	WO

Configurations

External register OSLAR\_EL1 is architecturally mapped to AArch64 System register [OSLAR\\_EL1](#).

External register OSLAR\_EL1 is architecturally mapped to AArch32 System register [DBGOSLAR](#).

OSLAR\_EL1 is in the Core power domain.

From ARMv8.2, external debug accesses to OSLAR\_EL1 are ignored and return an error when any of:

- ExternalInvasiveDebugEnabled() == FALSE.
- ExternalSecureInvasiveDebugEnabled() == FALSE and any of:
  - EL3 is not implemented and the PE is in Secure state.
  - EL3 is implemented and is using AArch64 and [MDCR\\_EL3](#).EDAD == 1
  - EL3 is implemented and is using AArch32 and [SDCR](#).EDAD == 1.

Attributes

OSLAR\_EL1 is a 32-bit register.

Field descriptions

The OSLAR\_EL1 bit assignments are:

Bits [31:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR\_EL1, bit[0] is copied to the OS lock.

Use [EDPRSR](#).OSLK to check the current status of the lock.

### Accessing the OSLAR\_EL1:

OSLAR\_EL1 can be accessed through the external debug interface:

Component	Offset
Debug	0x300

## **H9.3 Cross-Trigger Interface registers**

This section lists the Cross-Trigger Interface registers.

### H9.3.1 ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

#### Purpose

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

#### ———— Note ————

The architecturally-defined triggers must not be multiplexed.

#### Usage constraints

This register is accessible as follows:

Off	DLK	OSLK	EDAD	SLK	Default
IMP DEF	IMP DEF	IMP DEF	IMP DEF	RO	IMP DEF

#### Configurations

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

#### Attributes

ASICCTL is a 32-bit register.

#### Field descriptions

The ASICCTL bit assignments are:

#### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

#### Accessing the ASICCTL:

ASICCTL can be accessed through the external debug interface:

Component	Offset
CTI	0x144

## H9.3.2 CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

### Purpose

Clears bits of the Application Trigger register.

### Usage constraints

This register is accessible as follows:

SLK	Default
RO	WO

### Configurations

CTIAPPCLEAR is in the Debug power domain.

### Attributes

CTIAPPCLEAR is a 32-bit register.

### Field descriptions

The CTIAPPCLEAR bit assignments are:

### APPCLEAR<x>, bit [x], for x = 0 to 31

Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Writing to this bit has the following effect:

0 No effect.

1 Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use [CTIAPPULSE](#).

### Accessing the CTIAPPCLEAR:

CTIAPPCLEAR can be accessed through the external debug interface:

Component	Offset
CTI	0x018

### H9.3.3 CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

#### Purpose

Causes event pulses to be generated on ECT channels.

#### Usage constraints

This register is accessible as follows:

SLK	Default
RO	WO

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

#### Configurations

CTIAPPPULSE is in the Debug power domain.

#### Attributes

CTIAPPPULSE is a 32-bit register.

#### Field descriptions

The CTIAPPPULSE bit assignments are:

#### APPULSE<x>, bit [x], for x = 0 to 31

Generate event pulse on ECT channel <x>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Writing to this bit has the following effect:

- |   |                                    |
|---|------------------------------------|
| 0 | No effect.                         |
| 1 | Channel <x> event pulse generated. |

#### Note

- The CTIAPPPULSE operation does not affect the state of the Application Trigger register, CTIAPPTRIG. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

#### Accessing the CTIAPPPULSE:

CTIAPPPULSE can be accessed through the external debug interface:

Component	Offset
CTI	0x01C

**H9.3.4 CTIAPPSET, CTI Application Trigger Set register**

The CTIAPPSET characteristics are:

**Purpose**

Sets bits of the Application Trigger register.

**Usage constraints**

This register is accessible as follows:

SLK	Default
RO	RW

**Configurations**

CTIAPPSET is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

**Attributes**

CTIAPPSET is a 32-bit register.

**Field descriptions**

The CTIAPPSET bit assignments are:

**APPSET<x>, bit [x], for x = 0 to 31**

Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

- 0 Reading this means the application trigger is inactive. Writing this has no effect.
- 1 Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use [CTIAPPULSE](#).

This field resets to a value that is architecturally UNKNOWN.

**Accessing the CTIAPPSET:**

CTIAPPSET can be accessed through the external debug interface:

Component	Offset
CTI	0x014

### H9.3.5 CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

#### Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

#### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RO

#### Configurations

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance.

#### Attributes

CTIAUTHSTATUS is a 32-bit register.

#### Field descriptions

The CTIAUTHSTATUS bit assignments are:

#### Bits [31:8]

Reserved, RES0.

#### Bits [7:4]

Reserved, RAZ.

#### NSNID, bits [3:2]

If EL3 is not implemented and the implemented Security state is Secure state, holds the same value as [DBGAUTHSTATUS\\_EL1.SNID](#).

Otherwise, holds the same value as [DBGAUTHSTATUS\\_EL1.NSNID](#).

#### NSID, bits [1:0]

If EL3 is not implemented and the implemented Security state is Secure state, holds the same value as [DBGAUTHSTATUS\\_EL1.SID](#).

Otherwise, holds the same value as [DBGAUTHSTATUS\\_EL1.NSID](#).

### Accessing the CTIAUTHSTATUS:

CTIAUTHSTATUS can be accessed through the external debug interface:

Component	Offset
CTI	0xFB8

### H9.3.6 CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

**Purpose**

Provides the raw status of the ECT channel inputs to the CTI.

**Usage constraints**

This register is accessible as follows:

SLK	Default
RO	RO

**Configurations**

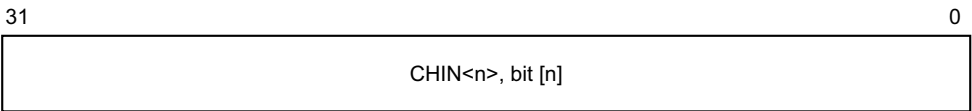

CTICHINSTATUS is in the Debug power domain.

**Attributes**

CTICHINSTATUS is a 32-bit register.

**Field descriptions**

The CTICHINSTATUS bit assignments are:

**CHIN<n>, bit [n], for n = 0 to 31**

Input channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

- 0 Input channel <n> is inactive.
- 1 Input channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

**Accessing the CTICHINSTATUS:**

CTICHINSTATUS can be accessed through the external debug interface:

Component	Offset
CTI	0x138

### H9.3.7 CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

#### Purpose

Provides the status of the ECT channel outputs from the CTI.

#### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RO

#### Configurations

CTICHOUTSTATUS is in the Debug power domain.

#### Attributes

CTICHOUTSTATUS is a 32-bit register.

#### Field descriptions

The CTICHOUTSTATUS bit assignments are:

#### CHOUT<n>, bit [n], for n = 0 to 31

Output channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

0 Output channel <n> is inactive.

1 Output channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

#### Note

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see [CTIGATE](#).

#### Accessing the CTICHOUTSTATUS:

CTICHOUTSTATUS can be accessed through the external debug interface:

Component	Offset
CTI	0x13C

### H9.3.8 CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.  
For more information see [About the Component Identification scheme on page K2-6149](#).

**Usage constraints**

This register is accessible as follows:

SLK	Default
RO	RO

**Configurations**

CTICIDR0 is in the Debug power domain.  
Implementation of this register is OPTIONAL.  
This register is required for CoreSight compliance.

**Attributes**

CTICIDR0 is a 32-bit register.

**Field descriptions**

The CTICIDR0 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PRMBL\_0, bits [7:0]**

Preamble. Must read as 0x0D.

**Accessing the CTICIDR0:**

CTICIDR0 can be accessed through the external debug interface:

Component	Offset
CTI	0xFF0

## H9.3.9 CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

### Purpose

Provides information to identify a CTI component.

For more information see [About the Component Identification scheme on page K2-6149](#).

### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RO

### Configurations

CTICIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

### Attributes

CTICIDR1 is a 32-bit register.

### Field descriptions

The CTICIDR1 bit assignments are:

31	8	7	4	3	0
RES0					
			CLASS		PRMBL_1

#### Bits [31:8]

Reserved, RES0.

#### CLASS, bits [7:4]

Component class. Reads as 0x9, debug component.

#### PRMBL\_1, bits [3:0]

Preamble. RAZ.

### Accessing the CTICIDR1:

CTICIDR1 can be accessed through the external debug interface:

Component	Offset
CTI	0xFF4

### H9.3.10 CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

**Purpose**

Provides information to identify a CTI component.  
For more information see [About the Component Identification scheme on page K2-6149](#).

**Usage constraints**

This register is accessible as follows:

SLK	Default
RO	RO

**Configurations**

CTICIDR2 is in the Debug power domain.  
Implementation of this register is OPTIONAL.  
This register is required for CoreSight compliance.

**Attributes**

CTICIDR2 is a 32-bit register.

**Field descriptions**

The CTICIDR2 bit assignments are:

**Bits [31:8]**

Reserved, RES0.

**PRMBL\_2, bits [7:0]**

Preamble. Must read as 0x05.

**Accessing the CTICIDR2:**

CTICIDR2 can be accessed through the external debug interface:

Component	Offset
CTI	0xFF8

### H9.3.11 CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

#### Purpose

Provides information to identify a CTI component.

For more information see [About the Component Identification scheme on page K2-6149](#).

#### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RO

#### Configurations

CTICIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

#### Attributes

CTICIDR3 is a 32-bit register.

#### Field descriptions

The CTICIDR3 bit assignments are:

#### Bits [31:8]

Reserved, RES0.

#### PRMBL\_3, bits [7:0]

Preamble. Must read as 0xB1.

#### Accessing the CTICIDR3:

CTICIDR3 can be accessed through the external debug interface:

Component	Offset
CTI	0xFFC

### H9.3.12 CTICLAIMCLR, CTI Claim Tag Clear register

The CTICLAIMCLR characteristics are:

#### Purpose

Used by software to read the values of the CLAIM bits, and to clear these bits to 0.

#### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RW

#### Configurations

CTICLAIMCLR is in the Debug power domain.

See the CLAIM field description for the effect of an External debug reset on the value returned by this register. This register is not affected by a Warm reset, and is not affected by a Cold reset.

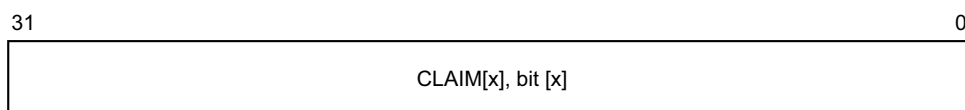

Implementation of this register is OPTIONAL.

#### Attributes

CTICLAIMCLR is a 32-bit register.

#### Field descriptions

The CTICLAIMCLR bit assignments are:

#### CLAIM[x], bit [x], for x = 0 to 31

CLAIM tag clear bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, reads return the value of CLAIM[x] and the behavior on writes is:

0 No action.

1 Indirectly clear CLAIM[x] to 0.

A single write to CTICLAIMCLR can clear multiple tags to 0.

An External Debug reset clears the CLAIM tag bits to 0.

#### Accessing the CTICLAIMCLR:

CTICLAIMCLR can be accessed through the external debug interface:

Component	Offset
CTI	0xFA4

**H9.3.13 CTICLAIMSET, CTI Claim Tag Set register**

The CTICLAIMSET characteristics are:

**Purpose**

Used by software to set CLAIM bits to 1.

**Usage constraints**

This register is accessible as follows:

SLK	Default
RO	RW

**Configurations**

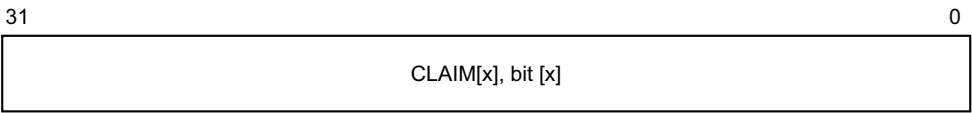

CTICLAIMSET is in the Debug power domain.  
Implementation of this register is OPTIONAL.

**Attributes**

CTICLAIMSET is a 32-bit register.

**Field descriptions**

The CTICLAIMSET bit assignments are:

**CLAIM[x], bit [x], for x = 0 to 31**

CLAIM tag set bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, the bit is RAO and the behavior on writes is:

0 No action.

1 Indirectly set CLAIM[x] tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

An External Debug reset clears the CLAIM tag bits to 0.

**Accessing the CTICLAIMSET:**

CTICLAIMSET can be accessed through the external debug interface:

Component	Offset
CTI	0xFA0

### H9.3.14 CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

#### Purpose

Controls whether the CTI is enabled.

#### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RW

#### Configurations

CTICONTROL is in the Debug power domain. Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

#### Attributes

CTICONTROL is a 32-bit register.

#### Field descriptions

The CTICONTROL bit assignments are:

#### Bits [31:1]

Reserved, RES0.

#### GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

0 CTI mapping functions disabled.

1 CTI mapping functions enabled.

When the mapping functions are disabled, no new events are signaled on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it remains asserted after the mapping functions are disabled. All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the CTICONTROL:

CTICONTROL can be accessed through the external debug interface:

Component	Offset
CTI	0x000

**H9.3.15 CTIDEVAFF0, CTI Device Affinity register 0**

The CTIDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE [MPIDR\\_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

**Usage constraints**

This register is accessible as follows:

SLK	Default
RO	RO

**Configurations**

CTIDEVAFF0 is in the Debug power domain.  
Implementation of this register is OPTIONAL.

**Attributes**

CTIDEVAFF0 is a 32-bit register.

**Field descriptions**

The CTIDEVAFF0 bit assignments are:

**Bits [31:0]**

[MPIDR\\_EL1](#) low half. Read-only copy of the low half of [MPIDR\\_EL1](#), as seen from the highest implemented Exception level.

**Accessing the CTIDEVAFF0:**

CTIDEVAFF0 can be accessed through the external debug interface:

Component	Offset
CTI	0xFA8

### H9.3.16 CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

#### Purpose

Copy of the high half of the PE [MPIDR\\_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

#### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RO

#### Configurations

CTIDEVAFF1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

#### Attributes

CTIDEVAFF1 is a 32-bit register.

#### Field descriptions

The CTIDEVAFF1 bit assignments are:

#### Bits [31:0]

[MPIDR\\_EL1](#) high half. Read-only copy of the high half of [MPIDR\\_EL1](#), as seen from the highest implemented Exception level.

#### Accessing the CTIDEVAFF1:

CTIDEVAFF1 can be accessed through the external debug interface:

Component	Offset
CTI	0xFAC

H9.3.17 CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the CTI component.

Usage constraints

This register is accessible as follows:

SLK	Default
RO	RO

Configurations

CTIDEVARCH is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions

The CTIDEVARCH bit assignments are:

ARCHITECT, bits [31:21]

Defines the architecture of the component. For CTI, this is ARM Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in ARMv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For CTI, the revision defined by ARMv8 is 0x0.

All other values are reserved.

ARCHID, bits [15:0]

Defines this part to be an ARMv8 debug component. For architectures defined by ARM this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.

### Accessing the CTIDEVARCH:

CTIDEVARCH can be accessed through the external debug interface:

Component	Offset
CTI	0xFBC

### H9.3.18 CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

**Purpose**

Describes the CTI component to the debugger.

**Usage constraints**

This register is accessible as follows:

SLK	Default
RO	RO

**Configurations**

CTIDEVID is in the Debug power domain.

**Attributes**

CTIDEVID is a 32-bit register.

**Field descriptions**

The CTIDEVID bit assignments are:

**Bits [31:26]**

Reserved, RES0.

**INOUT, bits [25:24]**

Input/output options. Indicates presence of the input gate. If the CTM is not implemented, this field is RAZ.

00 **CTIGATE** does not mask propagation of input events from external channels.

01 **CTIGATE** masks propagation of input events from external channels.

All other values are reserved.

**Bits [23:22]**

Reserved, RES0.

**NUMCHAN, bits [21:16]**

Number of ECT channels implemented. IMPLEMENTATION DEFINED. For ARMv8, valid values are:

000011 3 channels (0..2) implemented.

000100 4 channels (0..3) implemented.

000101 5 channels (0..4) implemented.

000110 6 channels (0..5) implemented.

and so on up to 100000, 32 channels (0..31) implemented.

All other values are reserved.

#### Bits [15:14]

Reserved, RES0.

#### NUMTRIG, bits [13:8]

Number of triggers implemented. IMPLEMENTATION DEFINED. This is one more than the index of the largest trigger, rather than the actual number of triggers.

For ARMv8, valid values are:

000011 Up to 3 triggers (0..2) implemented.

001000 Up to 8 triggers (0..7) implemented.

001001 Up to 9 triggers (0..8) implemented.

001010 Up to 10 triggers (0..9) implemented.

and so on up to 100000, 32 triggers (0..31) implemented.

All other values are reserved. If the contains a Trace extension, this field must be at least 0b001000. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

#### Bits [7:5]

Reserved, RES0.

#### EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, [ASICCTL](#).

### Accessing the CTIDEVID:

CTIDEVID can be accessed through the external debug interface:

Component	Offset
CTI	0xFC8

### H9.3.19 CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

#### Purpose

Reserved for future information about the CTI component to the debugger.

#### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RO

#### Configurations

CTIDEVID1 is in the Debug power domain.

#### Attributes

CTIDEVID1 is a 32-bit register.

#### Field descriptions

The CTIDEVID1 bit assignments are:

#### Bits [31:0]

Reserved, RES0.

#### Accessing the CTIDEVID1:

CTIDEVID1 can be accessed through the external debug interface:

Component	Offset
CTI	0xFC4

### H9.3.20 CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

#### Purpose

Reserved for future information about the CTI component to the debugger.

#### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RO

#### Configurations

CTIDEVID2 is in the Debug power domain.

#### Attributes

CTIDEVID2 is a 32-bit register.

#### Field descriptions

The CTIDEVID2 bit assignments are:

#### Bits [31:0]

Reserved, RES0.

#### Accessing the CTIDEVID2:

CTIDEVID2 can be accessed through the external debug interface:

Component	Offset
CTI	0xFC0

### H9.3.21 CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

#### Purpose

Indicates to a debugger that this component is part of a PE's cross-trigger interface.

#### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RO

#### Configurations

CTIDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

#### Attributes

CTIDEVTYPE is a 32-bit register.

#### Field descriptions

The CTIDEVTYPE bit assignments are:

31	8	7	4	3	0
RES0				SUB	MAJOR

#### Bits [31:8]

Reserved, RES0.

#### SUB, bits [7:4]

Subtype. Must read as 0x1 to indicate this is a component within a PE.

#### MAJOR, bits [3:0]

Major type. Must read as 0x4 to indicate this is a cross-trigger component.

#### Accessing the CTIDEVTYPE:

CTIDEVTYPE can be accessed through the external debug interface:

Component	Offset
CTI	0xFCC

## H9.3.22 CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

### Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RW

### Configurations

CTIGATE is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

### Attributes

CTIGATE is a 32-bit register.

### Field descriptions

The CTIGATE bit assignments are:

#### GATE<x>, bit [x], for x = 0 to 31

Channel <x> gate enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

- 0 Disable output and, if [CTIDEVID.INOUT](#) == 0b01, input channel <x> propagation.
- 1 Enable output and, if [CTIDEVID.INOUT](#) == 0b01, input channel <x> propagation.

If GATE[x] is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

This field resets to a value that is architecturally UNKNOWN.

### Accessing the CTIGATE:

CTIGATE can be accessed through the external debug interface:

Component	Offset
CTI	0x140

### H9.3.23 CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

#### Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

#### Usage constraints

This register is accessible as follows:

SLK	Default
RO	RW

#### Configurations

CTIINEN<n> is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.

If input trigger n is not connected, the behavior of CTIINEN<n> is IMPLEMENTATION DEFINED.

#### Attributes

CTIINEN<n> is a 32-bit register.

#### Field descriptions

The CTIINEN<n> bit assignments are:

#### INEN<x>, bit [x], for x = 0 to 31

Input trigger <n> to output channel <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

0 Input trigger <n> will not generate an event on output channel <x>.

1 Input trigger <n> will generate an event on output channel <x>.

This field resets to a value that is architecturally UNKNOWN.

#### Accessing the CTIINEN<n>:

CTIINEN<n> can be accessed through the external debug interface:

Component	Offset
CTI	0x020 + 4n

**H9.3.24 CTIINTACK, CTI Output Trigger Acknowledge register**

The CTIINTACK characteristics are:

**Purpose**

Can be used to deactivate the output triggers.

**Usage constraints**

This register is accessible as follows:

SLK	Default
RO	WO

A debugger must read [CTITRIGOUTSTATUS](#) to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPPULSE to activate another trigger.

**Configurations**

CTIINTACK is in the Debug power domain.

**Attributes**

CTIINTACK is a 32-bit register.

**Field descriptions**

The CTIINTACK bit assignments are:

**ACK<n>, bit [n], for n = 0 to 31**

Acknowledge for output trigger <n>.

Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the [CTIDEVID.NUMTRIG](#) field.

If any of the following is true, writes to ACK<n> are ignored:

- n >= [CTIDEVID.NUMTRIG](#), the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by [CTIOUTEN<n>](#), is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<n> are ignored:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

- |   |                         |
|---|-------------------------|
| 0 | No effect               |
| 1 | Deactivate the trigger. |

### Accessing the CTIINTACK:

CTIINTACK can be accessed through the external debug interface:

Component	Offset
CTI	0x010

### H9.3.25 CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

#### Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

#### Usage constraints

This register is accessible as follows:

Default
RW

#### Configurations

It is IMPLEMENTATION DEFINED whether CTIITCTRL is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Implementation of this register is OPTIONAL.

#### Attributes

CTIITCTRL is a 32-bit register.

#### Field descriptions

The CTIITCTRL bit assignments are:

#### Bits [31:1]

Reserved, RES0.

#### IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

0 Normal operation.

1 Integration mode enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the CTIITCTRL:

CTIITCTRL can be accessed through the external debug interface:

Component	Offset
CTI	0xF00

### H9.3.26 CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

#### Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

#### Usage constraints

This register is accessible as follows:

Default
WO

#### Configurations

CTILAR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software Lock can be implemented as part of CoreSight compliance.

CTILAR ignores writes if the Software lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses CTILAR to set or clear the lock, and [CTILSR](#) to check the current status of the lock.

#### Attributes

CTILAR is a 32-bit register.

#### Field descriptions
