MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
HPFAR_EL2	11	100	0110	0000	100

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## D7.2.36 HSTR\_EL2, Hypervisor System Trap Register

The HSTR\_EL2 characteristics are:

### Purpose

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower in AArch32, to the System register in the coproc == 1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

### Configurations

AArch64 System register HSTR\_EL2 is architecturally mapped to AArch32 System register [HSTR](#).

If EL2 is not implemented, this register is RES0 from EL3.

If no Exception level can use AArch32, then this register is RES0

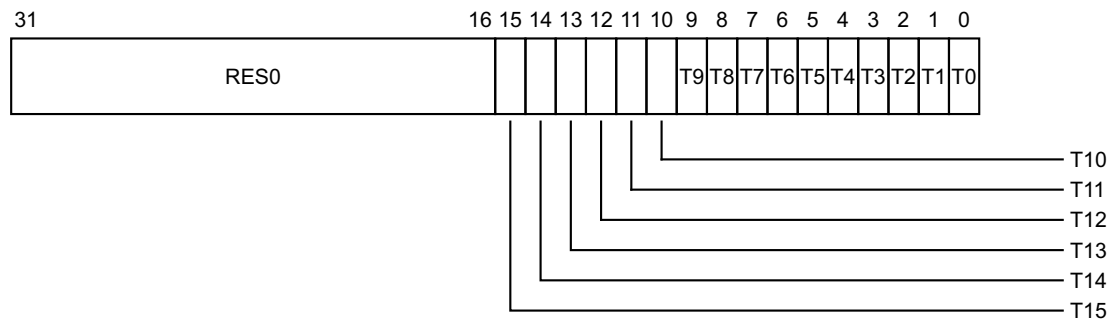

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

HSTR\_EL2 is a 32-bit register.

### Field descriptions

The HSTR\_EL2 bit assignments are:

### Bits [31:16]

Reserved, RES0.

### T<n>, bit [n], for n = 0 to 15

Fields T14 and T4 are RES0.

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 1111 encoding space are trapped to Hyp mode:

- 0 This control has no effect on Non-secure EL0 or EL1 accesses to System registers.
- 1 Any Non-secure EL1 MCR, MRC access with coproc == 1111 and CRn == <n> is trapped to Hyp mode if the access is not UNDEFINED when the value of this field is 0.  
Any Non-secure EL1 MCRR, MRRC access with coproc == 1111 and CRm == <n> is trapped to Hyp mode if the access is not UNDEFINED when the value of this field is 0.

For example, when HSTR\_EL2.T7 is 1:

- Any 32-bit access from a Non-secure EL1 mode, using an MCR or MRC instruction with coproc set to 1111 and <CRn> set to c7, and that is not UNDEFINED when HSTR\_EL2.T7 is 0, is trapped to Hyp mode.

- Any 64-bit access from a Non-secure EL1 mode, using an MCRR or MRRC instruction with coproc set to 1111 and <CRm> set to c7, and that is not UNDEFINED when HSTR\_EL2.T7 is 0, is trapped to Hyp mode.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

## Accessing the HSTR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
HSTR_EL2	11	100	0001	0001	011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
0	0	1	-	-	RW	RW
0	1	1	-	n/a	RW	RW
1	0	1	-	-	RW	RW
1	1	1	-	n/a	RW	RW

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AA64AFR0_EL1	11	000	0000	0101	100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.38 ID\_AA64AFR1\_EL1, AArch64 Auxiliary Feature Register 1

The ID\_AA64AFR1\_EL1 characteristics are:

### Purpose

Reserved for future expansion of information about the IMPLEMENTATION DEFINED features of the PE in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

There are no configuration notes.

### Attributes

ID\_AA64AFR1\_EL1 is a 64-bit register.

### Field descriptions

The ID\_AA64AFR1\_EL1 bit assignments are:

### Bits [63:0]

Reserved, RES0.

### Accessing the ID\_AA64AFR1\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AA64AFR1_EL1	11	000	0000	0101	101

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.39 ID\_AA64DFR0\_EL1, AArch64 Debug Feature Register 0

The ID\_AA64DFR0\_EL1 characteristics are:

### Purpose

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

The external register [EDDFR](#) gives information from this register.

### Attributes

ID\_AA64DFR0\_EL1 is a 64-bit register.

### Field descriptions

The ID\_AA64DFR0\_EL1 bit assignments are:

#### Bits [63:36]

Reserved, RES0.

#### PMSVer, bits [35:32]

##### *In ARMv8.2*

Statistical Profiling Extension version. When the Statistical Profiling Extension is implemented, the defined values of this field are:

0000 No Statistical Profiling extension.

0001 Version 1 of the Statistical Profiling extension present.

All other values are reserved.

When the Statistical Profiling Extension is not implemented this field is reserved, RES0.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### CTX\_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

#### Bits [27:24]

Reserved, RES0.

#### WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

#### Bits [19:16]

Reserved, RES0.

#### BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

### PMUVer, bits [11:8]

Performance Monitors Extension version. Indicates whether System register interface to Performance Monitors extension is implemented. Defined values are:

0000	Performance Monitors Extension System registers not implemented.
0001	Performance Monitors Extension System registers implemented, PMUv3.
0100	Performance Monitors Extension System registers implemented, PMUv3, with a 16-bit evtCount field, and if EL2 is implemented, the addition of the MDCR_EL2.HPMD bit.
1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported.

All other values are reserved.

In ARMv8.0 the permitted values are 0b0000, 0b0001 and 0b1111.

From ARMv8.1 the permitted values are 0b0000, 0b0100 and 0b1111.

### TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a trace macrocell is implemented. Defined values are:

0000	Trace macrocell System registers not implemented.
0001	Trace macrocell System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a trace macrocell is implemented. A trace macrocell might nevertheless be implemented without a System register interface.

### DebugVer, bits [3:0]

Debug architecture version. Indicates presence of ARMv8 debug architecture.

0110	ARMv8 debug architecture.
0111	ARMv8 debug architecture with Virtualization Host Extensions.
1000	ARMv8.2 debug architecture

All other values are reserved.

In an ARMv8.0 implementation, the only permitted value is 0b0110.

In an ARMv8.1 implementation that includes ARMv8.1-VHE, the only permitted value is 0b0111.

In an ARMv8.1 implementation that does not include ARMv8.1-VHE, the permitted values are 0b0110 and 0b0111.

In an ARMv8.2 implementation, the only permitted value is 0b1000.

## Accessing the ID\_AA64DFR0\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AA64DFR0_EL1	11	000	0000	0101	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

### D7.2.40 ID\_AA64DFR1\_EL1, AArch64 Debug Feature Register 1

The ID\_AA64DFR1\_EL1 characteristics are:

#### Purpose

Reserved for future expansion of top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

#### Configurations

There are no configuration notes.

#### Attributes

ID\_AA64DFR1\_EL1 is a 64-bit register.

#### Field descriptions

The ID\_AA64DFR1\_EL1 bit assignments are:

#### Bits [63:0]

Reserved, RES0.

#### Accessing the ID\_AA64DFR1\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AA64DFR1_EL1	11	000	0000	0101	001

#### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.41 ID\_AA64ISAR0\_EL1, AArch64 Instruction Set Attribute Register 0

The ID\_AA64ISAR0\_EL1 characteristics are:

### Purpose

Provides information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

### Configurations

There are no configuration notes.

### Attributes

ID\_AA64ISAR0\_EL1 is a 64-bit register.

### Field descriptions

The ID\_AA64ISAR0\_EL1 bit assignments are:

#### Bits [63:32]

Reserved, RES0.

#### RDM, bits [31:28]

##### *In ARMv8.2 and ARMv8.1*

SQRDMLAH and SQRDMLSH instructions implemented in AArch64 state. Defined values are:

0000 No SQRDMLAH and SQRDMLSH instructions implemented.

0001 SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.

In ARMv8.0 the only permitted value is 0000.

From ARMv8.1 the only permitted value is 0001. This feature is identified by the name [ARMv8.1-SIMD](#).

##### *In ARMv8.0.*

Reserved, RES0.

#### Bits [27:24]

Reserved, RES0.

#### Atomic, bits [23:20]

##### *In ARMv8.2 and ARMv8.1*

Atomic instructions implemented in AArch64 state. Defined values are:

0000 No Atomic instructions implemented.

0010 LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.

All other values are reserved.

In ARMv8.0 the only permitted value is 0000.

From ARMv8.1 the only permitted value is 0010. This feature is identified by the name [ARMv8.1-Atomics](#).

**In ARMv8.0.**

Reserved, RES0.

**CRC32, bits [19:16]**

CRC32 instructions implemented in AArch64 state. Defined values are:

0000 No CRC32 instructions implemented.

0001 CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.

All other values are reserved.

In ARMv8.0 the permitted values are 0000 and 0001.

From ARMv8.1 the only permitted value is 0001.

**SHA2, bits [15:12]**

SHA2 instructions implemented in AArch64 state. Defined values are:

0000 No SHA2 instructions implemented.

0001 SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 instructions implemented.

All other values are reserved.

**SHA1, bits [11:8]**

SHA1 instructions implemented in AArch64 state. Defined values are:

0000 No SHA1 instructions implemented.

0001 SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.

All other values are reserved.

**AES, bits [7:4]**

AES instructions implemented in AArch64 state. Defined values are:

0000 No AES instructions implemented.

0001 AESE, AESD, AESMC, and AESIMC instructions implemented.

0010 As for 0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

All other values are reserved.

**Bits [3:0]**

Reserved, RES0.

**Accessing the ID\_AA64ISAR0\_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AA64ISAR0_EL1	11	000	0000	0110	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.42 ID\_AA64ISAR1\_EL1, AArch64 Instruction Set Attribute Register 1

The ID\_AA64ISAR1\_EL1 characteristics are:

### Purpose

Reserved for future expansion of the information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

There are no configuration notes.

### Attributes

ID\_AA64ISAR1\_EL1 is a 64-bit register.

### Field descriptions

The ID\_AA64ISAR1\_EL1 bit assignments are:

#### Bits [63:4]

Reserved, RES0.

#### DPB, bits [3:0]

##### *In ARMv8.2*

Indicates support for the [DC CVAP](#) instruction in AArch64 state. Defined values are:

0000 [DC CVAP](#) not supported.

0001 [DC CVAP](#) supported.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the only permitted value is 0000.

From ARMv8.2 the only permitted value is 0001. This feature is identified by the name [ARMv8.2-DCPoP](#).

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

### Accessing the ID\_AA64ISAR1\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AA64ISAR1_EL1	11	000	0000	0110	001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.43 ID\_AA64MMFR0\_EL1, AArch64 Memory Model Feature Register 0

The ID\_AA64MMFR0\_EL1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

There are no configuration notes.

### Attributes

ID\_AA64MMFR0\_EL1 is a 64-bit register.

### Field descriptions

The ID\_AA64MMFR0\_EL1 bit assignments are:

#### Bits [63:32]

Reserved, RES0.

#### TGran4, bits [31:28]

Support for 4KB memory translation granule size. Defined values are:

0000 4KB granule supported.

1111 4KB granule not supported.

All other values are reserved.

#### TGran64, bits [27:24]

Support for 64KB memory translation granule size. Defined values are:

0000 64KB granule supported.

1111 64KB granule not supported.

All other values are reserved.

#### TGran16, bits [23:20]

Support for 16KB memory translation granule size. Defined values are:

0000 16KB granule not supported.

0001 16KB granule supported.

All other values are reserved.

#### BigEndEL0, bits [19:16]

Mixed-endian support at EL0 only. Defined values are:

0000 No mixed-endian support at EL0. The [SCTLR\\_EL1.E0E](#) bit has a fixed value.

0001 Mixed-endian support at EL0. The [SCTLR\\_EL1.E0E](#) bit can be configured.

All other values are reserved.

This field is invalid and is RES0 if the BigEnd field, bits [11:8], is not 0000.

#### SNSMem, bits [15:12]

Secure versus Non-secure Memory distinction. Defined values are:

- 0000 Does not support a distinction between Secure and Non-secure Memory.
  - 0001 Does support a distinction between Secure and Non-secure Memory.
- All other values are reserved.

#### BigEnd, bits [11:8]

Mixed-endian configuration support. Defined values are:

- 0000 No mixed-endian support. The [SCTLR\\_ELx.EE](#) bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.
- 0001 Mixed-endian support. The [SCTLR\\_ELx.EE](#) and [SCTLR\\_EL1.E0E](#) bits can be configured.

All other values are reserved.

#### ASIDBits, bits [7:4]

Number of ASID bits. Defined values are:

- 0000 8 bits.
- 0010 16 bits.

All other values are reserved.

#### PARange, bits [3:0]

Physical Address range supported. Defined values are:

- 0000 32 bits, 4GB.
- 0001 36 bits, 64GB.
- 0010 40 bits, 1TB.
- 0011 42 bits, 4TB.
- 0100 44 bits, 16TB.
- 0101 48 bits, 256TB.
- 0110 52 bits, 4PB.

All other values are reserved.

In all ARMv8 implementations, the values 0000, 0001, 0010, 0011, 0100 and 0101 are permitted.

From ARMv8.1, the value 0110 is permitted and indicates that [ARMv8.2-LPA](#) is implemented.

### Accessing the ID\_AA64MMFR0\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AA64MMFR0_EL1	11	000	0000	0111	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

#### D7.2.44 ID\_AA64MMFR1\_EL1, AArch64 Memory Model Feature Register 1

The ID\_AA64MMFR1\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D7-2195.

## Configurations

There are no configuration notes.

### Attributes

ID\_AA64MMFR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64MMFR1\_EL1 bit assignments are:

**Bits [63:32]**

Reserved, RES0.

**XNX, bits [31:28]**

*In ARMv8.2*

Indicates support for Execute Never control distinction at stage 2 bit. Defined values are:

0000	Distinction between EL0 and EL1 execute permission at stage 2 not supported.
------	--

0001	Distinction between EL0 and EL1 execute permission at stage 2 supported.
------	--

All other values are reserved.

In ARMv8.0 and ARMv8.1, the only permitted value is 0000.

From ARMv8.2, the only permitted value is 0001. This feature is identified by the name [ARMv8.2-TTS2UXN](#).

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

**SpecSEI, bits [27:24]**

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

0000 The PE never generates an SError interrupt due to an external abort on a speculative read.

0001 The PE might generate an SError interrupt due to an external abort on a speculative read.

All other values are reserved.

When the RAS Extension is not implemented, this field is RAZ.

**PAN, bits [23:20]**

*In ARMv8.2 and ARMv8.1*

Privileged Access Never. Indicates support for the PAN bit in PSTATE, [SPSR\\_EL1](#), [SPSR\\_EL2](#), [SPSR\\_EL3](#), and [DPSR\\_EL0](#). Defined values are:

- 0000 PAN not supported.
- 0001 PAN supported.
- 0010 PAN supported and AT S1E1RP and AT S1E1WP instructions supported.

All other values are reserved.

In ARMv8.0 the only permitted value is 0000.

In ARMv8.1 the only permitted value is 0001. This feature is identified by the name [ARMv8.1-PAN](#).

From ARMv8.2, the only permitted value is 0010. This feature is identified by the name [ARMv8.2-ATS1E1](#).

***In ARMv8.0.***

Reserved, RES0.

**LO, bits [19:16]**

***In ARMv8.2 and ARMv8.1***

LORegions. Indicates support for LORegions. Defined values are:

- 0000 LORegions not supported.
- 0001 LORegions supported.

All other values are reserved.

In ARMv8.0 the only permitted value is 0000.

From ARMv8.1, the only permitted value is 0001. This feature is identified by the name [ARMv8.1-LOR](#).

***In ARMv8.0.***

Reserved, RES0.

**HPDS, bits [15:12]**

***In ARMv8.2 and ARMv8.1***

Hierarchical permission disables bits in translation tables. Defined values are:

- 0000 Disabling of hierarchical controls not supported.
- 0001 Disabling of hierarchical controls supported using [TCR\\_EL1](#).HPD0, [TCR\\_EL1](#).HPD1, [TCR\\_EL2](#).HPD, and [TCR\\_EL3](#).HPD bits.
- 0010 Disabling of hierarchical controls supported using the [TCR\\_EL1](#).HPD0, [TCR\\_EL1](#).HPD1, [TCR\\_EL2](#).HPD, and [TCR\\_EL3](#).HPD bits, and hardware allocation of bits[62:59] of the last level page table descriptor for IMPLEMENTATION DEFINED use.

All other values are reserved.

In ARMv8.0 the only permitted value is 0000.

In ARMv8.1 the only permitted value is 0001. This feature is identified by the name [ARMv8.1-HPD](#).

From ARMv8.2, the permitted values are 0001 and 0010. This feature is identified by the name [ARMv8.2-TTPBHA](#).

***In ARMv8.0.***

Reserved, RES0.

**VH, bits [11:8]**

***In ARMv8.2 and ARMv8.1***

Virtualization Host Extensions. Defined values are:

- 0000 Virtualization Host Extensions not supported.
- 0001 Virtualization Host Extensions supported.

All other values are reserved.

In ARMv8.0 the only permitted value is 0000.

From ARMv8.1, the only permitted value is 0001. This feature is identified by the name [ARMv8.1-VHE](#).

***In ARMv8.0.***

Reserved, RES0.

**VMIDBits, bits [7:4]**

***In ARMv8.2 and ARMv8.1***

Number of VMID bits. Defined values are:

0000 8 bits

0010 16 bits

All other values are reserved.

In ARMv8.0 the only permitted value is 0000.

From ARMv8.1, the permitted values are 0000 and 0010.

***In ARMv8.0.***

Reserved, RES0.

**HAFDBS, bits [3:0]**

***In ARMv8.2 and ARMv8.1***

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

0000 No hardware update of the Access flag and dirty state is supported in hardware.

0001 Hardware update of the Access flag is supported in hardware.

0010 Hardware update of both the Access flag and dirty state is supported in hardware.

All other values are reserved.

***In ARMv8.0.***

Reserved, RES0.

**Accessing the ID\_AA64MMFR1\_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AA64MMFR1_EL1	11	000	0000	0111	001

**Accessibility**

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.45 ID\_AA64MMFR2\_EL1, AArch64 Memory Model Feature Register 2

The ID\_AA64MMFR2\_EL1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

### Configurations

This register is introduced in ARMv8.2.

### Attributes

ID\_AA64MMFR2\_EL1 is a 64-bit register.

### Field descriptions

The ID\_AA64MMFR2\_EL1 bit assignments are:

#### Bits [63:20]

Reserved, RES0.

#### VARange, bits [19:16]

Indicates support for a larger virtual address. Defined values are:

0000 48 bits of VA for each translation table page register are supported.

0001 52 bits of VA for each translation table page register are supported.

All other values are reserved.

From ARMv8.2, the permitted values are 0000 and 0001. This feature is identified by the name [ARMv8.2-LVA](#).

#### IESB, bits [15:12]

Indicates whether the implicit Error Synchronization Barrier operations are implemented. Defined values are:

0000 [SCTLR\\_ELx](#).IESB implicit ErrorSynchronizationBarrier control not implemented.

0001 [SCTLR\\_ELx](#).IESB implicit ErrorSynchronizationBarrier control implemented.

All other values are reserved.

#### LSM, bits [11:8]

Indicates support for LSMAOE and nTLSMD bits in [SCTLR\\_EL1](#) and [SCTLR\\_EL2](#). Defined values are:

0000 LSMAOE and nTLSMD bits not supported.

0001 LSMAOE and nTLSMD bits supported.

All other values are reserved.

From ARMv8.2, the permitted values are 0000 and 0001. This feature is identified by the name [ARMv8.2-LSMAOC](#).

### UAO, bits [7:4]

User Access Override. Defined values are:

0000 UAO not supported.

0001 UAO supported.

All other values are reserved.

From ARMv8.2, the only permitted value is 0001. This feature is identified by the name [ARMv8.2-UAO](#).

### CnP, bits [3:0]

Common not Private translations. Defined values are:

0000 Common not Private translations not supported.

0001 Common not Private translations supported.

All other values are reserved.

From ARMv8.2, the only permitted value is 0001. This feature is identified by the name [ARMv8.2-TTCNP](#).

## Accessing the ID\_AA64MMFR2\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AA64MMFR2_EL1	11	000	0000	0111	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.46 ID\_AA64PFR0\_EL1, AArch64 Processor Feature Register 0

The ID\_AA64PFR0\_EL1 characteristics are:

### Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

### Configurations

The external register [EDPFR](#) gives information from this register.

### Attributes

ID\_AA64PFR0\_EL1 is a 64-bit register.

### Field descriptions

The ID\_AA64PFR0\_EL1 bit assignments are:

#### Bits [63:36]

Reserved, RES0.

#### SVE, bits [35:32]

##### *In ARMv8.2*

Scalable Vector Extension. Defined values are:

0000 SVE is not implemented.

0001 SVE is implemented.

All other values are reserved.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### RAS, bits [31:28]

RAS Extension version. The defined values of this field are:

0000 No RAS Extension.

0001 Version 1 of the RAS Extension present.

All other values are reserved.

#### GIC, bits [27:24]

System register GIC interface support. Defined values are:

0000 No System register interface to the GIC is supported.

0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.

All other values are reserved.

### AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

- 0000 Advanced SIMD is implemented, including support for the following SIMD and SIMD operations:
- Integer byte, halfword, word and doubleword element operations.
  - Single-precision and double-precision floating-point arithmetic.
  - Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
- 0001 As for 0000, and also includes support for half-precision floating-point arithmetic.
- 1111 Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0000 in an implementation with Advanced SIMD support, that does not include the [ARMv8.2-FP16](#) extension.
- 0001 in an implementation with Advanced SIMD support, that includes the [ARMv8.2-FP16](#) extension.
- 1111 in an implementation without Advanced SIMD support.

### FP, bits [19:16]

Floating-point. Defined values are:

- 0000 Floating-point is implemented, and includes support for:
- Single-precision and double-precision floating-point types.
  - Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
- 0001 As for 0000, and also includes support for half-precision floating-point arithmetic.
- 1111 Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0000 in an implementation with floating-point support, that does not include the [ARMv8.2-FP16](#) extension.
- 0001 in an implementation with floating-point support, that includes the [ARMv8.2-FP16](#) extension.
- 1111 in an implementation without floating-point support.

### EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

- 0000 EL3 is not implemented.
- 0001 EL3 can be executed in AArch64 state only.
- 0010 EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

### EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

- 0000 EL2 is not implemented.
- 0001 EL2 can be executed in AArch64 state only.
- 0010 EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

#### EL1, bits [7:4]

EL1 Exception level handling. Defined values are:

0001 EL1 can be executed in AArch64 state only.

0010 EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

#### EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

0001 EL0 can be executed in AArch64 state only.

0010 EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

### Accessing the ID\_AA64PFR0\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AA64PFR0_EL1	11	000	0000	0100	000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.47 ID\_AA64PFR1\_EL1, AArch64 Processor Feature Register 1

The ID\_AA64PFR1\_EL1 characteristics are:

### Purpose

Reserved for future expansion of information about implemented PE features in AArch64 state.  
For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

There are no configuration notes.

### Attributes

ID\_AA64PFR1\_EL1 is a 64-bit register.

### Field descriptions

The ID\_AA64PFR1\_EL1 bit assignments are:

### Bits [63:0]

Reserved, RES0.

### Accessing the ID\_AA64PFR1\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AA64PFR1_EL1	11	000	0000	0100	001

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.48 ID\_AFR0\_EL1, AArch32 Auxiliary Feature Register 0

The ID\_AFR0\_EL1 characteristics are:

### Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

AArch64 System register ID\_AFR0\_EL1 is architecturally mapped to AArch32 System register [ID\\_AFR0](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_AFR0\_EL1 is a 32-bit register.

### Field descriptions

The ID\_AFR0\_EL1 bit assignments are:

### Bits [31:16]

Reserved, RES0.

### IMPLEMENTATION DEFINED, bits [15:12]

IMPLEMENTATION DEFINED.

### IMPLEMENTATION DEFINED, bits [11:8]

IMPLEMENTATION DEFINED.

### IMPLEMENTATION DEFINED, bits [7:4]

IMPLEMENTATION DEFINED.

### IMPLEMENTATION DEFINED, bits [3:0]

IMPLEMENTATION DEFINED.

### Accessing the ID\_AFR0\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_AFR0_EL1	11	000	0000	0001	011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.49 ID\_DFR0\_EL1, AArch32 Debug Feature Register 0

The ID\_DFR0\_EL1 characteristics are:

### Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

AArch64 System register ID\_DFR0\_EL1 is architecturally mapped to AArch32 System register [ID\\_DFR0](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_DFR0\_EL1 is a 32-bit register.

### Field descriptions

The ID\_DFR0\_EL1 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
RES0	PerfMon	MProfDbg	MMapTrc	CopTrc	MMapDbg	CopSDBG	CopDbg								

### Bits [31:28]

Reserved, RES0.

### PerfMon, bits [27:24]

Performance Monitors. Support for System registers-based ARM Performance Monitors Extension, using registers in the coproc == 1111 encoding space, for A and R profile processors. Defined values are:

0000	Performance Monitors Extension System registers not implemented.
0001	Support for Performance Monitors Extension version 1 (PMUv1) System registers.
0010	Support for Performance Monitors Extension version 2 (PMUv2) System registers.
0011	Support for Performance Monitors Extension version 3 (PMUv3) System registers.
0100	Support for Performance Monitors Extension version 3 (PMUv3) System registers, with a 16-bit evtCount field.
1111	IMPLEMENTATION DEFINED form of Performance Monitors System registers supported. PMUv3 not supported.

All other values are reserved.

In ARMv8.0 the permitted values are 0000, 0011, and 1111.

From ARMv8.1 the permitted values are 0000, 0100, and 1111.

In ARMv7, the value 0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an ARMv8 implementation.

### MProfDbg, bits [23:20]

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

0000	Not supported.
------	----------------

0001 Support for M profile Debug architecture, with memory-mapped access.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0000.

#### **MMapTrc, bits [19:16]**

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:  
0000 Not supported.  
0001 Support for ARM trace architecture, with memory-mapped access.  
All other values are reserved.  
In ARMv8-A the permitted values are 0000 and 0001.  
In the Trace registers, the ETMIDR gives more information about the implementation.

#### **CopTrc, bits [15:12]**

Support for System registers-based trace model, using registers in the coproc == 1110 encoding space. Defined values are:  
0000 Not supported.  
0001 Support for ARM trace architecture, with System registers access.  
All other values are reserved.  
In ARMv8-A the permitted values are 0000 and 0001.  
In the Trace registers, the ETMIDR gives more information about the implementation.

#### **MMapDbg, bits [11:8]**

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.  
In ARMv8-A this field is RES0.  
The optional memory map defined by ARMv8 is not compatible with ARMv7.

#### **CopSDBG, bits [7:4]**

Support for a System registers-based Secure debug model, using registers in the coproc = 1110 encoding space, for an A profile processor that includes EL3.  
If EL3 is not implemented and the implemented Security state is Non-Secure state, this field is RES0.  
Otherwise, this field reads the same as bits [3:0].

#### **CopDbg, bits [3:0]**

Support for System registers-based debug model, using registers in the coproc == 1110 encoding space, for A and R profile processors. Defined values are:  
0000 Not supported.  
0010 Support for ARMv6, v6 Debug architecture, with System registers access.  
0011 Support for ARMv6, v6.1 Debug architecture, with System registers access.  
0100 Support for ARMv7, v7 Debug architecture, with System registers access.  
0101 Support for ARMv7, v7.1 Debug architecture, with System registers access.  
0110 Support for ARMv8 debug architecture, with System registers access.  
0111 Support for ARMv8 debug architecture, with System registers access, and Virtualization Host extensions.  
1000 Support for ARMv8.2 debug architecture.  
All other values are reserved.  
In an ARMv8.0 implementation, the only permitted value is 0b0110.  
In an ARMv8.1 implementation that does not include ARMv8.1-VHE, the permitted values are 0b0110 and 0b0111.

In an ARMv8.1 implementation that includes ARMv8.1-VHE, the only permitted value is 0b0111.

In an ARMv8.2 implementation, the only permitted value is 0b1000.

## Accessing the ID\_DFR0\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_DFR0_EL1	11	000	0000	0001	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.50 ID\_ISAR0\_EL1, AArch32 Instruction Set Attribute Register 0

The ID\_ISAR0\_EL1 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

AArch64 System register ID\_ISAR0\_EL1 is architecturally mapped to AArch32 System register [ID\\_ISAR0](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_ISAR0\_EL1 is a 32-bit register.

### Field descriptions

The ID\_ISAR0\_EL1 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
RES0	Divide	Debug	Coproc	CmpBranch	BitField	BitCount	Swap								

#### Bits [31:28]

Reserved, RES0.

#### Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

0000 None implemented.

0001 Adds SDIV and UDIV in the T32 instruction set.

0010 As for 0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

0000 None implemented.

0001 Adds BKPT.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

0000 None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.

0001 Adds generic CDP, LDC, MCR, MRC, and STC.

0010 As for 0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.

0011 As for 0010, and adds generic MCRR and MRRC.  
0100 As for 0011, and adds generic MCRR2 and MRRC2.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0000.

#### CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:  
0000 None implemented.  
0001 Adds CBNZ and CBZ.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0001.

#### BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:  
0000 None implemented.  
0001 Adds BFC, BFI, SBFX, and UBFX.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0001.

#### BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:  
0000 None implemented.  
0001 Adds CLZ.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0001.

#### Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:  
0000 None implemented.  
0001 Adds SWP and SWPB.  
All other values are reserved.  
In ARMv8-A the only permitted value is 0000.

### Accessing the ID\_ISAR0\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_ISAR0_EL1	11	000	0000	0010	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.51 ID\_ISAR1\_EL1, AArch32 Instruction Set Attribute Register 1

The ID\_ISAR1\_EL1 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

### Configurations

AArch64 System register ID\_ISAR1\_EL1 is architecturally mapped to AArch32 System register [ID\\_ISAR1](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_ISAR1\_EL1 is a 32-bit register.

### Field descriptions

The ID\_ISAR1\_EL1 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
Jazelle	Interwork	Immediate	IfThen	Extend	Except_AR	Except	Endian								

#### Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

0000 No support for Jazelle.

0001 Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

0000 None implemented.

0001 Adds the BX instruction, and the T bit in the PSR.

0010 As for 0001, and adds the BLX instruction. PC loads have BX-like behavior.

0011 As for 0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

#### Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

0000 None implemented.

0001 Adds:

- The MOVT instruction.

- The MOV instruction encodings with zero-extended 16-bit immediates.
- The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

0000 None implemented.

0001 Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

0000 No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.

0001 Adds the SXTB, SXTB, UXTB, and UXTH instructions.

0010 As for 0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### Except\_AR, bits [11:8]

Indicates the implemented A and R profile exception-handling instructions. Defined values are:

0000 None implemented.

0001 Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### Except, bits [7:4]

Indicates the implemented exception-handling instructions in the ARM instruction set. Defined values are:

0000 Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.

0001 Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

0000 None implemented.

0001 Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

## Accessing the ID\_ISAR1\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_ISAR1_EL1	11	000	0000	0010	001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.52 ID\_ISAR2\_EL1, AArch32 Instruction Set Attribute Register 2

The ID\_ISAR2\_EL1 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D7-2195.

### Configurations

AArch64 System register ID\_ISAR2\_EL1 is architecturally mapped to AArch32 System register [ID\\_ISAR2](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_ISAR2\_EL1 is a 32-bit register.

### Field descriptions

The ID\_ISAR2\_EL1 bit assignments are:

#### Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

- 0000 None implemented.
- 0001 Adds the REV, REV16, and REVSH instructions.
- 0010 As for 0001, and adds the RBIT instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### PSR\_AR, bits [27:24]

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

- 0000 None implemented.
- 0001 Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

#### **MultU, bits [23:20]**

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

- 0000 None implemented.
- 0001 Adds the UMULL and UMLAL instructions.
- 0010 As for 0001, and adds the UMAAL instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### **MultS, bits [19:16]**

Indicates the implemented advanced signed Multiply instructions. Defined values are:

- 0000 None implemented.
- 0001 Adds the SMULL and SMLAL instructions.
- 0010 As for 0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
- 0011 As for 0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLS LD, SMLS LD, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSD X instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

#### **Mult, bits [15:12]**

Indicates the implemented additional Multiply instructions. Defined values are:

- 0000 No additional instructions implemented. This means only MUL is implemented.
- 0001 Adds the MLA instruction.
- 0010 As for 0001, and adds the MLS instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### **MultiAccessInt, bits [11:8]**

Indicates the support for interruptible multi-access instructions. Defined values are:

- 0000 No support. This means the LDM and STM instructions are not interruptible.
- 0001 LDM and STM instructions are restartable.
- 0010 LDM and STM instructions are continuable.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### **MemHint, bits [7:4]**

Indicates the implemented Memory Hint instructions. Defined values are:

- 0000 None implemented.
- 0001 Adds the PLD instruction.
- 0010 Adds the PLD instruction. (0001 and 0010 have identical effects.)
- 0011 As for 0001 (or 0010), and adds the PLI instruction.
- 0100 As for 0011, and adds the PLDW instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0100.

### LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

- 0000 No additional load/store instructions implemented.
- 0001 Adds the LDRD and STRD instructions.
- 0010 As for 0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

### Accessing the ID\_ISAR2\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_ISAR2_EL1	11	000	0000	0010	010

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.53 ID\_ISAR3\_EL1, AArch32 Instruction Set Attribute Register 3

The ID\_ISAR3\_EL1 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

AArch64 System register ID\_ISAR3\_EL1 is architecturally mapped to AArch32 System register [ID\\_ISAR3](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_ISAR3\_EL1 is a 32-bit register.

### Field descriptions

The ID\_ISAR3\_EL1 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
T32EE	TrueNOP		T32Copy		TabBranch		SynchPrim		SVC		SIMD		Saturate		

#### T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

0000 None implemented.

0001 Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

0000 None implemented. This means there are no NOP instructions that do not have any register dependencies.

0001 Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

0000 Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.

0001 Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

- 0000 None implemented.
- 0001 Adds the TBB and TBH instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### SynchPrim, bits [15:12]

Used in conjunction with ID\_ISAR4.SynchPrim\_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

- 0000 If SynchPrim\_frac == 0000, no Synchronization Primitives implemented.
- 0001 If SynchPrim\_frac == 0000, adds the LDREX and STREX instructions.  
If SynchPrim\_frac == 0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
- 0010 If SynchPrim\_frac == 0000, as for [0001, 0011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim\_frac are reserved.

In ARMv8-A the only permitted value is 0010.

#### SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

- 0000 Not implemented.
- 0001 Adds the SVC instruction.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

- 0000 None implemented.
- 0001 Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
- 0011 As for 0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, [MVFR0](#), [MVFR1](#), and [MVFR2](#) give information about the implemented Advanced SIMD instructions.

#### Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

- 0000 None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
- 0001 Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

## Accessing the ID\_ISAR3\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_ISAR3_EL1	11	000	0000	0010	011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.54 ID\_ISAR4\_EL1, AArch32 Instruction Set Attribute Register 4

The ID\_ISAR4\_EL1 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D7-2195.

### Configurations

AArch64 System register ID\_ISAR4\_EL1 is architecturally mapped to AArch32 System register [ID\\_ISAR4](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_ISAR4\_EL1 is a 32-bit register.

### Field descriptions

The ID\_ISAR4\_EL1 bit assignments are:

#### SWP\_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

0000 SWP or SWPB instructions not implemented.

0001 SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if the [ID\\_ISAR0](#).Swap\_instrs field is 0000.

In ARMv8-A the only permitted value is 0000.

#### PSR\_M, bits [27:24]

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

0000 None implemented.

0001 Adds the M profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### SynchPrim\_frac, bits [23:20]

Used in conjunction with [ID\\_ISAR3](#).SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

- 0000 If SynchPrim == 0000, no Synchronization Primitives implemented. If SynchPrim == 0001, adds the LDREX and STREX instructions. If SynchPrim == 0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
- 0011 If SynchPrim == 0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim\_frac are reserved.

In ARMv8-A the only permitted value is 0000.

#### Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

- 0000 None implemented. Barrier operations are provided only as System instructions in the (coproc==1111) encoding space.
- 0001 Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

- 0000 None implemented.
- 0001 Adds the SMC instruction.

All other values are reserved.

In ARMv8-A the permitted values are 0001 and 0000.

If EL1 cannot use AArch32 then this field has the value 0000.

#### Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

- 0000 Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
- 0001 Adds support for all of the writeback addressing modes.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

- 0000 Nonzero shifts supported only in MOV and shift instructions.
- 0001 Adds support for shifts of loads and stores over the range LSL 0-3.
- 0011 As for 0001, and adds support for other constant shift options, both on load/store and other instructions.
- 0100 As for 0011, and adds support for register-controlled shift options.

All other values are reserved.

In ARMv8-A the only permitted value is 0100.

### Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

0000 None implemented. No T variant instructions are implemented.

0001 Adds the LDRBT, LDRT, STRBT, and STRT instructions.

0010 As for 0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

### Accessing the ID\_ISAR4\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_ISAR4_EL1	11	000	0000	0010	100

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.55 ID\_ISAR5\_EL1, AArch32 Instruction Set Attribute Register 5

The ID\_ISAR5\_EL1 characteristics are:

### Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), and [ID\\_ISAR4\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

AArch64 System register ID\_ISAR5\_EL1 is architecturally mapped to AArch32 System register [ID\\_ISAR5](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_ISAR5\_EL1 is a 32-bit register.

### Field descriptions

The ID\_ISAR5\_EL1 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
RES0	RDM	RES0	CRC32	SHA2	SHA1	AES	SEVL	

#### Bits [31:28]

Reserved, RES0.

#### RDM, bits [27:24]

##### *In ARMv8.2 and ARMv8.1*

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

0000 No VQRDMLAH and VQRDMLSH instructions implemented.

0001 VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

In ARMv8.0 the only permitted value is 0000.

From ARMv8.1 the only permitted value is 0001. This feature is identified by the name [ARMv8.1-SIMD](#).

##### *In ARMv8.0.*

Reserved, RES0.

#### Bits [23:20]

Reserved, RES0.

#### CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

0000 No CRC32 instructions implemented.

0001 CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In ARMv8.0 the permitted values are 0000 and 0001.

From ARMv8.1 the only permitted value is 0001.

#### SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

0000 No SHA2 instructions implemented.

0001 SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

#### SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

0000 No SHA1 instructions implemented.

0001 SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

#### AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.

0000 No AES instructions implemented.

0001 AESE, AESD, AESMC, and AESIMC implemented.

0010 As for 0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

#### SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

0000 SEVL is implemented as a NOP.

0001 SEVL is implemented as Send Event Local.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

### Accessing the ID\_ISAR5\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_ISAR5_EL1	11	000	0000	0010	101

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.56 ID\_MMFR0\_EL1, AArch32 Memory Model Feature Register 0

The ID\_MMFR0\_EL1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR2\\_EL1](#), [ID\\_MMFR3\\_EL1](#), and [ID\\_MMFR4\\_EL1](#).

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D7-2195.

### Configurations

AArch64 System register ID\_MMFR0\_EL1 is architecturally mapped to AArch32 System register [ID\\_MMFR0](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_MMFR0\_EL1 is a 32-bit register.

### Field descriptions

The ID\_MMFR0\_EL1 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
InnerShr	FCSE	AuxReg	TCM	ShareLvl	OuterShr	PMSA	VMSA	

0010 Support for Auxiliary Fault Status Registers ([AIFSR](#) and [ADFSR](#)) and Auxiliary Control Register.

All other values are reserved.

In ARMv8 the only permitted value is 0010.

---

**Note**

---

Accesses to unimplemented Auxiliary registers are UNDEFINED.

---

#### TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

0000 Not supported.

0001 Support is IMPLEMENTATION DEFINED. ARMv7 requires this setting.

0010 Support for TCM only, ARMv6 implementation.

0011 Support for TCM and DMA, ARMv6 implementation.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

0000 One level of shareability implemented.

0001 Two levels of shareability implemented.

All other values are reserved.

In ARMv8 the only permitted value is 0001.

#### OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

0000 Implemented as Non-cacheable.

0001 Implemented with hardware coherency support.

1111 Shareability ignored.

All other values are reserved.

In ARMv8 the permitted values are 0000, 0001, and 1111.

#### PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

0000 Not supported.

0001 Support for IMPLEMENTATION DEFINED PMSA.

0010 Support for PMSAv6, with a Cache Type Register implemented.

0011 Support for PMSAv7, with support for memory subsections. ARMv7-R profile.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

0000 Not supported.

0001 Support for IMPLEMENTATION DEFINED VMSA.

0010 Support for VMSAv6, with Cache and TLB Type Registers implemented.

- 0011 Support for VMSAv7, with support for remapping and the Access flag. ARMv7-A profile.
- 0100 As for 0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
- 0101 As for 0100, and adds support for the Long-descriptor translation table format.
- All other values are reserved.
- In ARMv8-A the only permitted value is 0101.

### Accessing the ID\_MMFR0\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_MMFR0_EL1	11	000	0000	0001	100

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.57 ID\_MMFR1\_EL1, AArch32 Memory Model Feature Register 1

The ID\_MMFR1\_EL1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR2\\_EL1](#), [ID\\_MMFR3\\_EL1](#), and [ID\\_MMFR4\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

### Configurations

AArch64 System register ID\_MMFR1\_EL1 is architecturally mapped to AArch32 System register [ID\\_MMFR1](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_MMFR1\_EL1 is a 32-bit register.

### Field descriptions

The ID\_MMFR1\_EL1 bit assignments are:

31	28 27	24 23	20 19	16 15	12 11	8 7	4 3	0
BPred	L1TstCln	L1Uni	L1Hvd	L1UniSW	L1HvdSW	L1UniVA	L1HvdVA	

#### BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

0000 No branch predictor, or no MMU present. Implies a fixed MPU configuration.

0001 Branch predictor requires flushing on:

- Enabling or disabling a stage of address translation.
- Writing new data to instruction locations.
- Writing new mappings to the translation tables.
- Changes to the [TTBR0](#), [TTBR1](#), or [TTBCR](#) registers.
- Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.

0010 Branch predictor requires flushing on:

- Enabling or disabling a stage of address translation.
- Writing new data to instruction locations.
- Writing new mappings to the translation tables.
- Any change to the [TTBR0](#), [TTBR1](#), or [TTBCR](#) registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.

0011 Branch predictor requires flushing only on writing new data to instruction locations.

0100 For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In ARMv8-A the permitted values are 0010, 0011, or 0100. For values other than 0000 and 0100 the ARM Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

#### L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

- 0000      None supported.
- 0001      Supported Level 1 data cache test and clean operations are:
  - Test and clean data cache.
- 0010      As for 0001, and adds:
  - Test, clean, and invalidate data cache.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

- 0000      None supported.
- 0001      Supported entire Level 1 cache operations are:
  - Invalidate cache, including branch predictor if appropriate.
  - Invalidate branch predictor, if appropriate.
- 0010      As for 0001, and adds:
  - Clean cache, using a recursive model that uses the cache dirty status bit.
  - Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

- 0000      None supported.
- 0001      Supported entire Level 1 cache operations are:
  - Invalidate instruction cache, including branch predictor if appropriate.
  - Invalidate branch predictor, if appropriate.
- 0010      As for 0001, and adds:
  - Invalidate data cache.
  - Invalidate data cache and instruction cache, including branch predictor if appropriate.
- 0011      As for 0010, and adds:
  - Clean data cache, using a recursive model that uses the cache dirty status bit.
  - Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

- 0000      None supported.

0001 Supported Level 1 unified cache line maintenance operations by set/way are:

- Clean cache line by set/way.

0010 As for 0001, and adds:

- Clean and invalidate cache line by set/way.

0011 As for 0010, and adds:

- Invalidate cache line by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

0000 None supported.

0001 Supported Level 1 Harvard cache line maintenance operations by set/way are:

- Clean data cache line by set/way.
- Clean and invalidate data cache line by set/way.

0010 As for 0001, and adds:

- Invalidate data cache line by set/way.

0011 As for 0010, and adds:

- Invalidate instruction cache line by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

0000 None supported.

0001 Supported Level 1 unified cache line maintenance operations by VA are:

- Clean cache line by VA.
- Invalidate cache line by VA.
- Clean and invalidate cache line by VA.

0010 As for 0001, and adds:

- Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

0000 None supported.

0001 Supported Level 1 Harvard cache line maintenance operations by VA are:

- Clean data cache line by VA.
- Invalidate data cache line by VA.
- Clean and invalidate data cache line by VA.
- Clean instruction cache line by VA.

0010 As for 0001, and adds:

- Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

## Accessing the ID\_MMFR1\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_MMFR1_EL1	11	000	0000	0001	101

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID3==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.58 ID\_MMFR2\_EL1, AArch32 Memory Model Feature Register 2

The ID\_MMFR2\_EL1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR3\\_EL1](#), and [ID\\_MMFR4\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

### Configurations

AArch64 System register ID\_MMFR2\_EL1 is architecturally mapped to AArch32 System register [ID\\_MMFR2](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_MMFR2\_EL1 is a 32-bit register.

### Field descriptions

The ID\_MMFR2\_EL1 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
HWAccFlg	WFISall	MemBarr	UniTLB	HvdTLB	L1HvdRng	L1HvdBG	L1HvdFG								

#### HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the ARM Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

0000 Not supported.

0001 Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

In ARMv8 the only permitted value is 0000.

#### WFISall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

0000 Not supported.

0001 Support for WFI stalling.

All other values are reserved.

In ARMv8 the permitted values are 0000 and 0001.

#### MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==1111) encoding space:

0000 None supported.

0001 Supported memory barrier System instructions are:

- Data Synchronization Barrier (DSB).

- 0010 As for 0001, and adds:
- Instruction Synchronization Barrier (ISB).
  - Data Memory Barrier (DMB).

All other values are reserved.

In ARMv8 the only permitted value is 0010.

ARM deprecates the use of these operations. ID\_ISAR4.Barrier\_instrs indicates the level of support for the preferred barrier instructions.

#### UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

- 0000 Not supported.
- 0001 Supported unified TLB maintenance operations are:
- Invalidate all entries in the TLB.
  - Invalidate TLB entry by VA.
- 0010 As for 0001, and adds:
- Invalidate TLB entries by ASID match.
- 0011 As for 0010, and adds:
- Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.
- 0100 As for 0011, and adds:
- Invalidate Hyp mode unified TLB entry by VA.
  - Invalidate entire Non-secure PL1&0 unified TLB.
  - Invalidate entire Hyp mode unified TLB.
- 0101 As for 0100, and adds the following operations: [TLBIMVALIS](#), [TLBIMVAALIS](#), [TLBIMVALHIS](#), [TLBIMVAL](#), [TLBIMVAAL](#), [TLBIMVALH](#).
- 0110 As for 0101, and adds the following operations: [TLBIIPAS2IS](#), [TLBIIPAS2LIS](#), [TLBIIPAS2](#), [TLBIIPAS2L](#).

All other values are reserved.

In ARMv8-A the only permitted value is 0110.

#### HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. ARM deprecates the use of this field by software.

#### L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

- 0000 Not supported.
- 0001 Supported Level 1 Harvard cache maintenance range operations are:
- Invalidate data cache range by VA.
  - Invalidate instruction cache range by VA.
  - Clean data cache range by VA.
  - Clean and invalidate data cache range by VA.

All other values are reserved.

In ARMv8 the only permitted value is 0000.

### L1HvDBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

- 0000 Not supported.
- 0001 Supported Level 1 Harvard cache background fetch operations are:
- Fetch instruction cache range by VA.
  - Fetch data cache range by VA.

All other values are reserved.

In ARMv8 the only permitted value is 0000.

### L1HvDFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

- 0000 Not supported.
- 0001 Supported Level 1 Harvard cache foreground fetch operations are:
- Fetch instruction cache range by VA.
  - Fetch data cache range by VA.

All other values are reserved.

In ARMv8 the only permitted value is 0000.

## Accessing the ID\_MMFR2\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_MMFR2_EL1	11	000	0000	0001	110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.59 ID\_MMFR3\_EL1, AArch32 Memory Model Feature Register 3

The ID\_MMFR3\_EL1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR2\\_EL1](#), and [ID\\_MMFR4\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

### Configurations

AArch64 System register ID\_MMFR3\_EL1 is architecturally mapped to AArch32 System register [ID\\_MMFR3](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_MMFR3\_EL1 is a 32-bit register.

### Field descriptions

The ID\_MMFR3\_EL1 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
Supersec	CMemSz	CohWalk	PAN	MaintBcst	BPMaint	CMaintSW	CMaintVA								

#### Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

0000 Supersections supported.

1111 Supersections not supported.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 1111.

#### CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

0000 4GB, corresponding to a 32-bit physical address range.

0001 64GB, corresponding to a 36-bit physical address range.

0010 1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In ARMv8-A the permitted values are 0000, 0001, and 0010.

#### CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the point of unification. Defined values are:

0000 Updates to the translation tables require a clean to the point of unification to ensure visibility by subsequent translation table walks.

0001 Updates to the translation tables do not require a clean to the point of unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

#### PAN, bits [19:16]

##### *In ARMv8.2 and ARMv8.1*

Privileged Access Never. Indicates support for the PAN bit in [CPSR](#), [SPSR](#), and [DPSR](#) in AArch32. Defined values are:

0000 PAN not supported.

0001 PAN supported.

0010 PAN supported and ATS1CPRP and ATS1CPWP instructions supported.

All other values are reserved.

In ARMv8.0 the only permitted value is 0000.

In ARMv8.1 the only permitted value is 0001. This feature is identified by the name [ARMv8.1-PAN](#).

From ARMv8.2, the only permitted value is 0010. This feature is identified by the name [ARMv8.2-ATS1E1](#).

##### *In ARMv8.0.*

Reserved, RES0.

#### MaintBst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

0000 Cache, TLB, and branch predictor operations only affect local structures.

0001 Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.

0010 Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

0000 None supported.

0001 Supported branch predictor maintenance operations are:

- Invalidate all branch predictors.

0010 As for 0001, and adds:

- Invalidate branch predictors by VA.

All other values are reserved.

In ARMv8-A the only permitted value is 0010.

#### CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

0000 None supported.

0001 Supported hierarchical cache maintenance instructions by set/way are:

- Invalidate data cache by set/way.
- Clean data cache by set/way.

- Clean and invalidate data cache by set/way.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

#### CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

- 0000 None supported.
- 0001 Supported hierarchical cache maintenance operations by VA are:
- Invalidate data cache by VA.
  - Clean data cache by VA.
  - Clean and invalidate data cache by VA.
  - Invalidate instruction cache by VA.
  - Invalidate all instruction cache entries.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

#### Accessing the ID\_MMFR3\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_MMFR3_EL1	11	000	0000	0001	111

#### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.60 ID\_MMFR4\_EL1, AArch32 Memory Model Feature Register 4

The ID\_MMFR4\_EL1 characteristics are:

### Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR2\\_EL1](#), and [ID\\_MMFR3\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

### Configurations

AArch64 System register ID\_MMFR4\_EL1 is architecturally mapped to AArch32 System register [ID\\_MMFR4](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_MMFR4\_EL1 is a 32-bit register.

### Field descriptions

The ID\_MMFR4\_EL1 bit assignments are:

31	24	23	20	19	16	15	12	11	8	7	4	3	0
RAZ				LSM		HPDS		CnP	XNX		AC2	SpecSEI	

#### Bits [31:24]

Reserved, RAZ.

#### LSM, bits [23:20]

##### *In ARMv8.2*

Indicates support for LSMAOE and nTLSMD bits in [HSCTLR](#) and [SCTLR](#). Defined values are:

0000 LSMAOE and nTLSMD bits not supported.

0001 LSMAOE and nTLSMD bits supported.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the only permitted value is 0000.

From ARMv8.2, the permitted values are 0000 and 0001. This feature is identified by the name [ARMv8.2-LSMAOC](#).

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RAZ.

#### HPDS, bits [19:16]

##### *In ARMv8.2*

Hierarchical permission disables bits in translation tables. Defined values are:

0000 Disabling of hierarchical controls not supported.

0001 Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and [HTCR](#).HPD bits.

0010 Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and [HTCR](#).HPD bits, and hardware allocation of bits[62:59] of the last level page table descriptor for IMPLEMENTATION DEFINED use.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the only permitted value is 0000.

From ARMv8.2, the permitted values are 0000, 0001 and 0010. This feature is identified by the name [ARMv8.2-AA32HPD](#).

#### **Note**

The encoding 0000 implies that the encoding for TTBCR2 is unallocated.

#### ***In ARMv8.1 and ARMv8.0.***

Reserved, RAZ.

### **CnP, bits [15:12]**

#### ***In ARMv8.2***

Common not Private translations. Defined values are:

0000 Common not Private translations not supported.

0001 Common not Private translations supported.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the only permitted value is 0000.

From ARMv8.2, the only permitted value is 0001. This feature is identified by the name [ARMv8.2-TTCNP](#).

#### ***In ARMv8.1 and ARMv8.0.***

Reserved, RAZ.

### **XXN, bits [11:8]**

#### ***In ARMv8.2***

Support for execute never control distinction at stage 2 bit. Defined values are:

0000 Distinction between EL0 and EL1 execute permission at stage 2 not supported.

0001 Distinction between EL0 and EL1 execute permission at stage 2 supported.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the only permitted value is 0000.

From ARMv8.2, the only permitted value is 0001. This feature is identified by the name [ARMv8.2-TTS2UXN](#).

#### ***In ARMv8.1 and ARMv8.0.***

Reserved, RAZ.

### **AC2, bits [7:4]**

Indicates the extension of the [ACTLR](#) and [HACTLR](#) registers using [ACTLR2](#) and [HACTLR2](#).  
Defined values are:

0000 [ACTLR2](#) and [HACTLR2](#) are not implemented.

0001 [ACTLR2](#) and [HACTLR2](#) are implemented.

All other values are reserved.

In ARMv8.0 and ARMv8.1 the permitted values are 0000 and 0001.

From ARMv8.2, the only permitted value is 0001.

### SpecSEI, bits [3:0]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

- 0000 The PE never generates an SError interrupt due to an external abort on a speculative read.
  - 0001 The PE might generate an SError interrupt due to an external abort on a speculative read.
- All other values are reserved.

When the RAS Extension is not implemented, this field is RAZ.

### Accessing the ID\_MMFR4\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_MMFR4_EL1	11	000	0000	0010	110

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

If HCR\_EL2.TID3==1, then:

- If the register is not RAZ/WI then Non-secure EL1 read accesses to this register are trapped to EL2.
- Otherwise, it is IMPLEMENTATION DEFINED whether Non-secure EL1 read accesses to this register are trapped to EL2.

## D7.2.61 ID\_PFR0\_EL1, AArch32 Processor Feature Register 0

The ID\_PFR0\_EL1 characteristics are:

### Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with [ID\\_PFR1\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

### Configurations

AArch64 System register ID\_PFR0\_EL1 is architecturally mapped to AArch32 System register [ID\\_PFR0](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_PFR0\_EL1 is a 32-bit register.

### Field descriptions

The ID\_PFR0\_EL1 bit assignments are:

31	28	27	16	15	12	11	8	7	4	3	0
RAS	RES0				State3	State2	State1	State0			

#### RAS, bits [31:28]

RAS Extension version. The defined values of this field are:

0000 No RAS Extension.

0001 Version 1 of the RAS Extension present.

All other values are reserved.

#### Bits [27:16]

Reserved, RES0.

#### State3, bits [15:12]

T32EE instruction set support. Defined values are:

0000 Not implemented.

0001 T32EE instruction set implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### State2, bits [11:8]

Jazelle extension support. Defined values are:

0000 Not implemented.

0001 Jazelle extension implemented, without clearing of [JOSCR.CV](#) on exception entry.

0010 Jazelle extension implemented, with clearing of [JOSCR.CV](#) on exception entry.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

### State1, bits [7:4]

T32 instruction set support. Defined values are:

- 0000 T32 instruction set not implemented.
- 0001 T32 encodings before the introduction of Thumb-2 technology implemented:
  - All instructions are 16-bit.
  - A BL or BLX is a pair of 16-bit instructions.
  - 32-bit instructions other than BL and BLX cannot be encoded.
- 0011 T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In ARMv8-A the only permitted value is 0011.

### State0, bits [3:0]

A32 instruction set support. Defined values are:

- 0000 A32 instruction set not implemented.
- 0001 A32 instruction set implemented.

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

## Accessing the ID\_PFR0\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_PFR0_EL1	11	000	0000	0001	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.62 ID\_PFR1\_EL1, AArch32 Processor Feature Register 1

The ID\_PFR1\_EL1 characteristics are:

### Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with [ID\\_PFR0\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

### Configurations

AArch64 System register ID\_PFR1\_EL1 is architecturally mapped to AArch32 System register [ID\\_PFR1](#).

In an implementation that supports only AArch64 state, this register is UNKNOWN.

### Attributes

ID\_PFR1\_EL1 is a 32-bit register.

### Field descriptions

The ID\_PFR1\_EL1 bit assignments are:

#### GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

- 0000 No System register interface to the GIC CPU interface is supported.
  - 0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
- All other values are reserved.

#### Virt\_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:

- 0000 No features from the ARMv7 Virtualization Extensions are implemented.
- 0001 The following features of the ARMv7 Virtualization Extensions are implemented:
  - The [SCR.SIF](#) bit, if EL3 is implemented.
  - The modifications to the [SCR.AW](#) and [SCR.FW](#) bits described in the Virtualization Extensions, if EL3 is implemented.
  - The MSR (Banked register) and MRS (Banked register) instructions.
  - The ERET instruction.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0000 when EL2 is implemented.
- 0001 when EL2 is not implemented.

This field is only valid when the value of ID\_PFR1\_EL1.Virtualization is 0, otherwise it holds the value 0000.

---

**Note**

---

The ID\_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

---

**Sec\_frac, bits [23:20]**

Security fractional field. When the Security field is 0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

- |      |   |
|------|---|
| 0000 | No features from the ARMv7 Security Extensions are implemented.   |
| 0001 | The following features from the ARMv7 Security Extensions are implemented: <ul style="list-style-type: none"><li>• The VBAR register.</li><li>• The TTBCR.PD0 and TTBCR.PD1 bits.</li></ul> |
| 0010 | As for 0001, plus the ability to access Secure or Non-secure physical memory is supported.  |

All other values are reserved.

In ARMv8-A the permitted values are:

- 0000 when EL3 is implemented.
- 0001 or 0010 when EL3 is not implemented.

This field is only valid when the value of ID\_PFR1\_EL1.Security is 0, otherwise it holds the value 0000.

**GenTimer, bits [19:16]**

Generic Timer support. Defined values are:

- |      |                            |
|------|----------------------------|
| 0000 | Not implemented.           |
| 0001 | Generic Timer implemented. |

All other values are reserved.

In ARMv8-A the only permitted value is 0001.

**Virtualization, bits [15:12]**

Virtualization support. Defined values are:

- |      |  |
|------|--|
| 0000 | EL2, Hyp mode, and the HVC instruction not implemented.  |
| 0001 | EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0001 implemented. |

All other values are reserved.

In ARMv8-A the permitted values are:

- 0000 when EL2 is not implemented.
- 0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0001.

If EL1 cannot use AArch32 then this field has the value 0000.

---

**Note**

---

The ID\_ISARs do not identify whether the HVC instruction is implemented.

---

**MProgMod, bits [11:8]**

M profile programmers' model support. Defined values are:

- |      |   |
|------|---|
| 0000 | Not supported.                            |
| 0010 | Support for two-stack programmers' model. |

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### Security, bits [7:4]

Security support. Defined values are:

- 0000 EL3, Monitor mode, and the SMC instruction not implemented.
- 0001 EL3, Monitor mode, the SMC instruction, and all the features described by Sec\_frac == 0001 implemented.
- 0010 As for 0001, and adds the ability to set the NSACR.RFR bit. Not permitted in ARMv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In ARMv8-A the permitted values are:

- 0000 when EL3 is not implemented.
- 0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0001.

If EL1 cannot use AArch32 then this field has the value 0000.

#### ProgMod, bits [3:0]

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

- 0000 Not supported.
- 0001 Supported.

All other values are reserved.

In ARMv8-A the permitted values are 0001 and 0000.

If EL1 cannot use AArch32 then this field has the value 0000.

### Accessing the ID\_PFR1\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ID_PFR1_EL1	11	000	0000	0001	001

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.63 IFSR32\_EL2, Instruction Fault Status Register (EL2)

The IFSR32\_EL2 characteristics are:

### Purpose

Allows access to the AArch32 [IFSR](#) register from AArch64 state only. Its value has no effect on execution in AArch64 state.

### Configurations

AArch64 System register IFSR32\_EL2 is architecturally mapped to AArch32 System register [IFSR](#).

If EL1 is AArch64 only, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

RW fields in this register reset to architecturally UNKNOWN values.

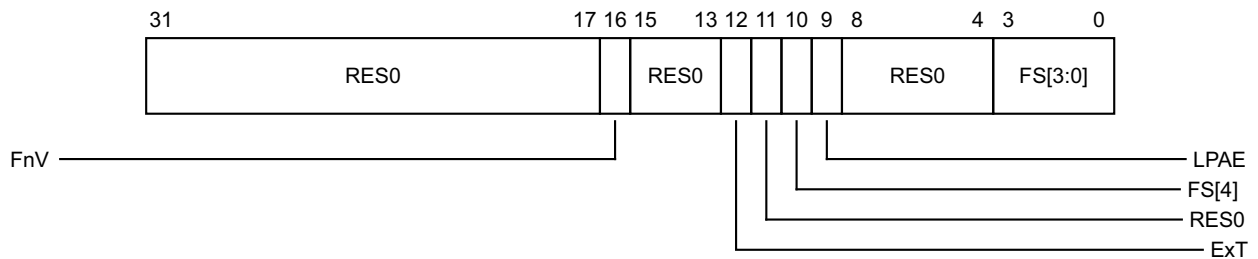

### Attributes

IFSR32\_EL2 is a 32-bit register.

### Field descriptions

The IFSR32\_EL2 bit assignments are:

**When *TTBCR.EAE*==0:**

### Bits [31:17]

Reserved, RES0.

### FnV, bit [16]

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

0 [IFAR](#) is valid.

1 [IFAR](#) is not valid, and holds an UNKNOWN value.

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

### Bits [15:13]

Reserved, RES0.

### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.

In an implementation that does not provide any classification of external aborts, this bit is RES0.

For aborts other than external aborts this bit always returns 0.

#### Bit [11]

Reserved, RES0.

#### FS[4], bit [10]

See FS[3:0], bits [3:0] for description of the FS field.

#### LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

- 0 Using the Short-descriptor translation table formats.
- 1 Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

#### Bits [8:4]

Reserved, RES0.

#### FS[3:0], bits [3:0]

Fault status bits. Interpreted with bit [10]. Possible values of FS[4:0] are:

- 00001 PC alignment fault
- 00010 Debug exception
- 00011 Access flag fault, level 1
- 00101 Translation fault, level 1
- 00110 Access flag fault, level 2
- 00111 Translation fault, level 2
- 01000 Synchronous external abort, not on translation table walk
- 01001 Domain fault, level 1
- 01011 Domain fault, level 2
- 01100 Synchronous external abort, on translation table walk, level 1
- 01101 Permission fault, level 1
- 01110 Synchronous external abort, on translation table walk, level 2
- 01111 Permission fault, level 2
- 10000 TLB conflict abort
- 10100 IMPLEMENTATION DEFINED fault (Lockdown fault)
- 11001 Synchronous parity or ECC error on memory access, not on translation table walk
- 11100 Synchronous parity or ECC error on translation table walk, level 1
- 11110 Synchronous parity or ECC error on translation table walk, level 2

All other values are reserved.

When the RAS Extension is implemented, 11001, 11100, and 11110 are reserved.

#### When TTBCR.EAE==1:

#### Bits [31:17]

Reserved, RES0.

#### FnV, bit [16]

FAR not Valid, for a Synchronous external abort other than a Synchronous external abort on a translation table walk.

0 [IFAR](#) is valid.

1 [IFAR](#) is not valid, and holds an UNKNOWN value.

This field is only valid for a Synchronous external abort other than a Synchronous external abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

#### Bits [15:13]

Reserved, RES0.

#### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of external aborts.

In an implementation that does not provide any classification of external aborts, this bit is RES0.

For aborts other than external aborts this bit always returns 0.

#### Bits [11:10]

Reserved, RES0.

#### LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

0 Using the Short-descriptor translation table formats.

1 Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

#### Bits [8:6]

Reserved, RES0.

#### STATUS, bits [5:0]

Fault status bits. All encodings not shown below are reserved:

000000 Address size fault in [TTBR0](#) or [TTBR1](#)

000001 Address size fault, level 1

000010 Address size fault, level 2

000011 Address size fault, level 3

000101 Translation fault, level 1

000110 Translation fault, level 2

000111 Translation fault, level 3

001001 Access flag fault, level 1

001010 Access flag fault, level 2

001011 Access flag fault, level 3

001101 Permission fault, level 1

001110 Permission fault, level 2

001111 Permission fault, level 3

010000 Synchronous external abort, not on translation table walk

010101 Synchronous external abort, on translation table walk, level 1

010110	Synchronous external abort, on translation table walk, level 2
010111	Synchronous external abort, on translation table walk, level 3
011000	Synchronous parity or ECC error on memory access, not on translation table walk
011101	Synchronous parity or ECC error on memory access on translation table walk, level 1
011110	Synchronous parity or ECC error on memory access on translation table walk, level 2
011111	Synchronous parity or ECC error on memory access on translation table walk, level 3
100001	PC alignment fault
100010	Debug exception
110000	TLB conflict abort

All other values are reserved.

The lookup level associated with a fault is:

When the RAS Extension is implemented, 011000, 011101, 011110, and 011111 are reserved.

- For a fault generated on a translation table walk, the lookup level of the walk being performed.
- For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a fault at level 1.
- For an Access flag fault, the lookup level of the translation table that gave the fault.
- For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.

## Accessing the IFSR32\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
IFSR32_EL2	11	100	0101	0000	001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## D7.2.64 ISR\_EL1, Interrupt Status Register

The ISR\_EL1 characteristics are:

### Purpose

Shows whether any IRQ, FIQ, or SError interrupt is pending. In an implementation that includes EL2, when the register is accessed from Non-secure EL1, a pending interrupt or external abort might be physical or virtual, and the architecture does not provide any mechanism that software executing at Non-secure EL1 can use to determine whether a pending interrupt or external abort is physical or virtual. For all other accesses, any indicated interrupt or external abort must be physical.

### Configurations

AArch64 System register ISR\_EL1 is architecturally mapped to AArch32 System register [ISR](#).

### Attributes

ISR\_EL1 is a 32-bit register.

### Field descriptions

The ISR\_EL1 bit assignments are:

#### Bits [31:9]

Reserved, RES0.

#### A, bit [8]

SError interrupt pending bit:

- 0 No pending SError.
- 1 An SError interrupt is pending.

#### I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

- 0 No pending IRQ.
- 1 An IRQ interrupt is pending.

#### F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

- 0 No pending FIQ.
- 1 An FIQ interrupt is pending.

#### Bits [5:0]

Reserved, RES0.

### Accessing the ISR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
ISR_EL1	11	000	1100	0001	000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## D7.2.65 LORC\_EL1, LORegion Control (EL1)

The LORC\_EL1 characteristics are:

### Purpose

Enables and disables LORegions, and selects the current LORegion descriptor.

### Configurations

If no LORegion descriptors are supported by the PE, then this register is RES0.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

### Attributes

LORC\_EL1 is a 64-bit register.

### Field descriptions

The LORC\_EL1 bit assignments are:

#### Bits [63:10]

Reserved, RES0.

#### DS, bits [9:2]

Descriptor Select. Selects the current LORegion descriptor accessed by [LORSA\\_EL1](#), [LOREA\\_EL1](#), and [LORN\\_EL1](#).

The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is  $\text{Log}_2(\text{Number of LORegion descriptors supported by the implementation})$ .

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers [LORN\\_EL1](#), [LOREA\\_EL1](#), and [LORSA\\_EL1](#) are RES0.

#### Bit [1]

Reserved, RES0.

#### EN, bit [0]

Enable. Indicates whether LORegions are enabled:

0 Disabled. Memory accesses do not match any LORegions.

1 Enabled. Memory accesses may match a LORegion.

This bit is permitted to be cached in a TLB.

### Accessing the LORC\_EL1

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
LORC_EL1	11	000	1010	0100	011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TLOR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TLOR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [SCR\\_EL3.TLOR](#)==1, Non-secure accesses to this register from EL1 and EL2 are trapped to EL3.

## D7.2.66 LOREA\_EL1, LORegion End Address (EL1)

The LOREA\_EL1 characteristics are:

### Purpose

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS.

### Configurations

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC\\_EL1](#).DS points to a LORegion that is not supported by the PE.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

### Attributes

LOREA\_EL1 is a 64-bit register.

### Field descriptions

The LOREA\_EL1 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

### Bits [63:52]

Reserved, RES0.

### EA[51:48], bits [51:48]

#### *In ARMv8.2*

Extension to EA[47:16]. See EA[47:16] for more details.

#### *In ARMv8.1.*

Reserved, RES0.

### EA[47:16], bits [47:16]

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS. Bits[15:0] of this address are defined to be 0xFFFF.

When [ARMv8.2-LPA](#) is implemented, and 52-bit addresses and a 64KB translation granule are in use, EA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, EA[51:48] are RES0.

### Bits [15:0]

Reserved, RES0.

### Accessing the LOREA\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
LOREA_EL1	11	000	1010	0100	001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TLOR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TLOR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [SCR\\_EL3.TLOR](#)==1, Non-secure accesses to this register from EL1 and EL2 are trapped to EL3.

## D7.2.67 LORID\_EL1, LORegionID (EL1)

The LORID\_EL1 characteristics are:

### Purpose

Indicates the number of LORegions and LORegion descriptors supported by the PE.

### Configurations

If no LORegion descriptors are implemented, then the registers [LORC\\_EL1](#), [LORN\\_EL1](#), [LOREA\\_EL1](#), and [LORSA\\_EL1](#) are RES0.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

### Attributes

LORID\_EL1 is a 64-bit register.

### Field descriptions

The LORID\_EL1 bit assignments are:

#### Bits [63:24]

Reserved, RES0.

#### LD, bits [23:16]

Number of LORegion descriptors supported by the PE. This is an 8-bit binary number.

#### Bits [15:8]

Reserved, RES0.

#### LR, bits [7:0]

Number of LORegions supported by the PE. This is an 8-bit binary number.

#### ————— Note —————

If LORID\_EL1 indicates that no LORegions are implemented, then LoadLOAcquire and StoreLORelease will behave as LoadAcquire and StoreRelease.

### Accessing the LORID\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
LORID_EL1	11	000	1010	0100	111

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TLOR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TLOR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [SCR\\_EL3.TLOR](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

## D7.2.68 LORN\_EL1, LORegion Number (EL1)

The LORN\_EL1 characteristics are:

### Purpose

Holds the number of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1.DS](#).

### Configurations

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC\\_EL1.DS](#) points to a LORegion that is not supported by the PE.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

### Attributes

LORN\_EL1 is a 64-bit register.

### Field descriptions

The LORN\_EL1 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

### Bits [63:8]

Reserved, RES0.

### Num, bits [7:0]

Number of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1.DS](#).

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log<sub>2</sub>(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

### Accessing the LORN\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
LORN_EL1	11	000	1010	0100	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TLOR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TLOR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [SCR\\_EL3.TLOR](#)==1, Non-secure accesses to this register from EL1 and EL2 are trapped to EL3.

## D7.2.69 LORSA\_EL1, LORegion Start Address (EL1)

The LORSA\_EL1 characteristics are:

### Purpose

Indicates whether the current LORegion descriptor selected by [LORC\\_EL1.DS](#) is enabled, and holds the physical address of the start of the LORegion.

### Configurations

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC\\_EL1.DS](#) points to a LORegion that is not supported by the PE.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

### Attributes

LORSA\_EL1 is a 64-bit register.

### Field descriptions

The LORSA\_EL1 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

### Bits [63:52]

Reserved, RES0.

### SA[51:48], bits [51:48]

#### *In ARMv8.2*

Extension to SA[47:16]. See SA[47:16] for more details.

#### *In ARMv8.1.*

Reserved, RES0.

### SA[47:16], bits [47:16]

Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1.DS](#). Bits[15:0] of this address are defined to be 0x0000.

When [ARMv8.2-LPA](#) is implemented, and 52-bit addresses and a 64KB translation granule are in use, SA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, SA[51:48] are RES0.

### Bits [15:1]

Reserved, RES0.

### Valid, bit [0]

Indicates whether the current LORegion Descriptor is enabled.

0	Disabled
1	Enabled

## Accessing the LORSA\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
LORSA_EL1	11	000	1010	0100	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	-
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TLOR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TLOR](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [SCR\\_EL3.TLOR](#)==1, Non-secure accesses to this register from EL1 and EL2 are trapped to EL3.

## D7.2.70 MAIR\_EL1, Memory Attribute Indirection Register (EL1)

The MAIR\_EL1 characteristics are:

### Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

### Configurations

AArch64 System register MAIR\_EL1[31:0] is architecturally mapped to AArch32 System register **PRRR** when TTBCR.EAE==0.

AArch64 System register MAIR\_EL1[31:0] is architecturally mapped to AArch32 System register **MAIR0** when TTBCR.EAE==1.

AArch64 System register MAIR\_EL1[63:32] is architecturally mapped to AArch32 System register **NMRR** when TTBCR.EAE==0.

AArch64 System register MAIR\_EL1[63:32] is architecturally mapped to AArch32 System register **MAIR1** when TTBCR.EAE==1.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

MAIR\_EL1 is a 64-bit register.

### Field descriptions

The MAIR\_EL1 bit assignments are:

MAIR\_EL1 is permitted to be cached in a TLB.

### Attr<n>, bits [8n+7:8n], for n = 0 to 7

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
00RW, RW not 00	Normal memory, Outer Write-Through Transient
0100	Normal memory, Outer Non-cacheable
01RW, RW not 00	Normal memory, Outer Write-Back Transient
10RW	Normal memory, Outer Write-Through Non-transient
11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0000	Meaning when Attr<n>[7:4] is not 0000
0000	Device-nGnRnE memory	UNPREDICTABLE
00RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
01RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=00)
10RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=00)
11RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0	No Allocate
1	Allocate

## Accessing the MAIR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MAIR_EL1	11	000	1010	0010	000
MAIR_EL12	11	101	1010	0010	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
MAIR_EL1	x	x	0	-	RW	n/a	RW
MAIR_EL1	0	0	1	-	RW	RW	RW
MAIR_EL1	0	1	1	-	n/a	RW	RW

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
MAIR_EL1	1	0	1	-	RW	<a href="#">MAIR_EL2</a>	RW
MAIR_EL1	1	1	1	-	n/a	<a href="#">MAIR_EL2</a>	RW
MAIR_EL12	x	x	0	-	-	n/a	-
MAIR_EL12	0	0	1	-	-	-	-
MAIR_EL12	0	1	1	-	n/a	-	-
MAIR_EL12	1	0	1	-	-	RW	RW
MAIR_EL12	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR\_EL1 or MAIR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.

D7.2.71 MAIR\_EL2, Memory Attribute Indirection Register (EL2)

The MAIR\_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

Configurations

AArch64 System register MAIR\_EL2[31:0] is architecturally mapped to AArch32 System register [HMAIR0](#).

AArch64 System register MAIR\_EL2[63:32] is architecturally mapped to AArch32 System register [HMAIR1](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

MAIR\_EL2 is a 64-bit register.

Field descriptions

The MAIR\_EL2 bit assignments are:

MAIR\_EL2 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 0 to 7

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where AttrIndx[2:0] gives the value of <n> in Attr<n>.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
00RW, RW not 00	Normal memory, Outer Write-Through Transient
0100	Normal memory, Outer Non-cacheable
01RW, RW not 00	Normal memory, Outer Write-Back Transient
10RW	Normal memory, Outer Write-Through Non-transient
11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0000	Meaning when Attr<n>[7:4] is not 0000
0000	Device-nGnRnE memory	UNPREDICTABLE
00RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
01RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=00)
10RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=00)
11RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0	No Allocate
1	Allocate

## Accessing the MAIR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MAIR_EL2	11	100	1010	0010	000
MAIR_EL1	11	000	1010	0010	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
MAIR_EL2	x	x	0	-	-	n/a	RW
MAIR_EL2	0	0	1	-	-	RW	RW
MAIR_EL2	0	1	1	-	n/a	RW	RW

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
MAIR_EL2	1	0	1	-	-	RW	RW
MAIR_EL2	1	1	1	-	n/a	RW	RW
MAIR_EL1	x	x	0	-	<a href="#">MAIR_EL1</a>	n/a	<a href="#">MAIR_EL1</a>
MAIR_EL1	0	0	1	-	<a href="#">MAIR_EL1</a>	<a href="#">MAIR_EL1</a>	<a href="#">MAIR_EL1</a>
MAIR_EL1	0	1	1	-	n/a	<a href="#">MAIR_EL1</a>	<a href="#">MAIR_EL1</a>
MAIR_EL1	1	0	1	-	<a href="#">MAIR_EL1</a>	RW	<a href="#">MAIR_EL1</a>
MAIR_EL1	1	1	1	-	n/a	RW	<a href="#">MAIR_EL1</a>

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic MAIR\_EL2 or MAIR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## D7.2.72 MAIR\_EL3, Memory Attribute Indirection Register (EL3)

The MAIR\_EL3 characteristics are:

### Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

### Configurations

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

MAIR\_EL3 is a 64-bit register.

### Field descriptions

The MAIR\_EL3 bit assignments are:

MAIR\_EL3 is permitted to be cached in a TLB.

### Attr<n>, bits [8n+7:8n], for n = 0 to 7

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
00RW, RW not 00	Normal memory, Outer Write-Through Transient
0100	Normal memory, Outer Non-cacheable
01RW, RW not 00	Normal memory, Outer Write-Back Transient
10RW	Normal memory, Outer Write-Through Non-transient
11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0000	Meaning when Attr<n>[7:4] is not 0000
0000	Device-nGnRnE memory	UNPREDICTABLE
00RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
01RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=00)

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0000	Meaning when Attr<n>[7:4] is not 0000
10RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=00)
11RW, RW not 00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0	No Allocate
1	Allocate

### Accessing the MAIR\_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MAIR_EL3	11	110	1010	0010	000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	-	RW
x	1	1	-	n/a	-	RW

## D7.2.73 MIDR\_EL1, Main ID Register

The MIDR\_EL1 characteristics are:

### Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

### Configurations

AArch64 System register MIDR\_EL1 is architecturally mapped to AArch32 System register [MIDR](#).

AArch64 System register MIDR\_EL1 is architecturally mapped to External register [MIDR\\_EL1](#).

### Attributes

MIDR\_EL1 is a 32-bit register.

### Field descriptions

The MIDR\_EL1 bit assignments are:

### Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

Hex representation	ASCII representation	Implementer
0x41	A	ARM Limited
0x42	B	Broadcom Corporation
0x43	C	Cavium Inc.
0x44	D	Digital Equipment Corporation
0x49	I	Infineon Technologies AG
0x4D	M	Motorola or Freescale Semiconductor Inc.
0x4E	N	NVIDIA Corporation
0x50	P	Applied Micro Circuits Corporation
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

### Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

### Architecture, bits [19:16]

The permitted values of this field are:

0001	ARMv4
0010	ARMv4T
0011	ARMv5 (obsolete)
0100	ARMv5T
0101	ARMv5TE
0110	ARMv5TEJ
0111	ARMv6
1111	Architectural features are individually identified in the ID_* registers, see <a href="#">Identification registers, functional group on page G4-4727</a> .

All other values are reserved.

### PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

### Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

## Accessing the MIDR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MIDR_EL1	11	000	0000	0000	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## D7.2.74 MPIDR\_EL1, Multiprocessor Affinity Register

The MPIDR\_EL1 characteristics are:

### Purpose

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

### Configurations

AArch64 System register MPIDR\_EL1 is architecturally mapped to AArch32 System register [MPIDR](#).

The assigned value of the [MPIDR](#).{Aff2, Aff1, Aff0} or MPIDR\_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

In a uniprocessor system ARM recommends that each Aff<n> field of this register returns a value of 0.

### Attributes

MPIDR\_EL1 is a 64-bit register.

### Field descriptions

The MPIDR\_EL1 bit assignments are:

### Bits [63:40]

Reserved, RES0.

### Aff3, bits [39:32]

Affinity level 3. Highest level affinity field.

### Bit [31]

Reserved, RES1.

### U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

- 0 Processor is part of a multiprocessor system.
- 1 Processor is part of a uniprocessor system.

### Bits [29:25]

Reserved, RES0.

### MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. The possible values of this bit are:

- 0 Performance of PEs at the lowest affinity level is largely independent.
- 1 Performance of PEs at the lowest affinity level is very interdependent.

**Aff2, bits [23:16]**

Affinity level 2. Second highest level affinity field.

**Aff1, bits [15:8]**

Affinity level 1. Third highest level affinity field.

**Aff0, bits [7:0]**

Affinity level 0. Lowest level affinity field.

**Accessing the MPIDR\_EL1**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MPIDR_EL1	11	000	0000	0000	101

**Accessibility**

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## D7.2.75 MVFR0\_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0\_EL1 characteristics are:

### Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR1\\_EL1](#) and [MVFR2\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

AArch64 System register MVFR0\_EL1 is architecturally mapped to AArch32 System register [MVFR0](#).

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

In an AArch64-only implementation, this register is UNKNOWN.

### Attributes

MVFR0\_EL1 is a 32-bit register.

### Field descriptions

The MVFR0\_EL1 bit assignments are:

31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
FPRound	FPSHVec	FPSqrt	FPDivide	FPTrap	FPDP	FPSP	SIMDReg								

#### FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

0000 Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the [FPSCR](#) setting.

0001 All rounding modes supported.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

#### FPSHVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

0000 Short vectors not supported.

0001 Short vector operation supported.

All other values are reserved.

In ARMv8-A the only permitted value is 0000.

#### FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

0000 Not supported in hardware.

0001 Supported.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

#### FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

0000 Not supported in hardware.

0001 Supported.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

#### FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

0000 Not supported.

0001 Supported.

All other values are reserved.

A value of 0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

#### FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

0000 Not supported in hardware.

0001 Supported, VFPv2.

0010 Supported, VFPv3, VFPv4, or ARMv8. VFPv3 and ARMv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0001.
- VDIV.F64 is only available if the Divide field is 0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

#### FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

0000 Not supported in hardware.

0001 Supported, VFPv2.

0010 Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0001.
- VDIV.F32 is only available if the Divide field is 0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

### SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

0000 The implementation has no Advanced SIMD and floating-point support.  
0001 The implementation includes floating-point support with 16 x 64-bit registers.  
0010 The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0010.

### Accessing the MVFR0\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MVFR0_EL1	11	000	0000	0011	000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.76 MVFR1\_EL1, AArch32 Media and VFP Feature Register 1

The MVFR1\_EL1 characteristics are:

### Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0\\_EL1](#) and [MVFR2\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D7-2195](#).

### Configurations

AArch64 System register MVFR1\_EL1 is architecturally mapped to AArch32 System register [MVFR1](#).

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

In an AArch64-only implementation, this register is UNKNOWN.

### Attributes

MVFR1\_EL1 is a 32-bit register.

### Field descriptions

The MVFR1\_EL1 bit assignments are:

#### SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

0000 Not implemented.

0001 Implemented.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

#### FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

0000 Not supported.

0001 Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.

0010 Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision and between double-precision and half-precision.

0011 As for 0010, and also includes support for half-precision floating-point arithmetic.

All other values are reserved.

The permitted values are:

- 0000 in an implementation without floating-point support.
- 0010 in an implementation with floating-point support, that does not include the [ARMv8.2-FP16](#) extension.
- 0011 in an implementation with floating-point support, that includes the [ARMv8.2-FP16](#) extension.

#### **SIMDHP, bits [23:20]**

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

- |      |   |
|------|---|
| 0000 | Not supported.  |
| 0001 | SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision. |
| 0010 | As for 0010, and also includes support for half-precision floating-point arithmetic.                                  |

All other values are reserved.

The permitted values are:

- 0000 in an implementation without SIMD floating-point support.
- 0001 in an implementation with SIMD floating-point support, that does not include the [ARMv8.2-FP16](#) extension.
- 0010 in an implementation with SIMD floating-point support, that includes the [ARMv8.2-FP16](#) extension.

#### **SIMDSP, bits [19:16]**

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

- |      |   |
|------|---|
| 0000 | Not implemented.  |
| 0001 | Implemented. This value is permitted only if the SIMDInt field is 0001. |

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

#### **SIMDInt, bits [15:12]**

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

- |      |                  |
|------|------------------|
| 0000 | Not implemented. |
| 0001 | Implemented.     |

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

#### **SIMDLS, bits [11:8]**

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

- |      |                  |
|------|------------------|
| 0000 | Not implemented. |
| 0001 | Implemented.     |

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

### FPDNaN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

0000 Not implemented, or hardware supports only the Default NaN mode.

0001 Hardware supports propagation of NaN values.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

### FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

0000 Not implemented, or hardware supports only the Flush-to-Zero mode of operation.

0001 Hardware supports full denormalized number arithmetic.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0001.

## Accessing the MVFR1\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MVFR1_EL1	11	000	0000	0011	001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.77 MVFR2\_EL1, AArch32 Media and VFP Feature Register 2

The MVFR2\_EL1 characteristics are:

### Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0\\_EL1](#) and [MVFR1\\_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D7-2195.

### Configurations

AArch64 System register MVFR2\_EL1 is architecturally mapped to AArch32 System register [MVFR2](#).

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

In an AArch64-only implementation, this register is UNKNOWN.

### Attributes

MVFR2\_EL1 is a 32-bit register.

### Field descriptions

The MVFR2\_EL1 bit assignments are:

31				8	7		4	3	0
RES0								FPMisc	SIMDMisc

#### Bits [31:8]

Reserved, RES0.

#### FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

0000 Not implemented, or no support for miscellaneous features.

0001 Support for Floating-point selection.

0010 As 0001, and Floating-point Conversion to Integer with Directed Rounding modes.

0011 As 0010, and Floating-point Round to Integer Floating-point.

0100 As 0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0100.

#### SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

0000 Not implemented, or no support for miscellaneous features.

0001 Floating-point Conversion to Integer with Directed Rounding modes.

0010 As 0001, and Floating-point Round to Integer Floating-point.

0011 As 0010, and Floating-point MaxNum and MinNum.

All other values are reserved.

In ARMv8-A the permitted values are 0000 and 0011.

## Accessing the MVFR2\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MVFR2_EL1	11	000	0000	0011	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TID3](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.78 PAR\_EL1, Physical Address Register

The PAR\_EL1 characteristics are:

### Purpose

Returns the output address (OA) from an address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

### Configurations

AArch64 System register PAR\_EL1 is architecturally mapped to AArch32 System register [PAR](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PAR\_EL1 is a 64-bit register.

### Field descriptions

The PAR\_EL1 bit assignments are:

#### For all register layouts:

#### F, bit [0]

Indicates whether the instruction performed a successful address translation.

0 Address translation completed successfully.

1 Address translation aborted.

#### When *PAR\_EL1.F*==0:

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR\_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The ATTR and SH fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.
- See the NS bit description for constraints on the value it returns.

#### ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in [MAIR\\_EL1](#), [MAIR\\_EL2](#), and [MAIR\\_EL3](#).

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

**Bits [55:52]**

Reserved, RES0.

**PA[51:48], bits [51:48]**

*In ARMv8.2*

Extension to PA[47:12]. See PA[47:12] for more details.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

**PA[47:12], bits [47:12]**

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When [ARMv8.2-LPA](#) is implemented, and 52-bit addresses and a 64KB translation granule are in use, PA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, the upper bits of this field, corresponding to address bits that are not implemented, are RES0.

**Bit [11]**

Reserved, RES1.

**IMP DEF, bit [10]**

IMPLEMENTATION DEFINED.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

**SH, bits [8:7]**

Shareability attribute, for the returned output address. Permitted values are:

- |    |                  |
|----|------------------|
| 00 | Non-shareable.   |
| 10 | Outer Shareable. |
| 11 | Inner Shareable. |

The value 01 is reserved.

———— **Note** ————

This field returns the value 10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

**Bits [6:1]**

Reserved, RES0.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

- |   |   |
|---|---|
| 0 | Address translation completed successfully. |
|---|---|

**When `PAR_EL1.F==1`:**

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

#### **IMP DEF, bits [63:56]**

IMPLEMENTATION DEFINED.

#### **IMP DEF, bits [55:52]**

IMPLEMENTATION DEFINED.

#### **IMP DEF, bits [51:48]**

IMPLEMENTATION DEFINED.

#### **Bits [47:12]**

Reserved, RES0.

#### **Bit [11]**

Reserved, RES1.

#### **Bit [10]**

Reserved, RES0.

#### **S, bit [9]**

Indicates the translation stage at which the translation aborted:

- 0 Translation aborted because of a fault in the stage 1 translation.
- 1 Translation aborted because of a fault in the stage 2 translation.

#### **PTW, bit [8]**

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

#### **Bit [7]**

Reserved, RES0.

#### **FST, bits [6:1]**

Fault status code, as shown in the Data Abort ESR encoding.

#### **F, bit [0]**

- Indicates whether the instruction performed a successful address translation.
- 1 Address translation aborted.

### **Accessing the `PAR_EL1`**

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PAR_EL1	11	000	0111	0100	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

D7.2.79 REVIDR\_EL1, Revision ID Register

The REVIDR\_EL1 characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configurations

AArch64 System register REVIDR\_EL1 is architecturally mapped to AArch32 System register [REVIDR](#).

If REVIDR\_EL1 has the same value as [MIDR\\_EL1](#), then its contents have no significance.

Attributes

REVIDR\_EL1 is a 32-bit register.

Field descriptions

The REVIDR\_EL1 bit assignments are:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the REVIDR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
REVIDR_EL1	11	000	0000	0000	110

Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TID1==1, Non-secure read accesses to this register from EL1 are trapped to EL2.

## D7.2.80 RMR\_EL1, Reset Management Register (EL1)

The RMR\_EL1 characteristics are:

### Purpose

If EL1 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

### Configurations

AArch64 System register RMR\_EL1 is architecturally mapped to AArch32 System register RMR when EL1 is highest implemented Exception level.

Only implemented if EL1 is the highest implemented Exception level. In this case:

- If EL1 can use AArch32 and AArch64 then this register must be implemented.
- If EL1 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

### Attributes

RMR\_EL1 is a 32-bit register.

### Field descriptions

The RMR\_EL1 bit assignments are:

### Bits [31:2]

Reserved, RES0.

### RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0 on a Warm or Cold reset.

### AA64, bit [0]

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

- 0 AArch32.
- 1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL1 cannot use AArch32 this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

### Accessing the RMR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
RMR_EL1	11	000	1100	0000	010

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL1 is the highest implemented Exception level.	x	x	x	-	RW	n/a	n/a

When RMR\_EL1 is not implemented, the encoding for this register is UNDEFINED.

## D7.2.81 RMR\_EL2, Reset Management Register (EL2)

The RMR\_EL2 characteristics are:

### Purpose

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

### Configurations

AArch64 System register RMR\_EL2 is architecturally mapped to AArch32 System register [HRMR](#).

Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

### Attributes

RMR\_EL2 is a 32-bit register.

### Field descriptions

The RMR\_EL2 bit assignments are:

### Bits [31:2]

Reserved, RES0.

### RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0 on a Warm or Cold reset.

### AA64, bit [0]

When EL2 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

0 AArch32.

1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 cannot use AArch32 this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

### Accessing the RMR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
RMR_EL2	11	100	1100	0000	010

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL2 is the highest implemented Exception level.	x	0	1	-	-	RW	n/a
EL2 is the highest implemented Exception level.	x	1	1	-	n/a	RW	n/a

When RMR\_EL2 is not implemented, the encoding for this register is UNDEFINED.

## D7.2.82 RMR\_EL3, Reset Management Register (EL3)

The RMR\_EL3 characteristics are:

### Purpose

If EL3 is implemented and this register is implemented:

- A write to the register at EL3 can request a Warm reset.
- If EL3 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

### Configurations

AArch64 System register RMR\_EL3 is architecturally mapped to AArch32 System register RMR when EL3 is implemented.

When EL3 is implemented:

- If EL3 can use AArch32 and AArch64 then this register must be implemented.
- If EL3 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

See the field descriptions for the reset values. These apply whenever the register is implemented.

### Attributes

RMR\_EL3 is a 32-bit register.

### Field descriptions

The RMR\_EL3 bit assignments are:

### Bits [31:2]

Reserved, RES0.

### RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0 on a Warm or Cold reset.

### AA64, bit [0]

When EL3 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

- 0 AArch32.
- 1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL3 cannot use AArch32 this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

### Accessing the RMR\_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
RMR_EL3	11	110	1100	0000	010

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL3 is the highest implemented Exception level.	x	x	0	-	-	n/a	RW
EL3 is the highest implemented Exception level.	x	0	1	-	-	-	RW
EL3 is the highest implemented Exception level.	x	1	1	-	n/a	-	RW

When RMR\_EL3 is not implemented, the encoding for this register is UNDEFINED.

### D7.2.83 RVBAR\_EL1, Reset Vector Base Address Register (if EL2 and EL3 not implemented)

The RVBAR\_EL1 characteristics are:

#### Purpose

If EL1 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

#### Configurations

Only implemented if the highest Exception level implemented is EL1.

#### Attributes

RVBAR\_EL1 is a 64-bit register.

#### Field descriptions

The RVBAR\_EL1 bit assignments are:

#### Bits [63:0]

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

#### Accessing the RVBAR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
RVBAR_EL1	11	000	1100	0000	001

#### Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL1 is the highest implemented Exception level.	x	x	x	-	RO	n/a	n/a

When EL1 is not the highest implemented Exception level, the encoding for this register is UNDEFINED.

## D7.2.84 RVBAR\_EL2, Reset Vector Base Address Register (if EL3 not implemented)

The RVBAR\_EL2 characteristics are:

### Purpose

If EL2 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

### Configurations

Only implemented if the highest Exception level implemented is EL2.

### Attributes

RVBAR\_EL2 is a 64-bit register.

### Field descriptions

The RVBAR\_EL2 bit assignments are:

### Bits [63:0]

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

### Accessing the RVBAR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
RVBAR_EL2	11	100	1100	0000	001

### Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL2 is the highest implemented Exception level.	x	0	1	-	-	RO	n/a
EL2 is the highest implemented Exception level.	x	1	1	-	n/a	RO	n/a

When EL2 is not the highest implemented Exception level, the encoding for this register is UNDEFINED.

## D7.2.85 RVBAR\_EL3, Reset Vector Base Address Register (if EL3 implemented)

The RVBAR\_EL3 characteristics are:

### Purpose

If EL3 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

### Configurations

Only implemented if the highest Exception level implemented is EL3.

### Attributes

RVBAR\_EL3 is a 64-bit register.

### Field descriptions

The RVBAR\_EL3 bit assignments are:

### Bits [63:0]

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

### Accessing the RVBAR\_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
RVBAR_EL3	11	110	1100	0000	001

### Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL3 is the highest implemented Exception level.	x	x	0	-	-	n/a	RO
EL3 is the highest implemented Exception level.	x	0	1	-	-	-	RO
EL3 is the highest implemented Exception level.	x	1	1	-	n/a	-	RO

When EL3 is not the highest implemented Exception level, the encoding for this register is UNDEFINED.

## D7.2.86 S3\_<op1>\_<Cn>\_<Cm>\_<op2>, IMPLEMENTATION DEFINED registers

The S3\_<op1>\_<Cn>\_<Cm>\_<op2> characteristics are:

### Purpose

This area of the instruction set space is reserved for IMPLEMENTATION DEFINED registers.

### Configurations

There are no configuration notes.

### Attributes

S3\_<op1>\_<Cn>\_<Cm>\_<op2> is a 64-bit register.

### Field descriptions

The S3\_<op1>\_<Cn>\_<Cm>\_<op2> bit assignments are:

### IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

### Accessing the S3\_<op1>\_<Cn>\_<Cm>\_<op2>

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
S3_<op1>_C<Cn>_C<Cm>_<op2>	11	op1<2:0>	Cn<3:0>	Cm<3:0>	op2<2:0>

- <op1> is in the range 0 - 7.
- <CRn> can take the values: 11, 15.
- <CRm> is in the range 0 - 15.
- <op2> is in the range 0 - 7.

The value of <Cn> must be either 11 or 15. Other values may refer to architecturally-defined registers.

### Accessibility

The accessibility of registers with these encodings is IMPLEMENTATION DEFINED.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If HCR\_EL2.TIDCP==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If HCR\_EL2.TIDCP==1, Non-secure accesses to this register from EL1 are trapped to EL2.

## D7.2.87 SCR\_EL3, Secure Configuration Register

The SCR\_EL3 characteristics are:

### Purpose

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0 and EL1, either Secure or Non-secure.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, and External Abort interrupts are taken to EL3.

### Configurations

AArch64 System register SCR\_EL3 can be mapped to AArch32 System register [SCR](#), but this is not architecturally mandated.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

SCR\_EL3 is a 32-bit register.

### Field descriptions

The SCR\_EL3 bit assignments are:

### Bits [31:16]

Reserved, RES0.

### TERR, bit [15]

Trap Error record accesses. If the RAS Extension is implemented, the possible values of this bit are:

- 0 Do not trap accesses to record registers from EL1 and EL2 to EL3.
- 1 Accesses to the ER\* registers from EL1 and EL2 generate a Trap exception to EL3.

This bit resets to 0 on Warm reset.

When the RAS Extension is not implemented, this field is RES0.

### TLOR, bit [14]

*In ARMv8.2 and ARMv8.1*

Trap LOR registers. Traps accesses to the [LORSA\\_EL1](#), [LOREA\\_EL1](#), [LORN\\_EL1](#), [LORC\\_EL1](#), and [LORID\\_EL1](#) registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

- 0 This control does not cause any instructions to be trapped.
- 1 EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped [HCR\\_EL2.TLOR](#).

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**In ARMv8.0.**

Reserved, RES0.

**TWE, bit [13]**

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from both Security states and both Execution states.

- 0 This control does not cause any instructions to be trapped.
- 1 Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by [SCTLR.nTWE](#), [HCR.TWE](#), [SCTLR\\_EL1.nTWE](#), [SCTLR\\_EL2.nTWE](#), or [HCR\\_EL2.TWE](#).

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

———— **Note** ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

**TWI, bit [12]**

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from both Security states and both Execution states.

- 0 This control does not cause any instructions to be trapped.
- 1 Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by [SCTLR.nTWI](#), [HCR.TWI](#), [SCTLR\\_EL1.nTWI](#), [SCTLR\\_EL2.nTWI](#), or [HCR\\_EL2.TWI](#).

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

———— **Note** ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

**ST, bit [11]**

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only.

- 0 Secure EL1 using AArch64 accesses to the [CNTPS\\_TVAL\\_EL1](#), [CNTPS\\_CTL\\_EL1](#), and [CNTPS\\_CVAL\\_EL1](#) are trapped to EL3.
- 1 This control does not cause any instructions to be trapped.

#### RW, bit [10]

Execution state control for lower Exception levels.

- |   |  |
|---|--|
| 0 | Lower levels are all AArch32.  |
| 1 | The next lower level is AArch64.<br>If EL2 is present: <ul style="list-style-type: none"> <li>• EL2 is AArch64.</li> <li>• EL2 controls EL1 and EL0 behaviors.</li> </ul> If EL2 is not present: <ul style="list-style-type: none"> <li>• EL1 is AArch64.</li> <li>• EL0 is determined by the Execution state described in the current process state when executing at EL0.</li> </ul> |

If all lower Exception levels cannot use AArch32 then this bit is RAO/WI.

This bit is permitted to be cached in a TLB.

#### SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory. The possible values for this bit are:

- |   |  |
|---|--|
| 0 | Secure state instruction fetches from Non-secure memory are permitted.     |
| 1 | Secure state instruction fetches from Non-secure memory are not permitted. |

This bit is permitted to be cached in a TLB.

#### HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3, EL2, and Non-secure EL1, in both Execution states.

- |   |   |
|---|---|
| 0 | HVC instructions are UNDEFINED at EL3, EL2, and Non-secure EL1, and any resulting exception is taken from the current Exception level to the current Exception level. |
| 1 | HVC instructions are enabled at EL1 and above.  |

#### ————— **Note** —————

HVC instructions are always UNDEFINED at EL0.

If EL2 is not implemented, this bit is RES0.

#### SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from both Security states and both Execution states.

- |   |  |
|---|--|
| 0 | SMC instructions are enabled at EL1 and above.   |
| 1 | SMC instructions are UNDEFINED at EL1 and above. |

#### ————— **Note** —————

SMC instructions are always UNDEFINED at EL0.

#### Bit [6]

Reserved, RES0.

#### Bits [5:4]

Reserved, RES1.

### EA, bit [3]

External Abort and SError Interrupt Routing.

- 0 When executing at Exception levels below EL3, External Aborts and SError Interrupts are not taken to EL3.  
In addition, when executing at EL3:
- SError Interrupts are not taken.
  - External Aborts are taken to EL3.
- 1 When executing at any Exception level, External Aborts and SError Interrupts are taken to EL3.

For more information, see [Asynchronous exception routing on page D1-1834](#).

### FIQ, bit [2]

Physical FIQ Routing.

- 0 When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3.  
When executing at EL3, physical FIQ interrupts are not taken.
- 1 When executing at any Exception level, physical FIQ interrupts are taken to EL3.

For more information, see [Asynchronous exception routing on page D1-1834](#).

### IRQ, bit [1]

Physical IRQ Routing.

- 0 When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3.  
When executing at EL3, physical IRQ interrupts are not taken.
- 1 When executing at any Exception level, physical IRQ interrupts are taken to EL3.

For more information, see [Asynchronous exception routing on page D1-1834](#).

### NS, bit [0]

Non-secure bit.

- 0 Indicates that EL0 and EL1 are in Secure state, and so memory accesses from those Exception levels can access Secure memory.  
When executing at EL3:
- The [AT S1E2R](#), [AT S1E2W](#), [TLBI VAE2](#), [TLBI VALE2](#), [TLBI VAE2IS](#), [TLBI VALE2IS](#), [TLBI ALLE2](#), and [TLBI ALLE2IS](#) System instructions are UNDEFINED.
  - Each AT S1E2\*\* System instruction executes as the corresponding AT S1E\*\* instruction. For example, [AT S1E2OR](#) executes as [AT S1E0R](#).
  - Each of the [TLBI IPAS2E1](#), [TLBI IPAS2E1IS](#), [TLBI IPAS2LE1](#), and [TLBI IPAS2LE1IS](#) System instructions executes as a NOP.
  - A [TLBI VMALLS12E1](#) System instruction executes as [TLBI VMALLE1](#), and a [TLBI VMALLS12E1IS](#) System instruction executes as [TLBI VMALLE1IS](#).
- 1 Indicates that EL0 and EL1 are in Non-secure state, and so memory accesses from those Exception levels cannot access Secure memory.

#### Note

EL2 is not supported in the Secure state. When `SCR_EL3.NS==0`, it is not possible to enter EL2, and the EL2 state has no effect on execution. See [Virtualization on page D1-1782](#).

## Accessing the SCR\_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
SCR_EL3	11	110	0001	0001	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
0	0	1	-	-	-	RW
0	1	1	-	n/a	-	RW
1	0	1	-	-	-	RW
1	1	1	-	n/a	-	RW

## D7.2.88 SCTLR\_EL1, System Control Register (EL1)

The SCTLR\_EL1 characteristics are:

### Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

### Configurations

AArch64 System register SCTLR\_EL1 is architecturally mapped to AArch32 System register [SCTLR](#).

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL1 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

SCTLR\_EL1 is a 32-bit register.

### Field descriptions

The SCTLR\_EL1 bit assignments are:

### Bits [31:30]

Reserved, RES0.

### LSMAOE, bit [29]

#### In ARMv8.2

Load Multiple and Store Multiple Atomicity and Ordering Enable. When the OPTIONAL feature [ARMv8.2-LSMAOC](#) is implemented, defined values are:

- 0 For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
- 1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for ARMv8.0.

This bit is permitted to be cached in a TLB.

If this bit is not implemented, it is RES1.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES1.

**nTLSMD, bit [28]**

***In ARMv8.2***

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory. When the OPTIONAL feature [ARMv8.2-LSMAOC](#) is implemented, defined values are:

- 0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
- 1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

If this bit is not implemented, it is RES1.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES1.

**Bit [27]**

Reserved, RES0.

**UCI, bit [26]**

Traps EL0 execution of cache maintenance instructions to EL1, from AArch64 state only.

- 0 Any attempt to execute a [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#), or [IC IVAU](#) instruction at EL0 using AArch64 is trapped to EL1.
- 1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

**EE, bit [25]**

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

- 0 Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.
- 1 Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an IMPLEMENTATION DEFINED value.

#### E0E, bit [24]

Endianness of data accesses at EL0.

The possible values of this bit are:

- 0 Explicit data accesses at EL0 are little-endian.
- 1 Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR\_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR\_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### SPAN, bit [23]

##### *In ARMv8.2 and ARMv8.1*

Set Privileged Access Never, on taking an exception to EL1.

- 0 PSTATE.PAN is set to 1 on taking an exception to EL1.
- 1 The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

##### *In ARMv8.0.*

Reserved, RES1.

#### Bit [22]

Reserved, RES1.

#### IESB, bit [21]

##### *In ARMv8.2*

Implicit Error Synchronization Barrier enable. Permitted values are:

- 0 Disabled.
- 1 An implicit ErrorSynchronizationBarrier() call is added:
  - After each exception taken to EL1.
  - Before the operational pseudocode of each ERET instruction executed at EL1.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and regardless of the value of the field its effective value might be 0 or 1. If the effective value of the field is 1, then an implicit ErrorSynchronizationBarrier() is added after each DCPSx instruction and before each DRPS instruction, in addition to the other cases where it is added.

This field is part of the required ARMv8.2 implementation of the RAS Extension. See [The Reliability, Availability, and Serviceability \(RAS\) Extension](#) on page A1-63.

This field resets to a value that is architecturally UNKNOWN.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

## Bit [20]

Reserved, RES1.

## WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

- 0 This control has no effect on memory access permissions.
- 1 Any region that is writable in the EL1&0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.

The WXN bit is permitted to be cached in a TLB.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

This field resets to a value that is architecturally UNKNOWN.

## nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL1, from both Execution states.

- 0 Any attempt to execute a WFE instruction at EL0 is trapped to EL1, if the instruction would otherwise have caused the PE to enter a low-power state.
- 1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

### Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

## Bit [17]

Reserved, RES0.

## nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL1, from both Execution states.

- 0 Any attempt to execute a WFI instruction at EL0 is trapped EL1, if the instruction would otherwise have caused the PE to enter a low-power state.
- 1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

### Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

#### UCT, bit [15]

Traps EL0 accesses to the [CTR\\_EL0](#) to EL1, from AArch64 state only.

0 Accesses to the [CTR\\_EL0](#) from EL0 using AArch64 are trapped to EL1.

1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

#### DZE, bit [14]

Traps EL0 execution of [DC ZVA](#) instructions to EL1, from AArch64 state only.

0 Any attempt to execute a [DC ZVA](#) instruction at EL0 using AArch64 is trapped to EL1. Reading [DCZID\\_EL0](#).DZP from EL0 returns 1, indicating that [DC ZVA](#) instructions are not supported.

1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

#### Bit [13]

Reserved, RES0.

#### I, bit [12]

Instruction access Cacheability control, for accesses at EL0 and EL1:

0 All instruction access to Normal memory from EL0 and EL1 are Non-cacheable for all levels of instruction and unified cache.

If the value of [SCTLR\\_EL1](#).M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

1 This control has no effect on the Cacheability of instruction access to Normal memory from EL0 and EL1.

If the value of [SCTLR\\_EL1](#).M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

When the value of the [HCR\\_EL2](#).DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the [SCTLR\\_EL1](#).I bit.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bit [11]

Reserved, RES1.

#### Bit [10]

Reserved, RES0.

#### UMA, bit [9]

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL1, from AArch64 state only.

0 Any attempt at EL0 using AArch64 to execute an MRS, MSR(register), or MSR(immediate) instruction that accesses the [DAIF](#) is trapped to EL1.

1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

#### SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

0 SETEND instruction execution is enabled at EL0 using AArch32.

1 SETEND instructions are UNDEFINED at EL0 using AArch32.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

If EL0 cannot use AArch32, this bit is RES1.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

0 All IT instruction functionality is enabled at EL0 using AArch32.

1 Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with `hw1[3:0] != 1000`.
- All encodings of the subsequent instruction with the following values for `hw1`:

11xxxxxxxxxxxx

All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.

1011xxxxxxxxxxxx

All instructions in [Miscellaneous 16-bit instructions on page F3-2883](#).

10100xxxxxxxxxxx

ADD Rd, PC, #imm

01001xxxxxxxxxxx

LDR Rd, [PC, #imm]

0100x1xxx1111xxx

ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.

010001xx1xxx111

ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see [Changes to an ITD control by an instruction in an IT block on page E1-2738](#)

If EL0 cannot use AArch32, this bit is RES1.

ITD is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the [SCTLR\\_EL1](#). If it is not implemented then this bit is RAZ/WI.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### Bit [6]

Reserved, RES0.

#### CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==1111) encoding space from EL0:

- |   |  |
|---|--|
| 0 | EL0 using AArch32: EL0 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is UNDEFINED. |
| 1 | EL0 using AArch32: EL0 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is enabled.   |

If EL0 cannot use AArch32, this bit is RES0.

CP15BEN is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the [SCTLR\\_EL1](#). If it is not implemented then this bit is RAO/WI.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-1793](#).

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

#### SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-1793](#).

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

This field resets to a value that is architecturally UNKNOWN.

#### C, bit [2]

Cacheability control, for data accesses.

- |   |  |
|---|--|
| 0 | All data access to Normal memory from EL0 and EL1, and all Normal memory accesses to the EL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.   |
| 1 | This control has no effect on the Cacheability of: <ul style="list-style-type: none"> <li>• Data access to Normal memory from EL0 and EL1.</li> <li>• Normal memory accesses to the EL1&amp;0 stage 1 translation tables.</li> </ul> |

When the value of the [HCR\\_EL2](#).DC bit is 1, the PE ignores SCLTR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

When this register has an architecturally-defined reset value, this field resets to 0.

## A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0:

- 0 Alignment fault checking disabled when executing at EL1 or EL0.  
Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
- 1 Alignment fault checking enabled when executing at EL1 or EL0.  
All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field resets to a value that is architecturally UNKNOWN.

## M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

- 0 EL1 and EL0 stage 1 address translation disabled.  
See the SCTLRL\_EL1.I field for the behavior of instruction accesses to Normal memory.
- 1 EL1 and EL0 stage 1 address translation enabled.

If the value of [HCR\\_EL2](#).{DC, TGE} is not {0, 0} then in Non-secure state the PE behaves as if the value of the SCTLRL\_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

When this register has an architecturally-defined reset value, this field resets to 0.

## Accessing the SCTLRL\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
SCTLRL_EL1	11	000	0001	0000	000
SCTLRL_EL12	11	101	0001	0000	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
SCTLR_EL1	x	x	0	-	RW	n/a	RW
SCTLR_EL1	0	0	1	-	RW	RW	RW
SCTLR_EL1	0	1	1	-	n/a	RW	RW
SCTLR_EL1	1	0	1	-	RW	<a href="#">SCTLR_EL2</a>	RW
SCTLR_EL1	1	1	1	-	n/a	<a href="#">SCTLR_EL2</a>	RW
SCTLR_EL12	x	x	0	-	-	n/a	-
SCTLR_EL12	0	0	1	-	-	-	-
SCTLR_EL12	0	1	1	-	n/a	-	-
SCTLR_EL12	1	0	1	-	-	RW	RW
SCTLR_EL12	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic SCTLR\_EL1 or SCTLR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.

## D7.2.89 SCTLR\_EL2, System Control Register (EL2)

The SCTLR\_EL2 characteristics are:

### Purpose

Provides top level control of the system, including its memory system, at EL2.

When [ARMv8.1-VHE](#) is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, these controls apply also to execution at Non-secure EL0.

### Configurations

AArch64 System register SCTLR\_EL2 is architecturally mapped to AArch32 System register [HSCTLR](#).

If EL2 is not implemented, this register is RES0 from EL3.

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

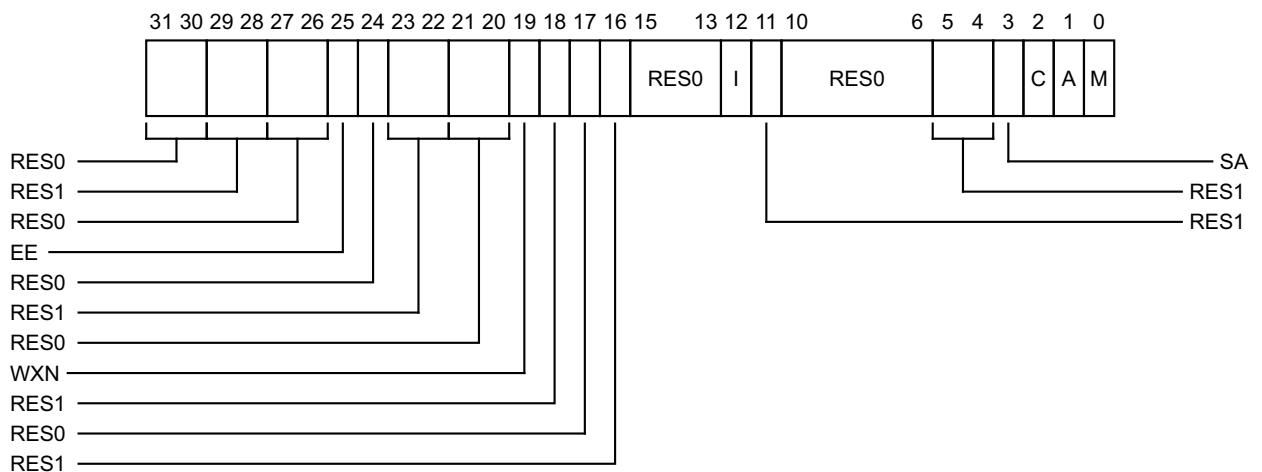

### Attributes

SCTLR\_EL2 is a 32-bit register.

### Field descriptions

The SCTLR\_EL2 bit assignments are:

**When [HCR\\_EL2](#).{E2H, TGE} != {1, 1}:**

This format applies in all ARMv8.0 implementations, and from ARMv8.1 in Secure state.

### Bits [31:30]

Reserved, RES0.

### Bits [29:28]

Reserved, RES1.

### Bits [27:26]

Reserved, RES0.

### EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

- 0 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian.
- 1 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an IMPLEMENTATION DEFINED value.

### Bit [24]

Reserved, RES0.

### Bits [23:22]

Reserved, RES1.

### Bits [21:20]

Reserved, RES0.

### WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

- 0 This control has no effect on memory access permissions.
- 1 Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

The WXN bit is permitted to be cached in a TLB.

This field resets to a value that is architecturally UNKNOWN.

### Bit [18]

Reserved, RES1.

### Bit [17]

Reserved, RES0.

### Bit [16]

Reserved, RES1.

### Bits [15:13]

Reserved, RES0.

### I, bit [12]

Instruction access Cacheability control, for accesses at EL2:

- 0 All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache.

If the value of SCTLR\_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

- 1 This control has no effect on the Cacheability of instruction access to Normal memory from EL2.

If the value of SCTLR\_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0 or EL3 translation regimes.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bit [11]

Reserved, RES1.

#### Bits [10:6]

Reserved, RES0.

#### Bits [5:4]

Reserved, RES1.

#### SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-1793](#).

This field resets to a value that is architecturally UNKNOWN.

#### C, bit [2]

Cacheability control, for data accesses.

- 0 All data access to Normal memory from EL2, and all Normal memory accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.

- 1 This control has no effect on the Cacheability of:
- Data access to Normal memory from EL2.
  - Normal memory accesses to the EL2 translation tables.

This bit has no effect on the EL1&0 or EL3 translation regimes.

When this register has an architecturally-defined reset value, this field resets to 0.

#### A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

- 0 Alignment fault checking disabled when executing at EL2.  
Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

- 1 Alignment fault checking enabled when executing at EL2.  
All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

This field resets to a value that is architecturally UNKNOWN.

#### M, bit [0]

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

- 0 EL2 stage 1 address translation disabled.

See the SCTLR\_EL2.I field for the behavior of instruction accesses to Normal memory.

1 EL2 stage 1 address translation enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

**When  $HCR\_EL2.\{E2H, TGE\} == \{1, 1\}$ :**

This format applies only from ARMv8.1 and only in Non-secure state when  $HCR\_EL2.\{E2H, TGE\} == \{1, 1\}$ .

#### Bits [31:30]

Reserved, RES0.

#### LSMAOE, bit [29]

##### *In ARMv8.2*

Load Multiple and Store Multiple Atomicity and Ordering Enable. When the OPTIONAL feature [ARMv8.2-LSMAOC](#) is implemented, defined values are:

- 0 For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
- 1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for ARMv8.0.

This bit is permitted to be cached in a TLB.

If this bit is not implemented, it is RES1.

##### *In ARMv8.1.*

Reserved, RES1.

#### nTLSMD, bit [28]

##### *In ARMv8.2*

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory. When the OPTIONAL feature [ARMv8.2-LSMAOC](#) is implemented, defined values are:

- 0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

- 1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

If this bit is not implemented, it is RES1.

**In ARMv8.1.**

Reserved, RES1.

**Bit [27]**

Reserved, RES0.

**UCI, bit [26]**

Traps EL0 execution of cache maintenance instructions to EL2, from AArch64 state only.

- 0 Any attempt to execute a [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), or [IC IVAU](#) instruction at EL0 using AArch64 is trapped to EL2.

- 1 This control does not cause any instructions to be trapped.

This field resets to a value that is architecturally UNKNOWN.

**EE, bit [25]**

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime.

The possible values of this bit are:

- 0 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime are little-endian.
- 1 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an IMPLEMENTATION DEFINED value.

**E0E, bit [24]**

Endianness of data accesses at EL0.

The possible values of this bit are:

- 0 Explicit data accesses at EL0 are little-endian.
- 1 Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR\_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR\_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

### SPAN, bit [23]

Set Privileged Access Never, on taking an exception to EL2.

0 PSTATE.PAN is set to 1 on taking an exception to EL2.

1 The value of PSTATE.PAN is left unchanged on taking an exception to EL2.

This field resets to a value that is architecturally UNKNOWN.

### Bit [22]

Reserved, RES1.

### IESB, bit [21]

#### *In ARMv8.2*

Implicit Error Synchronization Barrier enable. Permitted values are:

0 Disabled.

1 An implicit ErrorSynchronizationBarrier() call is added:

- After each exception taken to EL2.
- Before the operational pseudocode of each ERET instruction executed at EL2.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and regardless of the value of the field its effective value might be 0 or 1. If the effective value of the field is 1, then an implicit ErrorSynchronizationBarrier() is added after each DCPSx instruction and before each DRPS instruction, in addition to the other cases where it is added.

This field is part of the required ARMv8.2 implementation of the RAS Extension. See [The Reliability, Availability, and Serviceability \(RAS\) Extension on page A1-63](#).

#### *In ARMv8.1.*

Reserved, RES0.

### Bit [20]

Reserved, RES1.

### WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

0 This control has no effect on memory access permissions.

1 Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

The WXN bit is permitted to be cached in a TLB.

This field resets to a value that is architecturally UNKNOWN.

### nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL2, from both Execution states.

0 Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.

1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

#### **Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

This field resets to a value that is architecturally UNKNOWN.

#### Bit [17]

Reserved, RES0.

#### nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL2, from both Execution states.

- 0 Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
- 1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

#### ———— Note ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

This field resets to a value that is architecturally UNKNOWN.

#### UCT, bit [15]

Traps EL0 accesses to the [CTR\\_EL0](#) to EL2, from AArch64 state only.

- 0 Accesses to the [CTR\\_EL0](#) from EL0 using AArch64 are trapped to EL2.
- 1 This control does not cause any instructions to be trapped.

This field resets to a value that is architecturally UNKNOWN.

#### DZE, bit [14]

Traps EL0 execution of [DC ZVA](#) instructions to EL2, from AArch64 state only.

- 0 Any attempt to execute a [DC ZVA](#) instruction at EL0 using AArch64 is trapped to EL2. Reading [DCZID\\_EL0](#).DZP from EL0 returns 1, indicating that [DC ZVA](#) instructions are not supported.
- 1 This control does not cause any instructions to be trapped.

This field resets to a value that is architecturally UNKNOWN.

#### Bit [13]

Reserved, RES0.

#### I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and EL0:

- 0 All instruction access to Normal memory from EL2 and EL0 are Non-cacheable for all levels of instruction and unified cache.  
If the value of [SCTLR\\_EL2.M](#) is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
- 1 This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and EL0.  
If the value of [SCTLR\\_EL2.M](#) is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regimes.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bit [11]

Reserved, RES1.

#### Bits [10:9]

Reserved, RES0.

#### SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

0 SETEND instruction execution is enabled at EL0 using AArch32.

1 SETEND instructions are UNDEFINED at EL0 using AArch32.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

If EL0 cannot use AArch32, this bit is RES1.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

0 All IT instruction functionality is enabled at EL0 using AArch32.

1 Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with  $hw1[3:0] \neq 1000$ .
- All encodings of the subsequent instruction with the following values for  $hw1$ :

11xxxxxxxxxxxx

All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.

1011xxxxxxxxxxxx

All instructions in *Miscellaneous 16-bit instructions* on page F3-2883.

10100xxxxxxxxxxx

ADD Rd, PC, #imm

01001xxxxxxxxxxx

LDR Rd, [PC, #imm]

0100x1xxx1111xxx

ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.

010001xx1xxxx111

ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see *Changes to an ITD control by an instruction in an IT block* on page E1-2738

If EL0 cannot use AArch32, this bit is RES1.

ITD is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the [SCTLR\\_EL1](#). If it is not implemented then this bit is RAZ/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### Bit [6]

Reserved, RES0.

#### CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==1111) encoding space from EL0:

- |   |  |
|---|--|
| 0 | EL0 using AArch32: EL0 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is UNDEFINED. |
| 1 | EL0 using AArch32: EL0 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is enabled.   |

If EL0 cannot use AArch32, this bit is RES0.

CP15BEN is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the [SCTLR\\_EL1](#). If it is not implemented then this bit is RAO/WI.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-1793](#).

This field resets to a value that is architecturally UNKNOWN.

#### SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-1793](#).

This field resets to a value that is architecturally UNKNOWN.

#### C, bit [2]

Cacheability control, for data accesses.

- |   |  |
|---|--|
| 0 | All data access to Normal memory from EL2 and EL0, and all Normal memory accesses to the EL2&0 translation tables, are Non-cacheable for all levels of data and unified cache.   |
| 1 | This control has no effect on the Cacheability of: <ul style="list-style-type: none"> <li>• Data access to Normal memory from EL2 and EL0.</li> <li>• Normal memory accesses to the EL2&amp;0 translation tables.</li> </ul> |

This bit has no effect on the EL3 translation regimes.

When this register has an architecturally-defined reset value, this field resets to 0.

#### A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and EL0:

- |   |  |
|---|--|
| 0 | Alignment fault checking disabled when executing at EL2 and EL0.<br>Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.  |
| 1 | Alignment fault checking enabled when executing at EL2 and EL0.<br>All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception. |

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

This field resets to a value that is architecturally UNKNOWN.

#### M, bit [0]

MMU enable for EL2&0 stage 1 address translation. Possible values of this bit are:

0 EL2&0 stage 1 address translation disabled.

See the SCTLR\_EL2.I field for the behavior of instruction accesses to Normal memory.

1 EL2&1 stage 1 address translation enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the SCTLR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
SCTLR_EL2	11	100	0001	0000	000
SCTLR_EL1	11	000	0001	0000	000

### Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
SCTLR_EL2	x	x	0	-	-	n/a	RW
SCTLR_EL2	0	0	1	-	-	RW	RW
SCTLR_EL2	0	1	1	-	n/a	RW	RW
SCTLR_EL2	1	0	1	-	-	RW	RW
SCTLR_EL2	1	1	1	-	n/a	RW	RW
SCTLR_EL1	x	x	0	-	<a href="#">SCTLR_EL1</a>	n/a	<a href="#">SCTLR_EL1</a>
SCTLR_EL1	0	0	1	-	<a href="#">SCTLR_EL1</a>	<a href="#">SCTLR_EL1</a>	<a href="#">SCTLR_EL1</a>
SCTLR_EL1	0	1	1	-	n/a	<a href="#">SCTLR_EL1</a>	<a href="#">SCTLR_EL1</a>
SCTLR_EL1	1	0	1	-	<a href="#">SCTLR_EL1</a>	RW	<a href="#">SCTLR_EL1</a>
SCTLR_EL1	1	1	1	-	n/a	RW	<a href="#">SCTLR_EL1</a>

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic `SCTLR_EL2` or `SCTLR_EL1` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

D7.2.90 SCTLR\_EL3, System Control Register (EL3)

The SCTLR\_EL3 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL3.

Configurations

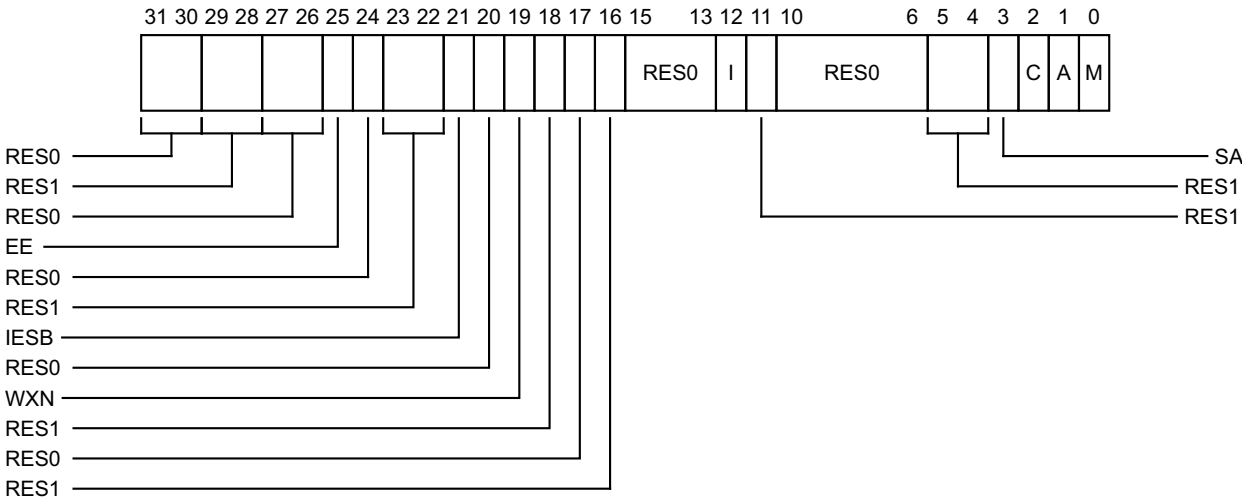

Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL3 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

SCTLR\_EL3 is a 32-bit register.

Field descriptions

The SCTLR\_EL3 bit assignments are:

Bits [31:30]

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

The possible values of this bit are:

- 0 Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.
- 1 Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to an IMPLEMENTATION DEFINED value.

#### Bit [24]

Reserved, RES0.

#### Bits [23:22]

Reserved, RES1.

#### IESB, bit [21]

##### *In ARMv8.2*

Implicit Error Synchronization Barrier enable. Permitted values are:

- 0 Disabled.
- 1 An implicit ErrorSynchronizationBarrier() call is added:
  - After each exception taken to EL3.
  - Before the operational pseudocode of each ERET instruction executed at EL3.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and regardless of the value of the field its effective value might be 0 or 1. If the effective value of the field is 1, then an implicit ErrorSynchronizationBarrier() is added after each DCPSx instruction and before each DRPS instruction, in addition to the other cases where it is added.

This field is part of the required ARMv8.2 implementation of the RAS Extension. See [The Reliability, Availability, and Serviceability \(RAS\) Extension on page A1-63](#).

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### Bit [20]

Reserved, RES0.

#### WXN, bit [19]

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

- 0 This control has no effect on memory access permissions.
- 1 Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.

The WXN bit is permitted to be cached in a TLB.

This field resets to a value that is architecturally UNKNOWN.

Reserved, RES0.

#### Bit [16]

Reserved, RES1.

#### Bits [15:13]

Reserved, RES0.

### I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

- 0 All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache.  
If the value of SCTLR\_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
- 1 This control has no effect on the Cacheability of instruction access to Normal memory from EL3.  
If the value of SCTLR\_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

When this register has an architecturally-defined reset value, this field resets to 0.

### Bit [11]

Reserved, RES1.

### Bits [10:6]

Reserved, RES0.

### Bits [5:4]

Reserved, RES1.

### SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-1793](#).

This field resets to a value that is architecturally UNKNOWN.

### C, bit [2]

Cacheability control, for data accesses.

- 0 All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.
- 1 This control has no effect on the Cacheability of:
- Data access to Normal memory from EL3.
  - Normal memory accesses to the EL3 translation tables.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

When this register has an architecturally-defined reset value, this field resets to 0.

### A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3:

- 0 Alignment fault checking disabled when executing at EL3.  
Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
- 1 Alignment fault checking enabled when executing at EL3.  
All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

This field resets to a value that is architecturally UNKNOWN.

#### M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

- 0 EL3 stage 1 address translation disabled.  
See the SCTLR\_EL3.I field for the behavior of instruction accesses to Normal memory.
- 1 EL3 stage 1 address translation enabled.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the SCTLR\_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
SCTLR_EL3	11	110	0001	0000	000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	-	RW
x	1	1	-	n/a	-	RW

## D7.2.91 TCR\_EL1, Translation Control Register (EL1)

The TCR\_EL1 characteristics are:

### Purpose

The control register for stage 1 of the EL1&0 translation regime.

### Configurations

AArch64 System register TCR\_EL1[31:0] is architecturally mapped to AArch32 System register [TTBCR](#).

AArch64 System register TCR\_EL1[63:32] is architecturally mapped to AArch32 System register [TTBCR2](#).

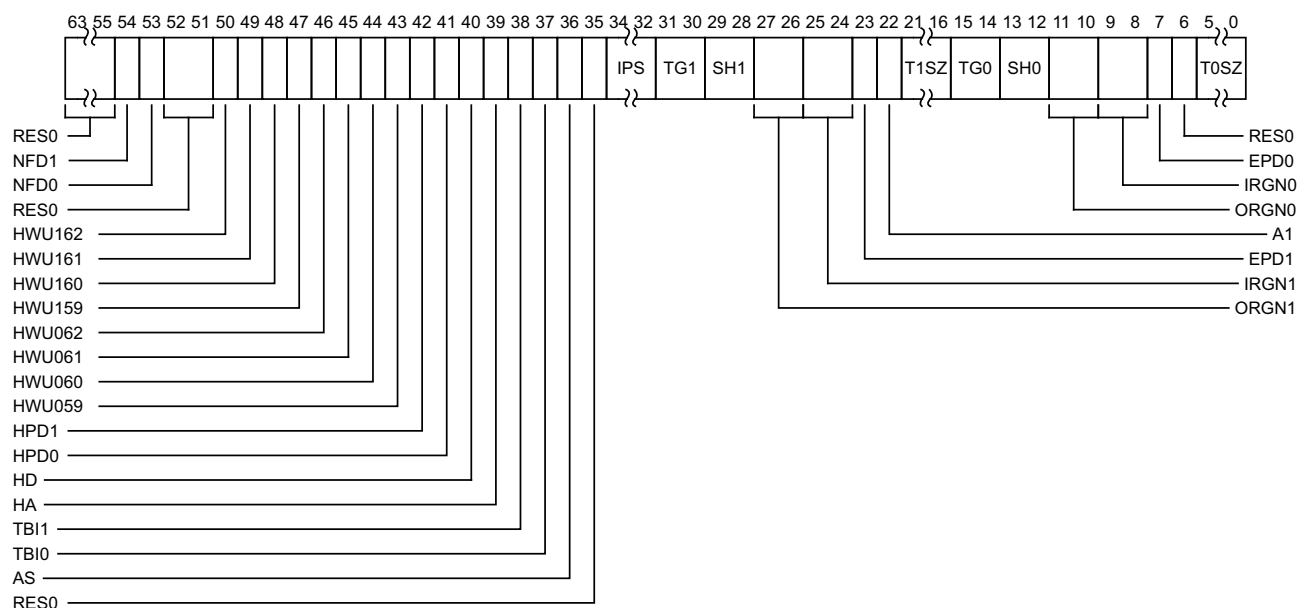

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

TCR\_EL1 is a 64-bit register.

### Field descriptions

The TCR\_EL1 bit assignments are:

Any of the bits in TCR\_EL1 are permitted to be cached in a TLB.

### Bits [63:55]

Reserved, RES0.

### NFD1, bit [54]

*In ARMv8.2*

Present only if [SVE](#) is implemented.

Non-fault translation table walk disable for translations using [TTBR1\\_EL1](#).

This bit controls whether to perform a translation table walk in response to an SVE non-fault access for an address that is translated using [TTBR1\\_EL1](#). The affected access types are:

- All accesses due to an SVE non-fault contiguous load instruction.
- Only the speculative accesses due to an SVE first-fault gather load. Speculative accesses due to an SVE first-fault contiguous load are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See *The Scalable Vector Extension (SVE)* on page A1-66 for more information.

Defined values are:

- |   |   |
|---|---|
| 0 | Perform translation table walks using <a href="#">TTBR1_EL1</a> .   |
| 1 | A TLB miss on an address that is translated using <a href="#">TTBR1_EL1</a> due to an SVE non-fault access generates a Translation fault. No translation table walk is performed. |

If [SVE](#) is not implemented, this field is RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

#### NFD0, bit [53]

**In ARMv8.2**

Present only if [SVE](#) is implemented.

Non-fault translation table walk disable for translations using [TTBR0\\_EL1](#).

This bit controls whether to perform a translation table walk in response to an SVE non-fault access for an address that is translated using [TTBR0\\_EL1](#). The affected access types are:

- All accesses due to an SVE non-fault contiguous load instruction.
- Only the speculative accesses due to an SVE first-fault gather load. Speculative accesses due to an SVE first-fault contiguous load are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See *The Scalable Vector Extension (SVE)* on page A1-66 for more information.

Defined values are:

- |   |   |
|---|---|
| 0 | Perform translation table walks using <a href="#">TTBR0_EL1</a> .   |
| 1 | A TLB miss on an address that is translated using <a href="#">TTBR0_EL1</a> due to an SVE non-fault access generates a Translation fault. No translation table walk is performed. |

If [SVE](#) is not implemented, this field is RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

#### Bits [52:51]

Reserved, RES0.

#### HWU162, bit [50]

**In ARMv8.2**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR1\\_EL1](#) if the TCR\_EL1.HPD1 value is 1.

Defined values are:

- |   |   |
|---|---|
| 0 | The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.                             |
| 1 | The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR_EL1.HPD1 value is 1. |

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HWU161, bit [49]**

***In ARMv8.2***

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR1\\_EL1](#) if the TCR\_EL1.HPD1 value is 1.

Defined values are:

- |   |   |
|---|---|
| 0 | The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.                             |
| 1 | The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR_EL1.HPD1 value is 1. |

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HWU160, bit [48]**

***In ARMv8.2***

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR1\\_EL1](#) if the TCR\_EL1.HPD1 value is 1.

Defined values are:

- |   |   |
|---|---|
| 0 | The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.                             |
| 1 | The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR_EL1.HPD1 value is 1. |

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HWU159, bit [47]**

***In ARMv8.2***

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR1\\_EL1](#) if the TCR\_EL1.HPD1 value is 1.

Defined values are:

- |   |   |
|---|---|
| 0 | The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.                             |
| 1 | The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR_EL1.HPD1 value is 1. |

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HWU062, bit [46]**

***In ARMv8.2***

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR0\\_EL1](#) if the TCR\_EL1.HPD0 value is 1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR\_EL1.HPD0 value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

#### HWU061, bit [45]

***In ARMv8.2***

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table block or level 3 entry for pages pointed to by [TTBR0\\_EL1](#) if the TCR\_EL1.HPD0 value is 1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR\_EL1.HPD0 value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

Defined values are:

0 Stage 1 hardware management of dirty state disabled.

1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

This bit is RES0 if [ARMv8.1-TTHM](#) is not implemented.

***In ARMv8.0.***

Reserved, RES0.

**HA, bit [39]**

***In ARMv8.2 and ARMv8.1***

Hardware Access flag update in stage 1 translations from EL0 and EL1.

Defined values are:

0 Stage 1 Access flag update disabled.

1 Stage 1 Access flag update enabled.

This bit is RES0 if [ARMv8.1-TTHM](#) is not implemented.

***In ARMv8.0.***

Reserved, RES0.

### TBI1, bit [38]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the [TTBR1\\_EL1](#) region, or ignored and used for tagged addresses. Defined values are:

- 0 Top Byte used in the address calculation.
- 1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR1\\_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

Additionally, this affects changes to the program counter, when TBI1 is 1 and bit [55] of the target address is 1, caused by:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

In these cases bits [63:56] of the address are also set to 1 before it is stored in the PC.

### TBI0, bit [37]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the [TTBR0\\_EL1](#) region, or ignored and used for tagged addresses. Defined values are:

- 0 Top Byte used in the address calculation.
- 1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR0\\_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

Additionally, this affects changes to the program counter, when TBI0 is 1 and bit [55] of the target address is 0, caused by:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

In these cases bits [63:56] of the address are also set to 0 before it is stored in the PC.

### AS, bit [36]

ASID Size. Defined values are:

- 0 8 bit - the upper 8 bits of [TTBR0\\_EL1](#) and [TTBR1\\_EL1](#) are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
- 1 16 bit - the upper 16 bits of [TTBR0\\_EL1](#) and [TTBR1\\_EL1](#) are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

### Bit [35]

Reserved, RES0.

### IPS, bits [34:32]

Intermediate Physical Address Size.

- 000 32 bits, 4GB.
- 001 36 bits, 64GB.
- 010 40 bits, 1TB.
- 011 42 bits, 4TB.
- 100 44 bits, 16TB.
- 101 48 bits, 256TB.

110 52 bits, 4PB

Other values are reserved.

The reserved values behave in the same way as the 101 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 110 is permitted only if [ARMv8.2-LPA](#) is implemented and the granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 110, then bits[51:48] of every translation table base addresses for the stage of translation controlled by TCR\_EL1 are 0000.

#### TTBR1, bits [31:30]

Granule size for the [TTBR1\\_EL1](#).

01 16KB

10 4KB

11 64KB

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

#### SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1\\_EL1](#).

Defined values are:

00 Non-shareable

10 Outer Shareable

11 Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries](#) on page K1-6133.

#### ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1\\_EL1](#).

00 Normal memory, Outer Non-cacheable

01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable

10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable

11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

#### IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1\\_EL1](#).

00 Normal memory, Inner Non-cacheable

01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable

10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable

11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

#### EPD1, bit [23]

Translation table walk disable for translations using [TTBR1\\_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1\\_EL1](#). The encoding of this bit is:

0 Perform translation table walks using [TTBR1\\_EL1](#).

- 1 A TLB miss on an address that is translated using [TTBR1\\_EL1](#) generates a Translation fault. No translation table walk is performed.

#### A1, bit [22]

Selects whether [TTBR0\\_EL1](#) or [TTBR1\\_EL1](#) defines the ASID. The encoding of this bit is:

- 0 [TTBR0\\_EL1](#).ASID defines the ASID.  
1 [TTBR1\\_EL1](#).ASID defines the ASID.

#### T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1\\_EL1](#). The region size is  $2^{(64-T1SZ)}$  bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

#### TG0, bits [15:14]

Granule size for the [TTBR0\\_EL1](#).

- 00 4KB  
01 64KB  
10 16KB

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

#### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0\\_EL1](#).

- 00 Non-shareable  
10 Outer Shareable  
11 Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-6133.

#### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL1](#).

- 00 Normal memory, Outer Non-cacheable  
01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable  
10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable  
11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

#### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL1](#).

- 00 Normal memory, Inner Non-cacheable  
01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable  
10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable  
11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

### EPD0, bit [7]

Translation table walk disable for translations using [TTBR0\\_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0\\_EL1](#). The encoding of this bit is:

- 0 Perform translation table walks using [TTBR0\\_EL1](#).
- 1 A TLB miss on an address that is translated using [TTBR0\\_EL1](#) generates a Translation fault. No translation table walk is performed.

### Bit [6]

Reserved, RES0.

### T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0\\_EL1](#). The region size is  $2^{(64-T0SZ)}$  bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

## Accessing the TCR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TCR_EL1	11	000	0010	0000	010
TCR_EL12	11	101	0010	0000	010

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
TCR_EL1	x	x	0	-	RW	n/a	RW
TCR_EL1	0	0	1	-	RW	RW	RW
TCR_EL1	0	1	1	-	n/a	RW	RW
TCR_EL1	1	0	1	-	RW	<a href="#">TCR_EL2</a>	RW
TCR_EL1	1	1	1	-	n/a	<a href="#">TCR_EL2</a>	RW
TCR_EL12	x	x	0	-	-	n/a	-
TCR_EL12	0	0	1	-	-	-	-

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
TCR_EL12	0	1	1	-	n/a	-	-
TCR_EL12	1	0	1	-	-	RW	RW
TCR_EL12	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TCR\_EL1 or TCR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.

## D7.2.92 TCR\_EL2, Translation Control Register (EL2)

The TCR\_EL2 characteristics are:

### Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of [HCR\\_EL2.E2H](#) is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using [TTBR0\\_EL2](#).
- When the value of [HCR\\_EL2.E2H](#) is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
  - A lower VA range, translated using [TTBR0\\_EL2](#).
  - A higher VA range, translated using [TTBR1\\_EL2](#).

### Configurations

AArch64 System register TCR\_EL2 is architecturally mapped to AArch32 System register [HTCR](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

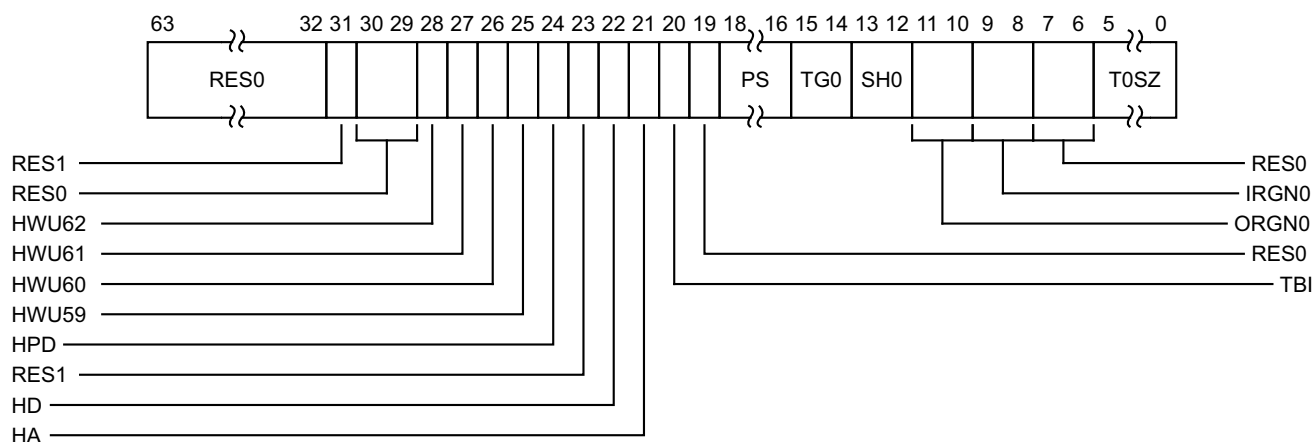

### Attributes

TCR\_EL2 is a 64-bit register.

### Field descriptions

The TCR\_EL2 bit assignments are:

**When [HCR\\_EL2.E2H](#)==0:**

This format applies in Secure state, and in all ARMv8.0 implementations.

Any of the bits in TCR\_EL2 are permitted to be cached in a TLB.

### Bits [63:32]

Reserved, RES0.

### Bit [31]

Reserved, RES1.

### Bits [30:29]

Reserved, RES0.

#### HWU62, bit [28]

##### *In ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table block or level 3 entry if the TCR\_EL2.HPD value is 1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR\_EL2.HPD value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### HWU61, bit [27]

##### *In ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table block or level 3 entry if the TCR\_EL2.HPD value is 1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR\_EL2.HPD value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### HWU60, bit [26]

##### *In ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table block or level 3 entry if the TCR\_EL2.HPD value is 1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR\_EL2.HPD bit value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### HWU59, bit [25]

##### *In ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table block or level 3 entry if the TCR\_EL2.HPD value is 1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR\_EL2.HPD bit value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HPD, bit [24]**

***In ARMv8.2 and ARMv8.1***

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0\\_EL2](#).

Defined values are:

- |   |  |
|---|--|
| 0 | Hierarchical permissions are enabled.  |
| 1 | Hierarchical permissions are disabled. |

**Note**

In this case bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This bit is RES0 if [ARMv8.1-HPD](#) is not implemented.

***In ARMv8.0.***

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**HD, bit [22]**

***In ARMv8.2 and ARMv8.1***

Hardware management of dirty state in stage 1 translations from EL2.

Defined values are:

- |   |  |
|---|--|
| 0 | Stage 1 hardware management of dirty state disabled.                                     |
| 1 | Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1. |

This bit is RES0 if [ARMv8.1-TTHM](#) is not implemented.

***In ARMv8.0.***

Reserved, RES0.

**HA, bit [21]**

***In ARMv8.2 and ARMv8.1***

Hardware Access flag update in stage 1 translations from EL2.

Defined values are:

- |   |                                      |
|---|--------------------------------------|
| 0 | Stage 1 Access flag update disabled. |
| 1 | Stage 1 Access flag update enabled.  |

This bit is RES0 if [ARMv8.1-TTHM](#) is not implemented.

***In ARMv8.0.***

Reserved, RES0.

**TBI, bit [20]**

Additionally, this affects changes to the program counter, when TBI is 1, caused by:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

In these cases bits [63:56] of the address are set to 0 before it is stored in the PC.

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0\\_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

#### Bit [19]

Reserved, RES0.

#### PS, bits [18:16]

Physical Address Size.

000	32 bits, 4GB.
001	36 bits, 64GB.
010	40 bits, 1TB.
011	42 bits, 4TB.
100	44 bits, 16TB.
101	48 bits, 256TB.
110	52 bits, 4PB

Other values are reserved.

The reserved values behave in the same way as the 101 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 110 is permitted only if [ARMv8.2-LPA](#) is implemented and the granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR\_EL2 are 0000.

#### TG0, bits [15:14]

Granule size for the [TTBR0\\_EL2](#).

00	4KB
01	64KB
10	16KB

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

#### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

00	Non-shareable
10	Outer Shareable
11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries](#) on page K1-6133.

#### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

00	Normal memory, Outer Non-cacheable
01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable

- |    |  |
|----|--|
| 10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable |
| 11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable    |

#### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

- |    |  |
|----|--|
| 00 | Normal memory, Inner Non-cacheable   |
| 01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable       |
| 10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable |
| 11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable    |

#### Bits [7:6]

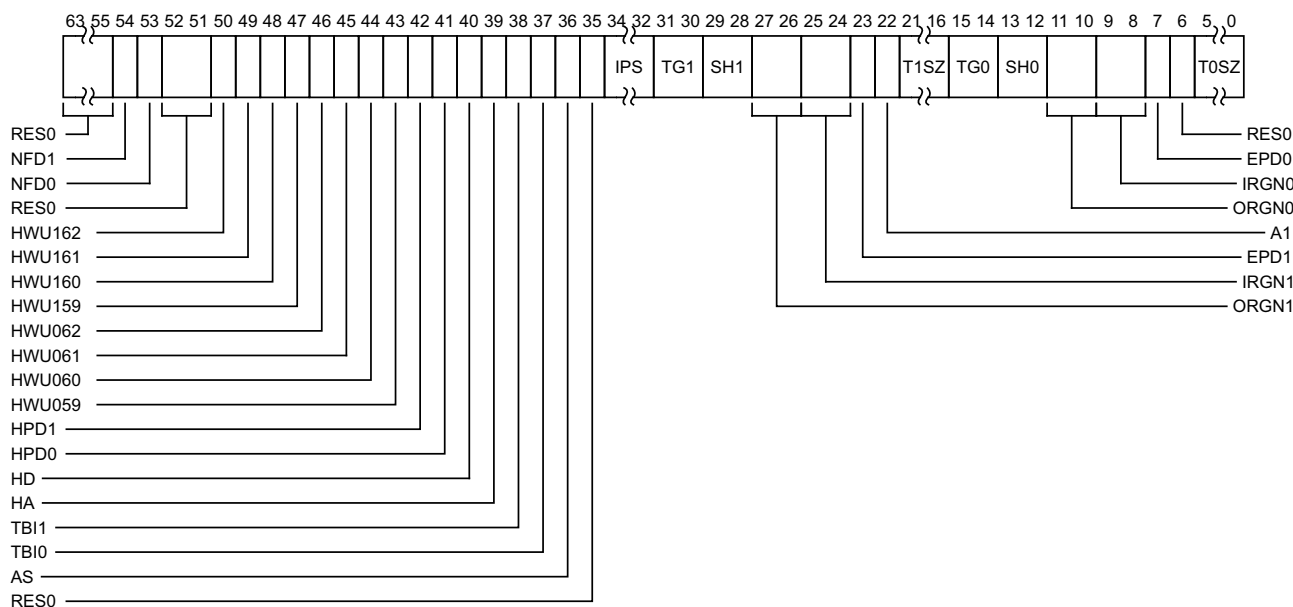

Reserved, RES0.

#### T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0\\_EL2](#). The region size is  $2^{(64-T0SZ)}$  bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

#### When HCR\_EL2.E2H==1:

This view of the register is only valid from ARMv8.1, in Non-secure state, when HCR\_EL2.E2H is 1.

Any of the bits in TCR\_EL2 are permitted to be cached in a TLB.

#### Bits [63:55]

Reserved, RES0.

#### NFD1, bit [54]

##### In ARMv8.2

Present only if SVE is implemented.

Non-fault translation table walk disable for translations using [TTBR1\\_EL2](#).

This bit controls whether to perform a translation table walk in response to an SVE non-fault access for an address that is translated using TTBR1\_EL2. The affected access types are:

- All accesses due to an SVE non-fault contiguous load instruction.
- Only the speculative accesses due to an SVE first-fault gather load. Speculative accesses due to an SVE first-fault contiguous load are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See *The Scalable Vector Extension (SVE)* on page A1-66 for more information.

Defined values are:

- |   |   |
|---|---|
| 0 | Perform translation table walks using TTBR1_EL2.  |
| 1 | A TLB miss on an address that is translated using TTBR1_EL2 due to an SVE non-fault access generates a Translation fault. No translation table walk is performed. |

If SVE is not implemented, this bit is RES0.

**In ARMv8.1.**

Reserved, RES0.

**NFD0, bit [53]**

**In ARMv8.2**

Present only if SVE is implemented.

Non-fault translation table walk disable for translations using TTBR0\_EL2.

This bit controls whether to perform a translation table walk in response to an SVE non-fault access for an address that is translated using TTBR0\_EL2. The affected access types are:

- All accesses due to an SVE non-fault contiguous load instruction.
- Only the speculative accesses due to an SVE first-fault gather load. Speculative accesses due to an SVE first-fault contiguous load are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See *The Scalable Vector Extension (SVE)* on page A1-66 for more information.

Defined values are:

- |   |   |
|---|---|
| 0 | Perform translation table walks using TTBR0_EL2.  |
| 1 | A TLB miss on an address that is translated using TTBR0_EL2 due to an SVE non-fault access generates a Translation fault. No translation table walk is performed. |

If SVE is not implemented, this bit is RES0.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR\_EL2.HPD0 value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

**In ARMv8.1.**

Reserved, RES0.

**HPD1, bit [42]**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR1\\_EL2](#).

Defined values are:

- 0 Hierarchical permissions are enabled.
- 1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This bit is RES0 if [ARMv8.1-HPD](#) is not implemented.

**HPD0, bit [41]**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0\\_EL2](#).

Defined values are:

- 0 Hierarchical permissions are enabled.
- 1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This bit is RES0 if [ARMv8.1-HPD](#) is not implemented.

**HD, bit [40]**

Hardware management of dirty state in stage 1 translations from EL2.

Defined values are:

- 0 Stage 1 hardware management of dirty state disabled.
- 1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

This bit is RES0 if [ARMv8.1-TTHM](#) is not implemented.

**HA, bit [39]**

Hardware Access flag update in stage 1 translations from EL2.

Defined values are:

- 0 Stage 1 Access flag update disabled.
- 1 Stage 1 Access flag update enabled.

This bit is RES0 if [ARMv8.1-TTHM](#) is not implemented.

**TBI1, bit [38]**

Additionally, this affects changes to the program counter, when TBI1 is 1 and bit [55] of the target address is 1, caused by:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

In these cases bits [63:56] of the address are also set to 1 before it is stored in the PC.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR1\\_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

### TBI0, bit [37]

Additionally, this affects changes to the program counter, when TBI0 is 1 and bit [55] of the target address is 0, caused by:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

In these cases bits [63:56] of the address are also set to 0 before it is stored in the PC.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0\\_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

### AS, bit [36]

ASID Size. Defined values are:

- |   |  |
|---|--|
| 0 | 8 bit - the upper 8 bits of <a href="#">TTBR0_EL2</a> and <a href="#">TTBR1_EL2</a> are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB. |
| 1 | 16 bit - the upper 16 bits of <a href="#">TTBR0_EL2</a> and <a href="#">TTBR1_EL2</a> are used for allocation and matching in the TLB.   |

If the implementation has only 8 bits of ASID, this field is RES0.

### Bit [35]

Reserved, RES0.

### IPS, bits [34:32]

Intermediate Physical Address Size.

- |     |                 |
|-----|-----------------|
| 000 | 32 bits, 4GB.   |
| 001 | 36 bits, 64GB.  |
| 010 | 40 bits, 1TB.   |
| 011 | 42 bits, 4TB.   |
| 100 | 44 bits, 16TB.  |
| 101 | 48 bits, 256TB. |
| 110 | 52 bits, 4PB    |

Other values are reserved.

The reserved values behave in the same way as the 101 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 110 is permitted only if [ARMv8.2-LPA](#) is implemented and the granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR\_EL2 are 0000.

### TG1, bits [31:30]

Granule size for the [TTBR1\\_EL2](#).

- |    |      |
|----|------|
| 01 | 16KB |
| 10 | 4KB  |
| 11 | 64KB |

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

#### SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1\\_EL2](#).  
Defined values are:

00	Non-shareable
10	Outer Shareable
11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-6133.

#### ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1\\_EL2](#).

00	Normal memory, Outer Non-cacheable
01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

#### IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1\\_EL2](#).

00	Normal memory, Inner Non-cacheable
01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

#### EPD1, bit [23]

Translation table walk disable for translations using [TTBR1\\_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1\\_EL2](#). The encoding of this bit is:

0	Perform translation table walks using <a href="#">TTBR1_EL2</a> .
1	A TLB miss on an address that is translated using <a href="#">TTBR1_EL2</a> generates a Translation fault. No translation table walk is performed.

#### A1, bit [22]

Selects whether [TTBR0\\_EL2](#) or [TTBR1\\_EL2](#) defines the ASID. The encoding of this bit is:

0	<a href="#">TTBR0_EL2</a> .ASID defines the ASID.
1	<a href="#">TTBR1_EL2</a> .ASID defines the ASID.

#### T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1\\_EL2](#). The region size is  $2^{(64-T1SZ)}$  bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

#### TG0, bits [15:14]

Granule size for the [TTBR0\\_EL2](#).

00	4KB
01	64KB
10	16KB

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

#### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

00	Non-shareable
10	Outer Shareable
11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries](#) on page K1-6133.

#### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

00	Normal memory, Outer Non-cacheable
01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

#### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

00	Normal memory, Inner Non-cacheable
01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

#### EPD0, bit [7]

Translation table walk disable for translations using [TTBR0\\_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0\\_EL2](#). The encoding of this bit is:

0	Perform translation table walks using <a href="#">TTBR0_EL2</a> .
1	A TLB miss on an address that is translated using <a href="#">TTBR0_EL2</a> generates a Translation fault. No translation table walk is performed.

#### Bit [6]

Reserved, RES0.

#### T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0\\_EL2](#). The region size is  $2^{(64-T0SZ)}$  bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

### Accessing the TCR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TCR_EL2	11	100	0010	0000	010
TCR_EL1	11	000	0010	0000	010

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
TCR_EL2	x	x	0	-	-	n/a	RW
TCR_EL2	0	0	1	-	-	RW	RW
TCR_EL2	0	1	1	-	n/a	RW	RW
TCR_EL2	1	0	1	-	-	RW	RW
TCR_EL2	1	1	1	-	n/a	RW	RW
TCR_EL1	x	x	0	-	TCR_EL1	n/a	TCR_EL1
TCR_EL1	0	0	1	-	TCR_EL1	TCR_EL1	TCR_EL1
TCR_EL1	0	1	1	-	n/a	TCR_EL1	TCR_EL1
TCR_EL1	1	0	1	-	TCR_EL1	RW	TCR_EL1
TCR_EL1	1	1	1	-	n/a	RW	TCR_EL1

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TCR\_EL2 or TCR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## D7.2.93 TCR\_EL3, Translation Control Register (EL3)

The TCR\_EL3 characteristics are:

### Purpose

The control register for stage 1 of the EL3 translation regime.

### Configurations

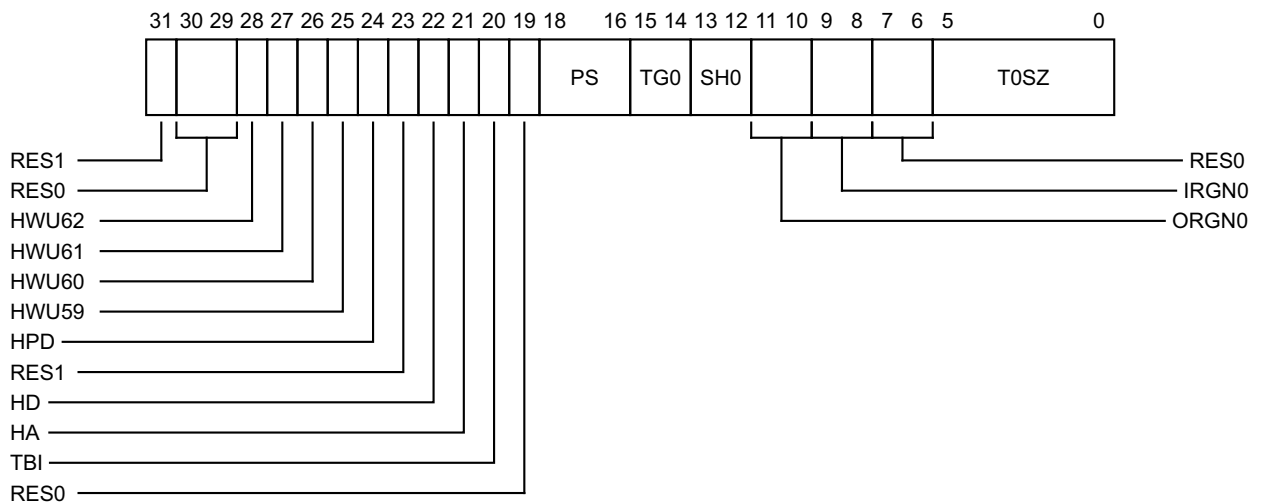

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

TCR\_EL3 is a 32-bit register.

### Field descriptions

The TCR\_EL3 bit assignments are:

Any of the bits in TCR\_EL3 are permitted to be cached in a TLB.

### Bit [31]

Reserved, RES1.

### Bits [30:29]

Reserved, RES0.

### HWU62, bit [28]

#### In ARMv8.2

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table block or level 3 entry if the TCR\_EL3.HPD value is 1.

Defined values are:

- 0 The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR\_EL3.HPD value is 1.

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

#### In ARMv8.1 and ARMv8.0.

Reserved, RES0.

#### HWU61, bit [27]

##### *In ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table block or level 3 entry if the TCR\_EL3.HPD value is 1.

Defined values are:

- |   |  |
|---|--|
| 0 | The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.                                |
| 1 | The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR_EL3.HPD bit value is 1. |

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### HWU60, bit [26]

##### *In ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table block or level 3 entry if the TCR\_EL3.HPD value is 1.

Defined values are:

- |   |  |
|---|--|
| 0 | The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.                                |
| 1 | The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR_EL3.HPD bit value is 1. |

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### HWU59, bit [25]

##### *In ARMv8.2*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table block or level 3 entry if the TCR\_EL3.HPD value is 1.

Defined values are:

- |   |  |
|---|--|
| 0 | The stage 1 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.                                |
| 1 | The stage 1 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose if the TCR_EL3.HPD bit value is 1. |

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### HPD, bit [24]

##### *In ARMv8.2 and ARMv8.1*

Hierarchical Permission Disables. This affects the hierarchical control bits, APTTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0\\_EL3](#).

Defined values are:

- |   |  |
|---|--|
| 0 | Hierarchical permissions are enabled.  |
| 1 | Hierarchical permissions are disabled. |

————— **Note** —————

In this case bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This bit is RES0 if [ARMv8.1-HPD](#) is not implemented.

***In ARMv8.0.***

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**HD, bit [22]**

***In ARMv8.2 and ARMv8.1***

Hardware management of dirty state in stage 1 translations from EL3.

Defined values are:

- 0 Stage 1 hardware management of dirty state disabled.
- 1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

This bit is RES0 if [ARMv8.1-TTHM](#) is not implemented.

***In ARMv8.0.***

Reserved, RES0.

**HA, bit [21]**

***In ARMv8.2 and ARMv8.1***

Hardware Access flag update in stage 1 translations from EL3.

Defined values are:

- 0 Stage 1 Access flag update disabled.
- 1 Stage 1 Access flag update enabled.

This bit is RES0 if [ARMv8.1-TTHM](#) is not implemented.

***In ARMv8.0.***

Reserved, RES0.

**TBI, bit [20]**

Top Byte ignored - indicates whether the top byte of an address is used for address match for the [TTBR0\\_EL3](#) region, or ignored and used for tagged addresses.

- 0 Top Byte used in the address calculation.
- 1 Top Byte ignored in the address calculation.

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by [TTBR0\\_EL3](#). It has an effect whether the EL3 translation regime is enabled or not.

Additionally, this affects changes to the program counter, when TBI is 1, caused by:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

In these cases bits [63:56] of the address are set to 0 before it is stored in the PC.

**Bit [19]**

Reserved, RES0.

#### PS, bits [18:16]

Physical Address Size.

000	32 bits, 4GB.
001	36 bits, 64GB.
010	40 bits, 1TB.
011	42 bits, 4TB.
100	44 bits, 16TB.
101	48 bits, 256TB.
110	52 bits, 4PB

Other values are reserved.

The reserved values behave in the same way as the 101 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 110 is permitted only if [ARMv8.2-LPA](#) is implemented and the granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR\_EL3 are 0000.

#### TG0, bits [15:14]

Granule size for the [TTBR0\\_EL3](#).

00	4KB
01	64KB
10	16KB

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

#### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0\\_EL3](#).

00	Non-shareable
10	Outer Shareable
11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-6133.

#### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL3](#).

00	Normal memory, Outer Non-cacheable
01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

#### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL3](#).

00	Normal memory, Inner Non-cacheable
01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable

- 10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
- 11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

#### Bits [7:6]

Reserved, RES0.

#### T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0\\_EL3](#). The region size is  $2^{(64-T0SZ)}$  bytes. The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

### Accessing the TCR\_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TCR_EL3	11	110	0010	0000	010

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
0	0	1	-	-	-	RW
0	1	1	-	n/a	-	RW
1	0	1	-	-	-	RW
1	1	1	-	n/a	-	RW

D7.2.94 TPIDR\_EL0, EL0 Read/Write Software Thread ID Register

The TPIDR\_EL0 characteristics are:

Purpose

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.  
The PE makes no use of this register.

Configurations

AArch64 System register TPIDR\_EL0[31:0] is architecturally mapped to AArch32 System register [TPIDRURW](#).  
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDR\_EL0 is a 64-bit register.

Field descriptions

The TPIDR\_EL0 bit assignments are:

Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

Accessing the TPIDR\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TPIDR_EL0	11	011	1101	0000	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

D7.2.95 TPIDR\_EL1, EL1 Software Thread ID Register

The TPIDR\_EL1 characteristics are:

Purpose

Provides a location where software executing at EL1 can store thread identifying information, for OS management purposes.  
The PE makes no use of this register.

Configurations

AArch64 System register TPIDR\_EL1[31:0] is architecturally mapped to AArch32 System register [TPIDRPRW](#).  
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TPIDR\_EL1 is a 64-bit register.

Field descriptions

The TPIDR\_EL1 bit assignments are:

Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

Accessing the TPIDR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TPIDR_EL1	11	000	1101	0000	100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

### D7.2.96 TPIDR\_EL2, EL2 Software Thread ID Register

The TPIDR\_EL2 characteristics are:

#### Purpose

Provides a location where software executing at EL2 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

#### Configurations

AArch64 System register TPIDR\_EL2[31:0] is architecturally mapped to AArch32 System register [HTPIDR](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

TPIDR\_EL2 is a 64-bit register.

#### Field descriptions

The TPIDR\_EL2 bit assignments are:

#### Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

#### Accessing the TPIDR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TPIDR_EL2	11	100	1101	0000	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## D7.2.97 TPIDR\_EL3, EL3 Software Thread ID Register

The TPIDR\_EL3 characteristics are:

### Purpose

Provides a location where software executing at EL3 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

### Configurations

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

TPIDR\_EL3 is a 64-bit register.

### Field descriptions

The TPIDR\_EL3 bit assignments are:

### Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

### Accessing the TPIDR\_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TPIDR_EL3	11	110	1101	0000	010

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	-	RW
x	1	1	-	n/a	-	RW

## D7.2.98 TPIDRRO\_EL0, EL0 Read-Only Software Thread ID Register

The TPIDRRO\_EL0 characteristics are:

### Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

### Configurations

AArch64 System register TPIDRRO\_EL0[31:0] is architecturally mapped to AArch32 System register [TPIDRURO](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

TPIDRRO\_EL0 is a 64-bit register.

### Field descriptions

The TPIDRRO\_EL0 bit assignments are:

### Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

### Accessing the TPIDRRO\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TPIDRRO_EL0	11	011	1101	0000	011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RW	n/a	RW
x	0	1	RO	RW	RW	RW
x	1	1	RO	n/a	RW	RW

## D7.2.99 TTBR0\_EL1, Translation Table Base Register 0 (EL1)

The TTBR0\_EL1 characteristics are:

### Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

### Configurations

AArch64 System register TTBR0\_EL1 is architecturally mapped to AArch32 System register [TTBR0](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

TTBR0\_EL1 is a 64-bit register.

### Field descriptions

The TTBR0\_EL1 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

#### ASID, bits [63:48]

An ASID for the translation table base address. The [TCR\\_EL1.A1](#) field selects either TTBR0\_EL1.ASID or [TTBR1\\_EL1.ASID](#).

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

#### BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

#### Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes [ARMv8.2-LPA](#), if the value of [TCR\\_EL1.IPS](#) is 110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If  $x \geq 6$  then  $z=x$ .
  - Otherwise,  $z=6$ .
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.

- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#) bit[0] of the stage 1 translation table base address is zero.

---

**Note**

---

In an implementation that includes [ARMv8.2-LPA](#) a [TCR\\_EL1](#).IPS value of 110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.

When the value of [ID\\_AA64MMFR0\\_EL1](#).PARange indicates that the implementation does not support a 52-bit IPA size, if a translation table lookup uses this register with the 64KB translation granule when the value of [TCR\\_EL1](#).IPS is 110 and the value of register bits[5:2] is nonzero then it is IMPLEMENTATION DEFINED whether an Address size fault is generated, but ARM deprecates not generating an Address size fault.

If the *Effective value* of [TCR\\_EL1](#).IPS is not 110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

---

**Note**

---

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

If any [TTBR0\\_EL1](#)[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using [TTBR0\\_EL1](#), then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR\\_EL1](#).T0SZ, the stage of translation, and the translation granule size.

## CnP, bit [0]

### In ARMv8.2

Common not Private. In an implementation that includes [ARMv8.2-TTCNP](#), indicates whether each entry that is pointed to by [TTBR0\\_EL1](#) is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of [TTBR0\\_EL1](#).CnP is 1.

- 0 The translation table entries pointed to by [TTBR0\\_EL1](#), for the current translation regime and ASID, are permitted to differ from corresponding entries for [TTBR0\\_EL1](#) for other PEs in the Inner Shareable domain. This is not affected by:
- The value of [TTBR0\\_EL1](#).CnP on those other PEs.
  - The value of the current ASID or, in Non-secure state, the value of the current VMID.

- 1 The translation table entries pointed to by TTBR0\_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0\_EL1.CnP is 1 and all of the following apply:
- The translation table entries are pointed to by TTBR0\_EL1.
  - The translation tables relate to the same translation regime.
  - The ASID is the same as the current ASID.
  - In Non-secure state, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

#### Note

If the value of the TTBR0\_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0\_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see [CONstrained UNPREDICTABLE behaviors due to caching of control or data values on page K1-6120](#).

In an implementation that does not include [ARMv8.2-TTCNP](#) this field is RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

## Accessing the TTBR0\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TTBR0_EL1	11	000	0010	0000	000
TTBR0_EL12	11	101	0010	0000	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
TTBR0_EL1	x	x	0	-	RW	n/a	RW
TTBR0_EL1	0	0	1	-	RW	RW	RW
TTBR0_EL1	0	1	1	-	n/a	RW	RW
TTBR0_EL1	1	0	1	-	RW	<a href="#">TTBR0_EL2</a>	RW
TTBR0_EL1	1	1	1	-	n/a	<a href="#">TTBR0_EL2</a>	RW

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
TTBR0_EL12	x	x	0	-	-	n/a	-
TTBR0_EL12	0	0	1	-	-	-	-
TTBR0_EL12	0	1	1	-	n/a	-	-
TTBR0_EL12	1	0	1	-	-	RW	RW
TTBR0_EL12	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0\_EL1 or TTBR0\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TRVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.

## D7.2.100 TTBR0\_EL2, Translation Table Base Register 0 (EL2)

The TTBR0\_EL2 characteristics are:

### Purpose

When [HCR\\_EL2.E2H](#) is 0, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When [HCR\\_EL2.E2H](#) is 1, holds the base address of translation for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

### Configurations

AArch64 System register TTBR0\_EL2 is architecturally mapped to AArch32 System register [HTTBR](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

TTBR0\_EL2 is a 64-bit register.

### Field descriptions

The TTBR0\_EL2 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

### ASID, bits [63:48]

#### *In ARMv8.2 and ARMv8.1*

When [HCR\\_EL2.E2H](#) is 0, this field is RES0.

When [HCR\\_EL2.E2H](#) is 1, it holds an ASID for the translation table base address. The [TCR\\_EL2.A1](#) field selects either TTBR0\_EL2.ASID or TTBR1\_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

#### *In ARMv8.0.*

Reserved, RES0.

### BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

#### **Note**

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes [ARMv8.2-LPA](#), if the value of [TCR\\_EL2.{I}PS](#) is 110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If  $x \geq 6$  then  $z=x$ .
  - Otherwise,  $z=6$ .
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#) bit[0] of the stage 1 translation table base address is zero.

---

**Note**

In an implementation that includes [ARMv8.2-LPA](#):

- A [TCR\\_EL2.{I}PS](#) value of 110, that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.
- The OA size is specified by:
  - The value of [TCR\\_EL2.PS](#) when the value of [HCR\\_EL2.E2H](#) is 0.
  - The value of [TCR\\_EL2.IPS](#) when the value of [HCR\\_EL2.E2H](#) is 1.

---

When the value of [ID\\_AA64MMFR0\\_EL1.PARange](#) indicates that the implementation does not support a 52-bit IPA size, if a translation table lookup uses this register with the 64KB translation granule when the value of [TCR\\_EL2.{I}PS](#) is 110 and the value of register bits[5:2] is nonzero then it is IMPLEMENTATION DEFINED whether an Address size fault is generated, but ARM deprecates not generating an Address size fault.

If the *Effective value* of [TCR\\_EL2.{I}PS](#) is not 110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

---

**Note**

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

---

If any [TTBR0\\_EL2](#)[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using [TTBR0\\_EL2](#), then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR\\_EL2.T0SZ](#), the stage of translation, and the translation granule size.

## CnP, bit [0]

### In ARMv8.2

Common not Private. In an implementation that includes [ARMv8.2-TTCNP](#), indicates whether each entry that is pointed to by TTBR0\_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0\_EL2.CnP is 1.

- 0 The translation table entries pointed to by TTBR0\_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0\_EL2 for other PEs in the Inner Shareable domain. This is not affected by:
- The value of TTBR0\_EL2.CnP on those other PEs.
  - When the current translation regime is the EL2&0 regime, the value of the current ASID.
- 1 The translation table entries pointed to by TTBR0\_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0\_EL2.CnP is 1 and all of the following apply:
- The translation table entries are pointed to by TTBR0\_EL2.
  - The translation tables relate to the same translation regime.
  - If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

### Note

If the value of the TTBR0\_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0\_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see [CONstrained UNPREDICTABLE behaviors due to caching of control or data values on page K1-6120](#).

In an implementation that does not include [ARMv8.2-TTCNP](#) this field is RES0.

### In ARMv8.1 and ARMv8.0.

Reserved, RES0.

## Accessing the TTBR0\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TTBR0_EL2	11	100	0010	0000	000
TTBR0_EL1	11	000	0010	0000	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
TTBR0_EL2	x	x	0	-	-	n/a	RW
TTBR0_EL2	0	0	1	-	-	RW	RW
TTBR0_EL2	0	1	1	-	n/a	RW	RW
TTBR0_EL2	1	0	1	-	-	RW	RW
TTBR0_EL2	1	1	1	-	n/a	RW	RW
TTBR0_EL1	x	x	0	-	TTBR0_EL1	n/a	TTBR0_EL1
TTBR0_EL1	0	0	1	-	TTBR0_EL1	TTBR0_EL1	TTBR0_EL1
TTBR0_EL1	0	1	1	-	n/a	TTBR0_EL1	TTBR0_EL1
TTBR0_EL1	1	0	1	-	TTBR0_EL1	RW	TTBR0_EL1
TTBR0_EL1	1	1	1	-	n/a	RW	TTBR0_EL1

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR0\_EL2 or TTBR0\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## D7.2.101 TTBR0\_EL3, Translation Table Base Register 0 (EL3)

The TTBR0\_EL3 characteristics are:

### Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

### Configurations

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

TTBR0\_EL3 is a 64-bit register.

### Field descriptions

The TTBR0\_EL3 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

### Bits [63:48]

Reserved, RES0.

### BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x].

#### Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes [ARMv8.2-LPA](#), if the value of [TCR\\_EL3](#).PS is 110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If  $x \geq 6$  then  $z=x$ .
  - Otherwise,  $z=6$ .
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#) bit[0] of the stage 1 translation table base address is zero.

---

**Note**

In an implementation that includes [ARMv8.2-LPA](#) a [TCR\\_EL3](#).PS value of 110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.

When the value of [ID\\_AA64MMFR0\\_EL1](#).PARange indicates that the implementation does not support a 52-bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of [TCR\\_EL3](#).PS is 110 and the value of register bits[5:2] is nonzero then it is IMPLEMENTATION DEFINED whether an Address size fault is generated, but ARM deprecates not generating an Address size fault.

If the *Effective value* of [TCR\\_EL3](#).PS is not 110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

---

**Note**

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

If any [TTBR0\\_EL3](#)[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using [TTBR0\\_EL3](#), then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR\\_EL3](#).T0SZ, the stage of translation, and the translation granule size.

## CnP, bit [0]

### In ARMv8.2

Common not Private. In an implementation that includes [ARMv8.2-TTCNP](#), indicates whether each entry that is pointed to by [TTBR0\\_EL3](#) is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of [TTBR0\\_EL3](#).CnP is 1.

- |   |   |
|---|---|
| 0 | The translation table entries pointed to by <a href="#">TTBR0_EL3</a> , for the current translation regime, are permitted to differ from corresponding entries for <a href="#">TTBR0_EL3</a> for other PEs in the Inner Shareable domain. This is not affected by the value of <a href="#">TTBR0_EL3</a> .CnP on those other PEs. |
| 1 | The translation table entries pointed to by <a href="#">TTBR0_EL3</a> are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of <a href="#">TTBR0_EL3</a> .CnP is 1 and the translation table entries are pointed to by <a href="#">TTBR0_EL3</a> .                   |

---

**Note**

If the value of the [TTBR0\\_EL3](#).CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those [TTBR0\\_EL3](#)s do not point to the same translation table entries the results of translations using [TTBR0\\_EL3](#) are CONSTRAINED UNPREDICTABLE, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6120](#).

In an implementation that does not include [ARMv8.2-TTCNP](#) this field is RES0.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

### Accessing the TTBR0\_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TTBR0_EL3	11	110	0010	0000	000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	-	RW
x	1	1	-	n/a	-	RW

## D7.2.102 TTBR1\_EL1, Translation Table Base Register 1 (EL1)

The TTBR1\_EL1 characteristics are:

### Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 translation regime, and other information for this translation regime.

### Configurations

AArch64 System register TTBR1\_EL1 is architecturally mapped to AArch32 System register [TTBR1](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

TTBR1\_EL1 is a 64-bit register.

### Field descriptions

The TTBR1\_EL1 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

#### ASID, bits [63:48]

An ASID for the translation table base address. The [TCR\\_EL1.A1](#) field selects either [TTBR0\\_EL1.ASID](#) or [TTBR1\\_EL1.ASID](#).

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

#### BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

#### Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes [ARMv8.2-LPA](#), if the value of [TCR\\_EL1.IPS](#) is 110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If  $x \geq 6$  then  $z=x$ .
  - Otherwise,  $z=6$ .
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.

- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#) bit[0] of the stage 1 translation table base address is zero.

---

**Note**

---

In an implementation that includes [ARMv8.2-LPA](#) a [TCR\\_EL1](#).IPS value of 110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.

When the value of [ID\\_AA64MMFR0\\_EL1](#).PARange indicates that the implementation does not support a 52-bit IPA size, if a translation table lookup uses this register with the 64KB translation granule when the value of [TCR\\_EL1](#).IPS is 110 and the value of register bits[5:2] is nonzero then it is IMPLEMENTATION DEFINED whether an Address size fault is generated, but ARM deprecates not generating an Address size fault.

If the *Effective value* of [TCR\\_EL1](#).IPS is not 110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

---

**Note**

---

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

If any [TTBR1\\_EL1](#)[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using [TTBR1\\_EL1](#), then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR\\_EL1](#).T1SZ, the stage of translation, and the translation granule size.

## CnP, bit [0]

### In ARMv8.2

Common not Private. In an implementation that includes [ARMv8.2-TTCNP](#), indicates whether each entry that is pointed to by [TBR1\\_EL1](#) is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of [TTBR1\\_EL1](#).CnP is 1.

- 0 The translation table entries pointed to by [TTBR1\\_EL1](#), for the current translation regime and ASID, are permitted to differ from corresponding entries for [TTBR1\\_EL1](#) for other PEs in the Inner Shareable domain. This is not affected by:
- The value of [TTBR1\\_EL1](#).CnP on those other PEs.
  - The value of the current ASID or, in Non-secure state, the value of the current VMID.

- 1 The translation table entries pointed to by TTBR1\_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1\_EL1.CnP is 1 and all of the following apply:
- The translation table entries are pointed to by TTBR1\_EL1.
  - The translation tables relate to the same translation regime.
  - The ASID is the same as the current ASID.
  - In Non-secure state, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

#### Note

If the value of the TTBR1\_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1\_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6120](#).

In an implementation that does not include [ARMv8.2-TTCNP](#) this field is RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

## Accessing the TTBR1\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TTBR1_EL1	11	000	0010	0000	001
TTBR1_EL12	11	101	0010	0000	001

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
TTBR1_EL1	x	x	0	-	RW	n/a	RW
TTBR1_EL1	0	0	1	-	RW	RW	RW
TTBR1_EL1	0	1	1	-	n/a	RW	RW
TTBR1_EL1	1	0	1	-	RW	<a href="#">TTBR1_EL2</a>	RW
TTBR1_EL1	1	1	1	-	n/a	<a href="#">TTBR1_EL2</a>	RW

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
TTBR1_EL12	x	x	0	-	-	n/a	-
TTBR1_EL12	0	0	1	-	-	-	-
TTBR1_EL12	0	1	1	-	n/a	-	-
TTBR1_EL12	1	0	1	-	-	RW	RW
TTBR1_EL12	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1\_EL1 or TTBR1\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 0):
  - If [HCR\\_EL2.TVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 0):
  - If [HCR\\_EL2.TVM](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If [HCR\\_EL2.TVM](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.

### D7.2.103 TTBR1\_EL2, Translation Table Base Register 1 (EL2)

The TTBR1\_EL2 characteristics are:

#### Purpose

When [HCR\\_EL2.E2H](#) is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

#### Note

When [HCR\\_EL2.E2H](#) is 0, the contents of this register are ignored by the PE, except for a direct read or write of the register.

#### Configurations

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

#### Attributes

TTBR1\_EL2 is a 64-bit register.

#### Field descriptions

The TTBR1\_EL2 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

#### ASID, bits [63:48]

An ASID for the translation table base address. The [TCR\\_EL2.A1](#) field selects either [TTBR0\\_EL2.ASID](#) or [TTBR1\\_EL2.ASID](#).

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

#### BADDR, bits [47:1]

Translation table base address,  $A[47:x]$  or  $A[51:x]$ , bits[47:1].

#### Note

- Translation table base addresses of 52 bits,  $A[51:x]$ , are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes [ARMv8.2-LPA](#), if the value of [TCR\\_EL2.{I}PS](#) is 110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If  $x \geq 6$  then  $z=x$ .
  - Otherwise,  $z=6$ .

- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#) bit[0] of the stage 1 translation table base address is zero.

---

**Note**

---

In an implementation that includes [ARMv8.2-LPA](#) a [TCR\\_EL2](#).IPS value of 110, that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.

When the value of [ID\\_AA64MMFR0\\_EL1](#).PARange indicates that the implementation does not support a 52-bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of [TCR\\_EL2](#).IPS is 110 and the value of register bits[5:2] is nonzero then it is IMPLEMENTATION DEFINED whether an Address size fault is generated, but ARM deprecates not generating an Address size fault.

If the *Effective value* of [TCR\\_EL2](#).IPS is not 110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

---

**Note**

---

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

If any [TTBR1\\_EL2](#)[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using [TTBR1\\_EL2](#), then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR\\_EL2](#).T1SZ, the stage of translation, and the translation granule size.

## CnP, bit [0]

### In ARMv8.2

Common not Private. In an implementation that includes [ARMv8.2-TTCNP](#), indicates whether each entry that is pointed to by [TBR1\\_EL2](#) is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of [TTBR1\\_EL2](#).CnP is 1.

- 0 The translation table entries pointed to by [TTBR1\\_EL2](#) for the current ASID are permitted to differ from corresponding entries for [TTBR1\\_EL2](#) for other PEs in the Inner Shareable domain. This is not affected by:
- The value of [TTBR1\\_EL2](#).CnP on those other PEs.
  - The value of the current ASID.

- 1 The translation table entries pointed to by TTBR1\_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1\_EL2.CnP is 1 and all of the following apply:
- The translation table entries are pointed to by TTBR1\_EL2.
  - The ASID is the same as the current ASID.

———— **Note** ————

TTBR1\_EL2 is accessible only when the value of [HCR\\_EL2.E2H](#) is 1, meaning the current translation regime is the EL2&0 regime.

If the value of the TTBR1\_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1\_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6120](#).

In an implementation that does not include [ARMv8.2-TTCNP](#) this field is RES0.

**In ARMv8.1.**

Reserved, RES0.

## Accessing the TTBR1\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
TTBR1_EL2	11	100	0010	0000	001
TTBR1_EL1	11	000	0010	0000	001

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
TTBR1_EL2	x	x	0	-	-	n/a	RW
TTBR1_EL2	0	0	1	-	-	RW	RW
TTBR1_EL2	0	1	1	-	n/a	RW	RW
TTBR1_EL2	1	0	1	-	-	RW	RW
TTBR1_EL2	1	1	1	-	n/a	RW	RW
TTBR1_EL1	x	x	0	-	<a href="#">TTBR1_EL1</a>	n/a	<a href="#">TTBR1_EL1</a>
TTBR1_EL1	0	0	1	-	<a href="#">TTBR1_EL1</a>	<a href="#">TTBR1_EL1</a>	<a href="#">TTBR1_EL1</a>

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
TTBR1_EL1	0	1	1	-	n/a	TTBR1_EL1	TTBR1_EL1
TTBR1_EL1	1	0	1	-	TTBR1_EL1	RW	TTBR1_EL1
TTBR1_EL1	1	1	1	-	n/a	RW	TTBR1_EL1

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR1\_EL2 or TTBR1\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## D7.2.104 VBAR\_EL1, Vector Base Address Register (EL1)

The VBAR\_EL1 characteristics are:

### Purpose

Holds the vector base address for any exception that is taken to EL1.

### Configurations

AArch64 System register VBAR\_EL1[31:0] is architecturally mapped to AArch32 System register [VBAR](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

VBAR\_EL1 is a 64-bit register.

### Field descriptions

The VBAR\_EL1 bit assignments are:

#### Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL1.

If the implementation does not support [ARMv8.2-LVA](#), then:

- If tagged addresses are being used, bits [55:48] of VBAR\_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR\_EL1 must be the same or else the use of the vector address will result in a recursive exception.

If the implementation supports [ARMv8.2-LVA](#), then:

- If tagged addresses are being used, bits [55:52] of VBAR\_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR\_EL1 must be the same or else the use of the vector address will result in a recursive exception.

#### Bits [10:0]

Reserved, RES0.

### Accessing the VBAR\_EL1

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
VBAR_EL1	11	000	1100	0000	000
VBAR_EL12	11	101	1100	0000	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
VBAR_EL1	x	x	0	-	RW	n/a	RW
VBAR_EL1	0	0	1	-	RW	RW	RW
VBAR_EL1	0	1	1	-	n/a	RW	RW
VBAR_EL1	1	0	1	-	RW	<a href="#">VBAR_EL2</a>	RW
VBAR_EL1	1	1	1	-	n/a	<a href="#">VBAR_EL2</a>	RW
VBAR_EL12	x	x	0	-	-	n/a	-
VBAR_EL12	0	0	1	-	-	-	-
VBAR_EL12	0	1	1	-	n/a	-	-
VBAR_EL12	1	0	1	-	-	RW	RW
VBAR_EL12	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic VBAR\_EL1 or VBAR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## D7.2.105 VBAR\_EL2, Vector Base Address Register (EL2)

The VBAR\_EL2 characteristics are:

### Purpose

Holds the vector base address for any exception that is taken to EL2.

### Configurations

AArch64 System register VBAR\_EL2[31:0] is architecturally mapped to AArch32 System register [HVBAR](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

VBAR\_EL2 is a 64-bit register.

### Field descriptions

The VBAR\_EL2 bit assignments are:

#### Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL2.

If the implementation does not support [ARMv8.2-LVA](#), then:

- If tagged addresses are being used, bits [55:48] of VBAR\_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR\_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports [ARMv8.2-LVA](#), then:

- If tagged addresses are being used, bits [55:52] of VBAR\_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR\_EL2 must be the same or else the use of the vector address will result in a recursive exception.

#### Bits [10:0]

Reserved, RES0.

### Accessing the VBAR\_EL2

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
VBAR_EL2	11	100	1100	0000	000
VBAR_EL1	11	000	1100	0000	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
VBAR_EL2	x	x	0	-	-	n/a	RW
VBAR_EL2	0	0	1	-	-	RW	RW
VBAR_EL2	0	1	1	-	n/a	RW	RW
VBAR_EL2	1	0	1	-	-	RW	RW
VBAR_EL2	1	1	1	-	n/a	RW	RW
VBAR_EL1	x	x	0	-	<a href="#">VBAR_EL1</a>	n/a	<a href="#">VBAR_EL1</a>
VBAR_EL1	0	0	1	-	<a href="#">VBAR_EL1</a>	<a href="#">VBAR_EL1</a>	<a href="#">VBAR_EL1</a>
VBAR_EL1	0	1	1	-	n/a	<a href="#">VBAR_EL1</a>	<a href="#">VBAR_EL1</a>
VBAR_EL1	1	0	1	-	<a href="#">VBAR_EL1</a>	RW	<a href="#">VBAR_EL1</a>
VBAR_EL1	1	1	1	-	n/a	RW	<a href="#">VBAR_EL1</a>

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic VBAR\_EL2 or VBAR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

D7.2.106 VBAR\_EL3, Vector Base Address Register (EL3)

The VBAR\_EL3 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL3.

Configurations

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

VBAR\_EL3 is a 64-bit register.

Field descriptions

The VBAR\_EL3 bit assignments are:

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL3.

If the implementation does not support [ARMv8.2-LVA](#), then:

- If tagged addresses are being used, bits [55:48] of VBAR\_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR\_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports [ARMv8.2-LVA](#), then:

- If tagged addresses are being used, bits [55:52] of VBAR\_EL3 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR\_EL3 must be the same or else the use of the vector address will result in a recursive exception.

Bits [10:0]

Reserved, RES0.

Accessing the VBAR\_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
VBAR_EL3	11	110	1100	0000	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
0	0	1	-	-	-	RW
0	1	1	-	n/a	-	RW
1	0	1	-	-	-	RW
1	1	1	-	n/a	-	RW

## D7.2.107 VMPIDR\_EL2, Virtualization Multiprocessor ID Register

The VMPIDR\_EL2 characteristics are:

### Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of [MPIDR\\_EL1](#).

### Configurations

AArch64 System register VMPIDR\_EL2[31:0] is architecturally mapped to AArch32 System register [VMPIDR](#).

If EL2 is not implemented, reads of this register return the value of the [MPIDR\\_EL1](#), and writes to the register are ignored.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

VMPIDR\_EL2 is a 64-bit register.

### Field descriptions

The VMPIDR\_EL2 bit assignments are:

#### Bits [63:40]

Reserved, RES0.

#### Aff3, bits [39:32]

Affinity level 3. Highest level affinity field.

#### Bit [31]

Reserved, RES1.

#### U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

- 0 Processor is part of a multiprocessor system.
- 1 Processor is part of a uniprocessor system.

#### Bits [29:25]

Reserved, RES0.

#### MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. The possible values of this bit are:

- 0 Performance of PEs at the lowest affinity level is largely independent.
- 1 Performance of PEs at the lowest affinity level is very interdependent.

#### Aff2, bits [23:16]

Affinity level 2. Second highest level affinity field.

#### Aff1, bits [15:8]

Affinity level 1. Third highest level affinity field.

#### Aff0, bits [7:0]

Affinity level 0. Lowest level affinity field.

### Accessing the VMPIDR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
VMPIDR_EL2	11	100	0000	0000	101

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## D7.2.108 VPIDR\_EL2, Virtualization Processor ID Register

The VPIDR\_EL2 characteristics are:

### Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of [MIDR\\_EL1](#).

### Configurations

AArch64 System register VPIDR\_EL2 is architecturally mapped to AArch32 System register [VPIDR](#).

If EL2 is not implemented, reads of this register return the value of the [MIDR\\_EL1](#), and writes to the register are ignored.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

VPIDR\_EL2 is a 32-bit register.

### Field descriptions

The VPIDR\_EL2 bit assignments are:

### Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

Hex representation	ASCII representation	Implementer
0x41	A	ARM Limited
0x42	B	Broadcom Corporation
0x43	C	Cavium Inc.
0x44	D	Digital Equipment Corporation
0x49	I	Infineon Technologies AG
0x4D	M	Motorola or Freescale Semiconductor Inc.
0x4E	N	NVIDIA Corporation
0x50	P	Applied Micro Circuits Corporation
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

ARM can assign codes that are not published in this manual. All values not assigned by ARM are reserved and must not be used.

### Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

### Architecture, bits [19:16]

The permitted values of this field are:

0001	ARMv4
0010	ARMv4T
0011	ARMv5 (obsolete)
0100	ARMv5T
0101	ARMv5TE
0110	ARMv5TEJ
0111	ARMv6
1111	Architectural features are individually identified in the ID_* registers, see <a href="#">Identification registers, functional group on page G4-4727</a> .

All other values are reserved.

### PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

### Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

## Accessing the VPIDR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
VPIDR_EL2	11	100	0000	0000	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## D7.2.109 VTCR\_EL2, Virtualization Translation Control Register

The VTCR\_EL2 characteristics are:

### Purpose

The control register for stage 2 of the EL1&0 translation regime.

### Configurations

AArch64 System register VTCR\_EL2 is architecturally mapped to AArch32 System register [VTCR](#).

If EL2 is not implemented, this register is RES0 from EL3.

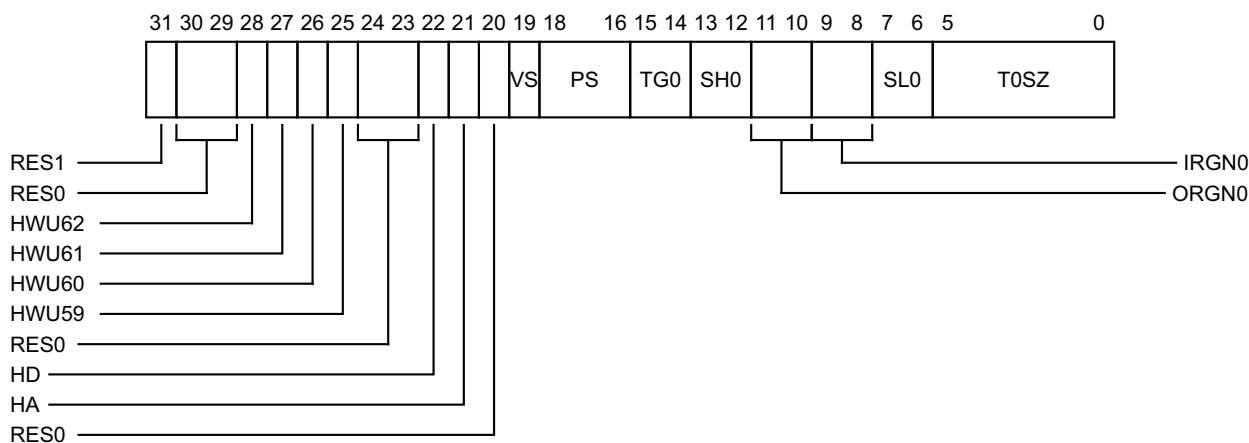

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

VTCR\_EL2 is a 32-bit register.

### Field descriptions

The VTCR\_EL2 bit assignments are:

Any of the bits in VTCR\_EL2 are permitted to be cached in a TLB.

### Bit [31]

Reserved, RES1.

### Bits [30:29]

Reserved, RES0.

### HWU62, bit [28]

#### In ARMv8.2

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table block or level 3 entry.

Defined values are:

- 0 The stage 2 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.
- 1 The stage 2 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.

This bit is RES0, if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HWU61, bit [27]**

***In ARMv8.2***

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table block or level 3 entry.

Defined values are:

- |   |   |
|---|---|
| 0 | The stage 2 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose. |
| 1 | The stage 2 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.    |

This bit is RES0, if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HWU60, bit [26]**

***In ARMv8.2***

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table block or level 3 entry.

Defined values are:

- |   |   |
|---|---|
| 0 | The stage 2 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose. |
| 1 | The stage 2 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.    |

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**HWU59, bit [25]**

***In ARMv8.2***

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table block or level 3 entry.

Defined values are:

- |   |   |
|---|---|
| 0 | The stage 2 translation table entry block or level 3 bit cannot be interpreted by hardware for an IMPLEMENTATION DEFINED purpose. |
| 1 | The stage 2 translation table entry block or level 3 bit can be interpreted by hardware for an IMPLEMENTATION DEFINED purpose.    |

This bit is RES0 if [ARMv8.2-TTPBHA](#) is not implemented.

***In ARMv8.1 and ARMv8.0.***

Reserved, RES0.

**Bits [24:23]**

Reserved, RES0.

**HD, bit [22]**

***In ARMv8.2 and ARMv8.1***

Hardware management of dirty state in stage 2 translations from Non-secure EL0 and EL1.

Defined values are:

- 0 Stage 2 hardware management of dirty state disabled.
  - 1 Stage 2 hardware management of dirty state enabled, only if the HA bit is also set to 1.
- This bit is RES0 if [ARMv8.1-TTHM](#) is not implemented.

**In ARMv8.0.**

Reserved, RES0.

#### HA, bit [21]

**In ARMv8.2 and ARMv8.1**

Hardware Access flag update in stage 2 translations from Non-secure EL0 and EL1.

Defined values are:

- 0 Stage 2 Access flag update disabled.
- 1 Stage 2 Access flag update enabled.

This bit is RES0 if [ARMv8.1-TTHM](#) is not implemented.

**In ARMv8.0.**

Reserved, RES0.

#### Bit [20]

Reserved, RES0.

#### VS, bit [19]

**In ARMv8.2 and ARMv8.1**

VMID Size.

Defined values are:

- 0 8 bit - the upper 8 bits of [VTTBR\\_EL2](#) are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.
- 1 16 bit - the upper 8 bits of [VTTBR\\_EL2](#) are used for allocation and matching in the TLB.

If the implementation only supports an 8-bit VMID, this field is RES0.

This bit is RES0 if [ARMv8.1-VMID16](#) is not implemented.

**In ARMv8.0.**

Reserved, RES0.

#### PS, bits [18:16]

Physical Address Size.

- 000 32 bits, 4GB.
- 001 36 bits, 64GB.
- 010 40 bits, 1TB.
- 011 42 bits, 4TB.
- 100 44 bits, 16TB.
- 101 48 bits, 256TB.
- 110 52 bits, 4PB

Other values are reserved.

The reserved values behave in the same way as the 101 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 110 is permitted only if [ARMv8.2-LPA](#) is implemented and the granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 110, then bits[51:48] of every translation table base address for the stage of translation controlled by VTCR\_EL2 are 0000.

#### TG0, bits [15:14]

Granule size for the [VTTBR\\_EL2](#).

00	4KB
01	64KB
10	16KB

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

#### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [VTTBR\\_EL2](#).

00	Non-shareable
10	Outer Shareable
11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in *Reserved values in System and memory-mapped registers and translation table entries* on page K1-6133.

#### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [VTTBR\\_EL2](#).

00	Normal memory, Outer Non-cacheable
01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable

#### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [VTTBR\\_EL2](#).

00	Normal memory, Inner Non-cacheable
01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable
10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable
11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable

#### SL0, bits [7:6]

Starting level of the [VTCR\\_EL2](#) addressed region. The meaning of this field depends on the value of VTCR\_EL2.TG0 (the granule size).

00	If TG0 is 00 (4KB granule), start at level 2. If TG0 is 10 (16KB granule) or 01 (64KB granule), start at level 3.
01	If TG0 is 00 (4KB granule), start at level 1. If TG0 is 10 (16KB granule) or 01 (64KB granule), start at level 2.
10	If TG0 is 00 (4KB granule), start at level 0. If TG0 is 10 (16KB granule) or 01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 0 Translation fault is generated.

### T0SZ, bits [5:0]

The size offset of the memory region addressed by [VTTBR\\_EL2](#). The region size is  $2^{(64-T0SZ)}$  bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 0 Translation fault is generated.

### Accessing the VTCR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
VTCR_EL2	11	100	0010	0001	010

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## D7.2.110 VTTBR\_EL2, Virtualization Translation Table Base Register

The VTTBR\_EL2 characteristics are:

### Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure EL1&0 translation regime, and other information for this translation regime.

### Configurations

AArch64 System register VTTBR\_EL2 is architecturally mapped to AArch32 System register [VTTBR](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

VTTBR\_EL2 is a 64-bit register.

### Field descriptions

The VTTBR\_EL2 bit assignments are:

Any of the fields in this register are permitted to be cached in a TLB.

### VMID[15:8], bits [63:56]

#### *In ARMv8.2 and ARMv8.1*

Extension to VMID[7:0]. See VMID[7:0] for more details.

#### *In ARMv8.0.*

Reserved, RES0.

### VMID[7:0], bits [55:48]

The VMID for the translation table.

It is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

If the implementation has an 8-bit VMID, then VMID[15:8] are RES0.

If the implementation has a 16-bit VMID, then:

- The [VTCR\\_EL2](#).VS bit selects whether VMID[15:8] are ignored by the hardware for every purpose except reading back the register, or whether these bits are used for allocation and matching in the TLB.
- The 16-bit VMID is only supported when EL2 is using AArch64. This means the hardware must ignore VMID[15:8] when EL2 is using AArch32.

### BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

---

#### Note

---

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes [ARMv8.2-LPA](#) and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

---

In an implementation that includes [ARMv8.2-LPA](#), if the value of [VTCR\\_EL2](#).IPS is 110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If  $x \geq 6$  then  $z=x$ .
  - Otherwise,  $z=6$ .
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes [ARMv8.2-TTCNP](#) bit[0] of the stage 1 translation table base address is zero.

---

#### Note

---

In an implementation that includes [ARMv8.2-LPA](#) a [VTCR\\_EL2](#).PS value of 110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.

---

When the value of [ID\\_AA64MMFR0\\_EL1](#).PARange indicates that the implementation does not support a 52-bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of [VTCR\\_EL2](#).PS is 110 and the value of register bits[5:2] is nonzero then it is IMPLEMENTATION DEFINED whether an Address size fault is generated, but ARM deprecates not generating an Address size fault.

If the *Effective value* of [VTCR\\_EL2](#).PS is not 110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:49] of the translation table base addresses used in this stage of translation are 0b0000.

---

#### Note

---

This definition applies:

- To an implementation that includes [ARMv8.2-LPA](#) and is using a translation granule smaller than 64KB.
- To any implementation that does not include [ARMv8.2-LPA](#).

---

If any [VTTBR\\_EL2](#)[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using [VTTBR\\_EL2](#), then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.

- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how  $x$  is calculated based on the value of [VTCR\\_EL2.T0SZ](#), the stage of translation, and the translation granule size.

#### CnP, bit [0]

##### *In ARMv8.2*

Common not Private. In an implementation that includes [ARMv8.2-TTCNP](#), indicates whether each entry that is pointed to by VTTBR\_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR\_EL2.CnP is 1.

- |   |  |
|---|--|
| 0 | The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.                             |
| 1 | The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID. |

#### ———— Note ————

If the value of VTTBR\_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR\_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR\_EL2 are *CONSTRAINED UNPREDICTABLE*, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-6120](#).

In an implementation that does not include [ARMv8.2-TTCNP](#) this field is RES0.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

### Accessing the VTTBR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
VTTBR_EL2	11	100	0010	0001	000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## D7.3 Debug registers

This section lists the Debug System registers in AArch64 state, in alphabetic order:

- The principal encoding space for debug registers is  $0p0==0b10$ ,  $0p1==\{0, 3, 4\}$ . [Instructions for accessing debug System registers on page C5-322](#) summarizes the registers in this encoding space and lists them in order of their encodings.
- In addition, the following registers in the  $0p0==0b11$  encoding space are classified as Debug registers:
  - [DLR\\_EL0](#).
  - [DSPSR\\_EL0](#).
  - [MDCR\\_EL2](#).
  - [MDCR\\_EL3](#).
  - [SDER32\\_EL3](#).

### D7.3.1 DBGAUTHSTATUS\_EL1, Debug Authentication Status register

The DBGAUTHSTATUS\_EL1 characteristics are:

#### Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

#### Configurations

AArch64 System register DBGAUTHSTATUS\_EL1 is architecturally mapped to AArch32 System register [DBGAUTHSTATUS](#).

AArch64 System register DBGAUTHSTATUS\_EL1 is architecturally mapped to External register [DBGAUTHSTATUS\\_EL1](#).

#### Attributes

DBGAUTHSTATUS\_EL1 is a 32-bit register.

#### Field descriptions

The DBGAUTHSTATUS\_EL1 bit assignments are:

#### Bits [31:8]

Reserved, RES0.

#### SNID, bits [7:6]

Secure non-invasive debug. Possible values of this field are:

- 00 Not implemented. EL3 is not implemented and the implemented Security state is Non-secure state.
  - 10 Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
  - 11 Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.
- Other values are reserved.

#### SID, bits [5:4]

Secure invasive debug. Possible values of this field are:

- 00 Not implemented. EL3 is not implemented and the implemented Security state is Non-secure state.
  - 10 Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
  - 11 Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.
- Other values are reserved.

#### NSNID, bits [3:2]

Non-secure non-invasive debug. Possible values of this field are:

- 00 Not implemented. EL3 is not implemented and the implemented Security state is Secure state.
- 10 Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
- 11 Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

Other values are reserved.

#### NSID, bits [1:0]

Non-secure invasive debug. Possible values of this field are:

- 00 Not implemented. EL3 is not implemented and the implemented Security state is Secure state.
  - 10 Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
  - 11 Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.
- Other values are reserved.

### Accessing the DBGAUTHSTATUS\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGAUTHSTATUS_EL1	10	000	0111	1110	110

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If MDCR\_EL2.TDA==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR\_EL3.TDA==1, read accesses to this register from EL1 and EL2 are trapped to EL3.

## D7.3.2 DBGBCR<n>\_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>\_EL1 characteristics are:

### Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>\\_EL1](#).

### Configurations

AArch64 System register DBGBCR<n>\_EL1 is architecturally mapped to AArch32 System register [DBGBCR<n>](#).

AArch64 System register DBGBCR<n>\_EL1 is architecturally mapped to External register [DBGBCR<n>\\_EL1](#).

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

### Attributes

DBGBCR<n>\_EL1 is a 32-bit register.

### Field descriptions

The DBGBCR<n>\_EL1 bit assignments are:

### Bits [31:24]

Reserved, RES0.

### BT, bits [23:20]

Breakpoint Type. Possible values are:

0000	Unlinked instruction address match.
0001	Linked instruction address match.
0010	Unlinked Context ID match.
0011	Linked Context ID match.
0110	Unlinked <a href="#">CONTEXTIDR_EL1</a> match (introduced in ARMv8.1).
0111	Linked <a href="#">CONTEXTIDR_EL1</a> match (introduced in ARMv8.1).
1000	Unlinked VMID match.
1001	Linked VMID match.
1010	Unlinked VMID and Context ID match.
1011	Linked VMID and Context ID match.
1100	Unlinked <a href="#">CONTEXTIDR_EL2</a> match (introduced in ARMv8.1).
1101	Linked <a href="#">CONTEXTIDR_EL2</a> match (introduced in ARMv8.1).
1110	Unlinked Full Context ID match (introduced in ARMv8.1).
1111	Linked Full Context ID match (introduced in ARMv8.1).

The field breaks down as follows:

- BT[3:1]: Base type.
 

000	Match address. <a href="#">DBGBVR&lt;n&gt;_EL1</a> is the address of an instruction.
001	Match Context ID. <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> when <a href="#">ARMv8.1-VHE</a> is not implemented, or not in a Host OS or a Host Application. When <a href="#">ARMv8.1-VHE</a> is implemented, and in a Host OS or Host Application, the Context ID is compared against <a href="#">CONTEXTIDR_EL2</a> .
011	Match <a href="#">CONTEXTIDR_EL1</a> . <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> .
100	Match VMID. <a href="#">DBGBVR&lt;n&gt;_EL1</a> .VMID is a VMID compared against <a href="#">VTTBR_EL2</a> .VMID.
101	Match VMID and Context ID. <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> , and <a href="#">DBGBVR&lt;n&gt;_EL1</a> .VMID is a VMID compared against <a href="#">VTTBR_EL2</a> .VMID.
110	Match <a href="#">CONTEXTIDR_EL2</a> . <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID2 is a Context ID compared against <a href="#">CONTEXTIDR_EL2</a> .
111	Match Full Context ID. <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID is compared against <a href="#">CONTEXTIDR_EL1</a> , and <a href="#">DBGBVR&lt;n&gt;_EL1</a> .ContextID2 is compared against <a href="#">CONTEXTIDR_EL2</a> .
- BT[0]: Enable linking.

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions. For more information, including the effect of programming this field to a reserved value, see [Reserved DBGBCR<n>\\_EL1.BT values on page D2-1935](#).

This field resets to a value that is architecturally UNKNOWN.

#### LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of [DBGBCR<n>\\_EL1.E](#) is 0.

This field resets to a value that is architecturally UNKNOWN.

#### SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see [Reserved DBGBCR<n>\\_EL1.{SSC, HMC, PMC} values on page D2-1936](#).

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-1931](#).

This field resets to a value that is architecturally UNKNOWN.

#### HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-1931](#).

This field resets to a value that is architecturally UNKNOWN.

**Bits [12:9]**

Reserved, RES0.

**BAS, bits [8:5]**

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64-only implementation, this field is reserved, RES1.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0011	DBGBVR<n>_EL1	Use for T32 instructions.
1100	DBGBVR<n>_EL1+2	Use for T32 instructions.
1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions.

All other values are reserved. For more information, see [Reserved DBGBCR<n>\\_EL1.BAS values on page D2-1937](#).

For more information on using the BAS field in address match breakpoints, see [Using the BAS field in Address Match breakpoints on page G2-4483](#).

For Context matching breakpoints, this field is RES1 and ignored.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

**Bits [4:3]**

Reserved, RES0.

**PMC, bits [2:1]**

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>\_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-1931](#).

This field resets to a value that is architecturally UNKNOWN.

**E, bit [0]**

Enable breakpoint DBGBVR<n>\_EL1. Possible values are:

- 0 Breakpoint disabled.
- 1 Breakpoint enabled.

This field resets to a value that is architecturally UNKNOWN.

**Accessing the DBGBCR<n>\_EL1**

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGBCR<n>_EL1	10	000	0000	n<3:0>	101

- <CRm> is in the range 0 - 15.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) and [Software Access debug event on page H3-5493](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [EDSCR.TDA](#)==1, [OSLSR\\_EL1.OSLK](#)==0, and halting is allowed, EL1, EL2, and EL3 accesses to this register generate a Software Access debug event.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.3 DBGBVR<n>\_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>\_EL1 characteristics are:

#### Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>\\_EL1](#).

#### Configurations

AArch64 System register DBGBVR<n>\_EL1[31:0] is architecturally mapped to AArch32 System register [DBGBVR<n>](#).

If the breakpoint is context-aware and EL2 is implemented then AArch64 System register DBGBVR<n>\_EL1[63:32] is architecturally mapped to AArch32 System register [DBGBXVR<n>](#). Otherwise there is no System register access to DBGBVR<n>\_EL1[63:32] from AArch32 state.

AArch64 System register DBGBVR<n>\_EL1 is architecturally mapped to External register [DBGBVR<n>\\_EL1](#).

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

#### Attributes

How this register is interpreted depends on the value of [DBGBCR<n>\\_EL1.BT](#).

- When [DBGBCR<n>\\_EL1.BT](#) is 0b000x, this register holds a virtual address.
- When [DBGBCR<n>\\_EL1.BT](#) is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>\\_EL1.BT](#) is 0b100x, this register holds a VMID.
- When [DBGBCR<n>\\_EL1.BT](#) is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>\\_EL1.BT](#) is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>\\_EL1.BT](#), this register is RES0.

#### Field descriptions

The DBGBVR<n>\_EL1 bit assignments are:

**When [DBGBCR<n>\\_EL1.BT](#)==0b000x:**

#### RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

#### VA[52:49], bits [52:49]

##### *In ARMv8.2*

Extension to VA[48:2]. See VA[48:2] for more details.

This field resets to a value that is architecturally UNKNOWN.

##### *In ARMv8.1 and ARMv8.0.*

Extension to RESS[14:4]. See RESS[14:4] for more details.

#### VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When [ARMv8.2-LVA](#) is implemented, and 52-bit addresses and a 64KB translation granule are in use, VA[52:49] form the upper part of the address value. Otherwise, VA[52:49] are RESS.

This field resets to a value that is architecturally UNKNOWN.

#### Bits [1:0]

Reserved, RES0.

**When  $DBGBCR<n>\_EL1.BT == 0b001x$ :**

#### Bits [63:32]

Reserved, RES0.

#### ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR\\_EL1](#) in the following cases:

- The PE is in Secure state.
- When [ARMv8.1-VHE](#) is not implemented.
- When [ARMv8.1-VHE](#) is implemented, [HCR\\_EL2.E2H](#) is 0 and the PE is in Non-secure EL0, EL1 or EL2.
- When [ARMv8.1-VHE](#) is implemented, [HCR\\_EL2](#).{E2H, TGE} is {1, 0} and the PE is in Non-secure EL0 or EL1.

When [ARMv8.1-VHE](#) is implemented, [HCR\\_EL2.E2H](#) is 1, the value is compared against [CONTEXTIDR\\_EL2](#) in the following cases:

- The PE is executing at EL2.
- [HCR\\_EL2.TGE](#) is 1 and the PE is in Non-secure EL0.

This field resets to a value that is architecturally UNKNOWN.

**When  $DBGBCR<n>\_EL1.BT == 0b011x$ :**

#### Bits [63:32]

Reserved, RES0.

### ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

This field resets to a value that is architecturally UNKNOWN.

**When  $DBGBCR<n>_{EL1}.BT==0b100x$  and EL2 implemented:**

### Bits [63:48]

Reserved, RES0.

### VMID[15:8], bits [47:40]

*In ARMv8.2 and ARMv8.1*

Extension to VMID[7:0]. See VMID[7:0] for more details.

This field resets to a value that is architecturally UNKNOWN.

*In ARMv8.0.*

Reserved, RES0.

### VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- [ARMv8.1-VMID16](#) is not implemented.

When [ARMv8.1-VMID16](#) is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- [VTCR\\_EL2.VS](#) has a value of 0.
- EL2 is using AArch32.

This field resets to a value that is architecturally UNKNOWN.

### Bits [31:0]

Reserved, RES0.

**When  $DBGBCR<n>_{EL1}.BT==0b101x$  and EL2 implemented:**

### Bits [63:48]

Reserved, RES0.

### VMID[15:8], bits [47:40]

*In ARMv8.2 and ARMv8.1*

Extension to VMID[7:0]. See VMID[7:0] for more details.

This field resets to a value that is architecturally UNKNOWN.

**In ARMv8.0.**

Reserved, RES0.

**VMID[7:0], bits [39:32]**

VMID value for comparison.

The VMID is 8 bits in the following cases.

- EL2 is using AArch32.
- [ARMv8.1-VMID16](#) is not implemented.

When [ARMv8.1-VMID16](#) is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- [VTCR\\_EL2.VS](#) has a value of 0.
- EL2 is using AArch32.

This field resets to a value that is architecturally UNKNOWN.

**ContextID, bits [31:0]**

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

This field resets to a value that is architecturally UNKNOWN.

**When  $DBGBCR<n>_{EL1}.BT == 0b110x$  and EL2 implemented:**

**ContextID2, bits [63:32]**

Context ID value for comparison against [CONTEXTIDR\\_EL2](#).

This field resets to a value that is architecturally UNKNOWN.

**Bits [31:0]**

Reserved, RES0.

**When  $DBGBCR<n>_{EL1}.BT == 0b111x$  and EL2 implemented:**

**ContextID2, bits [63:32]**

Context ID value for comparison against [CONTEXTIDR\\_EL2](#).

This field resets to a value that is architecturally UNKNOWN.

**ContextID, bits [31:0]**

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

This field resets to a value that is architecturally UNKNOWN.

## Accessing the DBGBVR<n>\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGBVR<n>_EL1	10	000	0000	n<3:0>	100

- <CRm> is in the range 0 - 15.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) and [Software Access debug event on page H3-5493](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [EDSCR.TDA](#)==1, [OSLSR\\_EL1.OSLK](#)==0, and halting is allowed, EL1, EL2, and EL3 accesses to this register generate a Software Access debug event.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.4 DBGCLAIMCLR\_EL1, Debug Claim Tag Clear register

The DBGCLAIMCLR\_EL1 characteristics are:

#### Purpose

Used by software to read the values of the CLAIM tag bits, and to clear these bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

#### ————— Note —————

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET\\_EL1](#) register.

#### Configurations

AArch64 System register DBGCLAIMCLR\_EL1 is architecturally mapped to AArch32 System register [DBGCLAIMCLR](#).

AArch64 System register DBGCLAIMCLR\_EL1 is architecturally mapped to External register [DBGCLAIMCLR\\_EL1](#).

An implementation must include 8 CLAIM tag bits.

This register is in the Cold reset domain. See the CLAIM field description for the effect of a Cold reset on the value returned by this register. This register is not affected by a Warm reset.

#### Attributes

DBGCLAIMCLR\_EL1 is a 32-bit register.

#### Field descriptions

The DBGCLAIMCLR\_EL1 bit assignments are:

31	8	7	0
RAZ/SBZ			CLAIM

#### Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

#### CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

A cold reset clears the CLAIM tag bits to 0.

#### Accessing the DBGCLAIMCLR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGCLAIMCLR_EL1	10	000	0111	1001	110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If MDCR\_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR\_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.5 DBGCLAIMSET\_EL1, Debug Claim Tag Set register

The DBGCLAIMSET\_EL1 characteristics are:

#### Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

#### ———— Note ————

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR\\_EL1](#) register.

#### Configurations

AArch64 System register DBGCLAIMSET\_EL1 is architecturally mapped to AArch32 System register [DBGCLAIMSET](#).

AArch64 System register DBGCLAIMSET\_EL1 is architecturally mapped to External register [DBGCLAIMSET\\_EL1](#).

An implementation must include 8 CLAIM tag bits.

#### Attributes

DBGCLAIMSET\_EL1 is a 32-bit register.

#### Field descriptions

The DBGCLAIMSET\_EL1 bit assignments are:

31	8	7	0
RAZ/SBZ			CLAIM

#### Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

#### CLAIM, bits [7:0]

Set CLAIM tag bits. RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

A cold reset clears the CLAIM tag bits to 0.

#### Accessing the DBGCLAIMSET\_EL1

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGCLAIMSET_EL1	10	000	0111	1000	110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If MDCR\_EL2.TDA==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If MDCR\_EL3.TDA==1, accesses to this register from EL1 and EL2 are trapped to EL3.

D7.3.6 DBGDTR\_EL0, Debug Data Transfer Register, half-duplex

The DBGDTR\_EL0 characteristics are:

Purpose

Transfers 64 bits of data between the PE and an external debugger. Can transfer both ways using only a single register.

Configurations

There are no configuration notes.

Attributes

DBGDTR\_EL0 is a 64-bit register.

Field descriptions

The DBGDTR\_EL0 bit assignments are:

HighWord, bits [63:32]

Writes to this register set DTRRX to the value in this field and do not change RXfull.  
Reads from this register return the value of DTRTX and do not change TXfull.

LowWord, bits [31:0]

Writes to this register set DTRTX to the value in this field and set TXfull to 1.  
Reads from this register return the value of DTRRX and clear RXfull to 0.

Accessing the DBGDTR\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGDTR_EL0	10	011	0000	0100	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules, in Non-debug state:

- In both security states, and not dependent on other bits:
  - If [MDSCR\\_EL1.TDCC](#)==1, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

### **Note**

Read and write accesses to this register are not trapped in Debug state.

### D7.3.7 DBGDTRRX\_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX\_EL0 characteristics are:

#### Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. It is a component of the Debug Communications Channel.

#### Configurations

AArch64 System register DBGDTRRX\_EL0 is architecturally mapped to AArch32 System register [DBGDTRRXint](#).

AArch64 System register DBGDTRRX\_EL0 is architecturally mapped to External register [DBGDTRRX\\_EL0](#).

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

#### Attributes

DBGDTRRX\_EL0 is a 32-bit register.

#### Field descriptions

The DBGDTRRX\_EL0 bit assignments are:

#### Bits [31:0]

Update DTRRX.

If RXfull is set to 1, then reads of this register return the last value written to DTRRX and clear RXfull to 0.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

This field resets to a value that is architecturally UNKNOWN.

#### Accessing the DBGDTRRX\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGDTRRX_EL0	10	011	0000	0101	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules, in Non-debug state:

- In both security states, and not dependent on other bits:
  - If [MDSCR\\_EL1.TDCC](#)==1, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

---

**Note**

---

Read accesses to this register are not trapped in Debug state.

---

### D7.3.8 DBGDTRTX\_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX\_EL0 characteristics are:

#### Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. It is a component of the Debug Communication Channel.

#### Configurations

AArch64 System register DBGDTRTX\_EL0 is architecturally mapped to AArch32 System register [DBGDTRTXint](#).

AArch64 System register DBGDTRTX\_EL0 is architecturally mapped to External register [DBGDTRTX\\_EL0](#).

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

#### Attributes

DBGDTRTX\_EL0 is a 32-bit register.

#### Field descriptions

The DBGDTRTX\_EL0 bit assignments are:

#### Bits [31:0]

Return DTRTX.

If TXfull is set to 0, then writes of this register update the value in DTRTX and set TXfull to 1.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

This field resets to a value that is architecturally UNKNOWN.

#### Accessing the DBGDTRTX\_EL0

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGDTRTX_EL0	10	011	0000	0101	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	WO	WO	n/a	WO
x	0	1	WO	WO	WO	WO
x	1	1	WO	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules, in Non-debug state:

- In both security states, and not dependent on other bits:
  - If [MDSCR\\_EL1.TDCC](#)==1, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, write accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

### **Note**

Write accesses to this register are not trapped in Debug state.

### D7.3.9 DBGPRCR\_EL1, Debug Power Control Register

The DBGPRCR\_EL1 characteristics are:

## Purpose

Controls behavior of the PE on powerdown request.

## Configurations

AArch64 System register DBGPRCR\_EL1 is architecturally mapped to AArch32 System register [DBGPRCR](#).

Bit [0] of this register is mapped to **EDPRCR**.CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

### Attributes

DBGPRCR\_EL1 is a 32-bit register.

## Field descriptions

The DBGPRCR EL1 bit assignments are:

**Bits [31:1]**

Reserved, RES0.

### CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown. Possible values of this bit are:

- |   |  |
|---|--|
| 0 | If the system responds to a powerdown request, it powers down Core power domain.   |
| 1 | If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain. |

Writes to this bit are permitted regardless of the state of the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request Core no powerdown regardless of whether invasive debug is permitted.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of `EDPRCR.COREPURQ` on exit from an IMPLEMENTATION DEFINED software-visible retention state.

## Accessing the DBGPRCR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreq>

This register can be written using MSR (register) with the following syntax:

MSR &lt;systemreg&gt;, &lt;Xt&gt;

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGPRCR_EL1	10	000	0001	0100	100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDOSA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDOSA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.10 DBGVCR32\_EL2, Debug Vector Catch Register

The DBGVCR32\_EL2 characteristics are:

## Purpose

Allows access to the AArch32 register **DBGVCR** from AArch64 state only. Its value has no effect on execution in AArch64 state.

## Configurations

AArch64 System register DBGVCR32\_EL2 is architecturally mapped to AArch32 System register DBGVCR.

If EL1 does not support AArch32, this register is UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

DBGVCR32\_EL2 is a 32-bit register.

## Field descriptions

The DBGVCR32 EL2 bit assignments are:

***When EL3 implemented and using AArch64:***

## NSF, bit [31]

FIO vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

This field resets to a value that is architecturally UNKNOWN.

## NSI, bit [30]

IRO vector catch enable in Non-secure state.

The exception vector offset is 0x18.

This field resets to a value that is architecturally UNKNOWN.

## Bit [29]

Reserved, RES0.

**NSD, bit [28]**

Data Abort vector catch enable in Non-secure state.

The exception vector offset is  $0x10$ .  
This field resets to a value that is architecturally UNKNOWN.

**NSP, bit [27]**

Prefetch Abort vector catch enable in Non-secure state.  
The exception vector offset is  $0x0C$ .  
This field resets to a value that is architecturally UNKNOWN.

**NSS, bit [26]**

Supervisor Call (SVC) vector catch enable in Non-secure state.  
The exception vector offset is  $0x08$ .  
This field resets to a value that is architecturally UNKNOWN.

**NSU, bit [25]**

Undefined Instruction vector catch enable in Non-secure state.  
The exception vector offset is  $0x04$ .  
This field resets to a value that is architecturally UNKNOWN.

**Bits [24:8]**

Reserved, RES0.

**SE, bit [7]**

FIQ vector catch enable in Secure state.  
The exception vector offset is  $0x1C$ .  
This field resets to a value that is architecturally UNKNOWN.

**SI, bit [6]**

IRQ vector catch enable in Secure state.  
The exception vector offset is  $0x18$ .  
This field resets to a value that is architecturally UNKNOWN.

**Bit [5]**

Reserved, RES0.

**SD, bit [4]**

Data Abort vector catch enable in Secure state.  
The exception vector offset is  $0x10$ .  
This field resets to a value that is architecturally UNKNOWN.

**SP, bit [3]**

Prefetch Abort vector catch enable in Secure state.  
The exception vector offset is  $0x0C$ .  
This field resets to a value that is architecturally UNKNOWN.

**SS, bit [2]**

Supervisor Call (SVC) vector catch enable in Secure state.  
The exception vector offset is  $0x08$ .  
This field resets to a value that is architecturally UNKNOWN.

**SU, bit [1]**

Undefined Instruction vector catch enable in Secure state.  
The exception vector offset is  $0x04$ .

This field resets to a value that is architecturally UNKNOWN.

#### Bit [0]

Reserved, RES0.

#### When EL3 not implemented:

#### Bits [31:8]

Reserved, RES0.

#### F, bit [7]

FIQ vector catch enable.

The exception vector offset is  $0x1C$ .

This field resets to a value that is architecturally UNKNOWN.

#### I, bit [6]

IRQ vector catch enable.

The exception vector offset is  $0x18$ .

This field resets to a value that is architecturally UNKNOWN.

#### Bit [5]

Reserved, RES0.

#### D, bit [4]

Data Abort vector catch enable.

The exception vector offset is  $0x10$ .

This field resets to a value that is architecturally UNKNOWN.

#### P, bit [3]

Prefetch Abort vector catch enable.

The exception vector offset is  $0x0C$ .

This field resets to a value that is architecturally UNKNOWN.

#### S, bit [2]

Supervisor Call (SVC) vector catch enable.

The exception vector offset is  $0x08$ .

This field resets to a value that is architecturally UNKNOWN.

#### U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is  $0x04$ .

This field resets to a value that is architecturally UNKNOWN.

#### Bit [0]

Reserved, RES0.

## Accessing the DBGVCR32\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGVCR32_EL2	10	100	0000	0111	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL2 are trapped to EL3.

### D7.3.11 DBGWCR<n>\_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>\_EL1 characteristics are:

#### Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>\_EL1.

#### Configurations

AArch64 System register DBGWCR<n>\_EL1 is architecturally mapped to AArch32 System register DBGWCR<n>.

AArch64 System register DBGWCR<n>\_EL1 is architecturally mapped to External register DBGWCR<n>\_EL1.

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

#### Attributes

DBGWCR<n>\_EL1 is a 32-bit register.

#### Field descriptions

The DBGWCR<n>\_EL1 bit assignments are:

#### Bits [31:29]

Reserved, RES0.

#### MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

00000 No mask.

00001 Reserved.

00010 Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn\_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0xFFFFFFFF mask for address).

This field resets to a value that is architecturally UNKNOWN.

#### Bits [23:21]

Reserved, RES0.

#### WT, bit [20]

Watchpoint type. Possible values are:

- 0 Unlinked data address match.
- 1 Linked data address match.

This field resets to a value that is architecturally UNKNOWN.

#### LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

This field resets to a value that is architecturally UNKNOWN.

#### SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint *n* is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions](#) on page D2-1943.

This field resets to a value that is architecturally UNKNOWN.

#### HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint *n* is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions](#) on page D2-1943.

This field resets to a value that is architecturally UNKNOWN.

#### BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>\\_EL1](#) is being watched.

BAS	Description
xxxxxxx1	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a>
xxxxxxx1x	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+1</a>
xxxxx1xx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+2</a>
xxxx1xxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+3</a>

In cases where [DBGWVR<n>\\_EL1](#) addresses a double-word:

BAS	Description, if <a href="#">DBGWVR&lt;n&gt;_EL1[2] == 0</a>
xxx1xxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+4</a>
xx1xxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+5</a>
x1xxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+6</a>
1xxxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1+7</a>

If [DBGWVR<n>\\_EL1\[2\] == 1](#), only BAS[3:0] are used and BAS[7:4] are ignored. ARM deprecates setting [DBGWVR<n>\\_EL1\[2\] == 1](#).

The valid values for BAS are nonzero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See [Reserved DBGWCR<n>\\_EL1.BAS values on page D2-1951](#).

This field resets to a value that is architecturally UNKNOWN.

#### LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

- 01 Match instructions that load from a watchpointed address.
- 10 Match instructions that store to a watchpointed address.
- 11 Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field resets to a value that is architecturally UNKNOWN.

#### PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-1943](#).

This field resets to a value that is architecturally UNKNOWN.

#### E, bit [0]

Enable watchpoint n. Possible values are:

- 0 Watchpoint disabled.
- 1 Watchpoint enabled.

This field resets to a value that is architecturally UNKNOWN.

### Accessing the DBGWCR<n>\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGWCR<n>_EL1	10	000	0000	n<3:0>	111

- <CRm> is in the range 0 - 15.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) and [Software Access debug event on page H3-5493](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [EDSCR.TDA](#)==1, [OSLSR\\_EL1.OSLK](#)==0, and halting is allowed, EL1, EL2, and EL3 accesses to this register generate a Software Access debug event.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.12 DBGWVR<n>\_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>\_EL1 characteristics are:

#### Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>\\_EL1](#).

#### Configurations

AArch64 System register DBGWVR<n>\_EL1[31:0] is architecturally mapped to AArch32 System register [DBGWVR<n>](#).

AArch64 System register DBGWVR<n>\_EL1 is architecturally mapped to External register [DBGWVR<n>\\_EL1](#).

If breakpoint n is not implemented then this register is unallocated.

This register is in the Cold reset domain. On a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

#### Attributes

DBGWVR<n>\_EL1 is a 64-bit register.

#### Field descriptions

The DBGWVR<n>\_EL1 bit assignments are:

#### RESS[14:4], bits [63:53]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

#### VA[52:49], bits [52:49]

##### In ARMv8.2

Extension to VA[48:2]. See VA[48:2] for more details.

This field resets to a value that is architecturally UNKNOWN.

##### In ARMv8.1 and ARMv8.0.

Extension to RESS[14:4]. See RESS[14:4] for more details.

#### VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When [ARMv8.2-LVA](#) is implemented, and 52-bit addresses and a 64KB translation granule are in use, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

ARM deprecates setting [DBGWVR<n>\\_EL1\[2\] == 1](#).

This field resets to a value that is architecturally UNKNOWN.

**Bits [1:0]**

Reserved, RES0.

**Accessing the DBGWVR<n>\_EL1**

This register can be read using MRS with the following syntax:

MRS &lt;Xt&gt;, &lt;systemreg&gt;

This register can be written using MSR (register) with the following syntax:

MSR &lt;systemreg&gt;, &lt;Xt&gt;

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DBGWVR<n>_EL1	10	000	0000	n<3:0>	110

- <CRm> is in the range 0 - 15.

**Accessibility**

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

**Traps and Enables**

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#) and [Software Access debug event on page H3-5493](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [EDSCR.TDA](#)==1, [OSLSR\\_EL1.OSLK](#)==0, and halting is allowed, EL1, EL2, and EL3 accesses to this register generate a Software Access debug event.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

D7.3.13 DLR\_EL0, Debug Link Register

The DLR\_EL0 characteristics are:

Purpose

In Debug state, holds the address to restart from.

Configurations

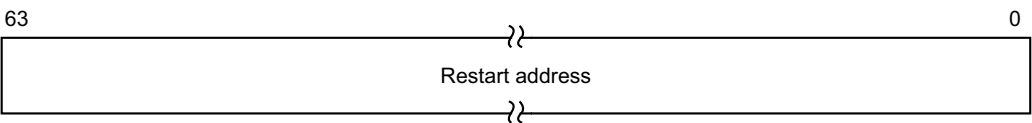

AArch64 System register DLR\_EL0[31:0] is architecturally mapped to AArch32 System register [DLR](#).

Attributes

DLR\_EL0 is a 64-bit register.

Field descriptions

The DLR\_EL0 bit assignments are:

Bits [63:0]

Restart address.

Accessing the DLR\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DLR_EL0	11	011	0100	0101	001

Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

Access to this register is from Debug state only. During normal execution this register is unallocated.

### D7.3.14 DSPSR\_EL0, Debug Saved Program Status Register

The DSPSR\_EL0 characteristics are:

#### Purpose

Holds the saved process state on entry to Debug state.

#### Configurations

AArch64 System register DSPSR\_EL0 is architecturally mapped to AArch32 System register [DSPSR](#).

#### Attributes

DSPSR\_EL0 is a 32-bit register.

#### Field descriptions

The DSPSR\_EL0 bit assignments are:

#### When exiting Debug state to AArch32:

#### N, bit [31]

Copied to [CPSR](#).N on exiting Debug state.

#### Z, bit [30]

Copied to [CPSR](#).Z on exiting Debug state.

#### C, bit [29]

Copied to [CPSR](#).C on exiting Debug state.

#### V, bit [28]

Copied to [CPSR](#).V on exiting Debug state.

#### Q, bit [27]

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

#### IT[1:0], bits [26:25]

IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

#### J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ARMv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

#### Bit [23]

Reserved, RES0.

**PAN, bit [22]**

***In ARMv8.2 and ARMv8.1***

When [ARMv8.1-PAN](#) is implemented, set to the value of [CPSR.PAN](#) on entering Debug state, and copied to [CPSR.PAN](#) on exiting Debug state.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

***In ARMv8.0.***

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of [PSTATE.SS](#) immediately before Debug state was entered.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of [PSTATE.IL](#) immediately before Debug state was entered.

**GE, bits [19:16]**

Greater than or Equal flags, for parallel addition and subtraction.

**IT[7:2], bits [15:10]**

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

**E, bit [9]**

Endianness state bit. Controls the load and store endianness for data accesses:

0 Little-endian operation

1 Big-endian operation.

Instruction fetches ignore this bit.

When the reset value of the [SCTLR.EE](#) bit is defined by a configuration input signal, that value also applies to the [CPSR.E](#) bit on reset, and therefore applies to software execution from reset.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

**A, bit [8]**

SError interrupt mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.

1 Exception masked.

#### F, bit [6]

FIQ mask bit. The possible values of this bit are:

- 0 Exception not masked.
- 1 Exception masked.

#### T, bit [5]

T32 Instruction set state bit. Determines the AArch32 instruction set state that the Debug state entry was taken from. Possible values of this bit are:

- 0 Taken from A32 state.
- 1 Taken from T32 state.

#### M[4], bit [4]

Execution state that Debug state was entered from. Possible values of this bit are:

- 1 Exception taken from AArch32.

#### M[3:0], bits [3:0]

AArch32 mode that Debug state was entered from. The possible values are:

M[3:0]	Mode
0b0000	User
0b0001	FIQ
0b0010	IRQ
0b0011	Supervisor
0b0110	Monitor
0b0111	Abort
0b1010	Hyp
0b1011	Undefined
0b1111	System

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE, as described in [Reserved values in System and memory-mapped registers and translation table entries](#) on page K1-6133.

#### When entering Debug state from AArch64 and exiting Debug state to AArch64:

#### N, bit [31]

Set to the value of the N condition flag on entering Debug state, and copied to the N condition flag on exiting Debug state.

**Z, bit [30]**

Set to the value of the Z condition flag on entering Debug state, and copied to the Z condition flag on exiting Debug state.

**C, bit [29]**

Set to the value of the C condition flag on entering Debug state, and copied to the C condition flag on exiting Debug state.

**V, bit [28]**

Set to the value of the V condition flag on entering Debug state, and copied to the V condition flag on exiting Debug state.

**Bits [27:24]**

Reserved, RES0.

**UAO, bit [23]**

*In ARMv8.2*

When [ARMv8.2-UAO](#) is implemented, set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

When [ARMv8.2-UAO](#) is not implemented, this bit is RES0.

*In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

**PAN, bit [22]**

*In ARMv8.2 and ARMv8.1*

When [ARMv8.1-PAN](#) is implemented, set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

When [ARMv8.1-PAN](#) is not implemented, this bit is RES0.

*In ARMv8.0.*

Reserved, RES0.

**SS, bit [21]**

Software step. Shows the value of PSTATE.SS immediately before Debug state was entered.

**IL, bit [20]**

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before Debug state was entered.

**Bits [19:10]**

Reserved, RES0.

**D, bit [9]**

Process state D mask. The possible values of this bit are:

- 0 Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.
- 1 Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

**A, bit [8]**

SError interrupt mask bit. The possible values of this bit are:

- 0 Exception not masked.

1 Exception masked.

#### I, bit [7]

IRQ mask bit. The possible values of this bit are:

0 Exception not masked.  
1 Exception masked.

#### F, bit [6]

FIQ mask bit. The possible values of this bit are:

0 Exception not masked.  
1 Exception masked.

#### Bit [5]

Reserved, RES0.

#### M[4], bit [4]

Execution state that Debug state was entered from. Possible values of this bit are:

0 Exception taken from AArch64.

#### M[3:0], bits [3:0]

AArch64 state (Exception level and selected SP) that Debug state was entered from. The possible values are:

M[3:0]	State
0b0000	EL0t
0b0100	EL1t
0b0101	EL1h
0b1000	EL2t
0b1001	EL2h
0b1100	EL3t
0b1101	EL3h

Other values are reserved, and returning to an Exception level that is using AArch64 with a reserved value in this field is treated as an illegal exception return.

The bits in this field are interpreted as follows:

- M[3:2] holds the Exception Level.
- M[1] is unused and is RES0 for all non-reserved values.
- M[0] is used to select the SP:
  - 0 means the SP is always SP0.
  - 1 means the exception SP is determined by the EL.

### Accessing the DSPSR\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
DSPSR_EL0	11	011	0100	0101	000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

Access to this register is from Debug state only. During normal execution this register is unallocated.

### D7.3.15 MDCCINT\_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT\_EL1 characteristics are:

#### Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

#### Configurations

AArch64 System register MDCCINT\_EL1 is architecturally mapped to AArch32 System register [DBGDCCINT](#).

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

MDCCINT\_EL1 is a 32-bit register.

#### Field descriptions

The MDCCINT\_EL1 bit assignments are:

#### Bit [31]

Reserved, RES0.

#### RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

0 No interrupt request generated by DTRRX.

1 Interrupt request will be generated on RXfull == 1.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

When this register has an architecturally-defined reset value, this field resets to 0.

#### TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

0 No interrupt request generated by DTRTX.

1 Interrupt request will be generated on TXfull == 0.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bits [28:0]

Reserved, RES0.

## Accessing the MDCCINT\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MDCCINT_EL1	10	000	0000	0010	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.16 MDCCSR\_EL0, Monitor DCC Status Register

The MDCCSR\_EL0 characteristics are:

#### Purpose

Main control register for the debug implementation, containing flow-control flags for the DCC. This is an internal, read-only view.

#### Configurations

There are no configuration notes.

#### Attributes

MDCCSR\_EL0 is a 32-bit register.

#### Field descriptions

The MDCCSR\_EL0 bit assignments are:

#### Bit [31]

Reserved, RES0.

#### RXfull, bit [30]

DTRRX full. Read-only view of the equivalent bit in the [EDSCR](#).

#### TXfull, bit [29]

DTRTX full. Read-only view of the equivalent bit in the [EDSCR](#).

#### Bits [28:19]

Reserved, RES0.

#### Bits [18:15]

Reserved. Hardware must implement this field as RAZ. Software must not rely on the register reading as zero.

#### Bits [14:13]

Reserved, RES0.

#### Bit [12]

Reserved. Hardware must implement this field as RAZ. Software must not rely on the register reading as zero.

#### Bits [11:6]

Reserved, RES0.

#### Bits [5:2]

Reserved. Hardware must implement this field as RAZ. Software must not rely on the register reading as zero.

### Bits [1:0]

Reserved, RES0.

## Accessing the MDCCSR\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MDCCSR_EL0	10	011	0000	0001	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [MDSCR\\_EL1.TDCC](#)==1, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

### D7.3.17 MDCR\_EL2, Monitor Debug Configuration Register (EL2)

The MDCR\_EL2 characteristics are:

#### Purpose

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

#### Configurations

AArch64 System register MDCR\_EL2 is architecturally mapped to AArch32 System register [HDCR](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

MDCR\_EL2 is a 32-bit register.

#### Field descriptions

The MDCR\_EL2 bit assignments are:

#### Bits [31:18]

Reserved, RES0.

#### HPMD, bit [17]

##### *In ARMv8.2 and ARMv8.1*

Guest Performance Monitors Disable. This control prohibits event counting at EL2. Permitted values are:

- 0 Event counting allowed at EL2.
- 1 Event counting prohibited at EL2.

In an ARMv8.1 implementation, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

This control applies only to:

- The event counters in the range [0..(HPMN-1)].
- If [PMCR\\_EL0.DP](#) is set to 1, [PMCCNTR\\_EL0](#).

The other event counters are unaffected, and when [PMCR\\_EL0.DP](#) is set to 0, [PMCCNTR\\_EL0](#) is unaffected.

When this register has an architecturally-defined reset value, this field resets to 0.

**In ARMv8.0.**

Reserved, RES0.

**Bits [16:15]**

Reserved, RES0.

**TPMS, bit [14]**

**In ARMv8.2**

Trap Performance Monitor Sampling. When the Statistical Profiling Extension is implemented this field controls access to Statistical Profiling control registers from Non-secure EL1 and EL0. The possible values of this bit are:

- 0 Do not trap Statistical Profiling controls to EL2.
- 1 Accesses to Statistical Profiling controls at Non-secure EL1 generate a Trap exception to EL2.

If EL2 is not implemented, the PE behaves as if TPMS == 0, other than for a direct read of the register.

When the Statistical Profiling Extension is not implemented this field is reserved, RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

**E2PB, bits [13:12]**

**In ARMv8.2**

EL2 Profiling Buffer. When the Statistical Profiling Extension is implemented this field controls the owning translation regime and access to Profiling Buffer control registers from Non-secure EL1. The possible values of this field are:

- 00 Profiling Buffer uses the EL2 stage 1 translation regime. Accesses to Profiling Buffer controls at Non-secure EL1 generate a Trap exception to EL2.
- 10 Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer controls at Non-secure EL1 generate a Trap exception to EL2.
- 11 Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer controls at Non-secure EL1 are not trapped to EL2.

All other values are reserved. If this field is programmed with a reserved value, the PE behaves as if this field has a defined value, other than for a direct read of the register. Software must not rely on the behavior of reserved values, as they might change in a future version of the architecture.

If EL2 is not implemented, the PE behaves as if E2PB == 0b11, other than for a direct read of the register.

When the Statistical Profiling Extension is not implemented this field is reserved, RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps Non-secure System register accesses to the Debug ROM registers to EL2. This trap is from:

- Non-secure EL0 using AArch32.
- Non-secure EL1, regardless of which Execution state it is using.

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2, unless it is trapped by [DBGDSCRExt.UDCCdis](#) or [MDSR\\_EL1.TDCC](#).

The registers for which accesses are trapped are as follows:

AArch64: [MDRAR\\_EL1](#).

AArch32: [DBGDRAR](#), [DBGDSAR](#).

If [MDCR\\_EL2.TDE](#) == 1 or [HCR\\_EL2.TGE](#) == 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to a value that is architecturally UNKNOWN.

#### TDOSA, bit [10]

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states:

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL1 System register accesses to the powerdown debug registers are trapped to EL2.

The registers for which accesses are trapped are as follows:

AArch64: [OSLAR\\_EL1](#), [OSLSR\\_EL1](#), [OSDLR\\_EL1](#), and the [DBGPRCR\\_EL1](#).

AArch32: [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and the [DBGPRCR](#).

AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

#### ———— Note ————

These registers are not accessible at EL0.

If [MDCR\\_EL2.TDE](#) == 1 or [HCR\\_EL2.TGE](#) == 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to a value that is architecturally UNKNOWN.

#### TDA, bit [9]

Trap Debug Access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers that are not trapped by either of the following:

- [MDCR\\_EL2.TDRA](#).
- [MDCR\\_EL2.TDOSA](#).

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by [MDCR\\_EL2.TDRA](#) and [MDCR\\_EL2.TDOSA](#), are trapped to EL2, from both Execution states, unless it is trapped by [DBGDSCRExt.UDCCdis](#) or [MDSCR\\_EL1.TDCC](#).

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

Traps of AArch64 accesses to [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#) are ignored in Debug state.

If [MDCR\\_EL2.TDE](#) == 1 or [HCR\\_EL2.TGE](#) == 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to a value that is architecturally UNKNOWN.

#### TDE, bit [8]

Trap Debug exceptions. The possible values of this field are:

- 0 This control has no effect on the routing of debug exceptions, and has no effect on Non-secure accesses to debug registers.
- 1 In Non-secure state:
  - Debug exceptions generated at EL1 or EL0 are routed to EL2.
  - The [MDCR\\_EL2](#).{[TDRA](#), [TDOSA](#), [TDA](#)} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

When `HCR_EL2.TGE == 1`, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

This field resets to a value that is architecturally UNKNOWN.

#### HPME, bit [7]

Hypervisor Performance Monitors Counters Enable. The possible values of this bit are:

- 0 EL2 Performance Monitors counters disabled.
- 1 EL2 Performance Monitors counters enabled.

When the value of this bit is 1, the Performance Monitors counters that are reserved for use from EL2 or Secure state are enabled. For more information see the description of the HPMN field.

If the Performance Monitors Extension is not implemented, this field is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### TPM, bit [6]

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to EL2, from both Execution states:

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to EL2.

#### ———— Note ————

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors Extension is not implemented, this field is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### TPMCR, bit [5]

Trap `PMCR_EL0` or `PMCR` accesses. Traps Non-secure EL0 and EL1 accesses to the `PMCR_EL0` or `PMCR` to EL2.

- 0 This control does not cause any instructions to be trapped.
- 1 Non-secure EL0 and EL1 accesses to the `PMCR_EL0` or `PMCR` are trapped to EL2, unless it is trapped by `PMUSERENR.EN` or `PMUSERENR_EL0.EN`.

#### ———— Note ————

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

If the Performance Monitors Extension is not implemented, this field is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### HPMN, bits [4:0]

Defines the number of Performance Monitors counters that are accessible from Non-secure EL0 and EL1 modes.

If the Performance Monitors Extension is not implemented, this field is RES0.

In Non-secure state, HPMN divides the Performance Monitors counters as follows. For counter *n* in Non-secure state:

- If *n* is in the range  $0 \leq n < \text{HPMN}$ , the counter is accessible from EL1 and EL2, and from EL0 if permitted by `PMUSERENR_EL0`. `PMCR_EL0.E` enables the operation of counters in this range.
- If *n* is in the range  $\text{HPMN} \leq n < \text{PMCR\_EL0.N}$ , the counter is accessible only from EL2 and from Secure state. `MDCR_EL2.HPME` enables the operation of counters in this range.

If this field is set to 0, or to a value larger than [PMCR\\_EL0.N](#), then the following CONSTRAINED UNPREDICTABLE behavior applies:

- The value returned by a direct read of MDCR\_EL2.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if MDCR\_EL2.HPMN is set to an UNKNOWN nonzero value less than [PMCR\\_EL0.N](#).
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to the value of [PMCR\\_EL0.N](#).

## Accessing the MDCR\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MDCR_EL2	11	100	0001	0001	001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL2 are trapped to EL3.

### D7.3.18 MDCR\_EL3, Monitor Debug Configuration Register (EL3)

The MDCR\_EL3 characteristics are:

#### Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

#### Configurations

AArch64 System register MDCR\_EL3 can be mapped to AArch32 System register [SDCR](#), but this is not architecturally mandated.

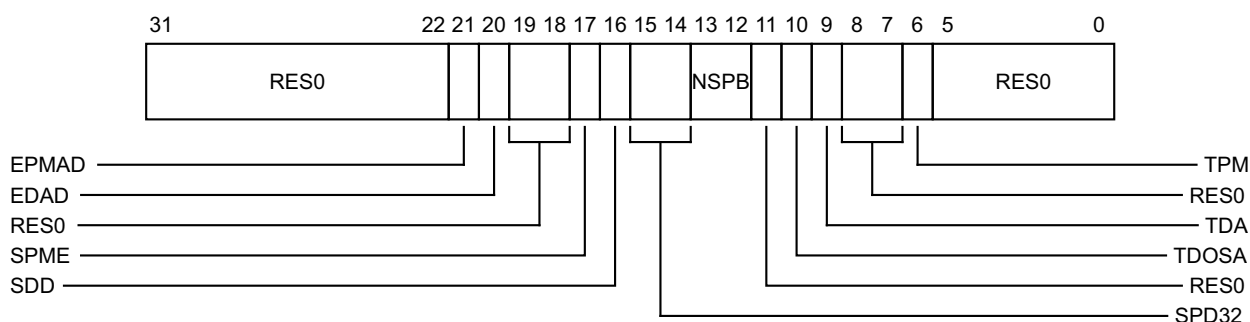

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

MDCR\_EL3 is a 32-bit register.

#### Field descriptions

The MDCR\_EL3 bit assignments are:

#### Bits [31:22]

Reserved, RES0.

#### EPMAD, bit [21]

External debug interface Performance Monitors registers disable. This disables access to these registers by an external debugger:

- 0 Access to Performance Monitors registers from external debugger is permitted.
- 1 Access to Performance Monitors registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension is not implemented or does not support external debug interface accesses this bit is RES0.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field, it resets to 0.

#### EDAD, bit [20]

External debug interface breakpoint and watchpoint register access disable. This disables access to these registers by an external debugger:

- 0 Access to breakpoint and watchpoint registers from external debugger is permitted.
- 1 Access to breakpoint and watchpoint registers from external debugger is disabled, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

When this register has an architecturally-defined reset value, this field resets to 0.

#### Bits [19:18]

Reserved, RES0.

#### SPME, bit [17]

Secure Performance Monitors enable. This allows event counting in Secure state:

- 0 Event counting prohibited in Secure state.  
In an ARMv8.0 or ARMv8.1 implementation, event counting is prohibited unless `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, meaning this control is overridden by the IMPLEMENTATION DEFINED authentication interface.
- 1 Event counting allowed in Secure state.

If the Performance Monitors Extension is not implemented, this field is RES0.

When this register has an architecturally-defined reset value, this field resets to 0.

#### SDD, bit [16]

AArch64 Secure self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

- 0 Debug exceptions from Secure EL0 are enabled, and debug exceptions from Secure EL1 are enabled if the value of `MDSCR_EL1.KDE` is 1 and the value of `PSTATE.D` is 0.
- 1 Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- Secure EL1 is using AArch64.

This field resets to a value that is architecturally UNKNOWN.

#### SPD32, bits [15:14]

AArch32 Secure self-hosted privileged invasive debug control. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions. Valid values for this field are:

- 00 Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.
- 10 Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
- 11 Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is:

- Ignored if either the PE is in Non-secure state or Secure EL1 is using AArch64.
- RES0 if the implementation does not support EL1 using AArch32.

If Secure EL1 is using AArch32 then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of `SDER32_EL3.SUIDEN` is 1.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### NSPB, bits [13:12]

*In ARMv8.2*

Non-secure Profiling Buffer. When the Statistical Profiling Extension is implemented this field controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers. The possible values of this field are:

- 00 Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer controls at EL2 and EL1 in both security states generate Trap exceptions to EL3.
- 01 Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer controls in Non-secure state generate Trap exceptions to EL3.
- 10 Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer controls at EL2 and EL1 in both security states generate Trap exceptions to EL3.
- 11 Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer controls at Secure EL1 generate Trap exceptions to EL3.

If EL3 is not implemented and the PE executes in Non-secure state, the PE behaves as if NSPB == 0b11.

If EL3 is not implemented and the PE executes in Secure state, the PE behaves as if NSPB == 0b01.

When the Statistical Profiling Extension is not implemented this field is reserved, RES0.

**In ARMv8.1 and ARMv8.0.**

Reserved, RES0.

**Bit [11]**

Reserved, RES0.

**TDOSA, bit [10]**

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3:

- 0 This control does not cause any instructions to be trapped.
- 1 EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by [HDCR.TDOSA](#) or [MDCR\\_EL2.TDOSA](#).

The registers for which accesses are trapped are as follows:

AArch64: [OSLAR\\_EL1](#), [OSLSR\\_EL1](#), [OSDLR\\_EL1](#), [DBGPRCR\\_EL1](#).

AArch32: [DBGOSLAR](#), [DBGOSLSR](#), [DBGOSDLR](#), [DBGPRCR](#).

AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

This field resets to a value that is architecturally UNKNOWN.

**TDA, bit [9]**

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the [MDCR\\_EL3.TDOSA](#) field. When [MDCR\\_EL3.TDA](#) is:

- 0 This control does not cause any instructions to be trapped.
- 1 EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by [MDCR\\_EL3.TDOSA](#), are trapped to EL3, from both Security states and both Execution states, unless it is trapped by [DBGDSCRExt.UDCCdis](#), [MDSCR\\_EL1.TDCC](#), [HDCR.TDA](#) or [MDCR\\_EL2.TDA](#).

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

Traps of AArch64 accesses to [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#) are ignored in Debug state.

This field resets to a value that is architecturally UNKNOWN.

#### Bits [8:7]

Reserved, RES0.

#### TPM, bit [6]

Trap Performance Monitors accesses. Traps EL2, EL1, and EL0 accesses to all Performance Monitors registers to EL3, from both Security states and both Execution states.

0 This control does not cause any instructions to be trapped.

1 EL2, EL1, and EL0 System register accesses to all Performance Monitors registers are trapped to EL3, unless it is trapped by [HDCR.TPM](#) or [MDCR\\_EL2.TPM](#).

If the Performance Monitors Extension is not implemented, this field is RES0.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### Bits [5:0]

Reserved, RES0.

### Accessing the MDCR\_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MDCR_EL3	11	110	0001	0011	001

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	-	RW
x	1	1	-	n/a	-	RW

### D7.3.19 MDRAR\_EL1, Monitor Debug ROM Address Register

The MDRAR\_EL1 characteristics are:

#### Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. ARMv8 deprecates any use of this register.

#### Configurations

AArch64 System register MDRAR\_EL1 is architecturally mapped to AArch32 System register [DBGDRAR](#).

#### Attributes

MDRAR\_EL1 is a 64-bit register.

#### Field descriptions

The MDRAR\_EL1 bit assignments are:

#### Bits [63:52]

Reserved, RES0.

#### ROMADDR[51:48], bits [51:48]

##### *In ARMv8.2*

Extension to ROMADDR[47:12]. See ROMADDR[47:12] for more details.

##### *In ARMv8.1 and ARMv8.0.*

Reserved, RES0.

#### ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

When [ARMv8.2-LPA](#) is implemented, and 52-bit addresses and a 64KB translation granule are in use, ROMADDR[52:49] forms the upper part of the address value. Otherwise, ROMADDR[52:49] is RES0.

If the physical address size in bits (PAsize) is less than 52 then the register bits corresponding to ROMADDR [51:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

ARM strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

#### Bits [11:2]

Reserved, RES0.

### Valid, bits [1:0]

This field indicates whether the ROM Table address is valid. The permitted values of this field are:

00 ROM Table address is not valid. Software must ignore ROMADDR.

11 ROM Table address is valid.

Other values are reserved.

### Accessing the MDRAR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MDRAR_EL1	10	000	0001	0000	000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDRA](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, read accesses to this register from EL1 and EL2 are trapped to EL3.

## D7.3.20 MDSCR\_EL1, Monitor Debug System Control Register

The MDSCR\_EL1 characteristics are:

### Purpose

Main control register for the debug implementation.

### Configurations

AArch64 System register MDSCR\_EL1 is architecturally mapped to AArch32 System register [DBGDSCRExt](#).

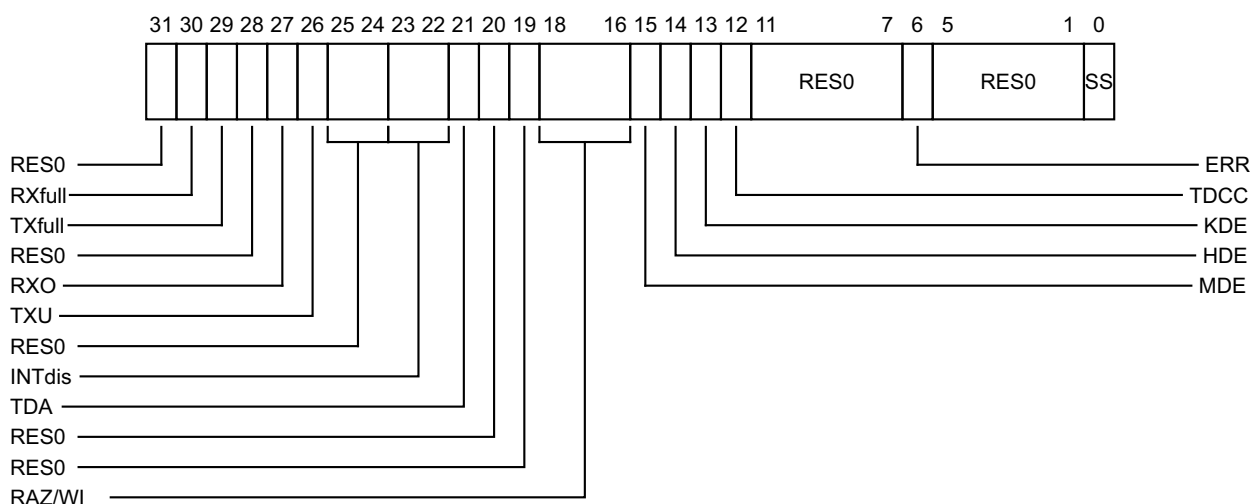

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

MDSCR\_EL1 is a 32-bit register.

### Field descriptions

The MDSCR\_EL1 bit assignments are:

### Bit [31]

Reserved, RES0.

### RXfull, bit [30]

Used for save/restore of [EDSCR.RXfull](#).

When [OSLSR\\_EL1.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.RXfull](#).

Reads and writes of this bit are indirect accesses to [EDSCR.RXfull](#).

The architected behavior of this field determines the value it returns after a reset.

### TXfull, bit [29]

Used for save/restore of [EDSCR.TXfull](#).

When [OSLSR\\_EL1.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.TXfull](#).

Reads and writes of this bit are indirect accesses to [EDSCR.TXfull](#).

The architected behavior of this field determines the value it returns after a reset.

#### Bit [28]

Reserved, RES0.

#### R XO, bit [27]

Used for save/restore of [EDSCR.R XO](#).

When [OSLSR\\_EL1.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.R XO](#).

Reads and writes of this bit are indirect accesses to [EDSCR.R XO](#).

The architected behavior of this field determines the value it returns after a reset.

#### T XU, bit [26]

Used for save/restore of [EDSCR.T XU](#).

When [OSLSR\\_EL1.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.T XU](#).

Reads and writes of this bit are indirect accesses to [EDSCR.T XU](#).

The architected behavior of this field determines the value it returns after a reset.

#### Bits [25:24]

Reserved, RES0.

#### INTdis, bits [23:22]

Used for save/restore of [EDSCR.INTdis](#).

When [OSLSR\\_EL1.OSLK](#) == 0 (the OS lock is unlocked), this field is RO, and software must treat it as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1 (the OS lock is locked), this field is RW and holds the value of [EDSCR.INTdis](#).

Reads and writes of this field are indirect accesses to [EDSCR.INTdis](#).

The architected behavior of this field determines the value it returns after a reset.

#### T DA, bit [21]

Used for save/restore of [EDSCR.T DA](#).

When [OSLSR\\_EL1.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.T DA](#).

Reads and writes of this bit are indirect accesses to [EDSCR.T DA](#).

The architected behavior of this field determines the value it returns after a reset.

#### Bit [20]

Reserved, RES0.

#### SC2, bit [19]

##### *In ARMv8.1*

Used for save/restore of [EDSCR.SC2](#).

When [OSLSR\\_EL1.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.SC2](#).

Reads and writes of this bit are indirect accesses to [EDSCR.SC2](#).

If the PC Sample-based Profiling Extension is not implemented, then this field is RES0.

##### *In ARMv8.2 and ARMv8.0.*

Reserved, RES0.

#### Bits [18:16]

Reserved. Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

#### MDE, bit [15]

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

0 Breakpoint, Watchpoint, and Vector Catch exceptions disabled.

1 Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

This field resets to a value that is architecturally UNKNOWN.

#### HDE, bit [14]

Used for save/restore of [EDSCR.HDE](#).

When [OSLSR\\_EL1.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.HDE](#).

Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The architected behavior of this field determines the value it returns after a reset.

#### KDE, bit [13]

Local (kernel) debug enable. If  $EL_D$  is using AArch64, enable debug exceptions within  $EL_D$ . Permitted values are:

0 Debug exceptions, other than Breakpoint Instruction exceptions, disabled within  $EL_D$ .

1 All debug exceptions enabled within  $EL_D$ .

RES0 if  $EL_D$  is using AArch32.

This field resets to a value that is architecturally UNKNOWN.

#### TDCC, bit [12]

Traps EL0 accesses to the DCC registers to EL1, from both Execution states:

0 This control does not cause any instructions to be trapped.

1 EL0 using AArch64: EL0 accesses to the [MDCCSR\\_EL0](#), [DBGDTR\\_EL0](#), [DBGDTRTX\\_EL0](#), and [DBGDTRRX\\_EL0](#) registers are trapped to EL1.  
EL0 using AArch32: EL0 accesses to the [DBGDSCRint](#), [DBGDTRRXint](#), [DBGDTRTXint](#), [DBGDIDR](#), [DBGDSAR](#), and [DBGDRAR](#) registers are trapped to EL1.

### Note

All accesses to these AArch32 registers are trapped, including LDC and STC accesses to [DBGDTRTXint](#) and [DBGDTRRXint](#), and MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#).

Traps of AArch32 accesses to the [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

Traps of AArch64 accesses to [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#) are ignored in Debug state.

This field resets to a value that is architecturally UNKNOWN.

#### Bits [11:7]

Reserved, RES0.

#### ERR, bit [6]

Used for save/restore of [EDSCR.ERR](#).

When [OSLSR\\_EL1.OSLK](#) == 0 (the OS lock is unlocked), this bit is RO, and software must treat it as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1 (the OS lock is locked), this bit is RW and holds the value of [EDSCR.ERR](#).

Reads and writes of this bit are indirect accesses to [EDSCR.ERR](#).

The architected behavior of this field determines the value it returns after a reset.

#### Bits [5:1]

Reserved, RES0.

#### SS, bit [0]

Software step control bit. If  $EL_D$  is using AArch64, enable Software step. Permitted values are:

0 Software step disabled

1 Software step enabled.

RES0 if  $EL_D$  is using AArch32.

This field resets to a value that is architecturally UNKNOWN.

### Accessing the MDSCR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
MDSCR_EL1	10	000	0000	0010	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

Individual fields within this register might have restricted accessibility when [OSLSR\\_EL1.OSLK](#) == 0 (the OS lock is unlocked.) See the field descriptions for more detail.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.21 OSDLR\_EL1, OS Double Lock Register

The OSDLR\_EL1 characteristics are:

## Purpose

Used to control the OS Double Lock.

## Configurations

AArch64 System register OSDLR\_EL1 is architecturally mapped to AArch32 System register [DBGOSDLR](#).

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

OSDLR\_EL1 is a 32-bit register.

## Field descriptions

The OSDLR\_EL1 bit assignments are:

**Bits [31:1]**

Reserved, RES0.

**DLK, bit [0]**

OS Double Lock control bit. Possible values are:

- |   |   |
|---|---|
| 0 | OS Double Lock unlocked.  |
| 1 | OS Double Lock locked, if <b>DBGPRCR_EL1</b> .CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state. |

When this register has an architecturally-defined reset value, this field resets to 0.

## Accessing the OSDLR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
OSDLR_EL1	10	000	0001	0011	100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDOSA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDOSA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

## D7.3.22 OSDTRRX\_EL1, OS Lock Data Transfer Register, Receive

The OSDTRRX\_EL1 characteristics are:

### Purpose

Used for save/restore of [DBGDTRRX\\_EL0](#). It is a component of the Debug Communications Channel.

### Configurations

AArch64 System register OSDTRRX\_EL1 is architecturally mapped to AArch32 System register [DBGDTRRXext](#).

### Attributes

OSDTRRX\_EL1 is a 32-bit register.

### Field descriptions

The OSDTRRX\_EL1 bit assignments are:

### Bits [31:0]

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

### Accessing the OSDTRRX\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
OSDTRRX_EL1	10	000	0000	0000	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

ARM deprecates reads and writes of OSDTRRX\_EL1 when the OS lock is unlocked.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.23 OSDTRTX\_EL1, OS Lock Data Transfer Register, Transmit

The OSDTRTX\_EL1 characteristics are:

#### Purpose

Used for save/restore of [DBGDTRTX\\_EL0](#). It is a component of the Debug Communications Channel.

#### Configurations

AArch64 System register OSDTRTX\_EL1 is architecturally mapped to AArch32 System register [DBGDTRTXext](#).

#### Attributes

OSDTRTX\_EL1 is a 32-bit register.

#### Field descriptions

The OSDTRTX\_EL1 bit assignments are:

#### Bits [31:0]

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

#### Accessing the OSDTRTX\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
OSDTRTX_EL1	10	000	0000	0011	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

ARM deprecates reads and writes of OSDTRTX\_EL1 when the OS lock is unlocked.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.24 OSECCR\_EL1, OS Lock Exception Catch Control Register

The OSECCR\_EL1 characteristics are:

#### Purpose

Provides a mechanism for an operating system to access the contents of [EDECCR](#) that are otherwise invisible to software, so it can save/restore the contents of [EDECCR](#) over powerdown on behalf of the external debugger.

#### Configurations

AArch64 System register OSECCR\_EL1 is architecturally mapped to AArch32 System register [DBGOSECCR](#).

AArch64 System register OSECCR\_EL1 is architecturally mapped to External register [EDECCR](#).

If [OSLSR\\_EL1.OSLK](#) == 0 then OSECCR\_EL1 returns an UNKNOWN value on reads and ignores writes.

#### Attributes

OSECCR\_EL1 is a 32-bit register.

#### Field descriptions

The OSECCR\_EL1 bit assignments are:

**When [OSLSR.OSLK](#)==1:**

#### EDECCR, bits [31:0]

Used for save/restore to [EDECCR](#) over powerdown.

Reads or writes to this field are indirect accesses to [EDECCR](#).

#### Accessing the OSECCR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
OSECCR_EL1	10	000	0000	0110	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
x	0	1	-	RW	RW	RW
x	1	1	-	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDA](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDA](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.25 OSLAR\_EL1, OS Lock Access Register

The OSLAR\_EL1 characteristics are:

#### Purpose

Used to lock or unlock the OS lock.

#### Configurations

AArch64 System register OSLAR\_EL1 is architecturally mapped to AArch32 System register [DBGOSLAR](#).

AArch64 System register OSLAR\_EL1 is architecturally mapped to External register [OSLAR\\_EL1](#).

#### Attributes

OSLAR\_EL1 is a 32-bit register.

#### Field descriptions

The OSLAR\_EL1 bit assignments are:

#### Bits [31:1]

Reserved, RES0.

#### OSLK, bit [0]

On writes to OSLAR\_EL1, bit[0] is copied to the OS lock.

Use [OSLSR\\_EL1](#).OSLK to check the current status of the lock.

#### Accessing the OSLAR\_EL1

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
OSLAR_EL1	10	000	0001	0000	100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	WO	n/a	WO
x	0	1	-	WO	WO	WO
x	1	1	-	n/a	WO	WO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDOSA](#)==1, Non-secure write accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDOSA](#)==1, write accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.26 OSLSR\_EL1, OS Lock Status Register

The OLSR\_EL1 characteristics are:

## Purpose

Provides the status of the OS lock.

## Configurations

AArch64 System register OSLSR\_EL1 is architecturally mapped to AArch32 System register [DBGOSLSR](#).

This register is in the Cold reset domain. Some or all RW fields of this register have defined reset values. On a Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Cold reset RW fields in this register reset to architecturally UNKNOWN values. The register is not affected by a Warm reset.

## Attributes

OSLSR\_EL1 is a 32-bit register.

## Field descriptions

The OSLSR\_EL1 bit assignments are:

**Bits [31:4]**

Reserved, RES0.

**OSLM[1], bit [3]**

See below for description of the OSLM field.

**nTT, bit [2]**

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

**OSLK, bit [1]**

OS Lock Status. The possible values are:

```
0      OS lock unlocked.
```

1 OS lock locked.

The OS lock is locked and unlocked by writing to the OS Lock Access Register.

When this register has an architecturally-defined reset value, this field resets to 1.

**OSLM[0], bit [0]**

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented. In ARMv8 these bits are as follows:

10 OS lock implemented. DBGOSSRR not implemented.

All other values are reserved.

## Accessing the OSLSR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
OSLSR_EL1	10	000	0001	0001	100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RO	n/a	RO
x	0	1	-	RO	RO	RO
x	1	1	-	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TDOSA](#)==1, Non-secure read accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TDOSA](#)==1, read accesses to this register from EL1 and EL2 are trapped to EL3.

### D7.3.27 SDER32\_EL3, AArch32 Secure Debug Enable Register

The SDER32\_EL3 characteristics are:

## Purpose

Allows access to the AArch32 register **SDER** from AArch64 state only. Its value has no effect on execution in AArch64 state.

## Configurations

AArch64 System register `SDER32_EL3` is architecturally mapped to AArch32 System register `SDER`.

If EL1 is AArch64 only, this register is UNDEFINED.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

## Attributes

SDER32\_EL3 is a 32-bit register.

## Field descriptions

The SDER32\_EL3 bit assignments are:

**Bits [31:2]**

Reserved, RES0.

**SUNIDEN, bit [1]**

Secure User Non-Invasive Debug Enable:

- 0 Performance Monitors event counting prohibited in Secure EL0 unless allowed by  
MDCR\_EL3.SPME or the IMPLEMENTATION DEFINED authentication interface  
ExternalSecureNoninvasiveDebugEnabled().
- 1 Performance Monitors event counting allowed in Secure EL0.

This field resets to a value that is architecturally UNKNOWN.

**SUIDEN, bit [0]**

Secure User Invasive Debug Enable:

- |   |  |
|---|--|
| 0 | Debug exceptions other than Breakpoint Instruction exceptions from Secure EL0 are disabled, unless enabled by <a href="#">MDCR_EL3.SPD32</a> . |
| 1 | Debug exceptions from Secure EL0 are enabled.  |

This field resets to a value that is architecturally UNKNOWN.

## Accessing the SDER32\_EL3

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreq>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
SDER_EL3	11	110	0001	0001	001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	-	RW
x	1	1	-	n/a	-	RW

## D7.4 Performance Monitors registers

This section lists the Performance Monitoring registers in AArch64.

## D7.4.1 PMCCFILTR\_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR\_EL0 characteristics are:

### Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR\\_EL0](#), increments.

### Configurations

AArch64 System register PMCCFILTR\_EL0 is architecturally mapped to AArch32 System register [PMCCFILTR](#).

AArch64 System register PMCCFILTR\_EL0 is architecturally mapped to External register [PMCCFILTR\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMCCFILTR\_EL0 is a 32-bit register.

### Field descriptions

The PMCCFILTR\_EL0 bit assignments are:

#### P, bit [31]

Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

- 0 Count cycles in EL1.
- 1 Do not count cycles in EL1.

#### U, bit [30]

User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

- 0 Count cycles in EL0.
- 1 Do not count cycles in EL0.

#### NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

#### NSU, bit [28]

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

### NSH, bit [27]

Non-secure EL2 (Hypervisor) filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

0	Do not count cycles in EL2.
1	Count cycles in EL2.

### M, bit [26]

Secure EL3 filtering bit. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

#### ———— **Note** ————

This field is not visible in the AArch32 PMCCFILTR System register.

### Bits [25:0]

Reserved, RES0.

## Accessing the PMCCFILTR\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMCCFILTR_EL0	11	011	1110	1111	111

PMCCFILTR\_EL0 can also be accessed by using [PMXEVTYPERS\\_EL0](#) with [PMSELR\\_EL0](#).SEL set to 0b11111.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0](#).EN==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2](#).TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3](#).TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.4.2 PMCCNTR\_EL0, Performance Monitors Cycle Count Register

The PMCCNTR\_EL0 characteristics are:

### Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See [Time as measured by the Performance Monitors cycle counter on page D5-2139](#) for more information.

[PMCCFILTR\\_EL0](#) determines the modes and states in which the PMCCNTR\_EL0 can increment.

### Configurations

AArch64 System register PMCCNTR\_EL0 is architecturally mapped to AArch32 System register [PMCCNTR](#).

AArch64 System register PMCCNTR\_EL0 is architecturally mapped to External register [PMCCNTR\\_EL0](#).

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR\_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMCCNTR\_EL0 is a 64-bit register.

### Field descriptions

The PMCCNTR\_EL0 bit assignments are:

### CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR\\_EL0](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR\\_EL0](#).C sets this field to 0.

### Accessing the PMCCNTR\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMCCNTR_EL0	11	011	1001	1101	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.CR](#)==0, and [PMUSERENR\\_EL0.EN](#)==0, read accesses to this register from EL0 are trapped to EL1.
  - If [PMUSERENR\\_EL0.EN](#)==0, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

### D7.4.3 PMCEID0\_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0\_EL0 characteristics are:

#### Purpose

Defines which common architectural and common microarchitectural feature events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

#### Configurations

AArch64 System register PMCEID0\_EL0[31:0] is architecturally mapped to AArch32 System register [PMCEID0](#).

AArch64 System register PMCEID0\_EL0[63:32] is architecturally mapped to AArch32 System register PMCEID2.

AArch64 System register PMCEID0\_EL0[31:0] is architecturally mapped to External register [PMCEID0](#).

AArch64 System register PMCEID0\_EL0[63:32] is architecturally mapped to External register PMCEID2.

#### Attributes

PMCEID0\_EL0 is a 64-bit register.

#### Field descriptions

The PMCEID0\_EL0 bit assignments are:

#### ID[16415:16384], bits [63:32]

##### *In ARMv8.2 and ARMv8.1*

PMCEID0\_EL0[63:32] maps to common events 0x4000 to 0x401F. For a list of event numbers and descriptions, see [Events, event numbers, and mnemonics on page D5-2152](#).

For each bit:

- 0           The common event is not implemented.
- 1           The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

##### *In ARMv8.0.*

Reserved, RES0.

#### ID[31:0], bits [31:0]

PMCEID0\_EL0[31:0] maps to common events 0x0000 to 0x001F. For a list of event numbers and descriptions, see [Events, event numbers, and mnemonics on page D5-2152](#).

For each bit:

- 0           The common event is not implemented.
- 1           The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

## Accessing the PMCEID0\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMCEID0_EL0	11	011	1001	1100	110

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.EN](#)==0, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.4.4 PMCEID1\_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1\_EL0 characteristics are:

### Purpose

Defines which common architectural and common microarchitectural feature events in the ranges 0x0020 to 0x003F and 0x4020 to 0x403F are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

### Configurations

AArch64 System register PMCEID1\_EL0[31:0] is architecturally mapped to AArch32 System register [PMCEID1](#).

AArch64 System register PMCEID1\_EL0[63:32] is architecturally mapped to AArch32 System register PMCEID3.

AArch64 System register PMCEID1\_EL0[31:0] is architecturally mapped to External register [PMCEID1](#).

AArch64 System register PMCEID1\_EL0[63:32] is architecturally mapped to External register PMCEID3.

### Attributes

PMCEID1\_EL0 is a 64-bit register.

### Field descriptions

The PMCEID1\_EL0 bit assignments are:

#### ID[16447:16416], bits [63:32]

##### *In ARMv8.2 and ARMv8.1*

PMCEID1\_EL0[63:32] maps to common events 0x4020 to 0x403F. For a list of event numbers and descriptions, see [Events, event numbers, and mnemonics on page D5-2152](#).

For each bit:

- 0 The common event is not implemented.
- 1 The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

##### *In ARMv8.0.*

Reserved, RES0.

#### ID[63:32], bits [31:0]

PMCEID1\_EL0[31:0] maps to common events 0x0020 to 0x003F. For a list of event numbers and descriptions, see [Events, event numbers, and mnemonics on page D5-2152](#).

For each bit:

- 0 The common event is not implemented.
- 1 The common event is implemented.

Bits that map to reserved event numbers are reserved to identify events that might be defined in future revisions to the architecture.

Events that do not require additional features in the PMU can be defined retrospectively, meaning that they can be implemented as part of a PMUv3 implementation.

## Accessing the PMCEID1\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMCEID1_EL0	11	011	1001	1100	111

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.EN](#)==0, read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure read accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, read accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.4.5 PMCNTENCLR\_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR\_EL0 characteristics are:

### Purpose

Disables the Cycle Count Register, [PMCCNTR\\_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

### Configurations

AArch64 System register PMCNTENCLR\_EL0 is architecturally mapped to AArch32 System register [PMCNTENCLR](#).

AArch64 System register PMCNTENCLR\_EL0 is architecturally mapped to External register [PMCNTENCLR\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMCNTENCLR\_EL0 is a 32-bit register.

### Field descriptions

The PMCNTENCLR\_EL0 bit assignments are:

#### C, bit [31]

[PMCCNTR\\_EL0](#) disable bit. Disables the cycle counter register. Possible values are:

- |   |  |
|---|--|
| 0 | When read, means the cycle counter is disabled. When written, has no effect.             |
| 1 | When read, means the cycle counter is enabled. When written, disables the cycle counter. |

#### P<n>, bit [n], for n = 0 to 30

Event counter disable bit for [PMEVCNTR<n>\\_EL0](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN. Otherwise, N is the value in [PMCR\\_EL0](#).N.

Possible values of each bit are:

- |   |  |
|---|--|
| 0 | When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> is disabled. When written, has no effect.                                  |
| 1 | When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> is enabled. When written, disables <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> . |

### Accessing the PMCNTENCLR\_EL0

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMCNTENCLR_EL0	11	011	1001	1100	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.EN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.4.6 PMCNTENSET\_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET\_EL0 characteristics are:

### Purpose

Enables the Cycle Count Register, [PMCCNTR\\_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

### Configurations

AArch64 System register PMCNTENSET\_EL0 is architecturally mapped to AArch32 System register [PMCNTENSET](#).

AArch64 System register PMCNTENSET\_EL0 is architecturally mapped to External register [PMCNTENSET\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMCNTENSET\_EL0 is a 32-bit register.

### Field descriptions

The PMCNTENSET\_EL0 bit assignments are:

#### C, bit [31]

[PMCCNTR\\_EL0](#) enable bit. Enables the cycle counter register. Possible values are:

- |   |   |
|---|---|
| 0 | When read, means the cycle counter is disabled. When written, has no effect.            |
| 1 | When read, means the cycle counter is enabled. When written, enables the cycle counter. |

#### P<n>, bit [n], for n = 0 to 30

Event counter enable bit for [PMEVCNTR<n>\\_EL0](#).

Bits [30:N] are RAZ/WI. When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN. Otherwise, N is the value in [PMCR\\_EL0](#).N.

Possible values of each bit are:

- |   |   |
|---|---|
| 0 | When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> is disabled. When written, has no effect.   |
| 1 | When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter is enabled. When written, enables <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> . |

### Accessing the PMCNTENSET\_EL0

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMCNTENSET_EL0	11	011	1001	1100	001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.EN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.4.7 PMCR\_EL0, Performance Monitors Control Register

The PMCR\_EL0 characteristics are:

### Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

### Configurations

AArch64 System register PMCR\_EL0 is architecturally mapped to AArch32 System register [PMCR](#).

AArch64 System register PMCR\_EL0[6:0] is architecturally mapped to External register [PMCR\\_EL0](#)[6:0].

This register is in the Warm reset domain. Some or all RW fields of this register have defined reset values. On a Warm or Cold reset these apply only if the PE resets into an Exception level that is using AArch64. Otherwise, on a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMCR\_EL0 is a 32-bit register.

### Field descriptions

The PMCR\_EL0 bit assignments are:

31	24	23	16	15	11	10	7	6	5	4	3	2	1	0				
IMP				IDCODE				N		RES0		LC	DP	X	D	C	P	E

#### IMP, bits [31:24]

Implementer code. This field is RO with an IMPLEMENTATION DEFINED value.

The implementer codes are allocated by ARM. Values have the same interpretation as bits [31:24] of the [MIDR](#).

#### IDCODE, bits [23:16]

Identification code. This field is RO with an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that is specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

#### N, bits [15:11]

Number of event counters. A RO field that indicates the number counters implemented. A value of 0b00000 in this field indicates that only the Cycle Count Register [PMCCNTR\\_EL0](#) is implemented.

The value of this field is the number of event counters implemented. This value is in the range of 0b00000, in which case only the [PMCCNTR\\_EL0](#) is implemented, to 0b11111, which indicates that the [PMCCNTR\\_EL0](#) and 31 event counters are implemented.

In an implementation that includes EL2, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of [MDCR\\_EL2](#).HPMN.

#### Bits [10:7]

Reserved, RES0.

#### LC, bit [6]

Long cycle counter enable. Determines which [PMCCNTR\\_EL0](#) bit generates an overflow recorded by [PMOVSRR\[31\]](#).

- 0 Cycle counter overflow on increment that changes [PMCCNTR\\_EL0\[31\]](#) from 1 to 0.
- 1 Cycle counter overflow on increment that changes [PMCCNTR\\_EL0\[63\]](#) from 1 to 0.

ARM deprecates use of `PMCR_EL0.LC = 0`.

In an AArch64-only implementation, this field is RES1.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### DP, bit [5]

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

- 0 [PMCCNTR\\_EL0](#), if enabled, counts when event counting is prohibited.
- 1 [PMCCNTR\\_EL0](#) does not count when event counting is prohibited.

Counting events is never prohibited in Non-secure state. However, there are some restrictions on counting events in Secure state. For more information about the interaction between the Performance Monitors and EL3, see [Interaction with EL3 on page D5-2145](#).

When EL3 is not implemented, this field is RES0:

- When [ARMv8.1-PMU](#) is not implemented.
- When [ARMv8.1-PMU](#) is implemented, only if EL2 is not implemented.

Otherwise this field is RW.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### X, bit [4]

Enable export of events in an IMPLEMENTATION DEFINED event stream. The possible values of this bit are:

- 0 Do not export events.
- 1 Export events where not prohibited.

This field enables the exporting of events over an event bus to another device, for example to an OPTIONAL trace macrocell. If the implementation does not include such an event bus then this field is RAZ/WI, otherwise it is an RW field.

In an implementation that includes an event bus, no events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### D, bit [3]

Clock divider. The possible values of this bit are:

- 0 When enabled, [PMCCNTR\\_EL0](#) counts every clock cycle.
- 1 When enabled, [PMCCNTR\\_EL0](#) counts once every 64 clock cycles.

In an AArch64-only implementation this field is RES0, otherwise it is an RW field. If `PMCR_EL0.LC == 1`, this bit is ignored and the cycle counter counts every clock cycle.

ARM deprecates use of `PMCR_EL0.D = 1`.

If this field is implemented as an RW field, it resets to a value that is architecturally UNKNOWN.

#### C, bit [2]

Cycle counter reset. This bit is WO. The effects of writing to this bit are:

- 0 No action.
- 1 Reset [PMCCNTR\\_EL0](#) to zero.

This bit is always RAZ.

Resetting [PMCCNTR\\_EL0](#) does not clear the [PMCCNTR\\_EL0](#) overflow bit to 0.

#### P, bit [1]

Event counter reset. This bit is WO. The effects of writing to this bit are:

- 0 No action.
- 1 Reset all event counters accessible in the current EL, not including [PMCCNTR\\_EL0](#), to zero.

This bit is always RAZ.

In Non-secure EL0 and EL1, if EL2 is implemented, a write of 1 to this bit does not reset event counters that [MDCR\\_EL2](#).HPMN reserves for EL2 use.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Resetting the event counters does not clear any overflow bits to 0.

#### E, bit [0]

Enable. The possible values of this bit are:

- 0 All counters that are accessible at Non-secure EL1, including [PMCCNTR\\_EL0](#), are disabled.
- 1 All counters that are accessible at Non-secure EL1 are enabled by [PMCNTESET\\_EL0](#).

This bit is RW.

If EL2 is implemented, this bit does not affect the operation of event counters that [MDCR\\_EL2](#).HPMN reserves for EL2 use.

When this register has an architecturally-defined reset value, this field resets to 0.

### Accessing the PMCR\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMCR_EL0	11	011	1001	1100	000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0](#).EN==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2](#).TPM==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
  - If [MDCR\\_EL2](#).TPMCR==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3](#).TPM==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.4.8 PMEVCNTR<n>\_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>\_EL0 characteristics are:

### Purpose

Holds event counter n, which counts events, where n is 0 to 30.

### Configurations

AArch64 System register PMEVCNTR<n>\_EL0 is architecturally mapped to AArch32 System register [PMEVCNTR<n>](#).

AArch64 System register PMEVCNTR<n>\_EL0 is architecturally mapped to External register [PMEVCNTR<n>\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMEVCNTR<n>\_EL0 is a 32-bit register.

### Field descriptions

The PMEVCNTR<n>\_EL0 bit assignments are:

### Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

### Accessing the PMEVCNTR<n>\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMEVCNTR<n>_EL0	11	011	1110	10:n<4:3>	n<2:0>

- <CRm> is in the range 8 - 11.
- <op2> is in the range 0 - 7.

PMEVCNTR<n>\_EL0 can also be accessed by using [PMXEVCNTR\\_EL0](#) with [PMSELR\\_EL0.SEL](#) set to the value of <n>.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVCNTR<n>\_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of [PMUSERENR\\_EL0.EN](#) is 1, if [PMSELR\\_EL0.SEL](#) is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

### Note

In an implementation that includes EL2, in Non-secure state at EL0 and EL1, [MDCR\\_EL2.HPMN](#) identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.EN](#)==0, and [PMUSERENR\\_EL0.ER](#)==0, read accesses to this register from EL0 are trapped to EL1.
  - If [PMUSERENR\\_EL0.EN](#)==0, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.4.9 PMEVTYPER<n>\_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>\_EL0 characteristics are:

### Purpose

Configures event counter n, where n is 0 to 30.

### Configurations

AArch64 System register PMEVTYPER<n>\_EL0 is architecturally mapped to AArch32 System register [PMEVTYPER<n>](#).

AArch64 System register PMEVTYPER<n>\_EL0 is architecturally mapped to External register [PMEVTYPER<n>\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMEVTYPER<n>\_EL0 is a 32-bit register.

### Field descriptions

The PMEVTYPER<n>\_EL0 bit assignments are:

### P, bit [31]

Privileged filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

- 0 Count events in EL1.
- 1 Do not count events in EL1.

### U, bit [30]

User filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

- 0 Count events in EL0.
- 1 Do not count events in EL0.

### NSK, bit [29]

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

### NSU, bit [28]

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

#### NSH, bit [27]

Non-secure EL2 (Hypervisor) filtering. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

- |   |                             |
|---|-----------------------------|
| 0 | Do not count events in EL2. |
| 1 | Count events in EL2.        |

#### M, bit [26]

Secure EL3 filtering bit. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

#### ————— **Note** —————

This field is not visible in the AArch32 PMEVTYPER System register.

#### MT, bit [25]

Multithreading. When the implementation is multi-threaded, the valid values for this bit are:

- |   |  |
|---|--|
| 0 | Count events only on controlling PE.   |
| 1 | Count events from any PE with the same affinity at level 1 and above as this PE. |

When the implementation is not multi-threaded, this bit is RES0.

#### ————— **Note** —————

- An implementation is described as multi-threaded when the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach. That is, the performance of PEs at the lowest affinity level is highly interdependent. On such an implementation, the value of MPIDR\_EL1.MT, when read at the highest implemented Exception level, is 1.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

#### Bits [24:16]

Reserved, RES0.

#### evtCount[15:10], bits [15:10]

##### *In ARMv8.2 and ARMv8.1*

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

##### *In ARMv8.0.*

Reserved, RES0.

#### evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter [PMEVCNTR<n>\\_EL0](#).

Software must program this field with an event that is supported by the PE being programmed.

There are three ranges of event numbers:

- Event numbers in the range 0x000 to 0x03F are common architectural and microarchitectural events.
- Event numbers in the range 0x040 to 0x0BF are ARM recommended common architectural and microarchitectural events.
- Event numbers in the range 0x0C0 to 0x3FF are IMPLEMENTATION DEFINED events.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the event type:

- For the range 0x000 to 0x03F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

———— **Note** —————

UNPREDICTABLE means the event must not expose privileged information.

ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

## Accessing the PMEVTYPEPER<n>\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMEVTYPEPER<n>_EL0	11	011	1110	11:n<4:3>	n<2:0>

- <CRm> is in the range 12 - 15.
- <op2> is in the range 0 - 7.

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

PMEVTYPEPER<n>\_EL0 can also be accessed by using [PMXEVTYPER\\_EL0](#) with [PMSELR\\_EL0.SEL](#) set to n.

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVTYPEPER<n>\_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.

- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of [PMUSERENR\\_EL0.EN](#) is 1, if [PMSELR\\_EL0.SEL](#) is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

---

**Note**

In an implementation that includes EL2, in Non-secure state at EL0 and EL1, [MDCR\\_EL2.HPMN](#) identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

---

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.EN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.4.10 PMINTENCLR\_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR\_EL1 characteristics are:

### Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR\\_EL0](#), and the event counters [PMEVCNTR<n>\\_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

### Configurations

AArch64 System register PMINTENCLR\_EL1 is architecturally mapped to AArch32 System register [PMINTENCLR](#).

AArch64 System register PMINTENCLR\_EL1 is architecturally mapped to External register [PMINTENCLR\\_EL1](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMINTENCLR\_EL1 is a 32-bit register.

### Field descriptions

The PMINTENCLR\_EL1 bit assignments are:

### C, bit [31]

[PMCCNTR\\_EL0](#) overflow interrupt request disable bit. Possible values are:

- 0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

### P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>\\_EL0](#).

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN. Otherwise, N is the value in [PMCR\\_EL0](#).N.

Bits [30:N] are RAZ/WI.

Possible values are:

- 0 When read, means that the [PMEVCNTR<n>\\_EL0](#) event counter interrupt request is disabled. When written, has no effect.
- 1 When read, means that the [PMEVCNTR<n>\\_EL0](#) event counter interrupt request is enabled. When written, disables the [PMEVCNTR<n>\\_EL0](#) interrupt request.

## Accessing the PMINTENCLR\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMINTENCLR_EL1	11	000	1001	1110	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

## D7.4.11 PMINTENSET\_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET\_EL1 characteristics are:

### Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR\\_EL0](#), and the event counters [PMEVCNTR<n>\\_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

### Configurations

AArch64 System register PMINTENSET\_EL1 is architecturally mapped to AArch32 System register [PMINTENSET](#).

AArch64 System register PMINTENSET\_EL1 is architecturally mapped to External register [PMINTENSET\\_EL1](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMINTENSET\_EL1 is a 32-bit register.

### Field descriptions

The PMINTENSET\_EL1 bit assignments are:

#### C, bit [31]

[PMCCNTR\\_EL0](#) overflow interrupt request enable bit. Possible values are:

- |   |   |
|---|---|
| 0 | When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.                                     |
| 1 | When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request. |

#### P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>\\_EL0](#).

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN. Otherwise, N is the value in [PMCR\\_EL0](#).N.

Bits [30:N] are RAZ/WI.

Possible values are:

- |   |  |
|---|--|
| 0 | When read, means that the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter interrupt request is disabled. When written, has no effect.  |
| 1 | When read, means that the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter interrupt request is enabled. When written, enables the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> interrupt request. |

### Accessing the PMINTENSET\_EL1

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMINTENSET_EL1	11	000	1001	1110	001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL1 and EL2 are trapped to EL3.

## D7.4.12 PMOVSCLR\_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSCLR\_EL0 characteristics are:

### Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR\\_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

### Configurations

AArch64 System register PMOVSCLR\_EL0 is architecturally mapped to AArch32 System register [PMOVSr](#).

AArch64 System register PMOVSCLR\_EL0 is architecturally mapped to External register [PMOVSCLR\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMOVSCLR\_EL0 is a 32-bit register.

### Field descriptions

The PMOVSCLR\_EL0 bit assignments are:

#### C, bit [31]

[PMCCNTR\\_EL0](#) overflow bit. Possible values are:

- 0 When read, means the cycle counter has not overflowed. When written, has no effect.
- 1 When read, means the cycle counter has overflowed. When written, clears the overflow bit to 0.

[PMCR\\_EL0](#).LC controls whether an overflow is detected from [PMCCNTR\\_EL0](#)[31] or from [PMCCNTR\\_EL0](#).

#### P<n>, bit [n], for n = 0 to 30

Event counter overflow clear bit for [PMEVCNTR<n>\\_EL0](#).

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN. Otherwise, N is the value in [PMCR\\_EL0](#).N.

Possible values of each bit are:

- 0 When read, means that [PMEVCNTR<n>\\_EL0](#) has not overflowed. When written, has no effect.
- 1 When read, means that [PMEVCNTR<n>\\_EL0](#) has overflowed. When written, clears the [PMEVCNTR<n>\\_EL0](#) overflow bit to 0.

### Accessing the PMOVSCLR\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMOVSLR_EL0	11	011	1001	1100	011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827*. Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.EN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

### D7.4.13 PMOVSSET\_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET\_EL0 characteristics are:

#### Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR\\_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#).

#### Configurations

AArch64 System register PMOVSSET\_EL0 is architecturally mapped to AArch32 System register [PMOVSSET](#).

AArch64 System register PMOVSSET\_EL0 is architecturally mapped to External register [PMOVSSET\\_EL0](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

PMOVSSET\_EL0 is a 32-bit register.

#### Field descriptions

The PMOVSSET\_EL0 bit assignments are:

#### C, bit [31]

[PMCCNTR\\_EL0](#) overflow bit. Possible values are:

- |   |  |
|---|--|
| 0 | When read, means the cycle counter has not overflowed. When written, has no effect.          |
| 1 | When read, means the cycle counter has overflowed. When written, sets the overflow bit to 1. |

#### P<n>, bit [n], for n = 0 to 30

Event counter overflow set bit for [PMEVCNTR<n>\\_EL0](#).

Bits [30:N] are RAZ/WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN. Otherwise, N is the value in [PMCR\\_EL0](#).N.

Possible values are:

- |   |   |
|---|---|
| 0 | When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> has not overflowed. When written, has no effect.  |
| 1 | When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> has overflowed. When written, sets the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> overflow bit to 1. |

#### Accessing the PMOVSSET\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMOVSSET_EL0	11	011	1001	1110	011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.EN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.4.14 PMSELR\_EL0, Performance Monitors Event Counter Selection Register

The PMSELR\_EL0 characteristics are:

### Purpose

Selects the current event counter [PMEVCNTR<n>](#) or the cycle counter, CCNT.

PMSELR\_EL0 is used in conjunction with [PMXEVTYPER\\_EL0](#) to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with [PMXVCNTR\\_EL0](#), to determine the value of a selected event counter.

### Configurations

AArch64 System register PMSELR\_EL0 is architecturally mapped to AArch32 System register [PMSELR](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMSELR\_EL0 is a 32-bit register.

### Field descriptions

The PMSELR\_EL0 bit assignments are:

#### Bits [31:5]

Reserved, RES0.

#### SEL, bits [4:0]

Selects event counter, [PMEVCNTR<n>](#), where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to [PMXEVTYPER\\_EL0](#) or [PMXVCNTR\\_EL0](#) occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR\_EL0.SEL is 0b11111 it selects the cycle counter and:

- A read of the [PMXEVTYPER\\_EL0](#) returns the value of [PMCCFILTR\\_EL0](#).
- A write of the [PMXEVTYPER\\_EL0](#) writes to [PMCCFILTR\\_EL0](#).
- A read or write of [PMXVCNTR\\_EL0](#) has CONSTRAINED UNPREDICTABLE effects, that can be one of the following:
  - Access to [PMXVCNTR\\_EL0](#) is UNDEFINED.
  - Access to [PMXVCNTR\\_EL0](#) behaves as a NOP.
  - Access to [PMXVCNTR\\_EL0](#) behaves as if the register is RAZ/WI.
  - Access to [PMXVCNTR\\_EL0](#) behaves as if the PMSELR\_EL0.SEL field contains an UNKNOWN value.

If this field is set to a value greater than or equal to the number of implemented counters, but not equal to 31, the results of access to [PMXEVTYPER\\_EL0](#) or [PMXVCNTR\\_EL0](#) are CONSTRAINED UNPREDICTABLE, and can be one of the following:

- Access to [PMXEVTYPER\\_EL0](#) or [PMXVCNTR\\_EL0](#) is UNDEFINED.

- Access to [PMXEVTYPER\\_EL0](#) or [PMXEVCNTR\\_EL0](#) behaves as a NOP.
- Access to [PMXEVTYPER\\_EL0](#) or [PMXEVCNTR\\_EL0](#) behaves as if the register is RAZ/WI.
- Access to [PMXEVTYPER\\_EL0](#) or [PMXEVCNTR\\_EL0](#) behaves as if the PMSELR\_EL0.SEL field contains an UNKNOWN value.
- Access to [PMXEVTYPER\\_EL0](#) or [PMXEVCNTR\\_EL0](#) behaves as if the PMSELR\_EL0.SEL field contains 0b11111.

Direct reads of this field return an UNKNOWN value.

## Accessing the PMSELR\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMSELR_EL0	11	011	1001	1100	101

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.EN](#)==0, and [PMUSERENR\\_EL0.ER](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and SCR\_EL3.NS == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.4.15 PMSWINC\_EL0, Performance Monitors Software Increment register

The PMSWINC\_EL0 characteristics are:

### Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see [SW\\_INCR](#).

### Configurations

AArch64 System register PMSWINC\_EL0 is architecturally mapped to AArch32 System register [PMSWINC](#).

AArch64 System register PMSWINC\_EL0 is architecturally mapped to External register [PMSWINC\\_EL0](#).

### Attributes

PMSWINC\_EL0 is a 32-bit register.

### Field descriptions

The PMSWINC\_EL0 bit assignments are:

### Bit [31]

Reserved, RES0.

### P<n>, bit [n], for n = 0 to 30

Event counter software increment bit for [PMEVCNTR<n>\\_EL0](#).

Bits [30:N] are WI.

When EL2 is implemented, in Non-secure EL1 and EL0, N is the value in [MDCR\\_EL2.HPMN](#). Otherwise, N is the value in [PMCR.N](#).

The effects of writing to this bit are:

- 0 No action. The write to this bit is ignored.
- 1 If [PMEVCNTR<n>\\_EL0](#) is enabled and configured to count the software increment event, increments [PMEVCNTR<n>\\_EL0](#) by 1. If [PMEVCNTR<n>\\_EL0](#) is disabled, or not configured to count the software increment event, the write to this bit is ignored.

### Accessing the PMSWINC\_EL0

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMSWINC_EL0	11	011	1001	1100	100

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0](#).EN==0, and [PMUSERENR\\_EL0](#).SW==0, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3](#).NS == 1:
  - If [MDCR\\_EL2](#).TPM==1, Non-secure write accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3](#).TPM==1, write accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.4.16 PMUSERENR\_EL0, Performance Monitors User Enable Register

The PMUSERENR\_EL0 characteristics are:

### Purpose

Enables or disables EL0 access to the Performance Monitors.

### Configurations

AArch64 System register PMUSERENR\_EL0 is architecturally mapped to AArch32 System register [PMUSERENR](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

PMUSERENR\_EL0 is a 32-bit register.

### Field descriptions

The PMUSERENR\_EL0 bit assignments are:

### Bits [31:4]

Reserved, RES0.

### ER, bit [3]

Event counter read trap control:

- 0 EL0 using AArch64: EL0 reads of the [PMXVCNTR\\_EL0](#) and [PMEVCNTR<n>\\_EL0](#), and EL0 read/write accesses to the [PMSELR\\_EL0](#), are trapped to EL1 if PMUSERENR\_EL0.EN is also 0.  
EL0 using AArch32: EL0 reads of the [PMXVCNTR](#) and [PMEVCNTR<n>](#), and EL0 read/write accesses to the [PMSELR](#), are trapped to EL1 if PMUSERENR\_EL0.EN is also 0.
- 1 This control does not cause any instructions to be trapped.

### CR, bit [2]

Cycle counter read trap control:

- 0 EL0 using AArch64: EL0 read accesses to the [PMCCNTR\\_EL0](#) are trapped to EL1 if PMUSERENR\_EL0.EN is also 0.  
EL0 using AArch32: EL0 read accesses to the [PMCCNTR](#) are trapped to EL1 if PMUSERENR\_EL0.EN is also 0.
- 1 This control does not cause any instructions to be trapped.

### SW, bit [1]

Software Increment write trap control:

- 0 EL0 using AArch64: EL0 writes to the [PMSWINC\\_EL0](#) are trapped to EL1 if PMUSERENR\_EL0.EN is also 0.

EL0 using AArch32: EL0 writes to the [PMSWINC](#) are trapped to EL1 if [PMUSERENR\\_EL0.EN](#) is also 0.

- 1 This control does not cause any instructions to be trapped.

#### EN, bit [0]

Traps EL0 accesses to the Performance Monitors registers to EL1, from both Execution states:

- 0 EL0 accesses to the Performance Monitors registers are trapped to EL1, unless enabled by one of [PMUSERENR\\_EL0](#).{ER, CR, SW}.
- 1 This control does not cause any instructions to be trapped. Software can access all PMU registers at EL0.

#### Note

- The [PMUSERENR\\_EL0](#) and [PMUSERENR](#) registers are always RO at EL0 and not trapped by this bit.
- EL0 cannot read or write [PMINTENSET\\_EL1](#) and [PMINTENCLR\\_EL1](#), or [PMINTENSET](#) and [PMINTENCLR](#).

### Accessing the [PMUSERENR\\_EL0](#)

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
<a href="#">PMUSERENR_EL0</a>	11	011	1001	1110	000

### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RW	n/a	RW
x	0	1	RO	RW	RW	RW
x	1	1	RO	n/a	RW	RW

### Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.

- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

### D7.4.17 PMXEVNTR\_EL0, Performance Monitors Selected Event Count Register

The PMXEVNTR\_EL0 characteristics are:

#### Purpose

Reads or writes the value of the selected event counter, [PMEVCNTR<n>\\_EL0](#). [PMSELR\\_EL0](#).SEL determines which event counter is selected.

#### Configurations

AArch64 System register PMXEVNTR\_EL0 is architecturally mapped to AArch32 System register [PMEVCNTR](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

PMXEVNTR\_EL0 is a 32-bit register.

#### Field descriptions

The PMXEVNTR\_EL0 bit assignments are:

#### PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, [PMEVCNTR<n>\\_EL0](#), where n is the value stored in [PMSELR\\_EL0](#).SEL.

#### Accessing the PMXEVNTR\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMXEVNTR_EL0	11	011	1001	1101	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

If [PMSELR\\_EL0.SEL](#) is greater than or equal to the number of accessible counters then reads and writes of [PMXVCNTR\\_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if [PMSELR\\_EL0.SEL](#) has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if [PMSELR\\_EL0.SEL](#) is 31.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of [PMUSERENR\\_EL0.EN](#) is 1, if [PMSELR\\_EL0.SEL](#) is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

### Note

In an implementation that includes EL2, in Non-secure state at EL0 and EL1, [MDCR\\_EL2.HPMN](#) identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.EN](#)==0, and [PMUSERENR\\_EL0.ER](#)==0, read accesses to this register from EL0 are trapped to EL1.
  - If [PMUSERENR\\_EL0.EN](#)==0, write accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

### D7.4.18 PMXEVTYPYPER\_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPYPER\_EL0 characteristics are:

#### Purpose

When [PMSELR\\_EL0.SEL](#) selects an event counter, this accesses a [PMEVTYPYPER<n>\\_EL0](#) register. When [PMSELR\\_EL0.SEL](#) selects the cycle counter, this accesses [PMCCFILTR\\_EL0](#).

#### Configurations

AArch64 System register PMXEVTYPYPER\_EL0 is architecturally mapped to AArch32 System register [PMXEVTYPYPER](#).

This register is in the Warm reset domain. On a Warm or Cold reset RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

PMXEVTYPYPER\_EL0 is a 32-bit register.

#### Field descriptions

The PMXEVTYPYPER\_EL0 bit assignments are:

#### Bits [31:0]

Event type register or [PMCCFILTR\\_EL0](#).

When [PMSELR\\_EL0.SEL](#) == 31, this register accesses [PMCCFILTR\\_EL0](#).

Otherwise, this register accesses [PMEVTYPYPER<n>\\_EL0](#) where n is the value in [PMSELR\\_EL0.SEL](#).

#### Accessing the PMXEVTYPYPER\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
PMXEVTYPYPER_EL0	11	011	1001	1101	001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RW	RW	n/a	RW
x	0	1	RW	RW	RW	RW
x	1	1	RW	n/a	RW	RW

If [PMSELR\\_EL0.SEL](#) is greater than or equal to the number of accessible counters then reads and writes of [PMXEVTYPYPER\\_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if [PMSELR\\_EL0.SEL](#) has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if [PMSELR\\_EL0.SEL](#) is 31.
- For an access from Non-secure EL1, or an access from Non-secure EL0 when the value of [PMUSERENR\\_EL0.EN](#) is 1, if [PMSELR\\_EL0.SEL](#) is greater than or equal to the number of accessible counters but is less than the number of implemented counters, the register access is trapped to EL2.

### Note

In an implementation that includes EL2, in Non-secure state at EL0 and EL1, [MDCR\\_EL2.HPMN](#) identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- In both security states, and not dependent on other bits:
  - If [PMUSERENR\\_EL0.EN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and [SCR\\_EL3.NS](#) == 1:
  - If [MDCR\\_EL2.TPM](#)==1, Non-secure accesses to this register from EL0 and EL1 are trapped to EL2.
- When EL3 is implemented and is using AArch64:
  - If [MDCR\\_EL3.TPM](#)==1, accesses to this register from EL0, EL1, and EL2 are trapped to EL3.

## D7.5 Generic Timer registers

This section lists the Generic Timer registers in AArch64.

## D7.5.1 CNTFRQ\_EL0, Counter-timer Frequency register

The CNTFRQ\_EL0 characteristics are:

### Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

### Configurations

AArch64 System register CNTFRQ\_EL0 is architecturally mapped to AArch32 System register [CNTFRQ](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTFRQ\_EL0 is a 32-bit register.

### Field descriptions

The CNTFRQ\_EL0 bit assignments are:

### Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

### Accessing the CNTFRQ\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTFRQ_EL0	11	011	1110	0000	000

## Accessibility

The register is accessible in software as follows:

Configuration	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
EL1 is the highest implemented Exception level.	x	x	x	RO	RW	n/a	n/a
EL2 is the highest implemented Exception level.	x	0	1	RO	RO	RW	n/a
EL2 is the highest implemented Exception level.	x	1	1	RO	n/a	RW	n/a
EL3 is the highest implemented Exception level.	x	x	0	RO	RO	RO	RW
EL3 is the highest implemented Exception level.	x	0	1	RO	RO	RO	RW
EL3 is the highest implemented Exception level.	x	1	1	RO	n/a	RO	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} = 0$ :
  - If  $\text{CNTKCTL\_EL1.EL0PCTEN} = 0$ , and  $\text{CNTKCTL\_EL1.EL0VCTEN} = 0$ , read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If  $\text{CNTKCTL\_EL1.EL0PCTEN} = 0$ , and  $\text{CNTKCTL\_EL1.EL0VCTEN} = 0$ , Non-secure read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 1)$ :
  - If  $\text{CNTHCTL\_EL2.EL0PCTEN} = 0$ , and  $\text{CNTHCTL\_EL2.EL0VCTEN} = 0$ , Non-secure read accesses to this register from EL0 are trapped to EL2.

## D7.5.2 CNTHCTL\_EL2, Counter-timer Hypervisor Control register

The CNTHCTL\_EL2 characteristics are:

### Purpose

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 to the physical counter and the Non-secure EL1 physical timer.

### Configurations

AArch64 System register CNTHCTL\_EL2 is architecturally mapped to AArch32 System register [CNTHCTL](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTHCTL\_EL2 is a 32-bit register.

### Field descriptions

The CNTHCTL\_EL2 bit assignments are:

**When *HCR\_EL2.E2H* == 0:**

This format applies in all ARMv8.0 implementations, and it also contains a description of the behavior when EL3 is implemented and EL2 is not implemented.

### Bits [31:8]

Reserved, RES0.

### EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register [CNTPCT\\_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

### EVNTDIR, bit [3]

Controls which transition of the counter register [CNTPCT\\_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

- 0 A 0 to 1 transition of the trigger bit triggers an event.
- 1 A 1 to 0 transition of the trigger bit triggers an event.

### EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTPCT\\_EL0](#):

- 0 Disables the event stream.
- 1 Enables the event stream.

### EL1PCEN, bit [1]

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to EL2.

0 From AArch64 state: Non-secure EL0 and EL1 accesses to the [CNTP\\_CTL\\_EL0](#), [CNTP\\_CVAL\\_EL0](#), and [CNTP\\_TVAL\\_EL0](#) are trapped to EL2, unless it is trapped by [CNTKCTL\\_EL1.EL0PTEN](#).

From AArch32 state: Non-secure EL0 and EL1 accesses to the [CNTP\\_CTL](#), [CNTP\\_CVAL](#), and [CNTP\\_TVAL](#) are trapped to EL2, unless it is trapped by [CNTKCTL\\_EL1.EL0PTEN](#) or [CNTKCTL.PL0PTEN](#).

1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

### EL1PCTEN, bit [0]

Traps Non-secure EL0 and EL1 accesses to the physical counter register to EL2.

0 From AArch64 state: Non-secure EL0 and EL1 accesses to the [CNTPCT\\_EL0](#) are trapped to EL2, unless it is trapped by [CNTKCTL\\_EL1.EL0PCTEN](#).

From AArch32 state: Non-secure EL0 and EL1 accesses to the [CNTPCT](#) are trapped to EL2, unless it is trapped by [CNTKCTL\\_EL1.EL0PCTEN](#) or [CNTKCTL.PL0PCTEN](#).

1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

**When [HCR\\_EL2.E2H](#) == 1:**

### Bits [31:12]

Reserved, RES0.

### EL1PTEN, bit [11]

When [HCR\\_EL2.TGE](#) is 0, traps Non-secure EL0 and EL1 accesses to the physical timer registers to EL2.

0 From AArch64 state: Non-secure EL0 and EL1 accesses to the [CNTP\\_CTL\\_EL0](#), [CNTP\\_CVAL\\_EL0](#), and [CNTP\\_TVAL\\_EL0](#) are trapped to EL2, unless it is trapped by [CNTKCTL\\_EL1.EL0PTEN](#).

From AArch32 state: Non-secure EL0 and EL1 accesses to the [CNTP\\_CTL](#), [CNTP\\_CVAL](#), and [CNTP\\_TVAL](#) are trapped to EL2, unless it is trapped by [CNTKCTL\\_EL1.EL0PTEN](#) or [CNTKCTL.PL0PTEN](#).

1 This control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

#### EL1PCTEN, bit [10]

When [HCR\\_EL2.TGE](#) is 0, traps Non-secure EL0 and EL1 accesses to the physical counter register to EL2.

- 0 From AArch64 state: Non-secure EL0 and EL1 accesses to the [CNTPCT\\_EL0](#) are trapped to EL2, unless it is trapped by [CNTKCTL\\_EL1.EL0PCTEN](#).  
From AArch32 state: Non-secure EL0 and EL1 accesses to the [CNTPCT](#) are trapped to EL2, unless it is trapped by [CNTKCTL\\_EL1.EL0PCTEN](#) or [CNTKCTL.PL0PCTEN](#).
- 1 This control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

#### EL0PTEN, bit [9]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the physical timer registers to EL2.

- 0 EL0 using AArch64: EL0 accesses to the [CNTP\\_CTL\\_EL0](#), [CNTP\\_CVAL\\_EL0](#), and [CNTP\\_TVAL\\_EL0](#) registers are trapped to EL2.  
EL0 using AArch32: EL0 accesses to the [CNTP\\_CTL](#), [CNTP\\_CVAL](#), and [CNTP\\_TVAL](#) registers are trapped to EL2.
- 1 This control does not cause any instructions to be trapped.

#### EL0VTEN, bit [8]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the virtual timer registers to EL2.

- 0 EL0 using AArch64: EL0 accesses to the [CNTV\\_CTL\\_EL0](#), [CNTV\\_CVAL\\_EL0](#), and [CNTV\\_TVAL\\_EL0](#) registers are trapped to EL2.  
EL0 using AArch32: EL0 accesses to the [CNTV\\_CTL](#), [CNTV\\_CVAL](#), and [CNTV\\_TVAL](#) registers are trapped to EL2.
- 1 This control does not cause any instructions to be trapped.

#### EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register [CNTPCT\\_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

#### EVNTDIR, bit [3]

Controls which transition of the counter register [CNTPCT\\_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

- 0 A 0 to 1 transition of the trigger bit triggers an event.
- 1 A 1 to 0 transition of the trigger bit triggers an event.

#### EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTPCT\\_EL0](#):

- 0 Disables the event stream.
- 1 Enables the event stream.

#### EL0VCTEN, bit [1]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the frequency register and virtual counter register to EL2.

- 0 EL0 using AArch64: EL0 accesses to the [CNTVCT\\_EL0](#) are trapped to EL2.  
EL0 using AArch64: EL0 accesses to the [CNTFRQ\\_EL0](#) register are trapped to EL2, if [CNTHTCTL\\_EL2.EL0PCTEN](#) is also 0.  
EL0 using AArch32: EL0 accesses to the [CNTVCT](#) are trapped to EL2.

EL0 using AArch32: EL0 accesses to the [CNTFRQ](#) register are trapped to EL2, if [CNTHCTL\\_EL2.EL0PCTEN](#) is also 0.

1 This control does not cause any instructions to be trapped.

#### EL0PCTEN, bit [0]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the frequency register and physical counter register to EL2.

0 EL0 using AArch64: EL0 accesses to the [CNTPCT\\_EL0](#) are trapped to EL2.

EL0 using AArch64: EL0 accesses to the [CNTFRQ\\_EL0](#) register are trapped to EL2, if [CNTHCTL\\_EL2.EL0VCTEN](#) is also 0.

EL0 using AArch32: EL0 accesses to the [CNTPCT](#) are trapped to EL2.

EL0 using AArch32: EL0 accesses to the [CNTFRQ](#) and register are trapped to EL2, if [CNTHCTL\\_EL2.EL0VCTEN](#) is also 0.

1 This control does not cause any instructions to be trapped.

### Accessing the CNTHCTL\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTHCTL_EL2	11	100	1110	0001	000
CNTKCTL_EL1	11	000	1110	0001	000

### Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTHCTL_EL2	x	x	0	-	-	n/a	RW
CNTHCTL_EL2	0	0	1	-	-	RW	RW
CNTHCTL_EL2	0	1	1	-	n/a	RW	RW
CNTHCTL_EL2	1	0	1	-	-	RW	RW
CNTHCTL_EL2	1	1	1	-	n/a	RW	RW
CNTKCTL_EL1	x	x	0	-	<a href="#">CNTKCTL_EL1</a>	n/a	<a href="#">CNTKCTL_EL1</a>
CNTKCTL_EL1	0	0	1	-	<a href="#">CNTKCTL_EL1</a>	<a href="#">CNTKCTL_EL1</a>	<a href="#">CNTKCTL_EL1</a>

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTKCTL_EL1	0	1	1	-	n/a	CNTKCTL_EL1	CNTKCTL_EL1
CNTKCTL_EL1	1	0	1	-	CNTKCTL_EL1	RW	CNTKCTL_EL1
CNTKCTL_EL1	1	1	1	-	n/a	RW	CNTKCTL_EL1

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHCTL\_EL2 or CNTKCTL\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

### D7.5.3 CNTHP\_CTL\_EL2, Counter-timer Hypervisor Physical Timer Control register

The CNTHP\_CTL\_EL2 characteristics are:

#### Purpose

Control register for the EL2 physical timer.

#### Configurations

AArch64 System register CNTHP\_CTL\_EL2 is architecturally mapped to AArch32 System register [CNTHP\\_CTL](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

CNTHP\_CTL\_EL2 is a 32-bit register.

#### Field descriptions

The CNTHP\_CTL\_EL2 bit assignments are:

#### Bits [31:3]

Reserved, RES0.

#### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

0 Timer condition is not met.

1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D6-2187](#) and [Operation of the TimerValue views of the timers on page D6-2188](#).

This bit is read-only.

#### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

0 Timer interrupt is not masked by the IMASK bit.

1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

#### ENABLE, bit [0]

Enables the timer. Permitted values are:

0 Timer disabled.

1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHP\\_TVAL\\_EL2](#) continues to count down.

———— **Note** ————

Disabling the output signal might be a power-saving option.

## Accessing the CNTHP\_CTL\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTHP_CTL_EL2	11	100	1110	0010	001
CNTP_CTL_EL0	11	011	1110	0010	001

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTHP_CTL_EL2	x	x	0	-	-	n/a	RW
CNTHP_CTL_EL2	0	0	1	-	-	RW	RW
CNTHP_CTL_EL2	0	1	1	-	n/a	RW	RW
CNTHP_CTL_EL2	1	0	1	-	-	RW	RW
CNTHP_CTL_EL2	1	1	1	-	n/a	RW	RW
CNTP_CTL_EL0	x	x	0	<a href="#">CNTP_CTL_EL0</a>	<a href="#">CNTP_CTL_EL0</a>	n/a	<a href="#">CNTP_CTL_EL0</a>
CNTP_CTL_EL0	0	0	1	<a href="#">CNTP_CTL_EL0</a>	<a href="#">CNTP_CTL_EL0</a>	<a href="#">CNTP_CTL_EL0</a>	<a href="#">CNTP_CTL_EL0</a>
CNTP_CTL_EL0	0	1	1	<a href="#">CNTP_CTL_EL0</a>	n/a	<a href="#">CNTP_CTL_EL0</a>	<a href="#">CNTP_CTL_EL0</a>
CNTP_CTL_EL0	1	0	1	<a href="#">CNTP_CTL_EL0</a>	<a href="#">CNTP_CTL_EL0</a>	RW	RW
CNTP_CTL_EL0	1	1	1	RW	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP\_CTL\_EL2 or CNTP\_CTL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If [CNTHCTL\\_EL2.EL0PTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL2.

#### D7.5.4 CNTHP\_CVAL\_EL2, Counter-timer Hypervisor Physical Timer CompareValue register

The CNTHP\_CVAL\_EL2 characteristics are:

## Purpose

Holds the compare value for the EL2 physical timer.

## Configurations

AArch64 System register CNTHP\_CVAL\_EL2 is architecturally mapped to AArch32 System register [CNTHP\\_CVAL](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTHP\_CVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHP\_CVAL\_EL2 bit assignments are:

**CompareValue, bits [63:0]**

Holds the EL2 physical timer CompareValue.

When `CNTHP_CTL_EL2.ENABLE` is 1, the timer condition is met when `(CNTPCT_EL0 - CompareValue)` is greater than zero. This means that `CompareValue` acts like a 64-bit upcounter timer. When the timer condition is met:

- `CNTHP_CTL_EL2.ISTATUS` is set to 1.
- If `CNTHP_CTL_EL2.IMASK` is 0, an interrupt is generated.

When **CNTHP\_CTL\_EL2.ENABLE** is 0, the timer condition is not met, but **CNTPCT\_EL0** continues to count.

## Accessing the CNTHP\_CVAL\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR &lt;systemreg&gt;, &lt;Xt&gt;

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTHP_CVAL_EL2	11	100	1110	0010	010
CNTP_CVAL_EL0	11	011	1110	0010	010

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTHP_CVAL_EL2	x	x	0	-	-	n/a	RW
CNTHP_CVAL_EL2	0	0	1	-	-	RW	RW
CNTHP_CVAL_EL2	0	1	1	-	n/a	RW	RW
CNTHP_CVAL_EL2	1	0	1	-	-	RW	RW
CNTHP_CVAL_EL2	1	1	1	-	n/a	RW	RW
CNTP_CVAL_EL0	x	x	0	CNTP_CVAL_EL0	CNTP_CVAL_EL0	n/a	CNTP_CVAL_EL0
CNTP_CVAL_EL0	0	0	1	CNTP_CVAL_EL0	CNTP_CVAL_EL0	CNTP_CVAL_EL0	CNTP_CVAL_EL0
CNTP_CVAL_EL0	0	1	1	CNTP_CVAL_EL0	n/a	CNTP_CVAL_EL0	CNTP_CVAL_EL0
CNTP_CVAL_EL0	1	0	1	CNTP_CVAL_EL0	CNTP_CVAL_EL0	RW	RW
CNTP_CVAL_EL0	1	1	1	RW	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP\_CVAL\_EL2 or CNTP\_CVAL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If [CNTHCTL\\_EL2.EL0PTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL2.

## D7.5.5 CNTHP\_TVAL\_EL2, Counter-timer Hypervisor Physical Timer TimerValue register

The CNTHP\_TVAL\_EL2 characteristics are:

### Purpose

Holds the timer value for the EL2 physical timer.

### Configurations

AArch64 System register CNTHP\_TVAL\_EL2 is architecturally mapped to AArch32 System register [CNTHP\\_TVAL](#).

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTHP\_TVAL\_EL2 is a 32-bit register.

### Field descriptions

The CNTHP\_TVAL\_EL2 bit assignments are:

### TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHP\\_CTL\\_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHP\\_CTL\\_EL2.ENABLE](#) is 1, the value returned is ([CNTHP\\_CVAL\\_EL2](#) - [CNTPCT\\_EL0](#)).

On a write of this register, [CNTHP\\_CVAL\\_EL2](#) is set to ([CNTPCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHP\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - [CNTHP\\_CVAL\\_EL2](#)) is greater than zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHP\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHP\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHP\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

### Accessing the CNTHP\_TVAL\_EL2

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTHP_TVAL_EL2	11	100	1110	0010	000
CNTP_TVAL_EL0	11	011	1110	0010	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTHP_TVAL_EL2	x	x	0	-	-	n/a	RW
CNTHP_TVAL_EL2	0	0	1	-	-	RW	RW
CNTHP_TVAL_EL2	0	1	1	-	n/a	RW	RW
CNTHP_TVAL_EL2	1	0	1	-	-	RW	RW
CNTHP_TVAL_EL2	1	1	1	-	n/a	RW	RW
CNTP_TVAL_EL0	x	x	0	CNTP_TVAL_EL0	CNTP_TVAL_EL0	n/a	CNTP_TVAL_EL0
CNTP_TVAL_EL0	0	0	1	CNTP_TVAL_EL0	CNTP_TVAL_EL0	CNTP_TVAL_EL0	CNTP_TVAL_EL0
CNTP_TVAL_EL0	0	1	1	CNTP_TVAL_EL0	n/a	CNTP_TVAL_EL0	CNTP_TVAL_EL0
CNTP_TVAL_EL0	1	0	1	CNTP_TVAL_EL0	CNTP_TVAL_EL0	RW	RW
CNTP_TVAL_EL0	1	1	1	RW	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP\_TVAL\_EL2 or CNTP\_TVAL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If [CNTHCTL\\_EL2.EL0PTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL2.

## D7.5.6 CNTHV\_CTL\_EL2, Counter-timer Virtual Timer Control register (EL2)

The CNTHV\_CTL\_EL2 characteristics are:

### Purpose

Control register for the EL2 virtual timer.

### Configurations

AArch64 System register CNTHV\_CTL\_EL2 is architecturally mapped to AArch32 System register CNTHV\_CTL.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

### Attributes

CNTHV\_CTL\_EL2 is a 32-bit register.

### Field descriptions

The CNTHV\_CTL\_EL2 bit assignments are:

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

0 Timer condition is not met.

1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D6-2187](#) and [Operation of the TimerValue views of the timers on page D6-2188](#).

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

0 Timer interrupt is not masked by the IMASK bit.

1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0 Timer disabled.
- 1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHV\\_TVAL\\_EL2](#) continues to count down.

#### Note

Disabling the output signal might be a power-saving option.

### Accessing the CNTHV\_CTL\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTHV_CTL_EL2	11	100	1110	0011	001
CNTV_CTL_EL0	11	011	1110	0011	001

### Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTHV_CTL_EL2	x	x	0	-	-	n/a	RW
CNTHV_CTL_EL2	0	0	1	-	-	RW	RW
CNTHV_CTL_EL2	0	1	1	-	n/a	RW	RW
CNTHV_CTL_EL2	1	0	1	-	-	RW	RW
CNTHV_CTL_EL2	1	1	1	-	n/a	RW	RW
CNTV_CTL_EL0	x	x	0	<a href="#">CNTV_CTL_EL0</a>	<a href="#">CNTV_CTL_EL0</a>	n/a	<a href="#">CNTV_CTL_EL0</a>
CNTV_CTL_EL0	0	0	1	<a href="#">CNTV_CTL_EL0</a>	<a href="#">CNTV_CTL_EL0</a>	<a href="#">CNTV_CTL_EL0</a>	<a href="#">CNTV_CTL_EL0</a>
CNTV_CTL_EL0	0	1	1	<a href="#">CNTV_CTL_EL0</a>	n/a	<a href="#">CNTV_CTL_EL0</a>	<a href="#">CNTV_CTL_EL0</a>
CNTV_CTL_EL0	1	0	1	<a href="#">CNTV_CTL_EL0</a>	<a href="#">CNTV_CTL_EL0</a>	RW	<a href="#">CNTV_CTL_EL0</a>
CNTV_CTL_EL0	1	1	1	RW	n/a	RW	<a href="#">CNTV_CTL_EL0</a>

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHV\\_CTL\\_EL2](#) or [CNTV\\_CTL\\_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 1) \ \&\& \ (\text{HCR\_EL2.TGE} == 1)$ :
  - If [CNTHCTL\\_EL2.EL0VTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL2.

## D7.5.7 CNTHV\_CVAL\_EL2, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV\_CVAL\_EL2 characteristics are:

### Purpose

Holds the compare value for the EL2 virtual timer.

### Configurations

AArch64 System register CNTHV\_CVAL\_EL2 is architecturally mapped to AArch32 System register CNTHV\_CVAL.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

### Attributes

CNTHV\_CVAL\_EL2 is a 64-bit register.

### Field descriptions

The CNTHV\_CVAL\_EL2 bit assignments are:

### CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTVCT\\_EL0](#) - CompareValue) is greater than zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHV\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHV\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count.

### Accessing the CNTHV\_CVAL\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTHV_CVAL_EL2	11	100	1110	0011	010
CNTV_CVAL_EL0	11	011	1110	0011	010

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTHV_CVAL_EL2	x	x	0	-	-	n/a	RW
CNTHV_CVAL_EL2	0	0	1	-	-	RW	RW
CNTHV_CVAL_EL2	0	1	1	-	n/a	RW	RW
CNTHV_CVAL_EL2	1	0	1	-	-	RW	RW
CNTHV_CVAL_EL2	1	1	1	-	n/a	RW	RW
CNTV_CVAL_EL0	x	x	0	CNTV_CVAL_EL0	CNTV_CVAL_EL0	n/a	CNTV_CVAL_EL0
CNTV_CVAL_EL0	0	0	1	CNTV_CVAL_EL0	CNTV_CVAL_EL0	CNTV_CVAL_EL0	CNTV_CVAL_EL0
CNTV_CVAL_EL0	0	1	1	CNTV_CVAL_EL0	n/a	CNTV_CVAL_EL0	CNTV_CVAL_EL0
CNTV_CVAL_EL0	1	0	1	CNTV_CVAL_EL0	CNTV_CVAL_EL0	RW	CNTV_CVAL_EL0
CNTV_CVAL_EL0	1	1	1	RW	n/a	RW	CNTV_CVAL_EL0

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV\_CVAL\_EL2 or CNTV\_CVAL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If [CNTHCTL\\_EL2.EL0VTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL2.

## D7.5.8 CNTHV\_TVAL\_EL2, Counter-timer Virtual Timer TimerValue register (EL2)

The CNTHV\_TVAL\_EL2 characteristics are:

### Purpose

Holds the timer value for the EL2 virtual timer.

### Configurations

AArch64 System register CNTHV\_TVAL\_EL2 is architecturally mapped to AArch32 System register CNTHV\_TVAL.

If EL2 is not implemented, this register is RES0 from EL3.

RW fields in this register reset to architecturally UNKNOWN values.

This register is introduced in ARMv8.1.

### Attributes

CNTHV\_TVAL\_EL2 is a 32-bit register.

### Field descriptions

The CNTHV\_TVAL\_EL2 bit assignments are:

### TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHV\\_CTL\\_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHV\\_CTL\\_EL2.ENABLE](#) is 1, the value returned is ([CNTHV\\_CVAL\\_EL2](#) - [CNTVCT\\_EL0](#)).

On a write of this register, [CNTHV\\_CVAL\\_EL2](#) is set to ([CNTVCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when (([CNTVCT\\_EL0](#) - [CNTHV\\_CVAL\\_EL2](#)) is greater than zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHV\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHV\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

### Accessing the CNTHV\_TVAL\_EL2

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTHV_TVAL_EL2	11	100	1110	0011	000
CNTV_TVAL_EL0	11	011	1110	0011	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTHV_TVAL_EL2	x	x	0	-	-	n/a	RW
CNTHV_TVAL_EL2	0	0	1	-	-	RW	RW
CNTHV_TVAL_EL2	0	1	1	-	n/a	RW	RW
CNTHV_TVAL_EL2	1	0	1	-	-	RW	RW
CNTHV_TVAL_EL2	1	1	1	-	n/a	RW	RW
CNTV_TVAL_EL0	x	x	0	CNTV_TVAL_EL0	CNTV_TVAL_EL0	n/a	CNTV_TVAL_EL0
CNTV_TVAL_EL0	0	0	1	CNTV_TVAL_EL0	CNTV_TVAL_EL0	CNTV_TVAL_EL0	CNTV_TVAL_EL0
CNTV_TVAL_EL0	0	1	1	CNTV_TVAL_EL0	n/a	CNTV_TVAL_EL0	CNTV_TVAL_EL0
CNTV_TVAL_EL0	1	0	1	CNTV_TVAL_EL0	CNTV_TVAL_EL0	RW	CNTV_TVAL_EL0
CNTV_TVAL_EL0	1	1	1	RW	n/a	RW	CNTV_TVAL_EL0

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV\_TVAL\_EL2 or CNTV\_TVAL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827*. Subject to the prioritization rules:

- When EL2 is implemented and is using AArch64 and (SCR\_EL3.NS == 1) && (HCR\_EL2.E2H == 1) && (HCR\_EL2.TGE == 1):
  - If [CNTHCTL\\_EL2.EL0VTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL2.

## D7.5.9 CNTKCTL\_EL1, Counter-timer Kernel Control register

The CNTKCTL\_EL1 characteristics are:

### Purpose

When [ARMv8.1-VHE](#) is not implemented, or when [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, this register controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

When [ARMv8.1-VHE](#) is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by [CNTHTCTL\\_EL2](#).

### Configurations

AArch64 System register CNTKCTL\_EL1 is architecturally mapped to AArch32 System register [CNTKCTL](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTKCTL\_EL1 is a 32-bit register.

### Field descriptions

The CNTKCTL\_EL1 bit assignments are:

### Bits [31:10]

Reserved, RES0.

### EL0PTEN, bit [9]

When [ARMv8.1-VHE](#) is not implemented, or when [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, traps EL0 accesses to the physical timer registers to EL1.

0 EL0 using AArch64: EL0 accesses to the [CNTP\\_CTL\\_EL0](#), [CNTP\\_CVAL\\_EL0](#), and [CNTP\\_TVAL\\_EL0](#) registers are trapped to EL1.

EL0 using AArch32: EL0 accesses to the [CNTP\\_CTL](#), [CNTP\\_CVAL](#), and [CNTP\\_TVAL](#) registers are trapped to EL1.

When [HCR\\_EL2](#).TGE is 1, this trap is routed to EL2.

1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

#### EL0VTEN, bit [8]

When [ARMv8.1-VHE](#) is not implemented, or when [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, traps EL0 accesses to the virtual timer registers to EL1.

- 0 EL0 using AArch64: EL0 accesses to the [CNTV\\_CTL\\_EL0](#), [CNTV\\_CVAL\\_EL0](#), and [CNTV\\_TVAL\\_EL0](#) registers are trapped to EL1.  
EL0 using AArch32: EL0 accesses to the [CNTV\\_CTL](#), [CNTV\\_CVAL](#), and [CNTV\\_TVAL](#) registers are trapped to EL1.  
When [HCR\\_EL2](#).TGE is 1, this trap is routed to EL2.
- 1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

#### EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register [CNTVCT\\_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

#### EVNTDIR, bit [3]

Controls which transition of the counter register [CNTVCT\\_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

- 0 A 0 to 1 transition of the trigger bit triggers an event.
- 1 A 1 to 0 transition of the trigger bit triggers an event.

#### EVNTEN, bit [2]

When [ARMv8.1-VHE](#) is not implemented, or when [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, enables the generation of an event stream from the counter register [CNTVCT\\_EL0](#):

- 0 Disables the event stream.
- 1 Enables the event stream.

When [ARMv8.1-VHE](#) is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this control does not enable the event stream.

#### EL0VCTEN, bit [1]

When [ARMv8.1-VHE](#) is not implemented, or when [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, traps EL0 accesses to the frequency register and virtual counter register to EL1.

- 0 EL0 using AArch64: EL0 accesses to the [CNTVCT\\_EL0](#) are trapped to EL1.  
EL0 using AArch64: EL0 accesses to the [CNTFRQ\\_EL0](#) register are trapped to EL1, if [CNTKCTL\\_EL1](#).EL0PCTEN is also 0.  
EL0 using AArch32: EL0 accesses to the [CNTVCT](#) are trapped to EL1.  
EL0 using AArch32: EL0 accesses to the [CNTFRQ](#) register are trapped to EL1, if [CNTKCTL\\_EL1](#).EL0PCTEN is also 0.  
When [HCR\\_EL2](#).TGE is 1, this trap is routed to EL2.
- 1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

#### EL0PCTEN, bit [0]

When [ARMv8.1-VHE](#) is not implemented, or when [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, traps EL0 accesses to the frequency register and physical counter register to EL1.

- 0 EL0 using AArch64: EL0 accesses to the [CNTPCT\\_EL0](#) are trapped to EL1.  
EL0 using AArch64: EL0 accesses to the [CNTFRQ\\_EL0](#) register are trapped to EL1, if [CNTKCTL\\_EL1](#).EL0VCTEN is also 0.  
EL0 using AArch32: EL0 accesses to the [CNTPCT](#) are trapped to EL1.  
EL0 using AArch32: EL0 accesses to the [CNTFRQ](#) and register are trapped to EL1, if [CNTKCTL\\_EL1](#).EL0VCTEN is also 0.

When [HCR\\_EL2.TGE](#) is 1, this trap is routed to EL2.

1 This control does not cause any instructions to be trapped.

When [ARMv8.1-VHE](#) is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

## Accessing the CNTKCTL\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTKCTL_EL1	11	000	1110	0001	000
CNTKCTL_EL12	11	101	1110	0001	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTKCTL_EL1	x	x	0	-	RW	n/a	RW
CNTKCTL_EL1	0	0	1	-	RW	RW	RW
CNTKCTL_EL1	0	1	1	-	n/a	RW	RW
CNTKCTL_EL1	1	0	1	-	RW	<a href="#">CNTHCTL_EL2</a>	RW
CNTKCTL_EL1	1	1	1	-	n/a	<a href="#">CNTHCTL_EL2</a>	RW
CNTKCTL_EL12	x	x	0	-	-	n/a	-
CNTKCTL_EL12	0	0	1	-	-	-	-
CNTKCTL_EL12	0	1	1	-	n/a	-	-
CNTKCTL_EL12	1	0	1	-	-	RW	RW
CNTKCTL_EL12	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTKCTL\_EL1 or CNTKCTL\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## D7.5.10 CNTP\_CTL\_EL0, Counter-timer Physical Timer Control register

The CNTP\_CTL\_EL0 characteristics are:

### Purpose

Control register for the EL1 physical timer.

### Configurations

AArch64 System register CNTP\_CTL\_EL0 is architecturally mapped to AArch32 System register [CNTP\\_CTL](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTP\_CTL\_EL0 is a 32-bit register.

### Field descriptions

The CNTP\_CTL\_EL0 bit assignments are:

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0 Timer condition is not met.
- 1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D6-2187](#) and [Operation of the TimerValue views of the timers on page D6-2188](#).

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0 Timer interrupt is not masked by the IMASK bit.
- 1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0 Timer disabled.
- 1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP\\_TVAL\\_EL0](#) continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

## Accessing the CNTP\_CTL\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTP_CTL_EL0	11	011	1110	0010	001
CNTP_CTL_EL02	11	101	1110	0010	001

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTP_CTL_EL0	x	x	0	RW	RW	n/a	RW
CNTP_CTL_EL0	0	0	1	RW	RW	RW	RW
CNTP_CTL_EL0	0	1	1	RW	n/a	RW	RW
CNTP_CTL_EL0	1	0	1	RW	RW	<a href="#">CNTHP_CTL_EL2</a>	RW
CNTP_CTL_EL0	1	1	1	<a href="#">CNTHP_CTL_EL2</a>	n/a	<a href="#">CNTHP_CTL_EL2</a>	RW
CNTP_CTL_EL02	x	x	0	-	-	n/a	-
CNTP_CTL_EL02	0	0	1	-	-	-	-
CNTP_CTL_EL02	0	1	1	-	n/a	-	-
CNTP_CTL_EL02	1	0	1	-	-	RW	RW
CNTP_CTL_EL02	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP\_CTL\_EL0 or CNTP\_CTL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827. Subject to the prioritization rules:

- When `HCR_EL2.E2H == 0`:
  - If `CNTKCTL_EL1.EL0PTEN == 0`, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 0)`:
  - If `CNTHCTL_EL2.EL1PCEN == 0`, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If `CNTHCTL_EL2.EL1PCEN == 0`, and `CNTKCTL_EL1.EL0PTEN == 1`, Non-secure accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 0)`:
  - If `CNTHCTL_EL2.EL1PTEN == 0`, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If `CNTHCTL_EL2.EL1PTEN == 0`, and `CNTKCTL_EL1.EL0PTEN == 1`, Non-secure accesses to this register from EL0 are trapped to EL2.
  - If `CNTKCTL_EL1.EL0PTEN == 0`, Non-secure accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1)`:
  - If `CNTHCTL_EL2.EL0PTEN == 0`, Non-secure accesses to this register from EL0 are trapped to EL2.

#### D7.5.11 CNTP\_CVAL\_EL0, Counter-timer Physical Timer CompareValue register

The CNTP\_CVAL\_EL0 characteristics are:

## Purpose

Holds the compare value for the EL1 physical timer.

## Configurations

AArch64 System register CNTP\_CVAL\_EL0 is architecturally mapped to AArch32 System register [CNTP\\_CVAL](#).

RW fields in this register reset to architecturally UNKNOWN values.

## Attributes

CNTP\_CVAL\_EL0 is a 64-bit register.

## Field descriptions

The CNTP\_CVAL\_EL0 bit assignments are:

**CompareValue, bits [63:0]**

Holds the EL1 physical timer CompareValue.

When `CNTPT_CTL_EL0.ENABLE` is 1, the timer condition is met when `(CNTPCT_EL0 - CompareValue)` is greater than zero. This means that `CompareValue` acts like a 64-bit upcounter timer. When the timer condition is met:

- `CNTP_CTL_EL0.ISTATUS` is set to 1.
- If `CNTP_CTL_EL0.IMASK` is 0, an interrupt is generated.

When `CNTP_CTL_EL0.ENABLE` is 0, the timer condition is not met, but `CNTPCT_EL0` continues to count.

## Accessing the CNTP\_CVAL\_ELO

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTP_CVAL_EL0	11	011	1110	0010	010
CNTP_CVAL_EL02	11	101	1110	0010	010

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTP_CVAL_EL0	x	x	0	RW	RW	n/a	RW
CNTP_CVAL_EL0	0	0	1	RW	RW	RW	RW
CNTP_CVAL_EL0	0	1	1	RW	n/a	RW	RW
CNTP_CVAL_EL0	1	0	1	RW	RW	<a href="#">CNTHP_CVAL_EL2</a>	RW
CNTP_CVAL_EL0	1	1	1	<a href="#">CNTHP_CVAL_EL2</a>	n/a	<a href="#">CNTHP_CVAL_EL2</a>	RW
CNTP_CVAL_EL02	x	x	0	-	-	n/a	-
CNTP_CVAL_EL02	0	0	1	-	-	-	-
CNTP_CVAL_EL02	0	1	1	-	n/a	-	-
CNTP_CVAL_EL02	1	0	1	-	-	RW	RW
CNTP_CVAL_EL02	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP\_CVAL\_EL0 or CNTP\_CVAL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} = 0$ :
  - If  $\text{CNTKCTL\_EL1.EL0PTEN} = 0$ , accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 0)$ :
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 0$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CNTHCTL\_EL2.EL1PCEN} = 0$ , and  $\text{CNTKCTL\_EL1.EL0PTEN} = 1$ , Non-secure accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If  $\text{CNTHCTL\_EL2.EL1PTEN} = 0$ , Non-secure accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CNTHCTL\_EL2.EL1PTEN} = 0$ , and  $\text{CNTKCTL\_EL1.EL0PTEN} = 1$ , Non-secure accesses to this register from EL0 are trapped to EL2.
  - If  $\text{CNTKCTL\_EL1.EL0PTEN} = 0$ , Non-secure accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 1)$ :
  - If  $\text{CNTHCTL\_EL2.EL0PTEN} = 0$ , Non-secure accesses to this register from EL0 are trapped to EL2.

## D7.5.12 CNTP\_TVAL\_EL0, Counter-timer Physical Timer TimerValue register

The CNTP\_TVAL\_EL0 characteristics are:

### Purpose

Holds the timer value for the EL1 physical timer.

### Configurations

AArch64 System register CNTP\_TVAL\_EL0 is architecturally mapped to AArch32 System register [CNTP\\_TVAL](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTP\_TVAL\_EL0 is a 32-bit register.

### Field descriptions

The CNTP\_TVAL\_EL0 bit assignments are:

### TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP\\_CTL\\_EL0.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP\\_CTL\\_EL0.ENABLE](#) is 1, the value returned is ([CNTP\\_CVAL\\_EL0](#) - [CNTPCT\\_EL0](#)).

On a write of this register, [CNTP\\_CVAL\\_EL0](#) is set to ([CNTPCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP\\_CTL\\_EL0.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - [CNTP\\_CVAL\\_EL0](#)) is greater than zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP\\_CTL\\_EL0.ISTATUS](#) is set to 1.
- If [CNTP\\_CTL\\_EL0.IMASK](#) is 0, an interrupt is generated.

When [CNTP\\_CTL\\_EL0.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

### Accessing the CNTP\_TVAL\_EL0

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTP_TVAL_EL0	11	011	1110	0010	000
CNTP_TVAL_EL02	11	101	1110	0010	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTP_TVAL_EL0	x	x	0	RW	RW	n/a	RW
CNTP_TVAL_EL0	0	0	1	RW	RW	RW	RW
CNTP_TVAL_EL0	0	1	1	RW	n/a	RW	RW
CNTP_TVAL_EL0	1	0	1	RW	RW	<a href="#">CNTHP_TVAL_EL2</a>	RW
CNTP_TVAL_EL0	1	1	1	<a href="#">CNTHP_TVAL_EL2</a>	n/a	<a href="#">CNTHP_TVAL_EL2</a>	RW
CNTP_TVAL_EL02	x	x	0	-	-	n/a	-
CNTP_TVAL_EL02	0	0	1	-	-	-	-
CNTP_TVAL_EL02	0	1	1	-	n/a	-	-
CNTP_TVAL_EL02	1	0	1	-	-	RW	RW
CNTP_TVAL_EL02	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP\_TVAL\_EL0 or CNTP\_TVAL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827*. Subject to the prioritization rules:

- When [HCR\\_EL2.E2H](#) == 0:
  - If [CNTKCTL\\_EL1.EL0PTEN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 0):
  - If [CNTHCTL\\_EL2.EL1PCEN](#)==0, Non-secure accesses to this register from EL1 are trapped to EL2.
  - If [CNTHCTL\\_EL2.EL1PCEN](#)==0, and [CNTKCTL\\_EL1.EL0PTEN](#)==1, Non-secure accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 1) && ([HCR\\_EL2.TGE](#) == 0):
  - If [CNTHCTL\\_EL2.EL1PTEN](#)==0, Non-secure accesses to this register from EL1 are trapped to EL2.

- If `CNTHCTL_EL2.EL1PTEN==0`, and `CNTKCTL_EL1.EL0PTEN==1`, Non-secure accesses to this register from EL0 are trapped to EL2.
- If `CNTKCTL_EL1.EL0PTEN==0`, Non-secure accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and `(SCR_EL3.NS == 1) && (HCR_EL2.E2H == 1) && (HCR_EL2.TGE == 1)`:
  - If `CNTHCTL_EL2.EL0PTEN==0`, Non-secure accesses to this register from EL0 are trapped to EL2.

### D7.5.13 CNTPCT\_EL0, Counter-timer Physical Count register

The CNTPCT\_EL0 characteristics are:

#### Purpose

Holds the 64-bit physical count value.

#### Configurations

AArch64 System register CNTPCT\_EL0 is architecturally mapped to AArch32 System register [CNTPCT](#).

#### Attributes

CNTPCT\_EL0 is a 64-bit register.

#### Field descriptions

The CNTPCT\_EL0 bit assignments are:

#### Bits [63:0]

Physical count value.

#### Accessing the CNTPCT\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTPCT_EL0	11	011	1110	0000	001

#### Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see *Synchronous exception prioritization for exceptions taken to AArch64* on page D1-1827. Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} == 0$ :
  - If  $\text{CNTKCTL\_EL1.EL0PCTEN} == 0$ , read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 0)$ :
  - If  $\text{CNTHCTL\_EL2.EL1PCTEN} == 0$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CNTHCTL\_EL2.EL1PCTEN} == 0$ , and  $\text{CNTKCTL\_EL1.EL0PCTEN} == 1$ , Non-secure read accesses to this register from EL0 are trapped to EL2.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 1) \ \&\& \ (\text{HCR\_EL2.TGE} == 0)$ :
  - If  $\text{CNTHCTL\_EL2.EL1PCTEN} == 0$ , Non-secure read accesses to this register from EL1 are trapped to EL2.
  - If  $\text{CNTHCTL\_EL2.EL1PCTEN} == 0$ , and  $\text{CNTKCTL\_EL1.EL0PCTEN} == 1$ , Non-secure read accesses to this register from EL0 are trapped to EL2.
  - If  $\text{CNTKCTL\_EL1.EL0PCTEN} == 0$ , Non-secure read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \ \&\& \ (\text{HCR\_EL2.E2H} == 1) \ \&\& \ (\text{HCR\_EL2.TGE} == 1)$ :
  - If  $\text{CNTHCTL\_EL2.EL0PCTEN} == 0$ , Non-secure read accesses to this register from EL0 are trapped to EL2.

## D7.5.14 CNTPS\_CTL\_EL1, Counter-timer Physical Secure Timer Control register

The CNTPS\_CTL\_EL1 characteristics are:

### Purpose

Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

### Configurations

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTPS\_CTL\_EL1 is a 32-bit register.

### Field descriptions

The CNTPS\_CTL\_EL1 bit assignments are:

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0 Timer condition is not met.
- 1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers on page D6-2187](#) and [Operation of the TimerValue views of the timers on page D6-2188](#).

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0 Timer interrupt is not masked by the IMASK bit.
- 1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0 Timer disabled.
- 1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTPS\\_TVAL\\_EL1](#) continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

## Accessing the CNTPS\_CTL\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTPS_CTL_EL1	11	111	1110	0010	001

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
0	0	1	-	-	-	RW
0	1	1	-	n/a	-	RW
1	0	1	-	-	-	RW
1	1	1	-	n/a	-	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL3 is implemented and is using AArch64 and SCR\_EL3.NS == 0:
  - If SCR\_EL3.ST==0, Secure accesses to this register from EL1 are trapped to EL3.

### D7.5.15 CNTPS\_CVAL\_EL1, Counter-timer Physical Secure Timer CompareValue register

The CNTPS\_CVAL\_EL1 characteristics are:

## Purpose

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

## Configurations

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTPS\_CVAL\_EL1 is a 64-bit register.

## Field descriptions

The CNTPS\_CVAL\_EL1 bit assignments are:

**CompareValue, bits [63:0]**

Holds the secure physical timer CompareValue.

When **CNTPS\_CTL\_EL1.ENABLE** is 1, the timer condition is met when (**CNTPCT\_EL0** - CompareValue) is greater than zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- `CNTPS_CTL_EL1`.ISTATUS is set to 1.
- If `CNTPS_CTL_EL1`.IMASK is 0, an interrupt is generated.

When `CNTPS_CTL_EL1.ENABLE` is 0, the timer condition is not met, but `CNTPCT_EL0` continues to count.

## Accessing the CNTPS\_CVAL\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR &lt;systemreg&gt;, &lt;Xt&gt;

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTPS_CVAL_EL1	11	111	1110	0010	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
0	0	1	-	-	-	RW
0	1	1	-	n/a	-	RW
1	0	1	-	-	-	RW
1	1	1	-	n/a	-	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL3 is implemented and is using AArch64 and SCR\_EL3.NS == 0:
  - If SCR\_EL3.ST==0, Secure accesses to this register from EL1 are trapped to EL3.

## D7.5.16 CNTPS\_TVAL\_EL1, Counter-timer Physical Secure Timer TimerValue register

The CNTPS\_TVAL\_EL1 characteristics are:

### Purpose

Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

### Configurations

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTPS\_TVAL\_EL1 is a 32-bit register.

### Field descriptions

The CNTPS\_TVAL\_EL1 bit assignments are:

### TimerValue, bits [31:0]

The TimerValue view of the secure physical timer.

On a read of this register:

- If [CNTPS\\_CTL\\_EL1.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTPS\\_CTL\\_EL1.ENABLE](#) is 1, the value returned is ([CNTPS\\_CVAL\\_EL1](#) - [CNTPCT\\_EL0](#)).

On a write of this register, [CNTPS\\_CVAL\\_EL1](#) is set to ([CNTPCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTPS\\_CTL\\_EL1.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - [CNTPS\\_CVAL\\_EL1](#)) is greater than zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTPS\\_CTL\\_EL1.ISTATUS](#) is set to 1.
- If [CNTPS\\_CTL\\_EL1.IMASK](#) is 0, an interrupt is generated.

When [CNTPS\\_CTL\\_EL1.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

### Accessing the CNTPS\_TVAL\_EL1

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTPS_TVAL_EL1	11	111	1110	0010	000

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	RW	n/a	RW
0	0	1	-	-	-	RW
0	1	1	-	n/a	-	RW
1	0	1	-	-	-	RW
1	1	1	-	n/a	-	RW

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When EL3 is implemented and is using AArch64 and SCR\_EL3.NS == 0:
  - If SCR\_EL3.ST==0, Secure accesses to this register from EL1 are trapped to EL3.

### D7.5.17 CNTV\_CTL\_EL0, Counter-timer Virtual Timer Control register

The CNTV\_CTL\_EL0 characteristics are:

## Purpose

Control register for the virtual timer.

## Configurations

AArch64 System register CNTV\_CTL\_EL0 is architecturally mapped to AArch32 System register CNTV\_CTL.

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTV\_CTL\_EL0 is a 32-bit register.

## Field descriptions

The CNTV\_CTL\_EL0 bit assignments are:

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

0 Timer condition is not met.

1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see [Operation of the CompareValue views of the timers](#) on page D6-2187 and [Operation of the TimerValue views of the timers](#) on page D6-2188.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

0 Timer interrupt is not masked by the IMASK bit.

1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

0	Timer disabled.
---	-----------------

1      Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV\\_TVAL\\_EL0](#) continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

## Accessing the CNTV\_CTL\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTV_CTL_EL0	11	011	1110	0011	001
CNTV_CTL_EL02	11	101	1110	0011	001

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTV_CTL_EL0	x	x	0	RW	RW	n/a	RW
CNTV_CTL_EL0	0	0	1	RW	RW	RW	RW
CNTV_CTL_EL0	0	1	1	RW	n/a	RW	RW
CNTV_CTL_EL0	1	0	1	RW	RW	<a href="#">CNTHV_CTL_EL2</a>	RW
CNTV_CTL_EL0	1	1	1	<a href="#">CNTHV_CTL_EL2</a>	n/a	<a href="#">CNTHV_CTL_EL2</a>	RW
CNTV_CTL_EL02	x	x	0	-	-	n/a	-
CNTV_CTL_EL02	0	0	1	-	-	-	-
CNTV_CTL_EL02	0	1	1	-	n/a	-	-
CNTV_CTL_EL02	1	0	1	-	-	RW	RW
CNTV_CTL_EL02	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV\_CTL\_EL0 or CNTV\_CTL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} == 0$ :
  - If  $\text{CNTKCTL\_EL1.EL0VTEN} == 0$ , accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \&\& (\text{HCR\_EL2.E2H} == 1) \&\& (\text{HCR\_EL2.TGE} == 0)$ :
  - If  $\text{CNTKCTL\_EL1.EL0VTEN} == 0$ , Non-secure accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} == 1) \&\& (\text{HCR\_EL2.E2H} == 1) \&\& (\text{HCR\_EL2.TGE} == 1)$ :
  - If  $\text{CNTHCTL\_EL2.EL0VTEN} == 0$ , Non-secure accesses to this register from EL0 are trapped to EL2.

#### D7.5.18 CNTV\_CVAL\_EL0, Counter-timer Virtual Timer CompareValue register

The CNTV\_CVAL\_EL0 characteristics are:

## Purpose

Holds the compare value for the virtual timer.

## Configurations

AArch64 System register CNTV\_CVAL\_EL0 is architecturally mapped to AArch32 System register [CNTV\\_CVAL](#).

RW fields in this register reset to architecturally UNKNOWN values.

### Attributes

CNTV CVAL EL0 is a 64-bit register.

## Field descriptions

The CNTV CVAL EL0 bit assignments are:

**CompareValue, bits [63:0]**

Holds the EL1 virtual timer CompareValue.

When `CNTV_CTL_EL0.ENABLE` is 1, the timer condition is met when `(CNTVCT_EL0 - CompareValue)` is greater than zero. This means that `CompareValue` acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV\_CTL\_EL0.ISTATUS is set to 1.
- If CNTV\_CTL\_EL0.IMASK is 0, an interrupt is generated.

When `CNTV_CTL_EL0.ENABLE` is 0, the timer condition is not met, but `CNTVCT_EL0` continues to count.

## Accessing the CNTV\_CVAL\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreq>

This register can be written using MSR (register) with the following syntax:

MSR &lt;systemreg&gt;, &lt;Xt&gt;

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTV_CVAL_EL0	11	011	1110	0011	010
CNTV_CVAL_EL02	11	101	1110	0011	010

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTV_CVAL_EL0	x	x	0	RW	RW	n/a	RW
CNTV_CVAL_EL0	0	0	1	RW	RW	RW	RW
CNTV_CVAL_EL0	0	1	1	RW	n/a	RW	RW
CNTV_CVAL_EL0	1	0	1	RW	RW	CNTHV_CVAL_EL2	RW
CNTV_CVAL_EL0	1	1	1	CNTHV_CVAL_EL2	n/a	CNTHV_CVAL_EL2	RW
CNTV_CVAL_EL02	x	x	0	-	-	n/a	-
CNTV_CVAL_EL02	0	0	1	-	-	-	-
CNTV_CVAL_EL02	0	1	1	-	n/a	-	-
CNTV_CVAL_EL02	1	0	1	-	-	RW	RW
CNTV_CVAL_EL02	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV\_CVAL\_EL0 or CNTV\_CVAL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When [HCR\\_EL2.E2H](#) == 0:
  - If [CNTKCTL\\_EL1.EL0VTEN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 1) && ([HCR\\_EL2.TGE](#) == 0):
  - If [CNTKCTL\\_EL1.EL0VTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 1) && ([HCR\\_EL2.TGE](#) == 1):
  - If [CNTHCTL\\_EL2.EL0VTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL2.

### D7.5.19 CNTV\_TVAL\_EL0, Counter-timer Virtual Timer TimerValue register

The CNTV\_TVAL\_EL0 characteristics are:

#### Purpose

Holds the timer value for the EL1 virtual timer.

#### Configurations

AArch64 System register CNTV\_TVAL\_EL0 is architecturally mapped to AArch32 System register [CNTV\\_TVAL](#).

RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

CNTV\_TVAL\_EL0 is a 32-bit register.

#### Field descriptions

The CNTV\_TVAL\_EL0 bit assignments are:

#### TimerValue, bits [31:0]

The TimerValue view of the EL1 virtual timer.

On a read of this register:

- If [CNTV\\_CTL\\_EL0.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV\\_CTL\\_EL0.ENABLE](#) is 1, the value returned is ([CNTV\\_CVAL\\_EL0](#) - ([CNTPCT\\_EL0](#) - [CNTVOFF\\_EL2](#))).

On a write of this register, [CNTV\\_CVAL\\_EL0](#) is set to ([CNTPCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTV\\_CTL\\_EL0.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - [CNTV\\_CVAL\\_EL0](#)) is greater than zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV\\_CTL\\_EL0.ISTATUS](#) is set to 1.
- If [CNTV\\_CTL\\_EL0.IMASK](#) is 0, an interrupt is generated.

When [CNTV\\_CTL\\_EL0.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

#### Accessing the CNTV\_TVAL\_EL0

This register can be read using MRS with the following syntax:

```
MRS <Xt>, <systemreg>
```

This register can be written using MSR (register) with the following syntax:

```
MSR <systemreg>, <Xt>
```

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTV_TVAL_EL0	11	011	1110	0011	000
CNTV_TVAL_EL02	11	101	1110	0011	000

## Accessibility

The register is accessible in software as follows:

<systemreg>	Control			Accessibility			
	E2H	TGE	NS	EL0	EL1	EL2	EL3
CNTV_TVAL_EL0	x	x	0	RW	RW	n/a	RW
CNTV_TVAL_EL0	0	0	1	RW	RW	RW	RW
CNTV_TVAL_EL0	0	1	1	RW	n/a	RW	RW
CNTV_TVAL_EL0	1	0	1	RW	RW	<a href="#">CNTHV_TVAL_EL2</a>	RW
CNTV_TVAL_EL0	1	1	1	<a href="#">CNTHV_TVAL_EL2</a>	n/a	<a href="#">CNTHV_TVAL_EL2</a>	RW
CNTV_TVAL_EL02	x	x	0	-	-	n/a	-
CNTV_TVAL_EL02	0	0	1	-	-	-	-
CNTV_TVAL_EL02	0	1	1	-	n/a	-	-
CNTV_TVAL_EL02	1	0	1	-	-	RW	RW
CNTV_TVAL_EL02	1	1	1	-	n/a	RW	RW

This table applies to all instructions that can access this register.

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV\_TVAL\_EL0 or CNTV\_TVAL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When [HCR\\_EL2.E2H](#) == 0:
  - If [CNTKCTL\\_EL1.EL0VTEN](#)==0, accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 1) && ([HCR\\_EL2.TGE](#) == 0):
  - If [CNTKCTL\\_EL1.EL0VTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and ([SCR\\_EL3.NS](#) == 1) && ([HCR\\_EL2.E2H](#) == 1) && ([HCR\\_EL2.TGE](#) == 1):
  - If [CNTHCTL\\_EL2.EL0VTEN](#)==0, Non-secure accesses to this register from EL0 are trapped to EL2.

### D7.5.20 CNTVCT\_EL0, Counter-timer Virtual Count register

The CNTVCT\_EL0 characteristics are:

#### Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in [CNTPCT\\_EL0](#) minus the virtual offset visible in [CNTVOFF\\_EL2](#).

#### Configurations

AArch64 System register CNTVCT\_EL0 is architecturally mapped to AArch32 System register [CNTVCT](#).

The value of this register is the same as the value of [CNTPCT\\_EL0](#) in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented, [HCR\\_EL2.E2H](#) is 1, and this register is read from EL2.
- When EL2 is implemented, [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, and this register is read from Non-secure EL0 or EL2.

#### Attributes

CNTVCT\_EL0 is a 64-bit register.

#### Field descriptions

The CNTVCT\_EL0 bit assignments are:

#### Bits [63:0]

Virtual count value.

#### Accessing the CNTVCT\_EL0

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTVCT_EL0	11	011	1110	0000	010

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	RO	RO	n/a	RO
x	0	1	RO	RO	RO	RO
x	1	1	RO	n/a	RO	RO

## Traps and Enables

For a description of the prioritization of any generated exceptions, see [Synchronous exception prioritization for exceptions taken to AArch64 on page D1-1827](#). Subject to the prioritization rules:

- When  $\text{HCR\_EL2.E2H} = 0$ :
  - If  $\text{CNTKCTL\_EL1.EL0VCTEN} = 0$ , read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 0)$ :
  - If  $\text{CNTKCTL\_EL1.EL0VCTEN} = 0$ , Non-secure read accesses to this register from EL0 are trapped to EL1.
- When EL2 is implemented and is using AArch64 and  $(\text{SCR\_EL3.NS} = 1) \ \&\& \ (\text{HCR\_EL2.E2H} = 1) \ \&\& \ (\text{HCR\_EL2.TGE} = 1)$ :
  - If  $\text{CNTHCTL\_EL2.EL0PCTEN} = 0$ , Non-secure read accesses to this register from EL0 are trapped to EL2.

### D7.5.21 CNTVOFF\_EL2, Counter-timer Virtual Offset register

The CNTVOFF\_EL2 characteristics are:

#### Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in [CNTPCT\\_EL0](#) and the virtual count value visible in [CNTVCT\\_EL0](#).

#### Configurations

AArch64 System register CNTVOFF\_EL2 is architecturally mapped to AArch32 System register [CNTVOFF](#).

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

#### Note

When EL2 is implemented and is using AArch64, the virtual counter uses a fixed virtual offset of zero in the following situations:

- [HCR\\_EL2.E2H](#) is 1, and [CNTVCT\\_EL0](#) is read from EL2.
- [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, and either:
  - [CNTVCT\\_EL0](#) is read from Non-secure EL0 or EL2.
  - [CNTVCT](#) is read from Non-secure EL0.

RW fields in this register reset to architecturally UNKNOWN values.

#### Attributes

CNTVOFF\_EL2 is a 64-bit register.

#### Field descriptions

The CNTVOFF\_EL2 bit assignments are:

#### Bits [63:0]

Virtual offset.

#### Accessing the CNTVOFF\_EL2

This register can be read using MRS with the following syntax:

MRS <Xt>, <systemreg>

This register can be written using MSR (register) with the following syntax:

MSR <systemreg>, <Xt>

This syntax is encoded with the following settings in the instruction encoding:

<systemreg>	op0	op1	CRn	CRm	op2
CNTVOFF_EL2	11	100	1110	0000	011

## Accessibility

The register is accessible in software as follows:

Control			Accessibility			
E2H	TGE	NS	EL0	EL1	EL2	EL3
x	x	0	-	-	n/a	RW
x	0	1	-	-	RW	RW
x	1	1	-	n/a	RW	RW

# Part E

## **The AArch32 Application Level Architecture**

# Chapter E1

## The AArch32 Application Level Programmers' Model

This chapter gives an Application level description of the programmers' model for software executing in AArch32 state. This means it describes execution in EL0 when EL0 is using AArch32. It contains the following sections:

- [\*About the Application level programmers' model on page E1-2728.\*](#)
- [\*The Application level programmers' model in AArch32 state on page E1-2729.\*](#)
- [\*Advanced SIMD and floating-point instructions on page E1-2740.\*](#)
- [\*About the AArch32 System register interface on page E1-2752.\*](#)
- [\*Exceptions on page E1-2753.\*](#)

## E1.1 About the Application level programmers' model

This chapter contains the programmers' model information required for the development of applications that will execute in AArch32 state.

The information in this chapter is distinct from the system information required to service and support application execution under an operating system, or higher level of system software. However, some knowledge of that system information is needed to put the Application level programmers' model into context.

Depending on the implementation, the architecture supports multiple levels of execution privilege. These privilege levels are indicated by different *Exception levels* that number upwards from EL0, where EL0 corresponds to the lowest privilege level and is often described as *unprivileged*. The Application level programmers' model is the programmers' model for software executing at EL0. For more information see [ARMv8 architectural concepts on page A1-34](#).

System software determines the Exception level, and therefore the level of privilege, at which application software runs. When an operating system supports execution at both EL1 and EL0, an application usually runs unprivileged. This has the following effects:

- It means that the operating system can allocate system resources to an application in a unique or shared manner.
- It provides a degree of protection from other processes, and so helps protect the operating system from malfunctioning software.

This chapter indicates where some System level understanding is helpful, and if appropriate it gives a reference to the System level description.

When included in an implementation:

- EL3 provides two Security states, Secure and Non-secure. Secure state provides additional hardware features that support the development of secure applications.
- EL2 provides virtualization of operation in Non-secure state.

However, application level software is generally unaware of its Security state, and of any virtualization. For more information, see [The ARMv8-A security model on page G1-4315](#) and [The effect of implementing EL2 on the Exception model on page G1-4320](#).

### ————— **Note** —————

- When an implementation includes EL3, application and operating system software normally executes in Non-secure state.
- EL2, that provides the virtualization features, is implemented only in Non-secure state.
- Older documentation, describing implementations or architecture versions that support only two privilege levels, often refers to execution at EL1 as *privileged* execution.
- In this manual, the terms *CONSTRAINED UNPREDICTABLE*, *IMPLEMENTATION DEFINED*, *OPTIONAL*, *RES0*, *RES1*, *UNDEFINED*, *UNKNOWN*, and *UNPREDICTABLE* have ARM-specific meanings, as defined in the [Glossary](#). In body text, these terms are shown in SMALL CAPS, for example IMPLEMENTATION DEFINED.

## E1.2 The Application level programmers' model in AArch32 state

The following sections give more information about the Application level programmers' model in AArch32 state:

- [Instruction sets, arithmetic operations, and register files.](#)
- [Core data types and arithmetic in AArch32 state.](#)
- [The general-purpose registers, and the PC, in AArch32 state on page E1-2731.](#)
- [Process state, PSTATE on page E1-2734.](#)
- [Jazelle support on page E1-2739.](#)

### E1.2.1 Instruction sets, arithmetic operations, and register files

The A32 and T32 instruction sets both provide a wide range of integer arithmetic and logical operations, that operate on a register file of sixteen 32-bit registers, that are comprised of the AArch32 general-purpose registers and the PC. As described in [The general-purpose registers, and the PC, in AArch32 state on page E1-2731](#), these registers include the registers SP (R13) and LR (R14), which have specialized uses. [Core data types and arithmetic in AArch32 state](#) gives more information about these operations.

In addition, an implementation that implements the T32 and A32 instruction sets includes both:

- Scalar floating-point instructions.
- The Advanced SIMD vector instructions.

Floating-point and vector instructions operate on a separate common register file, described in [The SIMD and floating-point register file on page E1-2740](#). [Advanced SIMD and floating-point instructions on page E1-2740](#) gives more information about these instructions.

### E1.2.2 Core data types and arithmetic in AArch32 state

When executing in AArch32 state, a PE supports the following data types in memory:

<b>Byte</b>	8 bits.
<b>Halfword</b>	16 bits.
<b>Word</b>	32 bits.
<b>Doubleword</b>	64 bits.

PE registers are 32 bits in size. The instruction sets provide instructions that use the following data types for data held in registers:

- 32-bit pointers.
- Unsigned or signed 32-bit integers.
- Unsigned 16-bit or 8-bit integers, held in zero-extended form.
- Signed 16-bit or 8-bit integers, held in sign-extended form.
- Two 16-bit integers packed into a register.
- Four 8-bit integers packed into a register.
- Unsigned or signed 64-bit integers held in two registers.

Load and store operations can transfer bytes, halfwords, or words to and from memory. Loads of bytes or halfwords zero-extend or sign-extend the data as it is loaded, as specified in the appropriate load instruction.

The instruction sets include load and store operations that transfer two or more words to and from memory. Software can load and store doublewords using these instructions.

#### ————— Note —————

For information about the atomicity of memory accesses see [Atomicity in the ARM architecture on page E2-2758](#).

When any of the data types is described as *unsigned*, the N-bit data value represents a non-negative integer in the range 0 to  $2^N-1$ , using normal binary format.

When any of these types is described as *signed*, the N-bit data value represents an integer in the range  $-2^{(N-1)}$  to  $+2^{(N-1)}-1$ , using two's complement format.

The instructions that operate on packed halfwords or bytes include some multiply instructions that use only one of two halfwords, and SIMD instructions that perform parallel addition or subtraction on all of the halfwords or bytes.

---

**Note**

---

These SIMD instructions operate on values held in the general-purpose registers, and must not be confused with the Advanced SIMD instructions that operate on a separate register file that provides registers of up to 128 bits.

---

Direct instruction support for 64-bit integers is limited, and most 64-bit operations require sequences of two or more instructions to synthesize them.

## Integer arithmetic

The instruction set provides a wide range of operations on the values in registers, including bitwise logical operations, shifts, additions, subtractions, multiplications, and divisions. The pseudocode described in [Appendix K10 ARM Pseudocode Definition](#) defines these operations, usually in one of three ways:

- By direct use of the pseudocode operators and built-in functions defined in [Operators on page K10-6262](#).
- By use of pseudocode helper functions defined in the main text. See [Appendix K12 Pseudocode Index](#).
- By a sequence of the form:
  1. Use of the `SInt()`, `UInt()`, and `Int()` built-in functions defined in [Converting bitstrings to integers on page K10-6274](#) to convert the bitstring contents of the instruction operands to the unbounded integers that they represent as two's complement or unsigned integers.
  2. Use of mathematical operators, built-in functions and helper functions on those unbounded integers to calculate other such integers.
  3. Use of either the bitstring extraction operator defined in [Bitstring concatenation and slicing on page K10-6263](#) or of the saturation helper functions described in [Pseudocode description of saturation on page E1-2731](#) to convert an unbounded integer result into a bitstring result that can be written to a register.

## Shift and rotate operations

The following types of shift and rotate operations are used in instructions:

### Logical Shift Left

The `LSL()` pseudocode function moves each bit of a bitstring left by a specified number of bits. Zeros are shifted in at the right end of the bitstring. Bits that are shifted off the left end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

### Logical Shift Right

The `LSR()` pseudocode function moves each bit of a bitstring right by a specified number of bits. Zeros are shifted in at the left end of the bitstring. Bits that are shifted off the right end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

### Arithmetic Shift Right

The `ASR()` pseudocode function moves each bit of a bitstring right by a specified number of bits. Copies of the leftmost bit are shifted in at the left end of the bitstring. Bits that are shifted off the right end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

**Rotate Right** The `ROR()` pseudocode function moves each bit of a bitstring right by a specified number of bits. Each bit that is shifted off the right end of the bitstring is re-introduced at the left end. The last bit shifted off the right end of the bitstring can be produced as a carry output.

### Rotate Right with Extend

The `RRX()` pseudocode function moves each bit of a bitstring right by one bit. A carry input is shifted in at the left end of the bitstring. The bit shifted off the right end of the bitstring can be produced as a carry output.

### Pseudocode description of addition and subtraction

In pseudocode, addition and subtraction can be performed on any combination of unbounded integers and bitstrings, provided that if they are performed on two bitstrings, the bitstrings must be identical in length. The result is another unbounded integer if both operands are unbounded integers, and a bitstring of the same length as the bitstring operand or operands otherwise. For the definition of these operations, see [Addition and subtraction on page K10-6264](#).

The main addition and subtraction instructions can produce status information about both unsigned carry and signed overflow conditions. When necessary, multi-word additions and subtractions can be synthesized from this status information. In pseudocode the `AddWithCarry()` function provides an addition with a carry input and a set of output Condition flags including carry output and overflow:

An important property of the `AddWithCarry()` function is that if:

```
(result, nzcvc) = AddWithCarry(x, NOT(y), carry_in)
```

Then:

- If `carry_in == '1'`, then `result == x-y` with:
  - `nzcvc<0> == '1'` if signed overflow occurred during the subtraction.
  - `nzcvc<1> == '1'` if unsigned borrow did not occur during the subtraction, that is, if  $x \geq y$ .
- If `carry_in == '0'`, then `result == x-y-1` with:
  - `nzcvc<0> == '1'` if signed overflow occurred during the subtraction.
  - `nzcvc<1> == '1'` if unsigned borrow did not occur during the subtraction, that is, if  $x \geq y$ .

Taken together, this means that the `carry_in` and `nzcvc<1>` output in `AddWithCarry()` calls can act as NOT borrow flags for subtractions as well as carry flags for additions.

### Pseudocode description of saturation

Some instructions perform *saturating arithmetic*, that is, if the result of the arithmetic overflows the destination signed or unsigned N-bit integer range, the result produced is the largest or smallest value in that range, rather than wrapping around modulo  $2^N$ . This is supported in pseudocode by:

- The `SignedSatQ()` and `UnsignedSatQ()` functions when an operation requires, in addition to the saturated result, a Boolean argument that indicates whether saturation occurred.
- The `SignedSat()` and `UnsignedSat()` functions when only the saturated result is required.

`SatQ(i, N, unsigned)` returns either `UnsignedSatQ(i, N)` or `SignedSatQ(i, N)` depending on the value of its third argument, and `Sat(i, N, unsigned)` returns either `UnsignedSat(i, N)` or `SignedSat(i, N)` depending on the value of its third argument.

## E1.2.3 The general-purpose registers, and the PC, in AArch32 state

In the AArch32 Application level view, a PE has:

- Fifteen general-purpose 32-bit registers, R0 to R14, of which R13 and R14 have alternative names reflecting how they are, or can be, used:
  - R13 is usually identified as SP.
  - R14 is usually identified as LR.
- The PC (*program counter*), that can be described as R15.

The specialized uses of the SP (R13), LR (R14), and PC (R15) are:

### SP, the stack pointer

The PE uses SP as a pointer to the active stack.

In the T32 instruction set, some instructions cannot access SP. Instructions that can access SP can use SP as a general-purpose register.

The A32 instruction set provides more general access to SP, and it can be used as a general-purpose register.

#### ———— Note ————

Using SP for any purpose other than as a stack pointer might break the requirements of operating systems, debuggers, and other software systems, causing them to malfunction.

Software can refer to SP as R13.

### LR, the link register

The link register can be used to hold return link information, and some cases described in this manual require this use of the LR. When software does not require the LR for linking, it can use it for other purposes. Software can refer to LR as R14.

### PC, the program counter

- When executing an A32 instruction, PC reads as the address of the current instruction plus 8.
- When executing a T32 instruction, PC reads as the address of the current instruction plus 4.
- Writing an address to PC causes a branch to that address.

Most T32 instructions cannot access PC.

The A32 instruction set provides more general access to the PC, and many A32 instructions can use the PC as a general-purpose register. However, ARM deprecates the use of PC for any purpose other than as the program counter. See [Writing to the PC](#) for more information.

Software can refer to PC as R15.

See [AArch32 general-purpose registers, the PC, and the Special-purpose registers on page G1-4327](#) for the system level view of these registers.

#### ———— Note ————

In general, ARM strongly recommends using the names SP, LR and PC instead of R13, R14 and R15. However, sometimes it is simpler to use the R13-R15 names when referring to a group of registers. For example, it is simpler to refer to *registers R8 to R15*, rather than to *registers R8 to R12, the SP, LR and PC*. These two descriptions of the group of registers have exactly the same meaning.

## Writing to the PC

In the A32 and T32 instruction sets, many data-processing instructions can write to the PC. Writes to the PC are handled as follows:

- In T32 state, the following 16-bit T32 instruction encodings branch to the value written to the PC:
  - Encoding T2 of [ADD, ADDS \(register\)](#) on page F5-3017.
  - Encoding T1 of [MOV, MOVs \(register\)](#) on page F5-3260.

The value written to the PC is forced to be halfword-aligned by ignoring its least significant bit, treating that bit as being 0.

- The B, BL, CBNZ, CBZ, CHKA, HB, HBL, HBLP, HBP, TBB, and TBH instructions remain in the same instruction set state and branch to the value written to the PC.

The definition of each of these instructions ensures that the value written to the PC is correctly aligned for the current instruction set state.

- The BLX (immediate) instruction switches between A32 and T32 states and branches to the value written to the PC. Its definition ensures that the value written to the PC is correctly aligned for the new instruction set state.
- The following instructions write a value to the PC, treating that value as an interworking address to branch to, with low-order bits that determine the new instruction set state:
  - BLX (register), BX, and BXJ.
  - LDR instructions with <Rt> equal to the PC.
  - POP and all forms of LDM except LDM (exception return), when the register list includes the PC.
  - In A32 state only, ADC, ADD, ADR, AND, ASR (immediate), BIC, EOR, LSL (immediate), LSR (immediate), MOV, MVN, ORR, ROR (immediate), RRX, RSB, RSC, SBC, and SUB instructions with <Rd> equal to the PC and without flag-setting specified.

For details of how an interworking address specifies the new instruction set state and instruction address, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC](#).

———— **Note** —————

The register-shifted register instructions, that are available only in the A32 instruction set and are summarized in [Data-processing register \(register shift\) on page F4-2955](#), are CONSTRAINED UNPREDICTABLE if they attempt to write to the PC, see [Using R15 on page K1-6097](#).

- Some instructions are treated as exception return instructions, and write both the PC and the CPSR. For more information, including which instructions are exception return instructions, see [Exception return to an Exception level using AArch32 on page G1-4360](#).
- Some instructions cause an exception, and the exception handler address is written to the PC as part of the exception entry.

## Pseudocode description of operations on the AArch32 general-purpose registers and the PC

In pseudocode, the uses of the `R[]` function, with an index parameter `n`, are:

- Reading or writing R0-R12, SP, and LR, using `n = 0-12, 13, and 14` respectively.
- Reading the PC, using `n = 15`.

[Pseudocode description of general-purpose register and PC operations on page G1-4329](#) describes accesses to these registers.

Descriptions of A32 store instructions that store the PC value use the `PCStoreValue()` pseudocode function to specify the PC value stored by the instruction.

Writing an address to the PC causes either a simple branch to that address or an *interworking* branch that also selects the instruction set to execute after the branch. A simple branch is performed by the `BranchWritePC()` function.

An interworking branch is performed by the `BXWritePC()` function.

The `LoadWritePC()` and `ALUWritePC()` functions are used for two cases where the behavior was systematically modified between architecture versions.

## E1.2.4 Process state, PSTATE

Process state or **PSTATE** is an abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

### ———— Note ————

In this chapter, references to **PSTATE** link to the more appropriate of:

- The Application-level view of **PSTATE** given in this section.
- The System-level description in *Process state, PSTATE* on page G1-4332.

The following **PSTATE** information is accessible at EL0:

### The Condition flags

Flag-setting instructions set these. They are:

- N** Negative Condition flag. If the result of the instruction is regarded as a two's complement signed integer, the PE sets this to:
- 1 if the result is negative.
  - 0 if the result is positive or zero.
- Z** Zero Condition flag. Set to:
- 1 if the result of the instruction is zero.
  - 0 otherwise.
- A result of zero often indicates an equal result from a comparison.
- C** Carry Condition flag. Set to:
- 1 if the instruction results in a carry condition, for example an unsigned overflow that is the result of an addition.
  - 0 otherwise.
- V** Overflow Condition flag. Set to:
- 1 if the instruction results in an overflow condition, for example a signed overflow that is the result of an addition.
  - 0 otherwise.

Conditional instructions test the N, Z, C, and V Condition flags, combining them with the *Condition code* for the instruction, to determine whether the instruction must be executed. In this way, execution of the instruction is conditional on the result of a previous operation. For more information about conditional execution, see *Conditional execution* on page F2-2849.

### The overflow or saturation flag

- Q** Some instructions can set this. For those instructions that can, the PE:
- Sets it to 1 if the instruction indicates overflow or saturation.
  - Leaves it unchanged otherwise.

For more information, see *Pseudocode description of saturation* on page E1-2731.

### The greater than or equal flags

- GE[3:0]** The instructions described in *Parallel addition and subtraction instructions* on page F1-2818 update these to indicate the results from individual bytes or halfwords of the operation. These flags can control a later SEL instruction. For more information, see *SEL* on page F5-3409.

**PSTATE** also contains *PE state controls*. There is no direct access to these from application level instructions, but they can be changed by side-effects of application level instructions. They are:

#### Instruction set state

**J, T** The current instruction set state, as shown in [Table E1-1](#). In ARMv8, the J bit is RES0, see the Note in this section.

**Table E1-1 PSTATE.{J, T} encoding**

J	T	Instruction set state
0	0	A32
0	1	T32

**A32** The PE is executing the A32 instruction set, summarized in [Chapter F4 A32 Instruction Set Encoding](#).

**T32** The PE is executing the T32 instruction set, summarized in [Chapter F3 T32 Instruction Set Encoding](#).

#### Note

##### Encoding with J==1 before ARMv8, Jazelle and T32EE states

In previous versions of the ARM architecture, the encoding {1, 0} selected Jazelle state, and encoding {1, 1} selected T32EE state. ARMv8 does not support either of these states, and these are encodings for unimplemented instruction set states, see [Unimplemented instruction sets on page G1-4338](#). ARMv8 AArch32 state requires a Trivial Jazelle implementation, see [Trivial implementation of the Jazelle extension on page G1-4338](#).

#### The IT block state

**IT[7:0]** The If-Then controls for the T32 IT instruction, that applies to the *IT block* of instructions that immediately follow the IT instruction. See [IT on page F5-3126](#) for a description of the IT instruction and its associated IT block.  
For more information about the use of **PSTATE.IT** see [Use of PSTATE.IT on page E1-2737](#).

#### Endianness mapping

**E** For data accesses, controls the endianness:  
**0** Little-endian.  
**1** Big-endian.  
 If an implementation does not provide:  
 • Big-endian support for data accesses, this bit is RES0.  
 • Little-endian support for data accesses, this bit is RES1.  
 Instruction fetches are always little-endian, and ignore **PSTATE.E**.

## Accessing PSTATE fields at EL0

The following sections describe which **PSTATE** fields can be directly accessed at EL0, and how they can be accessed:

- [The Application Program Status Register, APSR.](#)
- [The SETEND instruction.](#)

### The Application Program Status Register, APSR

At EL0, some **PSTATE** fields can be accessed using the Special-purpose *Application Program Status Register* (APSR). The APSR can be directly read using the **MRS** instruction, and directly written using the **MSR (register)** and **MSR (immediate)** instructions.

The APSR bit assignments are:

#### N, Z, C, V, bits [31:28]

The **PSTATE** Condition flags.

**Q, bit [27]** The **PSTATE** overflow or saturation flag.

**Bits[26:24]** Reserved, RAZ/SBZP. Software can use MSR instructions that write the top byte of the APSR without using a read-modify-write sequence. If it does this, it must write zeros to bits[26:24].

#### Bits[23:20, 15:0]

Reserved bits that are allocated to system features, or are available for future expansion. Unprivileged execution ignores writes to fields that are accessible only at EL1 or higher. However, application level software that writes to the APSR must treat reserved bits as *Do-Not-Modify* (DNM) bits. For more information about the reserved bits, see [The Current Program Status Register, CPSR on page G1-4334](#).

#### GE[3:0], bits [19:16]

The **PSTATE** greater than or equal flags.

The other **PSTATE** fields cannot be accessed by using the APSR.

The system level alias for the APSR is the **CPSR**. The **CPSR** is a superset of the APSR. See [The Current Program Status Register, CPSR on page G1-4334](#).

Writes to the **PSTATE** fields have side-effects on various aspects of PE operation. All of these side-effects, except side-effects on memory accesses associated with fetching instructions, are synchronous to the APSR write. This means they are guaranteed:

- Not to be visible to earlier instructions in the execution stream.
- To be visible to later instructions in the execution stream.

### The SETEND instruction

The A32 and T32 instruction sets both include an instruction to manipulate **PSTATE.E**:

SETEND BE Sets **PSTATE.E** to 1, for big-endian operation.  
SETEND LE Sets **PSTATE.E** to 0, for little-endian operation.

The SETEND instruction is unconditional. For more information, see [SETEND on page F5-3411](#). ARM deprecates use of the SETEND instruction.

## Use of PSTATE.IT

PSTATE.IT provides the If-Then controls for the T32 IT instruction, that applies to the *IT block* of instructions that immediately follow the IT instruction.

PSTATE.IT divides into two subfields:

**IT[7:5]** Holds the *base condition* for the current IT block. The base condition is the top three bits of the Condition code specified by the <firstcond> field of the IT instruction.

**IT[4:0]** Encodes:

- Implicitly, the size of the IT block. This is the number of instructions that are to be conditionally executed. The size of the block is indicated by the position of the least significant 1 in this field, as shown in [Table E1-2](#).
- For each instruction in the IT block, the least significant bit of the Condition code. This is encoded in the IT block entries that [Table E1-2](#) shows as Nx.

### ———— Note ————

Changing the least significant bit of a Condition code from 0 to 1 has the effect of inverting the Condition code.

Both subfields are all zeros when no IT block is active.

When an IT instruction is executed, PSTATE.IT is set according to the <firstcond> field of the instruction and the *Then* and *Else* (T and E) parameters in the instruction, see [IT on page F5-3126](#). This means that, on executing an IT instruction, the initial state of PSTATE.IT depends on the number of instructions in the IT block, as [Table E1-2](#) shows:

**Table E1-2 Initial state of PSTATE.IT on executing an IT instruction**

Number of instructions in IT block	PSTATE.IT bits <sup>a</sup>						Notes
	[7:5]	[4]	[3]	[2]	[1]	[0]	
4	cond_base	N1	N2	N3	N4	1	-
3	cond_base	N1	N2	N3	1	0	-
2	cond_base	N1	N2	1	0	0	-
1	cond_base	N1	1	0	0	0	-
Not executing an IT instruction	000	0	0	0	0	0	No IT block is active

a. Combinations of the IT bits not shown in this table are reserved.

In [Table E1-2](#), N1 refers to the first instruction in the IT block, and N2, N3, and N4 refer to the second, third, and fourth instructions in the IT block if they are present,

When permitted, an instruction in an IT block is conditional, see [Conditional instructions on page F1-2809](#) and [Conditional execution on page F2-2849](#). The Condition code used is the current value of IT[7:4]. When an instruction in an IT block completes its execution normally, PSTATE.IT[4:0] is left-shifted by one bit, so that PSTATE[4] always relates to the next instruction to be executed. [Table E1-3 on page E1-2738](#) shows how PSTATE.IT during the execution of an IT instruction with four instructions in the IT block.

**Table E1-3 Updates to `PSTATE.IT` when executing an IT instruction with a four-instruction IT block**

IT block instruction being executed	<code>PSTATE.IT</code> bits						Notes
	[7:5]	[4]	[3]	[2]	[1]	[0]	
First	cond_base	N1	N2	N3	N4	1	-
Second	cond_base	N2	N3	N4	1	0	-
Third	cond_base	N3	N4	1	0	0	-
Fourth	cond_base	N4	1	0	0	0	-
Not executing an IT instruction	000	0	0	0	0	0	No IT block is active

A few instructions, for example BKPT, cannot be conditional and therefore are always executed ignoring the current value of `PSTATE.IT`.

For details of what happens if an instruction in an IT block takes an exception, see [Overview of exception entry on page G1-4347](#).

An instruction that might complete its normal execution by branching is only permitted in an IT block as the last instruction in the block. This means that normal execution of the instruction always results in `PSTATE.IT` advancing to execution where no IT block is active.

For performance reasons, ARMv8 deprecates the use of IT other than with a single 16-bit T32 instruction from a specified subset of the 16-bit T32 instructions, see [Partial deprecation of IT on page F1-2826](#). In addition, implementations can provide a set of ITD control fields, `SCTLR.ITD`, `SCTLR_EL1.ITD`, and `HSCTLR.ITD`, to disable these deprecated uses, making them UNDEFINED. When an implementation includes ITD control fields, [Changes to an ITD control by an instruction in an IT block](#) describes the permitted CONSTRAINED UNPREDICTABLE behaviors if an instruction in an IT block changes the value of an ITD control to disable the use of the IT instruction.

On a branch or an exception return, if `PSTATE.IT` is set to a value that is not consistent with the instruction stream being branched to or returned to, then instruction execution is CONSTRAINED UNPREDICTABLE.

`PSTATE.IT` affects instruction execution only in T32 state. In A32 state, `PSTATE.IT` must be 0b00000000, otherwise the behavior is CONSTRAINED UNPREDICTABLE.

For more information see [CONSTRAINED UNPREDICTABLE behavior associated with IT instructions and `PSTATE.IT` on page K1-6098](#).

### **Changes to an ITD control by an instruction in an IT block**

In an implementation that includes `SCTLR.ITD`, `SCTLR_EL1.ITD`, and `HSCTLR.ITD` controls, if an instruction in an IT block changes an ITD control so that the IT instruction using the IT block would be disabled, then one of the following behaviors applies:

- The change to the ITD field, once synchronized, has no effect on the execution of instructions in the current IT block, but applies only to any subsequent execution of an IT instruction to which the control applies.
- Synchronizing the change to the ITD field guarantees that all bits of `PSTATE.IT` are cleared to 0.

In addition, after the change to the ITD field has been synchronized, any remaining instructions in the IT block that would be made UNDEFINED by the new value of ITD are either:

- Executed normally.
- Treated as UNDEFINED.

The choice between the options described in this section is determined by the implementation, and any choice can vary between different changes to an ITD control by an instruction in an IT block.

### Pseudocode description of PSTATE PE state fields

The pseudocode function [CurrentInstrSet\(\)](#) returns the current instruction set. The pseudocode function [SelectInstrSet\(\)](#) selects a new instruction set.

[PSTATE.IT](#) advances after normal execution of an IT block instruction. This is described by the [AArch32.ITAdvance\(\)](#) pseudocode function.

The pseudocode function [InITBlock\(\)](#) tests whether the current instruction is in an IT block. The pseudocode function [LastInITBlock\(\)](#) tests whether the current instruction is the last instruction in an IT block.

The [BigEndian\(\)](#) pseudocode function tests whether big-endian data memory accesses are currently selected.

## E1.2.5 Jazelle support

ARMv8 requires AArch32 state to include a trivial implementation of the Jazelle extension, as described in [Trivial implementation of the Jazelle extension on page G1-4338](#).

## E1.3 Advanced SIMD and floating-point instructions

In general, ARMv8 requires implementation of Advanced SIMD and floating-point instructions in the T32 and A32 instruction sets, but see [Implications of not including Advanced SIMD and floating-point support on page E1-2747](#).

The Advanced SIMD instructions perform packed *Single Instruction Multiple Data* (SIMD) operations, either integer or single-precision floating-point. The floating-point instructions perform single-precision or double-precision scalar floating-point operations. **When ARMv8.2-FP16 is implemented, half-precision floating-point can also be used for data processing.**

These instructions permit *floating-point exceptions*, such as Overflow or Divide by Zero, to be handled without trapping. When handled in this way, a floating-point exception causes a cumulative status register bit to be set to 1 and a default result to be produced by the operation. ARMv8 also optionally supports the trapping of floating-point exceptions, see [Trapping of floating-point exceptions on page E1-2742](#). For more information about floating-point exceptions see [Floating-point exceptions and exception traps on page E1-2743](#).

The floating-point and Advanced SIMD instructions also provide conversion functions in both directions between half-precision floating-point and single-precision floating-point.

Some Advanced SIMD instructions support polynomial arithmetic over  $\{0, 1\}$ , as described in [Polynomial arithmetic over  \$\{0, 1\}\$  on page A1-47](#).

For system level information about the Advanced SIMD and Floating-point implementation see [Advanced SIMD and floating-point support on page G1-4412](#).

The following sections give more information about the Advanced SIMD and floating-point instructions:

- [Floating-point standards, and terminology on page A1-49](#).
- [The SIMD and floating-point register file](#).
- [Data types supported by the Advanced SIMD implementation on page E1-2742](#).
- [Advanced SIMD and floating-point System registers on page E1-2742](#).
- [Trapping of floating-point exceptions on page E1-2742](#).
- [Floating-point data types and arithmetic on page E1-2743](#).
- [Floating-point exceptions and exception traps on page E1-2743](#).
- [Controls of Advanced SIMD operation that do not apply to floating-point operation on page E1-2746](#).
- [Implications of not including Advanced SIMD and floating-point support on page E1-2747](#).
- [Pseudocode description of floating-point operations on page E1-2747](#).

### E1.3.1 The SIMD and floating-point register file

The Advanced SIMD and floating-point instructions use the same register file, that comprises 32 registers. This is distinct from the register file that holds the general-purpose registers and the PC.

The Advanced SIMD and floating-point views of the register file are different. The following sections describe these different views. [Figure E1-1 on page E1-2741](#) shows the views of the register file, and the way the word, doubleword, and quadword registers overlap.

#### Advanced SIMD views of the register file

Advanced SIMD can view this register file as:

- Sixteen 128-bit quadword registers, Q0-Q15.
- Thirty-two 64-bit doubleword registers, D0-D31.

These views can be used simultaneously. For example, a program might hold 64-bit vectors in D0 and D1 and a 128-bit vector in Q1.

## Floating-point views of the register file

The Advanced SIMD and floating-point register file consists of thirty-two doubleword registers, that can be viewed as:

- Thirty-two 64-bit doubleword registers, D0-D31. This view is also available to Advanced SIMD instructions.
- Thirty-two 32-bit single word registers, S0-S31. Only half of the set is accessible in this view.

The two views can be used simultaneously.

## SIMD and Floating-point register file mapping onto registers

Figure E1-1 shows the different views of the SIMD and floating-point register file, and the relationship between them.

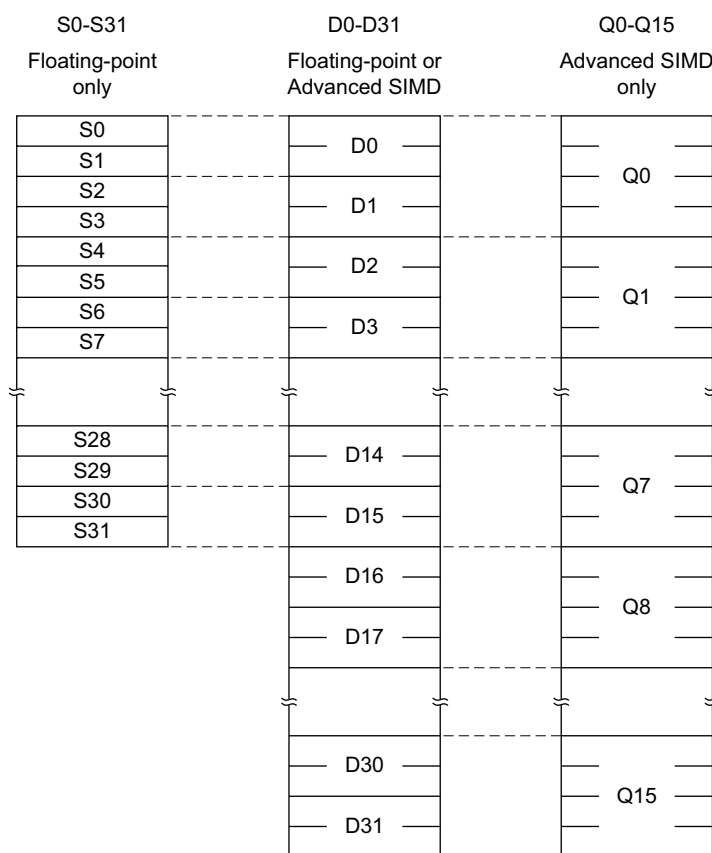

Figure E1-1 SIMD and floating-point register file, AArch32 operation

The mapping between the registers is as follows:

- S<2n> maps to the least significant half of D<n>.
- S<2n+1> maps to the most significant half of D<n>.
- D<2n> maps to the least significant half of Q<n>.
- D<2n+1> maps to the most significant half of Q<n>.

For example, software can access the least significant half of the elements of a vector in Q6 by referring to D12, and the most significant half of the elements by referring to D13.

## Pseudocode description of the SIMD and Floating-point register file

The functions `_Dc1one`, `S[]`, and `D[]` provide the S0-S31, D0-D31, and Q0-Q15 views of the Advanced SIMD and floating-point registers:

The `Din[]` function returns a Doubleword register from the `_Dc1one[]` copy of the SIMD and Floating-point register file, and the `Qin[]` function returns a Quadword register from that register file.

### ————— Note —————

The `CheckAdvSIMDEnabled()` function copies the `D[]` register file to `_Dc1one[]`, see *Pseudocode description of enabling SIMD and floating-point functionality on page G1-4451*.

## E1.3.2 Data types supported by the Advanced SIMD implementation

Advanced SIMD instructions can operate on integer and floating-point data, and the implementation defines a set of data types that support the required data formats. *Vector formats in AArch32 state on page A1-40* describes these formats.

### Advanced SIMD vectors

In an implementation that includes support for Advanced SIMD operation, a register can hold one or more packed elements, all of the same size and type. The combination of a register and a data type describes a vector of elements. The vector is considered to be an array of elements of the data type specified in the instruction. The number of elements in the vector is implied by the size of the data elements and the size of the register.

Vector indices are in the range 0 to (number of elements – 1). An index of 0 refers to the least significant end of the vector. In *Vector formats in AArch32 state on page A1-40*, *Figure A1-3 on page A1-42* shows the Advanced SIMD vector formats.

### Pseudocode description of Advanced SIMD vectors

The pseudocode function `E1em[]` accesses the element of a specified index and size in a vector.

## E1.3.3 Advanced SIMD and floating-point System registers

The Advanced SIMD and floating-point instructions have a shared register space for System registers. Only one register in this space is accessible at the Application level, see *FPSCR, Floating-Point Status and Control Register on page G6-4885*.

Writes to the `FPSCR` can have side-effects on various aspects of PE operation. All of these side-effects are synchronous to the `FPSCR` write. This means they are guaranteed not to be visible to earlier instructions in the execution stream, and they are guaranteed to be visible to later instructions in the execution stream.

See *Advanced SIMD and floating-point System registers on page G1-4415* for the system level view of the registers.

These registers can be described as the *SIMD and floating-point System registers*.

## E1.3.4 Trapping of floating-point exceptions

It is IMPLEMENTATION DEFINED whether the floating-point implementation supports the trapping of floating-point exceptions:

- If it does, the `FPSCR`.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable the exception traps.
- Otherwise, the `FPSCR` trap bits are RES0.

Trapped exception handling never causes the corresponding cumulative exception bit of the `FPSCR` to be set to 1. If this behavior is desired, the trap handler routine must use a read, modify, write sequence on the `FPSCR` to set the cumulative exception bit.

### E1.3.5 Floating-point data types and arithmetic

The T32 and A32 floating-point instructions support single-precision (32-bit) and double-precision (64-bit) data types and arithmetic as defined by the IEEE 754 floating-point standard. They also support the half-precision (16-bit) floating-point data type for data storage, by supporting conversions between single-precision and half-precision data types. **When ARMv8.2-FP16 is implemented, it also supports the half-precision floating-point data type for data processing operations.**

*ARM standard floating-point arithmetic* means IEEE 754 floating-point arithmetic with the restrictions described in *Floating-point and Advanced SIMD support on page A1-48*, including supporting only the input and output values described in *ARM standard floating-point input and output values on page A1-50*.

The AArch32 Advanced SIMD instructions support only single-precision **and, when ARMv8.2-FP16 is implemented, half-precision** ARM standard floating-point arithmetic.

The following sections describe the Advanced SIMD and floating-point formats:

- *Half-precision floating-point formats on page A1-42.*
- *Single-precision floating-point format on page A1-44.*
- *Double-precision floating-point format on page A1-45.*

The following sections describe features of Advanced SIMD and floating-point processing:

- *Flush-to-zero on page A1-51.*
- *NaN handling and the Default NaN on page A1-52.*

### E1.3.6 Floating-point exceptions and exception traps

ARM Advanced SIMD and floating-point instructions record the following floating-point exceptions in the **FPSCR** cumulative bits, unless the floating-point exception is trapped and generates an exception:

**FPSCR.IOC** Invalid Operation. The bit is set to 1 if the result of an operation has no mathematical value or cannot be represented. Cases include, for example:

- $(\text{infinity}) \times 0$ .
- $(+\text{infinity}) + (-\text{infinity})$ .

These tests are made after flush-to-zero processing. For example, if flush-to-zero mode is selected, multiplying a denormalized number and an infinity is treated as  $(0 \times \text{infinity})$ , and causes an Invalid Operation floating-point exception.

IOC is also set on any floating-point operation with one or more signaling NaNs as operands, except for negation and absolute value, as described in *Floating-point negation and absolute value on page E1-2747*.

**FPSCR.DZC** Divide by Zero. The bit is set to 1 if a divide operation has a zero divisor and a dividend that is not zero, an infinity or a NaN. These tests are made after flush-to-zero processing, so if flush-to-zero processing is selected, a denormalized dividend is treated as zero and prevents Divide by Zero from occurring, and a denormalized divisor is treated as zero and causes Divide by Zero to occur if the dividend is a normalized number.

For the reciprocal and reciprocal square root estimate functions the dividend is assumed to be +1.0. This means that a zero or denormalized operand to these functions sets the DZC bit.

**FPSCR.OFC** Overflow. The bit is set to 1 if the absolute value of the result of an operation, produced after rounding, is greater than the maximum positive normalized number for the destination precision.

**FPSCR.UFC** Underflow. The bit is set to 1 if the absolute value of the result of an operation, produced before rounding, is less than the minimum positive normalized number for the destination precision, and the rounded result is inexact.

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For details, see *Flush-to-zero on page A1-51*.

**FPSCR.IXC** Inexact. The bit is set to 1 if the result of an operation is not equivalent to the value that would be produced if the operation were performed with unbounded precision and exponent range.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For details, see [Flush-to-zero on page A1-51](#).

**FPSCR.IDC** Input Denormal. The bit is set to 1 if a denormalized input operand is replaced in the computation by a zero, as described in [Flush-to-zero on page A1-51](#).

For Advanced SIMD instructions, and for floating-point instructions when floating-point exception trapping is not supported, these are non-trapping exceptions and the data-processing instructions do not generate any trapped exceptions.

For floating-point instructions when floating-point exception trapping is supported:

- The floating-point exceptions can be trapped, by setting trap enable bits in the **FPSCR**, see [Trapping of floating-point exceptions on page E1-2742](#) and [Floating-point exception traps on page G1-4416](#), and:
  - When a trap is not enabled the corresponding floating-point exception updates the corresponding **FPSCR** cumulative bit does not generate an exception.
  - When a trap is enabled the corresponding floating-point exception does not update the **FPSCR**, but generates an exception. In this case, bits in the **FPEXC** indicate which floating-point exceptions have occurred.
- The definition of the Underflow floating-point exception is different in the trapped and cumulative exception cases. In the trapped case the definition is:
  - The trapped Underflow floating-point exception occurs if the absolute value of the result of an operation, produced before rounding, is less than the minimum positive normalized number for the destination precision, regardless of whether the rounded result is inexact.
- As with cumulative exceptions, higher priority trapped exceptions can prevent lower priority exceptions from occurring, as described in [Combinations of floating-point exceptions on page E1-2745](#).
- For Invalid Operation floating-point exceptions, for details of which quiet NaN is produced as the default result see [NaN handling and the Default NaN on page A1-52](#).
- For Overflow floating-point exceptions, the sign bit of the default result is determined normally for the overflowing operation.
- For Divide by Zero floating-point exceptions, the sign bit of the default result is determined normally for a division. This means it is the exclusive OR of the sign bits of the two operands.

[Table E1-4](#) shows the results of untrapped floating-point exceptions. That table uses the following abbreviations:

<b>MaxNorm</b>	The maximum normalized number of the destination precision.
<b>RM</b>	Round towards Minus Infinity mode, as defined in the IEEE 754 standard.
<b>RN</b>	Round to Nearest mode, as defined in the IEEE 754 standard.
<b>RP</b>	Round towards Plus Infinity mode, as defined in the IEEE 754 standard.
<b>RZ</b>	Round towards Zero mode, as defined in the IEEE 754 standard.

For more information about the IEEE 754 descriptions of the rounding modes see [Floating-point standards, and terminology on page A1-49](#).

**Table E1-4 Results of untrapped floating-point exceptions**

Exception type	Default result for positive sign	Default result for negative sign
IOC, Invalid Operation	Quiet NaN	Quiet NaN
DZC, Divide by Zero	+infinity	-infinity
OFC, Overflow	RN, RP: +infinity RM, RZ: +MaxNorm	RN, RM: -infinity RP, RZ: -MaxNorm

**Table E1-4 Results of untrapped floating-point exceptions (continued)**

Exception type	Default result for positive sign	Default result for negative sign
UFC, Underflow	Normal rounded result	Normal rounded result
IXC, Inexact	Normal rounded result	Normal rounded result
IDC, Input Denormal	Normal rounded result	Normal rounded result

## Combinations of floating-point exceptions

Many pseudocode functions perform *floating-point operations*, including `FixedToFP()`, `FPAdd()`, `FPCompare()`, `FPCompareEQ()`, `FPCompareGE()`, `FPCompareGT()`, `FPDiv()`, `FPMaX()`, `FPMIn()`, `FPMu1()`, `FPMu1Add()`, `FPRecipEstimate()`, `FPRecipStep()`, `FPRSqrtEstimate()`, `FPRSqrtStep()`, `FPSqrt()`, `FPSub()`, and `FPToFixed()`. All of these operations can generate floating-point exceptions.

### ———— Note ————

`FPAbs()` and `FPNeg()` are not classified as *floating-point operations* because:

- They cannot generate floating-point exceptions.
- The floating-point operation behavior described in the following sections does not apply to them:
  - [Flush-to-zero on page A1-51](#).
  - [NaN handling and the Default NaN on page A1-52](#).

More than one exception can occur on the same operation. The only combinations of floating-point exceptions that can occur are:

- Overflow with Inexact.
- Underflow with Inexact.
- Input Denormal with other floating-point exceptions.

The priority order of these floating-point exceptions is that the Inexact exception is treated as lowest priority, and the Input Denormal exception is treated as highest priority.

When none of the floating-point exceptions caused by an operation is trapped, any floating-point exception that occurs causes the associated cumulative bit in the `FPSCR` to be set.

When one or more floating-point exceptions caused by an operation is trapped, the behavior of the instruction depends on the priority of the exceptions:

- If the higher priority floating-point exception is trapped, its trap handler is called. It is IMPLEMENTATION DEFINED whether any information about the lower priority floating-point exception is provided.

### ———— Note ————

Information about the lower priority floating-point exception might be provided in:

- The `FPEXC`, if the exception generated by the trap is taken to an Exception level that is using AArch32.
- The `ESR_ELx.ISS` field, if the exception generated by the trap is taken to an Exception level that is using AArch64.

However, information might be provided in another IMPLEMENTATION DEFINED way, for example using an IMPLEMENTATION DEFINED register.

Apart from this, the lower priority floating-point exception is ignored in this case.

- If the higher priority floating-point exception is untrapped, its cumulative bit is set to 1 and its default result is evaluated. Then the lower priority floating-point exception is handled normally, using this default result.

Some floating-point instructions specify more than one floating-point operation, as indicated by the pseudocode descriptions of the instruction. In such cases, a floating-point exception on one operation is treated as higher priority than a floating-point exception on another operation if the occurrence of the second floating-point exception depends on the result of the first operation. Otherwise, it is **CONSTRAINED UNPREDICTABLE** which floating-point exception is treated as higher priority.

For example, a `VMLA.F32` instruction specifies a floating-point multiplication followed by a floating-point addition. The addition can generate Overflow, Underflow and Inexact floating-point exceptions, all of which depend on both operands to the addition and so are treated as lower priority than any floating-point exception on the multiplication. The same applies to Invalid Operation floating-point exceptions on the addition caused by adding opposite-signed infinities. The addition can also generate an Input Denormal floating-point exception, caused by the addend being a denormalized number while in Flush-to-zero mode. It is **CONSTRAINED UNPREDICTABLE** which of an Input Denormal floating-point exception on the addition and a floating-point exception on the multiplication is treated as higher priority, because the occurrence of the Input Denormal floating-point exception does not depend on the result of the multiplication. The same applies to an Invalid Operation floating-point exception on the addition caused by the addend being a signaling NaN.

———— **Note** ————

The VFMA instruction performs a vector addition and a vector multiplication as a single operation. The VFMS instruction performs a vector subtraction and a vector multiplication as a single operation.

—————

### E1.3.7 Controls of Advanced SIMD operation that do not apply to floating-point operation

ARMv7 permitted implementation of either, both, or neither of the Advanced SIMD and floating-point additions to the base instruction set, and provided some controls that applied to the Advanced SIMD functionality but not to the floating-point functionality. In ARMv8, Advanced SIMD functionality cannot be separated from floating-point functionality, but in AArch32 state these controls function as they did in ARMv7. This means they apply only to the following instructions and instruction encodings:

- All instructions with encodings defined in:
  - [Advanced SIMD data-processing on page F3-2904](#), for the T32 instruction set.
  - [Advanced SIMD data-processing on page F4-2985](#), for the A32 instruction set.
- All instructions with encodings defined in:
  - [Advanced SIMD element or structure load/store on page F3-2922](#), for the T32 instruction set.
  - [Advanced SIMD element or structure load/store on page F4-2997](#), for the A32 instruction set.
- The form of the `VDUP` instruction described in [VDUP \(general-purpose register\) on page F6-3851](#).
- The byte and halfword forms of the `VMOV` instructions described in each of:
  - [VMOV \(general-purpose register to scalar\) on page F6-4002](#).
  - [VMOV \(scalar to general-purpose register\) on page F6-4006](#).

The controls of this functionality are:

- The `CPACR.ASEDIS` field.
- The `HCPTR.TASE` field.

In an implementation that supports Advanced SIMD functionality, support for each of these controls is optional:

- If the `CPACR.ASEDIS` control is not supported then the `CPACR.ASEDIS` field is RAZ/WI. This is equivalent to the control permitting the execution of Advanced SIMD instructions at EL1 and EL0.
- If the `HCPTR.TASE` control is not supported then the `HCPTR.TASE` field is RAZ/WI. This means the `HCPTR` does not provide a control that can trap Non-secure execution of Advanced SIMD instructions to Hyp mode.

### E1.3.8 Implications of not including Advanced SIMD and floating-point support

In general, ARMv8 requires the inclusion of the Advanced SIMD and floating-point instructions in all instruction sets. Exceptionally, for implementation targeting specialized markets, ARM might produce or license an ARMv8-A implementation that does not provide any support for Advanced SIMD and floating-point instructions. In such an implementation, in AArch32 state:

- Each of the [CPACR](#).{cp10, cp11} fields is RES0.
- The [CPACR](#).ASEDIS bit is RES0.
- Each of the [HCPTR](#).{TASE, TCP10, TCP11} fields is RES1.
- Each of the [NSACR](#).{NSASEDIS, cp10, cp11} fields is RES0.
- The [FPEXC](#) register is UNDEFINED.

### E1.3.9 Pseudocode description of floating-point operations

The following subsections contain pseudocode definitions of the floating-point functionality supported by the ARMv8 architecture:

- *[Generation of specific floating-point values.](#)*
- *[Floating-point negation and absolute value.](#)*
- *[Floating-point value unpacking.](#)*
- *[Floating-point exception and NaN handling on page E1-2748.](#)*
- *[Floating-point rounding on page E1-2748.](#)*
- *[Selection of ARM standard floating-point arithmetic on page E1-2748.](#)*
- *[Floating-point comparisons on page E1-2748.](#)*
- *[Floating-point maximum and minimum on page E1-2748.](#)*
- *[Floating-point addition and subtraction on page E1-2748.](#)*
- *[Floating-point multiplication and division on page E1-2749.](#)*
- *[Floating-point fused multiply-add on page E1-2749.](#)*
- *[Floating-point reciprocal estimate and step on page E1-2749.](#)*
- *[Floating-point square root on page E1-2750.](#)*
- *[Floating-point reciprocal square root estimate and step on page E1-2750.](#)*
- *[Floating-point conversions on page E1-2751.](#)*

#### Generation of specific floating-point values

The following pseudocode functions generate specific floating-point values. The `sign` argument is '0' for the positive version and '1' for the negative version:

- [FPInfinity\(\)](#).
- [FPMaxNormal\(\)](#).
- [FPZero\(\)](#).
- [FPTwo\(\)](#).
- [FPThree\(\)](#).
- [FPDefaultNaN\(\)](#).

#### Floating-point negation and absolute value

The floating-point negation and absolute value operations only affect the sign bit. They do not treat NaN operands specially, nor denormalized number operands when flush-to-zero is selected.

The floating-point negation operation is described by the pseudocode function [FPNeg\(\)](#). The floating-point absolute value operation is described by the pseudocode function [FPAbs\(\)](#).

#### Floating-point value unpacking

The [FPUntpack\(\)](#) function determines the type of a floating-point number, defined by [FPTYPE{}](#), and its numerical value. It also does flush-to-zero processing on input operands.

## Floating-point exception and NaN handling

The `FPProcessException()` procedure checks whether a floating-point exception is trapped, and handles it accordingly. The floating-point exception types are defined by `FPExc{}`.

The `FPProcessNaN()` function processes a NaN operand, producing the correct result value and generating an Invalid Operation floating-point exception if necessary. The `FPProcessNaNs()` function performs the standard NaN processing for a two-operand operation. The `FPProcessNaNs3()` function performs the standard NaN processing for a three-operand operation.

## Floating-point rounding

The `FPRound()` function rounds and encodes a floating-point result to a specified destination format. This includes processing Overflow, Underflow and Inexact floating-point exceptions and performing flush-to-zero processing on result values.

## Selection of ARM standard floating-point arithmetic

The `StandardFPSCRValue()` function returns the `FPSCR` value that selects ARM standard floating-point arithmetic. Most of the arithmetic functions have a Boolean `fpscr_controlled` argument that is `TRUE` for Floating-point operations and `FALSE` for Advanced SIMD operations, and that selects between using the real `FPSCR` value and this value.

## Floating-point comparisons

The `FPCompare()` function compares two floating-point numbers, producing a {N, Z, C, V} Condition flags result as shown in Table E1-5:

Table E1-5 Effect of a Floating-point comparison on the Condition flags

Comparison result	N	Z	C	V
Equal	0	1	1	0
Less than	1	0	0	0
Greater than	0	0	1	0
Unordered	0	0	1	1

This result defines the operation of the VCMP floating-point instruction. The VCMP instruction writes these flag values in the `FPSCR`. After using a VMRS instruction to transfer them to the APSR, they can control conditional execution as shown in Table F2-1 on page F2-2849.

The `FPCompareEQ()`, `FPCompareGE()`, and `FPCompareGT()` functions describe the operation of Advanced SIMD instructions that perform floating-point comparisons.

## Floating-point maximum and minimum

The `FPMax()` function returns the maximum of two floating-point numbers. The `FPMin()` function returns the minimum of two floating-point numbers.

## Floating-point addition and subtraction

The `FPAdd()` function adds two floating-point numbers. The `FPSub()` function subtracts one floating-point number from another floating-point number.

## Floating-point multiplication and division

The `FPMul()` function multiplies two floating-point numbers. The `FPDiv()` function divides one floating-point number by another floating-point number.

## Floating-point fused multiply-add

The `FPMulAdd()` function performs a floating-point fused multiply-add.

## Floating-point reciprocal estimate and step

The Advanced SIMD implementation includes instructions that support Newton-Raphson calculation of the reciprocal of a number.

The `VRECPE` instruction produces the initial estimate of the reciprocal. It uses the pseudocode functions:

- `FPrecipEstimate()`.
- `UnsignedRecipEstimate()`. This pseudocode function calls the C function `recip_estimate()`:  

```
double recip_estimate(double a)
{
    int q, s;
    double r;
    q = (int)(a * 512.0);          /* a in units of 1/512 rounded down */
    r = 1.0 / (((double)q + 0.5) / 512.0); /* reciprocal r */
    s = (int)(256.0 * r + 0.5);    /* r in units of 1/256 rounded to nearest */
    return (double)s / 256.0;
}
```

Table E1-6 shows the results where input values are out of range.

**Table E1-6 VRECPE results for out of range inputs**

Number type	Input Vm[i]	Result Vd[i]
Integer	$\leq 0x7FFFFFFF$	$0xFFFFFFFF$
Floating-point	NaN	Default NaN
Floating-point	$\pm 0$ or denormalized number	$\pm\infty$ <sup>a</sup>
Floating-point	$\pm\infty$	$\pm 0$
Floating-point	Absolute value $\geq 2^{126}$	$\pm 0$

a. `FPSCR.DZC` is set to 1

The Newton-Raphson iteration:

$$x_{n+1} = x_n(2 - dx_n)$$

converges to  $(1/d)$  if  $x_0$  is the result of `VRECPE` applied to  $d$ .

The `VRECPS` instruction performs a  $(2 - \text{op1} \times \text{op2})$  calculation and can be used with a multiplication to perform a step of this iteration. The functionality of this instruction is defined by the `FPrecipStep()` pseudocode function.

Table E1-7 shows the results where input values are out of range.

**Table E1-7 VRECPS results for out of range inputs**

Input Vn[i]	Input Vm[i]	Result Vd[i]
Any NaN	-	Default NaN
-	Any NaN	Default NaN
±0.0 or denormalized number	±infinity	2.0
±infinity	±0.0 or denormalized number	2.0

## Floating-point square root

The `FPSqrt()` function returns the square root of a floating-point number.

## Floating-point reciprocal square root estimate and step

The Advanced SIMD implementation includes instructions that support Newton-Raphson calculation of the reciprocal of the square root of a number.

The `VRSQRTE` instruction produces the initial estimate of the reciprocal of the square root. It uses the pseudocode functions:

- `FPRSqrtEstimate()`.
- `UnsignedRSqrtEstimate()`. This pseudocode function calls the C function `recip_sqrt_estimate()`.

```
double recip_sqrt_estimate(double a)
{
    int q0, q1, s;
    double r;
    if (a < 0.5) /* range 0.25 <= a < 0.5 */
    {
        q0 = (int)(a * 512.0); /* a in units of 1/512 rounded down */
        r = 1.0 / sqrt(((double)q0 + 0.5) / 512.0); /* reciprocal root r */
    }
    else /* range 0.5 <= a < 1.0 */
    {
        q1 = (int)(a * 256.0); /* a in units of 1/256 rounded down */
        r = 1.0 / sqrt(((double)q1 + 0.5) / 256.0); /* reciprocal root r */
    }
    s = (int)(256.0 * r + 0.5); /* r in units of 1/256 rounded to nearest */
    return (double)s / 256.0;
}
```

Table E1-8 shows the results where input values are out of range.

**Table E1-8 VRSQRTE results for out of range inputs**

Number type	Input Vm[i]	Result Vd[i]
Integer	<= 0x3FFFFFFF	0xFFFFFFFF
Floating-point	NaN, -(normalized number), -infinity	Default NaN
Floating-point	-0 or -(denormalized number)	-infinity <sup>a</sup>
Floating-point	+0 or +(denormalized number)	+infinity <sup>a</sup>
Floating-point	+infinity	+0

a. `FPSCR.DZC` is set to 1.

The Newton-Raphson iteration:

$$x_{n+1} = x_n(3 - dx_n^2)/2$$

converges to  $(1/\sqrt{d})$  if  $x_0$  is the result of VRSQRTE applied to  $d$ .

The VRSQRTS instruction performs a  $(3 - \text{op1} \times \text{op2})/2$  calculation and can be used with two multiplications to perform a step of this iteration. The functionality of this instruction is defined by the [FPRSqrtStep\(\)](#) pseudocode function.

[Table E1-9](#) shows the results where input values are out of range.

**Table E1-9 VRSQRTS results for out of range inputs**

Input Vn[i]	Input Vm[i]	Result Vd[i]
Any NaN	-	Default NaN
-	Any NaN	Default NaN
$\pm 0.0$ or denormalized number	$\pm \text{infinity}$	1.5
$\pm \text{infinity}$	$\pm 0.0$ or denormalized number	1.5

[FPRSqrtStep\(\)](#) calls the [FPHalvedSub\(\)](#) pseudocode function.

## Floating-point conversions

The [FPConvert\(\)](#) pseudocode function performs conversions between half-precision, single-precision, and double-precision floating-point numbers.

The [FPToFixed\(\)](#) and [FixedToFP\(\)](#) functions perform conversions between floating-point numbers and integers or fixed-point numbers.

## E1.4 About the AArch32 System register interface

AArch32 state provides a System register encoding space, that is indexed by the parameter set {coproc, opc1, CRn, CRm, opc2}, and a set of System register access instructions. This encoding space is used for:

- System registers.
- System instructions, for:
  - Cache and branch predictor maintenance.
  - Address translation.
  - TLB maintenance.

In ARMv8, this encoding space uses only the coproc values 0b111x.

### ———— Note ————

The encoding space with coproc values 0b101x is redefined to provide Advanced SIMD and floating-point functionality.

In ARMv8:

- The (coproc==0b1111) encodings provide system control functionality, by providing access to System registers and System instructions. This includes architecture and feature identification, as well as control, status information and configuration support.

The following sections give a general description of these encodings:

- [About the System registers for VMSAv8-32 on page G4-4689.](#)
- [VMSAv8-32 organization of registers in the \(coproc==0b1111\) encoding space on page G4-4707.](#)
- [Functional grouping of VMSAv8-32 System registers on page G4-4726.](#)

These encodings also provide the Performance monitor registers, see [Chapter D5 The Performance Monitors Extension](#).

- The (coproc==0b1110) encodings provide access to additional registers, that support:
  - Debug, see [Chapter G2 AArch32 Self-hosted Debug](#).
  - The Jazelle identification registers, see [Jazelle support on page E1-2739](#).

[UNPREDICTABLE, CONSTRAINED UNPREDICTABLE, and UNDEFINED behavior for AArch32 System register accesses on page G6-4764](#) gives information more information about permitted accesses to the System registers in AArch32 state.

Most functionality in the (coproc==0b111x) encoding space cannot be accessed by software executing at EL0. This manual clearly identifies those functions that can be accessed at EL0.

For more information:

- About this encoding space, including the naming of the parameters that index the space, see [The AArch32 System register interface on page G1-4408](#).
- About the System interface access instructions, see [System register access instructions on page F1-2828](#).

## E1.5 Exceptions

The ARM architecture uses the following terms to describe various types of exceptional condition:

**Exceptions** In the ARM architecture, an *exception* causes entry to EL1, EL2, or EL3. If the Exception level that is entered is using AArch32, it also causes entry to the PE mode in which the exception must be taken. A software handler for the exception is then executed.

### ————— **Note** —————

The term *floating-point exception* does not use this meaning of *exception*. This term is described later in this list.

Exceptions include:

- Reset.
- Interrupts.
- Memory system aborts.
- Undefined instructions.
- Supervisor calls (SVCs), Secure Monitor calls (SMCs), and hypervisor calls (HVCs).
- Debug exceptions.

Most details of exception handling are not visible to application level software, and are described in [Handling exceptions that are taken to an Exception level using AArch32 on page G1-4340](#). In an ARMv8 implementation that includes all the Exception levels, aspects that are visible to application level software are:

- The SVC instruction causes a Supervisor Call exception. This provides a mechanism for unprivileged software to make a call to the operating system, or other system component that is accessible only at EL1.
- The SMC instruction causes a Secure Monitor Call exception, but only if software execution is at EL1 or higher. Unprivileged software can only cause a Secure Monitor Call exception by methods defined by the operating system, or by another component of the software system that executes at EL1 or higher.
- The HVC instruction causes a Hypervisor Call exception, but only if software execution is at EL1 or higher. Unprivileged software can only cause a Hypervisor Call exception by methods defined by the hypervisor, or by another component of the software system that executes at EL1 or higher.
- The BKPT instruction causes a Breakpoint Instruction exception, that is taken as a Prefetch Abort exception. This provides a mechanism for a debugger to insert breakpoints into unprivileged software, or for unprivileged software to make a call into a debugger that is accessible at EL1.
- The WFI (Wait for Interrupt) instruction provides a hint that nothing needs to be done until an interrupt or another WFI wake-up event occurs, see [Wait For Interrupt on page G1-4406](#). This means the hardware might enter a low-power state until the wake-up event occurs.
- The WFE (Wait for Event) instruction provides a hint that nothing needs to be done until either an SEV instruction generates an event, or another WFE wake-up event occurs, see [Wait For Event and Send Event on page G1-4403](#). This means the hardware might enter a low-power state until the wake-up event occurs.

### **Floating-point exceptions**

These relate to exceptional conditions encountered during floating-point arithmetic, such as Divide by Zero or Overflow. For more information see:

- [Floating-point exceptions and exception traps on page E1-2743](#).
- [FPEXC, Floating-Point Exception Control register on page G6-4880](#).
- [FPSCR, Floating-Point Status and Control Register on page G6-4885](#).
- ANSI/IEEE Std. 754, *IEEE Standard for Binary Floating-Point Arithmetic*.

# Chapter E2

## The AArch32 Application Level Memory Model

This chapter gives an application level description of the memory model for software executing in AArch32 state. This means it describes the memory model for execution in EL0 when EL0 is using AArch32 in the following sections:

- [About the ARM memory model](#) on page E2-2756.
- [Atomicity in the ARM architecture](#) on page E2-2758.
- [Definition of the ARMv8 memory model](#) on page E2-2762.
- [Caches and memory hierarchy](#) on page E2-2772.
- [Alignment support](#) on page E2-2777.

### Note

---

In this chapter, System register names usually link to the description of the register in [Chapter G6 AArch32 System Register Descriptions](#), for example [SCTLR](#).

---

## E2.1 About the ARM memory model

The ARM architecture is a weakly ordered memory architecture that permits the observation and completion of memory accesses in a different order from the program order. The following sections of this chapter provide the complete definition of the ARMv8 memory model, this introduction is not intended to contradict the definition found in those sections. In general, the basic principles of the ARMv8 memory model are:

- To provide a memory model that has similar weaknesses to those found in the memory models used by high-level programming languages such as C or Java. For example, by permitting independent memory accesses to be re-ordered as seen by other observers.
- To avoid the requirement for multi-copy atomicity in the majority of memory types.
- The provision of instructions and memory barriers to compensate for the lack of multi-copy atomicity in the cases where it would be needed.
- The use of address, data, and control dependencies in the creation of order so as to avoid having excessive numbers of barriers or other explicit instructions in common situations where some order is required by the programmer or the compiler.

This section contains:

- [Address space](#).
- [Memory type overview](#).

### E2.1.1 Address space

Address calculations are performed using 32-bit registers. Supervisory software determines the valid address range.

Attempting to access an address that is not valid generates an MMU fault.

Address calculations are performed modulo  $2^{32}$ .

The result of an address calculation is UNKNOWN if it overflows or underflows the 32-bit address range A[31:0].

Memory accesses use the [MemA\[\]](#), [MemO\[\]](#), [MemU\[\]](#), and [MemU\\_unpriv\[\]](#) pseudocode functions:

- The [MemA\[\]](#) function makes an aligned access of the required type.
- The [MemO\[\]](#) function makes an ordered access of the required type.
- The [MemU\[\]](#) function makes an unaligned access of the required type
- The [MemU\\_unpriv\[\]](#) function makes an unaligned, unprivileged access of the required type.

Each of these functions calls [Mem\\_with\\_type\[\]](#) function, that specifies the required access. This calls [AArch32.MemSingle\[\]](#), which performs an atomic, little-endian read of size bytes.

The [AccType](#) enumeration defines the different access types.

#### ————— Note —————

- [Chapter G3 The AArch32 System Level Memory Model](#) and [Chapter G4 The AArch32 Virtual Memory System Architecture](#) include descriptions of memory system features that are transparent to the application, including memory access, address translation, memory maintenance instructions, and alignment checking and the associated fault handling. These chapters also reference pseudocode descriptions of these operations.
- For references to the pseudocode that relates to memory accesses, see [Basic memory access](#) on page G3-4553, [Unaligned memory access](#) on page G3-4554, and [Aligned memory access](#) on page G3-4554.

### E2.1.2 Memory type overview

ARMv8 provides the following mutually-exclusive memory types:

**Normal** This is generally used for bulk memory operations, both read-write and read-only operations.

- Device** The ARM architecture forbids speculative reads of any type of Device memory. This means Device memory types are suitable attributes for read-sensitive locations.
- Locations of the memory map that are assigned to peripherals are usually assigned the Device memory attribute.
- Device memory has additional attributes that have the following effects:
- They prevent aggregation of reads and writes, maintaining the number and size of the specified memory accesses. See [Gathering on page E2-2788](#).
  - They preserve the access order and synchronization requirements, both for accesses to a single peripheral and where there is a synchronization requirement on the observability of one or more memory write and read accesses. See [Reordering on page E2-2789](#)
  - They indicate whether a write can be acknowledged other than at the end point. See [Early Write Acknowledgement on page E2-2790](#).

For more information on Normal memory and Device memory, see [Memory types and attributes on page E2-2782](#).

---

**Note**

Earlier versions of the ARM architecture defined a single Device memory type and a Strongly-Ordered memory type. A Note in [Device memory on page E2-2786](#) describes how these memory types map onto the ARMv8 memory types.

---

## E2.2 Atomicity in the ARM architecture

*Atomicity* is a feature of memory accesses, described as *atomic* accesses. The ARM architecture description refers to two types of atomicity, *single-copy atomicity* and *multi-copy atomicity*. In the ARMv8 architecture, the atomicity requirements for memory accesses depend on the memory type, and whether the access is explicit or implicit. For more information see:

- [Requirements for single-copy atomicity](#).
- [Properties of single-copy atomic accesses on page E2-2759](#).
- [Multi-copy atomicity on page E2-2759](#).
- [Requirements for multi-copy atomicity on page E2-2760](#).
- [Concurrent modification and execution of instructions on page E2-2760](#).

For more information about the memory types, see [Memory type overview on page E2-2756](#).

### E2.2.1 Requirements for single-copy atomicity

In AArch32 state, the single-copy atomic PE accesses are:

- All byte accesses.
- All halfword accesses to halfword-aligned locations.
- All word accesses to word-aligned locations.
- Memory accesses caused by LDREXD and STREXD instructions to doubleword-aligned locations.

LDM, LDC, LDRD, STM, STC, STRD, PUSH, POP, RFE, SRS, VLDM, VLDR, VSTM, and VSTR instructions are executed as a sequence of word-aligned word accesses. Each 32-bit word access is guaranteed to be single-copy atomic. The architecture does not require subsequences of two or more word accesses from the sequence to be single-copy atomic.

LDRD and STRD accesses to 64-bit aligned locations are 64-bit single-copy atomic as seen by translation table walks and accesses to translation tables.

#### ————— Note —————

This requirement has been added to avoid the need for complex measures to avoid atomicity issues when changing translation table entries, without creating a requirement that all locations in the memory system are 64-bit single-copy atomic. This addition means:

- The system designer must ensure that all writable memory locations that might be used to hold translations, such as bulk SDRAM, can be accessed with 64-bit single-copy atomicity.
- Software must ensure that translation tables are not held in memory locations that cannot meet this atomicity requirement, such as peripherals that are typically accessed using a narrow bus.

This requirement places no burden on read-only memory locations for which reads have no side effects, since it is impossible to detect the size of memory accesses to such locations.

Advanced SIMD element and structure loads and stores are executed as a sequence of accesses of the element or structure size. The architecture requires the element accesses to be single-copy atomic if and only if both:

- The element size is 32 bits, or smaller.
- The elements are naturally aligned.

Accesses to 64-bit elements or structures that are 32-bit aligned are executed as a sequence of 32-bit accesses, each of which is single-copy atomic. The architecture does not require subsequences of two or more 32-bit accesses from the sequence to be single-copy atomic.

When an access is not single-copy atomic by the rules described in this section, it is executed as a sequence of one or more accesses that aggregate to the size of the original access. Each of the accesses in this sequence is single-copy atomic, at least at the byte level.

---

**Note**

---

In this section, the terms *before the write operation* and *after the write operation* mean before or after the write operation has had its effect on the coherence order of the bytes of the memory location accessed by the write operation.

---

If, according to these rules, an instruction is executed as a sequence of accesses, a synchronous Data Abort exception or Debug state entry can be taken during that sequence. This causes execution of the instruction to be abandoned. See [Data Abort exception on page G1-4387](#) and, when ARMv8.2-LSMAOC is implemented, [Taking an interrupt or other exception during a multiple-register load or store on page G1-4374](#).

If the synchronous Data Abort exception is returned from using the preferred return address, the instruction that generated the sequence of accesses is re-executed and so any access that was performed before the exception was taken is repeated. This also applies to an exit from Debug state.

---

**Note**

---

The exception behavior for these multiple access instructions means they are not suitable for use for writes to memory for the purpose of software synchronization.

---

For implicit accesses:

- Cache linefills and evictions have no effect on the single-copy atomicity of explicit transactions or instruction fetches.
- Instruction fetches are single-copy atomic:
  - At 32-bit granularity in A32 state.
  - At 16-bit granularity in T32 state.
- [Concurrent modification and execution of instructions on page E2-2760](#) describes additional constraints on the behavior of instruction fetches.
- Translation table walks are performed using accesses that are single-copy atomic:
  - At 32-bit granularity when using Short-descriptor format translation tables.
  - At 64-bit granularity when using Long-descriptor format translation tables.

## E2.2.2 Properties of single-copy atomic accesses

A memory access instruction that is single-copy atomic has the following properties:

1. For a pair of overlapping single-copy atomic store instructions, all of the overlapping writes generated by one of the stores are [Coherence-after](#) the corresponding overlapping writes generated by the other store.
2. For a single-copy atomic load instruction  $L_1$  that overlaps a single-copy atomic store instruction  $S_2$ , if one of the overlapping reads generated by  $L_1$  [Reads-from](#) one of the overlapping writes generated by  $S_2$ , then none of the overlapping writes generated by  $S_2$  are [Coherence-after](#) the corresponding overlapping reads generated by  $L_1$ .

For more information, see [Definition of the ARMv8 memory model on page E2-2762](#).

## E2.2.3 Multi-copy atomicity

In a multiprocessing system, writes to a memory location are *multi-copy atomic* if the following conditions are both true:

- All writes to the same location are *serialized*, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes.
- A read of a location does not return the value of a write until all observers observe that write.

---

**Note**

Writes that are not coherent are not multi-copy atomic.

---

#### E2.2.4 Requirements for multi-copy atomicity

For Normal memory, writes are not required to be multi-copy atomic.

For Device memory, writes are not required to be multi-copy atomic.

The ARMv8 memory model is [Other-multi-copy atomic](#). For more information, see [Ordering constraints on page E2-2766](#).

#### E2.2.5 Concurrent modification and execution of instructions

The ARMv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization.

Concurrent modification and execution of instructions can lead to the resulting instruction performing any behavior that can be achieved by executing any sequence of instructions that can be executed from the same Exception level, except where the instruction before modification and the instruction after modification is a:

- B, BL, NOP, BKPT, SVC, HVC, or SMC A32 instruction
- B, BX, BLX, NOP, BKPT, or SVC 16-bit T32 instruction.

In addition, for the T32 instructions, for which [Instruction encodings on page F2-2844](#) describes the meaning of {hw1, hw2}:

- hw1 of a 32-bit BL (immediate) instruction can be concurrently modified to hw1 of another BL (immediate) instruction:
  - This means that some of the most significant bits of the immediate value can be modified.
- hw1 of a 32-bit BLX (immediate) instruction can be concurrently modified to hw1 of another BLX immediate instruction:
  - This means that some of the most significant bits of the immediate value can be modified.
- hw1 of a 32-bit BL (immediate) or BLX (immediate) instruction can be concurrently modified to a T32 16-bit B, BX, BLX, BKPT, or SVC instruction. This modification also works in reverse.
- hw2 of a 32-bit BL (immediate) instruction can be concurrently modified to hw2 of another BL (immediate) instruction with a different immediate:
  - This means that some bits of the immediate value, including the least significant bits, can be modified.
- hw2 of a 32-bit BLX (immediate) instruction can be concurrently modified to hw2 of another BLX (immediate) instruction with a different immediate:
  - This means that some bits of the immediate value, including the least significant bits, can be modified.
- hw2 of a 32-bit B (immediate) instruction with a condition field can be concurrently modified to hw2 of another 32-bit B (immediate) instruction with a condition field with a different immediate:
  - This means that some bits of the immediate value, including the least significant bits, can be modified.
- hw2 of a 32-bit B (immediate) instruction without a condition field can be concurrently modified to hw2 of another 32-bit B (immediate) instruction without a condition field:
  - This means that some bits of the immediate value, including the least significant bits, can be modified.

---

**Note**

In the T32 instruction set:

- The only encodings of BKPT and SVC are 16-bit.
  - The only encoding of BL is 32-bit.
-

For the instructions explicitly identified in this section, the architecture guarantees that, after modification of the instruction, behavior is consistent with execution of either:

- The instruction originally fetched.
- A fetch of the modified instruction.

The instructions to which this applies are the B, BL, NOP, BKPT, SVC, HVC, and SMC instructions.

For both instruction sets, if one thread of execution changes a conditional branch instruction to another conditional branch instruction, and the change affects both the condition field and the branch target, execution of the changed instruction by another thread of execution before the change is synchronized can lead to either:

- The old condition being associated with the new target address.
- The new condition being associated with the old target address.

These possibilities apply regardless of whether the condition, either before or after the change to the branch instruction, is the *always* condition.

For all other instructions, to avoid UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior, instruction modifications must be explicitly synchronized before they are executed. The required synchronization is as follows:

1. No PE must be executing an instruction when another PE is modifying that instruction.
2. To ensure that the modified instructions are observable, the PE that modified the instructions must issue the following sequence of instructions and operations:

```
; Coherency example for self-modifying code
; Enter this code with <Rt> containing a new 32-bit instruction,
; to be held in Cacheable space at a location pointed to by Rn. Use STRH in the first
; line instead of STR for a 16-bit instruction.
STR <Rt>, [Rn]
DCCMVAU Rn          ; Clean data cache by MVA to point of unification (PoU)
DSB                 ; Ensure visibility of the data stored
ICIMVAU Rn          ; Invalidate instruction cache by VA to PoU
BPIMVA Rn           ; Invalidate branch predictor by MVA to PoU
DSB                 ; Ensure completion of the invalidations
```

#### ———— **Note** ————

The DCCMVAU operation is not required if the area of memory is either Non-cacheable or Write-through Cacheable.

3. In a multiprocessor system, the ICIMVAU and BPIMVA are broadcast to all PEs within the Inner Shareable domain of the PE running this sequence. However, once the modified instructions are observable, each PE that is executing the modified instructions must issue the following instruction to ensure execution of the modified instructions:

```
ISB                 ; Synchronize fetched instruction stream
```

For more information about the required synchronization operation, see [Synchronization and coherency issues between data and instruction accesses on page E2-2774](#).

#### ———— **Note** ————

For information about memory accesses caused by instruction fetches, see [Ordering constraints on page E2-2766](#).

## E2.3 Definition of the ARMv8 memory model

This section describes observation and ordering in the ARMv8 memory model. It contains the following subsections:

- [Locations](#).
- [Ordering and observability](#) on page E2-2763.
- [Ordering constraints](#) on page E2-2766.
- [Completion and endpoint ordering](#) on page E2-2767.
- [Memory barriers](#) on page E2-2768.

For more information on endpoint ordering of memory accesses, see [Reordering](#) on page E2-2789.

In the ARMv8 memory model, the Shareability memory attribute indicates the degree to which hardware must ensure memory coherency between a set of observers, see [Memory types and attributes](#) on page E2-2782.

The ARMv8 memory system architecture defines additional memory attributes and associated behaviors, which are defined in the system level section of this manual. See:

- [Chapter G3 The AArch32 System Level Memory Model](#).
- [Chapter G4 The AArch32 Virtual Memory System Architecture](#).

See also [Mismatched memory attributes](#) on page E2-2792.

### E2.3.1 Locations

The ARMv8 memory model provides a set of definitions that are used to construct conditions on the permitted sequences of accesses to memory. The ARMv8 memory model defines:

- The ordering of observation of memory accesses between different observers.
- The ordering of arrival of memory accesses arriving at an endpoint.
- The mechanisms to control the ordering of observation of memory accesses and the arrival of memory accesses at an endpoint.

#### Locations, Memory effects, and Observers

The ARMv8 memory model provides the following definition of a *Location* in memory:

##### Location

A *Location* refers to a single byte in memory.

As part of its execution an instruction might generate a [Memory effect](#). [Observers](#) in the system might observe the [Memory effects](#) of that instruction on a [Location](#). The ARMv8 memory model provides the following definitions of a [Memory effect](#) and an [Observer](#):

##### Memory effect

The *Memory effects* of an instruction are the read, write, or barrier effects of that instruction. For an instruction that accesses memory:

- A read effect is generated for each [Location](#) that is read by the instruction.
- A write effect is generated for each [Location](#) that is written by the instruction.

An instruction can generate both read and write effects.

The memory effects of an instruction  $I_1$  are said to appear in program order before the Memory effects of instruction  $I_2$  if and only if  $I_1$  occurs before  $I_2$  in program order.

For the purposes of describing the ARMv8 memory model, all read and write effects access only Normal memory locations in a [Common Shareability Domain](#). Where this section refers to a read, write, or memory barrier without any qualification, then it is referring to the corresponding Memory effect.

## Observer

An *Observer* refers to either a processing element, or some other memory accessing agent that can generate reads from or writes to memory.

## Common Shareability Domain

A *Common Shareability Domain* for a program is the smallest Shareability domain that contains all of the active [Observers](#) of the [Memory effects](#) generated by a program.

## E2.3.2 Ordering and observability

The ARMv8 memory model permits reordering of memory accesses. This section defines the permitted reordering of memory accesses using the following:

- Register value dependencies to establish order between instructions on a PE.
- Ordering constraints to establish order between accesses to a [Location](#).

### Register value dependencies

The ARMv8 memory model defines the following dependencies between instructions:

#### Register dependency

A *Register dependency* from a first data value  $V_1$  to a second data value  $V_2$  exists within a PE if and only if either:

- The register, excluding the AArch64 zero register (XZR or WZR), that is used to hold  $V_1$  is used in the calculation of  $V_2$ .
- There is a Register dependency from  $V_1$  to a third data value  $V_3$  and there is a register dependency from  $V_3$  to  $V_2$ .

#### Register data dependency

A *Register data dependency* from a first data value  $V_1$  to a second data value  $V_2$  exists within a PE if and only if either:

- The register, excluding the AArch64 zero register (XZR or WZR) and the AArch32 PC, that is used to hold  $V_1$  and is used in the calculation of  $V_2$ , and the calculation between  $V_1$  and the  $V_2$  does not consist of either:
  - A conditional branch whose condition is determined by  $V_1$ .
  - A conditional selection, move, or computation whose condition is determined by  $V_1$ , where the input data values for the selection, move, or computation do not have a data dependency on  $V_1$ .
- There is a Register data dependency from  $V_1$  to a third data value  $V_3$ , and there is a Register data dependency from  $V_3$  to  $V_2$ .

#### Address dependency

An *Address dependency* from a read  $R_1$  to a subsequent read  $R_2$  exists if and only if there is a [Register data dependency](#) from the data value that is returned by  $R_1$  to the address used by  $R_2$ .

An *Address dependency* from a read  $R_1$  to a subsequent read  $W_2$  exists if and only if there is a [Register data dependency](#) from the data value that is returned by  $R_1$  to the address used by  $W_2$ .

#### Data dependency

A *Data dependency* from a read  $R_1$  to a subsequent write  $W_2$  exists if and only if there is a [Register dependency](#) from the data value returned by  $R_1$  to the data value written by  $W_2$ .

### Control dependency

A *Control dependency* from a read  $R_1$  to a subsequent instruction  $I_2$  exists if and only if there is a [Register dependency](#) from the data value returned by  $R_1$  to the data value used in the evaluation of a conditional branch or the determination of a synchronous exception on an instruction and  $I_2$  is only executed as a result of one of the possible outcomes of that conditional branch or synchronous exception.

### Ordering and observability at a Location

[Memory effects](#) on a [Location](#) are related by the following relations:

#### Reads-from

A *Reads-from* relation that couples reads and writes to the same [Location](#) such that each read is paired with a single write in the program. If a read  $R_2$  of a [Location](#) Reads-from a write  $W_1$  to the same [Location](#) if and only if  $R_2$  takes its data from  $W_1$ .

##### ———— Note ————

The Reads-from relation represents a read being satisfied by a write and then returning the written data.

#### Coherence order

A *Coherence order* relation for each [Location](#) in the program that provides a total order on all writes from all coherent [Observers](#) to that [Location](#), starting with a notional write of the initial value.

##### ———— Note ————

The Coherence order of a [Location](#) represents the order in which writes to the [Location](#) arrive at memory.

#### Coherence-after

A write  $W_2$  to a [Location](#) is *Coherence-after* another write  $W_1$  to the same [Location](#) if and only if  $W_2$  is sequenced after  $W_1$  in the [Coherence order](#) of the [Location](#).

A write  $W_2$  to a [Location](#) is Coherence-after a read  $R_1$  of the same location if and only if  $R_1$  [Reads-from](#) a write  $W_3$  to the same [Location](#) and  $W_2$  is Coherence-after  $W_3$ .

#### Overlapping accesses

Two [Memory effect](#) overlap if and only if they access the same [Location](#). Two instructions overlap if and only if one or more of their generated [Memory effects](#) overlap.

#### Observed-by

A read or a write  $RW_1$  from an [Observer](#) is *Observed-by* a write  $W_2$  from a different [Observer](#) if and only if  $W_2$  is coherence-after  $RW_1$ .

A write  $W_1$  from an [Observer](#) is Observed-by a read  $R_2$  from a different [Observer](#) if and only if  $R_2$  [Reads-from](#)  $W_1$ .

##### ———— Note ————

The Observed-by relation only relates accesses generated by different [Observers](#).

#### DMB FULL

A DMB FULL is a DMB with neither the LD or the ST qualifier.

Where this section refers to DMB without any qualification, then it is referring to all types of DMB. Unless a specific shareability domain is defined, a DMB applies to the [Common Shareability Domain](#).

All properties that apply to DMB also apply to the corresponding DSB.

## Ordering relations

In addition to the ordering relations that describe order at a location, the ARMv8 memory model also provides ordering relations to describe the ordering of instructions. These are as follows:

### Dependency-ordered-before

A dependency creates externally-visible order between a read and another [Memory effect](#) generated by the same [Observer](#). A read  $R_1$  is *Dependency-ordered-before* a read or write  $RW_2$  from the same [Observer](#) if and only if  $R_1$  appears in program order before  $RW_2$  and any of the following cases apply:

- There is an [Address dependency](#) or a [Data dependency](#) from  $R_1$  to  $RW_2$ .
- $RW_2$  is a write  $W_2$  and there is a [Control dependency](#) from  $R_1$  to  $W_2$ .
- $RW_2$  is a read  $R_2$  generated by an instruction appearing in program order after an instruction  $I_3$  that generates a [Context synchronization event](#), and there is a [Control dependency](#) from  $R_1$  to  $I_3$ .
- $RW_2$  is a write  $W_2$  appearing in program order after a read or a write  $RW_3$  and there is an [Address dependency](#) from  $R_1$  to  $RW_3$ .
- $RW_2$  is a write  $W_2$  that is [Coherence-after](#) a write  $W_3$  and there is a [Control dependency](#) or a [Data dependency](#) from  $R_1$  to  $W_3$ .
- $RW_2$  is a read  $R_2$  that [Reads-from](#) a write  $W_3$  and there is an [Address dependency](#) or a [Data dependency](#) from  $R_1$  to  $W_3$ .

### Atomic-ordered-before

Load-Exclusive and Store-Exclusive instructions provide some ordering guarantees, even in the absence of dependencies. A read  $R_1$  is *Atomic-ordered-before* a read or a write  $RW_2$  from the same [Observer](#) if and only if  $R_1$  appears in program order before  $RW_2$  and either of the following cases apply:

- $RW_2$  is a write  $W_2$  such that  $R_1$  and  $W_2$  are generated by an atomic instruction or a successful Load-Exclusive/Store-Exclusive instruction pair to the same [Location](#).
- $RW_2$  is a read  $R_2$  such that  $R_1$  is Atomic-ordered-before a write  $W_3$  and  $R_2$  [Reads-from](#)  $W_3$ .

For more information, see [Synchronization and semaphores on page E2-2795](#).

### Barrier-ordered-before

Barrier instructions order prior [Memory effects](#) before subsequent [Memory effects](#) generated by the same [Observer](#). A read or a write  $RW_1$  is *Barrier-ordered-before* a read or a write  $RW_2$  from the same [Observer](#) if and only if  $RW_1$  appears in program order before  $RW_2$  and any of the following cases apply:

- $RW_1$  appears in program order before a DMB FULL that appears in program order before  $RW_2$ .
- $RW_1$  is a write  $W_1$  generated by a Store-Release instruction and  $RW_2$  is a read  $R_2$  generated by a Load-Acquire instruction.
- $RW_1$  is a read  $R_1$  and either:
  - $R_1$  appears in program order before a DMB LD that appears in program order before  $RW_2$ .
  - $R_1$  is generated by a Load-Acquire instruction.
- $RW_2$  is a write  $W_2$  and either:
  - $RW_1$  is a write  $W_1$  appearing in program order before a DMB ST that appears in program order before  $W_2$ .
  - $W_2$  is generated by a Store-Release instruction.
  - $RW_1$  appears in program order before a write  $W_3$  generated by a Store-Release instruction and  $W_2$  is [Coherence-after](#)  $W_3$ .

### Ordered-before

An arbitrary pair of **Memory effects** is ordered if it can be linked by a chain of ordered accesses consistent with external observation. A read or a write  $RW_1$  is *Ordered-before* a read or a write  $RW_2$  if and only if any of the following cases apply:

- $RW_1$  is **Observed-by**  $RW_2$ .
- $RW_1$  is **Dependency-ordered-before**  $RW_2$ .
- $RW_1$  is **Atomic-ordered-before**  $RW_2$ .
- $RW_1$  is **Barrier-ordered-before**  $RW_2$ .
- $RW_1$  is Ordered-before a read or a write that is Ordered-before  $RW_2$ .

## E2.3.3 Ordering constraints

The ARMv8 memory model is described as being **Other-multi-copy atomic**. The definition of Other-multi-copy atomic is as follows:

### Other-multi-copy atomic

In an *Other-multi-copy atomic* system, it is required that a write from an **Observer**, if observed by a different **Observer**, is then observed by all other **Observers** that access the **Location** coherently. It is, however, permitted for an **Observer** to observe its own writes prior to making them visible to other observers in the system.

The **Other-multi-copy atomic** property of the ARMv8 memory model is enforced by placing constraints on the possible executions of a program. Those executions that meet the constraints given by the ordering model are said to be *architecturally well-formed*. An implementation that is executing a program is only permitted to exhibit behavior consistent with an architecturally well-formed execution.

An architecturally well-formed execution must satisfy both of the following requirements:

### Internal visibility requirement

For a read or a write  $RW_1$  that appears in program order before a read or a write  $RW_2$  to the same **Location**, the internal visibility requirement requires that exactly one of the following statements is true:

- $RW_2$  is a write  $W_2$  that is **Coherence-after**  $RW_1$ .
- $RW_1$  is a write  $W_1$  and  $RW_2$  is a read  $R_2$  such that either:
  - $R_2$  **Reads-from**  $W_1$ .
  - $R_2$  **Reads-from** another write that is **Coherence-after**  $W_1$ .
- $RW_1$  and  $RW_2$  are both reads  $R_1$  and  $R_2$  such that  $R_1$  **Reads-from** a write  $W_3$  and either:
  - $R_2$  **Reads-from**  $W_3$ .
  - $R_2$  **Reads-from** another write that is **Coherence-after**  $W_3$ .

### Note

Informally, if a **Memory effect**  $M_1$  from an **Observer** appears in program order before a **Memory effect**  $M_2$  from the same **Observer**, then  $M_1$  will be seen to occur before  $M_2$  by that **Observer**.

### External visibility requirement

For a read or a write  $RW_1$  that is **Ordered-before** a read or a write  $RW_2$ , to the same **Location** and from a different **Observer**, the external visibility requirement requires that exactly one of the following statements is true:

- $RW_2$  is a write  $W_2$  and  $RW_1$  is **Observed-by**  $W_2$ .
- $RW_1$  is a write  $W_1$  and  $RW_2$  is a read  $R_2$  such that either:
  - $W_1$  is **Observed-by**  $R_2$ .

- There is a write  $W_3$  such that  $W_3$  is **Observed-by**  $R_2$  and  $W_1$  is **Observed-by**  $W_3$ .
- $RW_1$  and  $RW_2$  are both reads  $R_1$  and  $R_2$  and there is a write  $W_3$  such that either:
  - $W_3$  is **Observed-by** both  $R_1$  and  $R_2$ .
  - $R_1$  is **Observed-by**  $W_3$  and  $W_3$  is **Observed-by**  $R_2$ .

---

**Note**

---

If a **Memory effect**  $M_1$  is **Ordered-before** another **Memory effect**  $M_2$ , to the same **Location** and from a different **Observer**, then  $M_1$  will be seen to occur before  $M_2$  by all **Observers** in the system.

---

## E2.3.4 Completion and endpoint ordering

Interaction between **Observers** in a system is not restricted to communication via shared variables in coherent memory. For example, an **Observer** could configure an interrupt controller to raise an interrupt on another **Observer** as a form of message passing. These interactions typically involve an additional agent, which defines the instruction sequence that is required to establish communication links between different **Observers**. When these forms of interaction are used in conjunction with shared variables, a DSB instruction can be used to enforce ordering between them.

### Peripherals

This section defines a **Memory-mapped peripheral** and the total order of reads and write to a peripheral which is defined as the **Peripheral coherence order**:

#### Memory-mapped peripheral

A *Memory-mapped peripheral* occupies a memory region of IMPLEMENTATION DEFINED size and can be accessed using load and store instructions. **Memory effects** to a Memory-mapped peripheral can have side-effects, such as causing the peripheral to perform an action. Values that are read from addresses within a Memory-mapped peripheral might not correspond to the last data value written to those addresses. As such, **Memory effects** to a Memory-mapped peripheral might not appear in the **Reads-from** or **Coherence order** relations.

#### Peripheral coherence order

The *Peripheral coherence order* of a **Memory-mapped peripheral** is a total order on all reads and writes to that peripheral.

---

**Note**

---

The Peripheral coherence order for a **Memory-mapped peripheral** signifies the order in which accesses arrive at the endpoint.

---

For a read or a write  $RW_1$  and a read or a write  $RW_2$  to the same peripheral, then  $RW_1$  will appear in the Peripheral coherence order for the peripheral before  $RW_2$  if either of the following cases apply:

- $RW_1$  and  $RW_2$  are accesses using Non-cacheable or Device attributes and  $RW_1$  is **Ordered-before**  $RW_2$ .
- $RW_1$  and  $RW_2$  are accesses using Device-nGnRE or Device-nGnRnE attributes and  $RW_1$  appears in program order before  $RW_2$ .

#### Out-of-band-ordered-before

A read or a write  $RW_1$  is *Out-of-band-ordered-before* a read or a write  $RW_2$  if and only if either of the following cases apply:

- $RW_1$  appears in program order before a DSB instruction that begins an IMPLEMENTATION DEFINED instruction sequence indirectly leading to the generation of  $RW_2$ .
- $RW_1$  is **Ordered-before** a read or a write  $RW_3$  and  $RW_3$  is Out-of-band-ordered-before  $RW_2$ .

If a [Memory effect](#)  $M_1$  is Out-of-band-ordered-before a read or a write  $M_2$ , then  $M_1$  is seen to occur before  $M_2$  by all [Observers](#).

### E2.3.5 Memory barriers

The ARM architecture is a weakly ordered memory architecture that supports out of order completion. *Memory barrier* is the general term applied to an instruction, or sequence of instructions, that forces synchronization events by a PE with respect to retiring Load/Store instructions. The memory barriers defined by the ARMv8 architecture provide a range of functionality, including:

- Ordering of Load/Store instructions.
- Completion of Load/Store instructions.
- Context synchronization.

The following subsections describe the ARMv8 memory barrier instructions:

- [Instruction Synchronization Barrier \(ISB\)](#).
- [Data Memory Barrier \(DMB\)](#) on page E2-2769.
- [Data Synchronization Barrier \(DSB\)](#) on page E2-2769.
- [Shareability and access limitations on the data barrier operations](#) on page E2-2769.
- [Load-Acquire, Store-Release](#) on page E2-2770.

#### ————— Note —————

Depending on the required synchronization, a program might use memory barriers on their own, or it might use them in conjunction with cache maintenance and memory management instructions that in general are only available when software execution is at EL1 or higher.

The DMB and DSB memory barriers affect reads and writes to the memory system generated by Load/Store instructions and data or unified cache maintenance instructions being executed by the PE. Instruction fetches or accesses caused by a hardware translation table access are not explicit accesses.

AArch32 state also supports the legacy barrier instructions [CP15DMB](#), [CP15DSB](#), and [CP15ISB](#). These instructions are executed as MCRs using the appropriate encoding, and are accessible from EL0. However, for performance reasons ARM deprecates any use of these operations, and strongly recommends that software uses the DMB, DSB, and ISB instructions described in this section instead. Optionally, an implementation can support a CP15BEN control that supervisory software can use to disable use of these instructions, meaning the corresponding MCR encodings are UNDEFINED. When the CP15BEN control is supported, setting one of the following CP15BEN fields to 0 makes execution of [CP15DMB](#), [CP15DSB](#), and [CP15ISB](#) UNDEFINED:

- [SCTLR\\_EL1](#).CP15BEN, for execution of these instructions at EL0 using AArch32 when EL1 is using AArch64.
- [SCTLR](#).CP15BEN, for execution of these instructions at EL0 or EL1 when EL1 is using AArch32.
- [HSTCLR](#).CP15BEN, for execution of these instructions at EL2 when EL2 is using AArch32.

### Instruction Synchronization Barrier (ISB)

An ISB instruction flushes the pipeline in the PE, so that all instructions that come after the ISB instruction in program order are fetched from the cache or memory after the ISB instruction has completed. Using an ISB ensures that the effects of context-changing operations executed before the ISB are visible to the instructions fetched after the ISB instruction. Examples of context-changing operations that require the insertion of an ISB instruction to ensure the effects of the operation are visible to instructions fetched after the ISB instruction are:

- Completed cache and TLB maintenance instructions.
- Changes to System registers.

Any context-changing operations appearing in program order after the ISB instruction only take effect after the ISB has been executed.

The pseudocode function for the operation of an ISB is [InstructionSynchronizationBarrier\(\)](#).

See also [Memory barriers on page G3-4555](#).

### Data Memory Barrier (DMB)

The DMB instruction is a memory barrier instruction that ensures the relative order of memory accesses before the barrier with memory accesses after the barrier. The DMB instruction does not ensure the completion of any of the memory accesses for which it ensures relative order.

The full definition of the DMB is covered formally in the [Definition of the ARMv8 memory model on page E2-2762](#) and this introduction to the DMB instruction is not intended to contradict that section.

The basic principle of a DMB instruction is to introduce order between memory accesses that are specified to be affected by the DMB options supplied as arguments to the DMB instruction. The DMB instruction ensures that all affected memory accesses by the PE executing the DMB that appear in program order before the DMB and those which originate from a different PE, to the extent required by the DMB options, which have been **Observed-by** the PE before the DMB is executed, are **Observed-by** each PE, to the extent required by the DMB options, before any affected memory accesses that appear in program order after the DMB are **Observed-by** that PE.

The use of a DMB creates order between the [Memory effects](#) of instructions as described in the definition of [Barrier-ordered-before](#).

The pseudocode function for the operation of a DMB is `DataMemoryBarrier()`.

### Data Synchronization Barrier (DSB)

A DSB is a memory barrier that ensures that memory accesses that occur before the DSB have completed before the completion of the DSB instruction. In doing this, it acts as a stronger barrier than a DMB and all ordering that is created by a DMB with specific options is also generated by a DSB with the same options.

Execution of a DSB at EL2 ensures that any memory accesses caused by speculative translation table walks from the Non-secure PL1&0 translation regime have been observed.

For more information, see [Use of out-of-context translation regimes on page G4-4564](#).

A DSB completes when all of the following apply:

- All explicit memory accesses that are observed by PE<sub>e</sub> before the DSB is executed and are of the required access types, and are from observers in the same required shareability domain as PE<sub>e</sub>, are complete for the set of observers in the required shareability domain.
- If the required access types of the DSB is reads and writes, then all cache and branch predictor maintenance instructions and all TLB maintenance instructions issued by PE<sub>e</sub> before the DSB are complete for the required shareability domain.

In addition, no instruction that appears in program order after the DSB instruction can alter any state of the system or perform any part of its functionality other than:

- Being fetched from memory and decoded.
- Reading the general-purpose, SIMD and floating-point, Special-purpose, or System registers that are directly or indirectly read without causing side-effects until the DSB completes.

The pseudocode function for the operation of a DSB is `DataSynchronizationBarrier()`.

See also [Memory barrier instructions on page G3-4552](#) and [Memory barriers on page G3-4555](#).

### Shareability and access limitations on the data barrier operations

The DMB and DSB instructions can each take an optional limitation argument that specifies:

- The shareability domain over which the instruction must operate. This is one of:
  - Full system.
  - Outer Shareable.
  - Inner Shareable.

- Non-shareable.
- The accesses for which the instruction operates. This is one of:
  - Read and write accesses, both before and after the barrier instruction.
  - Write accesses only, before and after the barrier instruction.
  - Read accesses before the barrier instruction, and read and write accesses after the barrier instruction.

**Note**

This form of a DMB or DSB instruction can be described as a Load-Load/Store barrier.

For more information on whether an access is before or after a barrier instruction, see [Data Memory Barrier \(DMB\) on page E2-2769](#) or [Data Synchronization Barrier \(DSB\) on page E2-2769](#).

Table E2-1 shows how these options are encoded in the <option> field of the instruction.

**Table E2-1 Encoding of the DMB and DSB <option> parameter**

Accesses		Shareability domain			
Before the barrier	After the barrier	Full system	Outer Shareable	Inner Shareable	Non-shareable
Reads and writes	Reads and writes	SY	OSH	ISH	NSH
Writes	Writes	ST	OSHST	ISHST	NSHST
Reads	Reads and writes	LD	OSHL	ISHL	NSHL

If no <option> is specified then the instruction operates for read and write accesses, over the full system, meaning the operation is the same as for the SY option. See the instruction descriptions for more information:

- [DMB on page F5-3103](#).
- [DSB on page F5-3106](#).

**Note**

ISB also supports an optional limitation argument that can only contain one value that corresponds to full system operation, see [ISB on page F5-3125](#).

## Load-Acquire, Store-Release

ARMv8 provides a set of instructions with Acquire semantics for loads, and Release semantics for stores.

The full definition of the Load-Acquire instruction is covered formally in the [Definition of the ARMv8 memory model on page E2-2762](#) and this introduction to the Load-Acquire instruction is not intended to contradict that section.

The basic principle of a Load-Acquire instruction is to introduce order between the memory access generated by the Load-Acquire instruction and the memory accesses appearing in program order after the Load-Acquire instruction, such that the memory access generated by the Load-Acquire instruction is **Observed-by** each PE, to the extent that that PE is required to observe the access coherently, before any of the memory accesses appearing in program order after the Load-Acquire instruction are **Observed-by** that PE, to the extent that the PE is required to observe the accesses coherently.

The use of a Load-Acquire instruction creates order between the **Memory effects** of instructions as described in the definition of **Barrier-ordered-before**.

The full definition of the Store-Release instruction is covered formally in the [Definition of the ARMv8 memory model on page E2-2762](#) and this introduction to the Store-Release instruction is not intended to contradict that section.

The basic principle of a Store-Release instruction is to introduce order between the memory accesses generated by the PEE executing the Store-Release instruction, together with those which originate from a different PE, to the extent that the PEE is required to observe them coherently, [Observed-by](#) the PEE before executing the Store-release.

The use of a Store-Release instruction creates order between the [Memory effects](#) of instructions as described in the definition of [Barrier-ordered-before](#).

In addition, the use of a Load-Acquire or a Store-Release instruction on accesses to a [Memory-mapped peripheral](#) introduces order between the [Memory effects](#) of the instructions that access that peripheral, as described in the definition of [Peripheral coherence order](#).

Load-Acquire and Store-Release, other than LDAEXD and STLEXD, access only a single data element. This access is single-copy atomic. The address of the data object must be aligned to the size of the data element being accessed, otherwise the access generates an Alignment fault.

LDAEXD and STLEXD access two data elements. The address supplied to the instructions must be doubleword aligned, otherwise the access generates an Alignment fault.

A Store-Release Exclusive instruction only has the release semantics if the store is successful.

———— **Note** ————

- Each Load-Acquire Exclusive and Store-Release Exclusive instruction is essentially a variant of the equivalent Load-Exclusive or Store-Exclusive instruction. All usage restrictions and single-copy atomicity properties:
  - That apply to the Load-Exclusive instructions also apply to the Load-Acquire Exclusive instructions.
  - That apply to the Store-Exclusive instructions also apply to the Store-Release Exclusive instructions.
- The Load-Acquire/Store-Release instructions can remove the requirement to use the explicit DMB memory barrier instruction.

[Table E2-2](#) summarizes the Load-Acquire/Store-release instructions.

**Table E2-2 Load-Acquire/Store-Release instructions**

Data type	Load-Acquire	Store-Release	Load-Acquire Exclusive	Store-Release Exclusive
32-bit word	LDA	STL	LDAEX	STLEX
16-bit halfword	LDAH	STLH	LDAEXH	STLEXH
8-bit byte	LDAB	STLB	LDAEXB	STLEXB
64-bit doubleword	-	-	LDAEXD	STLEXD

## E2.4 Caches and memory hierarchy

The implementation of a memory system depends heavily on the microarchitecture and therefore many details of the memory system are IMPLEMENTATION DEFINED. ARMv8 defines the application level interface to the memory system, including a hierarchical memory system with multiple levels of cache. This section describes an application level view of this system. It contains the subsections:

- [Introduction to caches.](#)
- [Memory hierarchy.](#)
- [Implication of caches for the application programmer on page E2-2774.](#)
- [Preloading caches on page E2-2775.](#)

### E2.4.1 Introduction to caches

A cache is a block of high-speed memory that contains a number of entries, each consisting of:

- Main memory address information, commonly known as a *tag*.
- The associated data.

Caches increase the average speed of a memory access and take account of two principles of locality:

#### Spatial locality

An access to one location is likely to be followed by accesses to adjacent locations. Examples of this principle are:

- Sequential instruction execution.
- Accessing a data structure.

#### Temporal locality

An access to an area of memory is likely to be repeated in a short time period. An example of this principle is the execution of a software loop.

To minimize the quantity of control information stored, the spatial locality property groups several locations together under the same tag. This logical block is commonly known as a *cache line*. When data is loaded into a cache, access times for subsequent loads and stores are reduced, resulting in overall performance benefits. An access to information already in a cache is known as a *cache hit*, and other accesses are called *cache misses*.

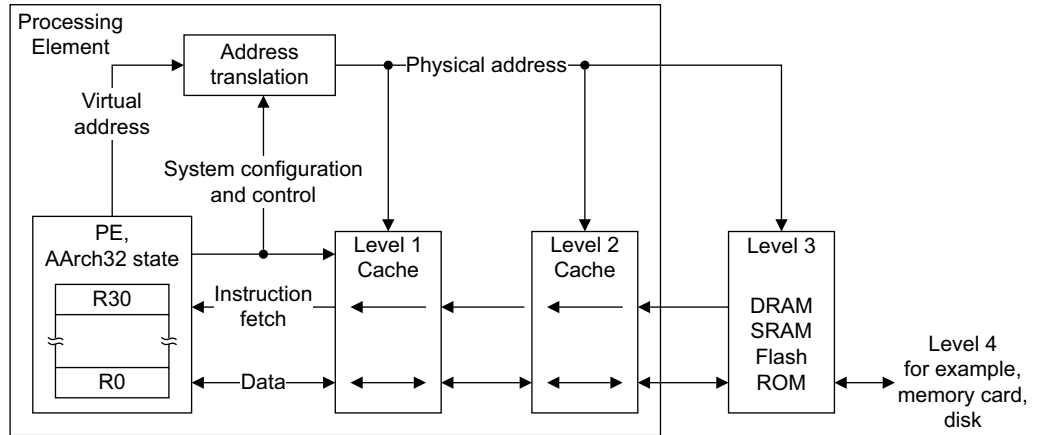

Normally, caches are self-managing, with the updates occurring automatically. Whenever the PE accesses a cacheable memory location, the cache is checked. If the access is a cache hit, the access occurs in the cache. Otherwise, the access is made to memory. Typically, when making this access, a cache location is allocated and the cache line loaded from memory. ARMv8 permits different cache topologies and access policies, provided they comply with the memory coherency model described in this manual.

Caches introduce a number of potential problems, mainly because:

- Memory accesses can occur at times other than when the programmer would expect them.
- A data item can be held in multiple physical locations.

### E2.4.2 Memory hierarchy

Typically memory close to a PE has very low latency, but is limited in size and expensive to implement. Further from the PE it is common to implement larger blocks of memory but these have increased latency. To optimize overall performance, an ARMv8 memory system can include multiple levels of cache in a hierarchical memory system that exploits this trade-off between size and latency. [Figure E2-1 on page E2-2773](#) shows an example of such a system in an ARMv8-A system that supports virtual addressing.

**Figure E2-1 Multiple levels of cache in a memory hierarchy**

### Note

In this manual, in a hierarchical memory system, Level 1 refers to the level closest to the PE, as shown in [Figure E2-1](#).

Instructions and data can be held in separate caches or in a unified cache. A cache hierarchy can have one or more levels of separate instruction and data caches, with one or more unified caches located at the levels closest to the main memory. Memory coherency for cache topologies can be defined by two conceptual points:

#### Point of Unification (PoU)

The point at which the instruction cache, data cache, and translation table walks of a particular PE are guaranteed to see the same copy of a memory location. In many cases, the point of unification is the point in a uniprocessor memory system by which the instruction and data caches and the translation table walks have merged. The point of unification might coincide with the point of coherency.

#### Point of Coherency (PoC)

The point at which all agents that can access memory are guaranteed to see the same copy of a memory location for accesses of any memory type or cacheability attribute. In many cases this is effectively the main system memory, although the architecture does not prohibit the implementation of caches beyond the PoC that have no effect on the coherency between memory system agents.

### Note

The presence of system caches can affect the determination of the point of coherency as described in [System level caches on page D3-1996](#).

See also [About cache maintenance in AArch32 state on page G3-4531](#).

## The Cacheability and Shareability memory attributes

Cacheability and Shareability are two attributes that describe the memory hierarchy in a multiprocessing system:

**Cacheability** This term defines whether memory locations are allowed to be allocated into a cache or not. Cacheability is defined independently for Inner and Outer Cacheability locations.

**Shareability** This term defines whether memory locations are shareable between different agents in a system. Marking a memory location as shareable for a particular domain requires hardware to ensure that the location is coherent for all agents in that domain. Shareability is defined independently for Inner and Outer Shareability domains.

For more information about the Cacheability and Shareability attributes see [Memory types and attributes on page E2-2782](#).

### E2.4.3 Implication of caches for the application programmer

In normal operation, the caches are largely invisible to the application programmer. However they can become visible when there is a breakdown in the coherency of the caches. Such a breakdown can occur:

- When memory locations are updated by other agents in the system that do not use hardware management of coherency.
- When memory updates made from the application software must be made visible to other agents in the system, without the use of hardware management of coherency.

For example:

- In the absence of hardware management of coherency of DMA accesses, in a system with a DMA controller that reads memory locations that are held in the data cache of a PE, a breakdown of coherency occurs when the PE has written new data in the data cache, but the DMA controller reads the old data held in memory.
- In a Harvard cache implementation, where there are separate instruction and data caches, a breakdown of coherency occurs when new instruction data has been written into the data cache, but the instruction cache still contains the old instruction data.

#### Data coherency issues

Software can ensure the data coherency of caches in the following ways:

- By not using the caches in situations where coherency issues can arise. This can be achieved by:
  - Using Non-cacheable or, in some cases, Write-Through Cacheable memory.
  - Not enabling caches in the system.
- By using system calls to functions using cache maintenance instructions that execute at a higher Exception level.
- By using hardware coherency mechanisms to ensure the coherency of data accesses to memory for cacheable locations by observers within the different shareability domains, see [Non-shareable Normal memory on page E2-2784](#) and [Shareable, Inner Shareable, and Outer Shareable Normal memory on page E2-2783](#).

#### ————— Note —————

The performance of these hardware coherency mechanisms is highly implementation-specific. In some implementations the mechanism suppresses the ability to cache shareable locations. In other implementations, cache coherency hardware can hold data in caches while managing coherency between observers within the shareability domains.

#### Synchronization and coherency issues between data and instruction accesses

How far ahead of the current point of execution instructions are fetched from is IMPLEMENTATION DEFINED. Such prefetching can be either a fixed or a dynamically varying number of instructions, and can follow any or all possible future execution paths. For all types of memory:

- The PE might have fetched the instructions from memory at any time since the last [Context synchronization event](#) on that PE.
- Any instructions fetched in this way might be executed multiple times, if this is required by the execution of the program, without being re-fetched from memory.

The ARM architecture does not require the hardware to ensure coherency between instruction caches and memory, even for locations of shared memory.

If software requires coherency between instruction execution and memory, it must manage this coherency using [Context synchronization events](#) and cache maintenance instructions. These can only be accessed from an Exception level that is higher than EL0, and therefore require a system call, see [Exception-generating and exception-handling instructions on page F1-2827](#). The following code sequence can be used for this purpose:

```
; Coherency example for data and instruction accesses within the same Inner Shareable domain.
; Enter this code with <Rt> containing a new 32-bit instruction,
; to be held in Cacheable space at a location pointed to by Rn. Use STRH in the first line
; instead of STR for a 16-bit instruction.
STR Rt, [Rn]
DCCMVAU Rn      ; Clean data cache by MVA to point of unification (PoU)
DSB              ; Ensure visibility of the data cleaned from cache
ICIMVAU Rn      ; Invalidate instruction cache by MVA to PoU
BPIMVA Rn       ; Invalidate branch predictor by MVA to PoU
DSB              ; Ensure completion of the invalidations
ISB              ; Synchronize the fetched instruction stream
```

---

**Note**

- For accesses that are Non-cacheable or Write-Through, the clean data cache instruction is not required. For accesses that are Non-cacheable, the invalidate instruction cache is not required, because in AArch32 state these accesses are not permitted to be held in an instruction cache.
  - This code can be used when the thread of execution modifying the code is the same thread of execution that is executing the code. The ARMv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization. See [Concurrent modification and execution of instructions on page E2-2760](#).
- 

## E2.4.4 Preloading caches

The ARM architecture provides the memory system hints PLD (Preload Data), PLDW (Preload Data With Intent To Write) and PLI (Preload Instruction) that software can use to communicate the expected use of memory locations to the hardware. The memory system can respond by taking actions that are expected to speed up the memory accesses if they occur. The effect of these memory system hints is IMPLEMENTATION DEFINED. Typically, implementations use this information to bring data or instruction locations into caches.

The Preload instructions are hints, and so implementations can treat them as NOPs without affecting the functional behavior of the device. The instructions cannot generate synchronous Data Abort exceptions, but the resulting memory system operations might, under exceptional circumstances, generate an asynchronous external abort, which is reported using an SError interrupt and taken using an asynchronous Data Abort exception. For more information, see [Data Abort exception on page G1-4387](#).

A PLD, PLDW, or PLI instruction can only cause allocation to software-visible caching structures such as caches or TLBs for memory locations that can be accessed, according to the permissions defined by the current translation regime or a translation regime for a higher Exception level in the current Security state, by any of:

- Reads.
- Writes.
- Instruction fetches.

A PLD, PLDW, or PLI instruction can access any memory location in Normal memory that can be accessed, according to the permissions defined by the current translation regime or a translation regime for a higher Exception level in the current Security state, by any of:

- Reads.
- Writes.
- Instruction fetches.

---

**Note**

In each case, the entire list applies to each of PLD, PLDW, and PLI.

---

A PLD, PLDW, or PLI instruction is guaranteed not to access any type of Device memory.

A PLI instruction must not perform any access that cannot be performed by a speculative instruction fetch by the processor. Therefore in a VMSA implementation, if all associated MMUs are disabled, a PLI instruction cannot access any memory location that cannot be accessed by instruction fetches.

The pseudocode enumeration [PrefetchHint](#) defines the prefetch hint types.

The [Hint\\_Prefetch\(\)](#) pseudocode function signals to the memory system that memory accesses of the type hint to or from the specified address are likely to occur in the near future. The memory system might take some action to speed up the memory accesses when they do occur, such as preloading the specified address into one or more caches as indicated by the innermost cache level target and non-temporal hint stream.

For more information on PLD, PLI, and PLDW, see:

- [PLD, PLDW \(immediate\)](#) on page F5-3314.
- [PLD \(literal\)](#) on page F5-3316.
- [PLD, PLDW \(register\)](#) on page F5-3318.
- [PLI \(immediate, literal\)](#) on page F5-3320.
- [PLI \(register\)](#) on page F5-3323.

## E2.5 Alignment support

This section describes alignment support. It contains the following subsections:

- [Instruction alignment](#).
- [Unaligned data access](#).
- [Cases where unaligned accesses are CONSTRAINED UNPREDICTABLE](#) on page E2-2778.
- [Unaligned data access restrictions](#) on page E2-2778.

### E2.5.1 Instruction alignment

A32 instructions are word-aligned.

T32 instructions are halfword-aligned.

### E2.5.2 Unaligned data access

An ARMv8 implementation must support unaligned data accesses to Normal memory by some load and store instructions. As [Table E2-3](#) shows, software can control whether a misaligned access to Normal memory by one of these instructions causes an Alignment fault Data Abort exception:

- By setting [SCTLR.A](#), for unaligned accesses from any mode other than Hyp mode.
- By setting [HSCTLR.A](#), for unaligned accesses from Hyp mode.

**Table E2-3 Alignment requirements of load/store instructions**

Instructions	Alignment check	Result if check fails when:	
		<a href="#">SCTLR.A</a> or <a href="#">HSCTLR.A</a> is 0	<a href="#">SCTLR.A</a> or <a href="#">HSCTLR.A</a> is 1
LDRB, LDREXB, LDRBT, LDRSB, LDRSBT, STRB, STREXB, STRBT, TBB	None	-	-
LDRH, LDRHT, LDRSH, LDRSHT, STRH, STRHT, TBH	Halfword	Unaligned access	Alignment fault
LDREXH, STREXH, LDAH, STLH, LDAEXH, STLEXH	Halfword	Alignment fault	Alignment fault
LDR, LDRT, STR, STRT PUSH, encodings T3 and A2 only POP, encodings T3 and A2 only	Word	Unaligned access	Alignment fault
LDREX, STREX, LDA, STL, LDAEX, STLEX	Word	Alignment fault	Alignment fault
LDREXD, STREXD, LDAEXD, STLEXD	Doubleword	Alignment fault	Alignment fault
All forms of LDM and STM, LDRD, RFE, SRS, STRD	Word	Alignment fault	Alignment fault
LDC, STC	Word	Alignment fault	Alignment fault
VLDM, VLDR, VPOP, VPUSH, VSTM, VSTR	Word	Alignment fault	Alignment fault
VLD1, VLD2, VLD3, VLD4, VST1, VST2, VST3, VST4, all with standard alignment	Element size	Unaligned access	Alignment fault
VLD1, VLD2, VLD3, VLD4, VST1, VST2, VST3, VST4, all with :<align> specified <sup>a</sup>	As specified by :<align>	Alignment fault	Alignment fault

a. Previous versions of this manual used @<align> to specify alignment. Both forms are supported, see [Chapter F6 T32 and A32 Advanced SIMD and floating-point Instruction Descriptions](#) for more information.

---

**Note**

---

Any unaligned access to any type of Device memory generates an Alignment fault, see [Alignment faults on page G4-4656](#).

---

### E2.5.3 Cases where unaligned accesses are CONSTRAINED UNPREDICTABLE

Any load instruction that is not faulted by the alignment restrictions shown in [Table E2-3 on page E2-2777](#) and that loads the PC has CONSTRAINED UNPREDICTABLE behavior if the address it loads from is not word-aligned, see [Loads and Stores to unaligned locations on page K1-6098](#). This overrules any permitted Load/Store behavior shown in [Table E2-3 on page E2-2777](#).

### E2.5.4 Unaligned data access restrictions

The following points apply to unaligned data accesses in ARMv8:

- Accesses are not guaranteed to be single-copy atomic except at the byte access level, see [Atomicity in the ARM architecture on page E2-2758](#).
- Unaligned accesses typically take a number of additional cycles to complete compared to a naturally-aligned access.
- An operation that performs an unaligned access can abort on any memory access that it makes, and can abort on more than one access. This means that an unaligned access that occurs across a page boundary can generate an abort on either side of the boundary.

## E2.6 Endian support

*General description of endianness in the ARM architecture* describes the relationship between endianness and memory addressing in the ARM architecture.

The following subsections then describe the endianness schemes supported by the architecture:

- *Instruction endianness*.
- *Data endianness* on page E2-2780.
- *Endianness of memory-mapped peripherals* on page E2-2781.

### E2.6.1 General description of endianness in the ARM architecture

This section only describes memory addressing and the effects of endianness for data elements up to doubleword of 64 bits. However, this description can be extended to apply to larger data elements.

For an address A, [Figure E2-2](#) shows, for big-endian and little-endian memory systems, the relationship between:

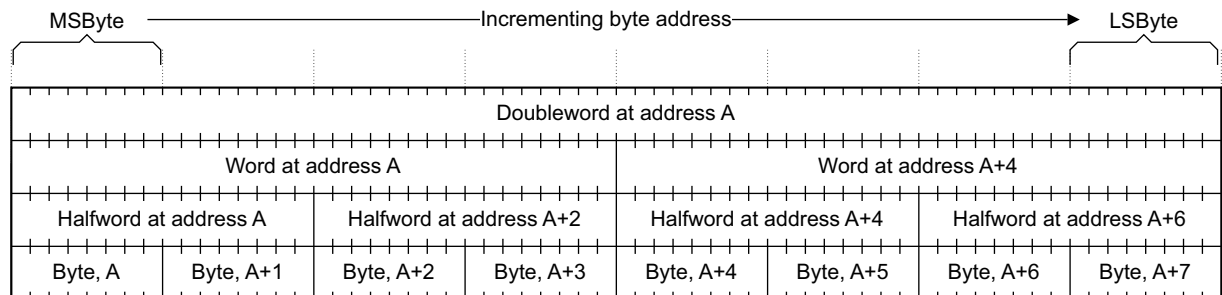

- The doubleword at address A.
- The words at addresses A and A+4.
- The halfwords at addresses A, A+2, A+4, and A+6.
- The bytes at addresses A, A+1, A+2, A+3, A+4, A+5, A+6, and A+7.

The terms in [Figure E2-2](#) have the following definitions:

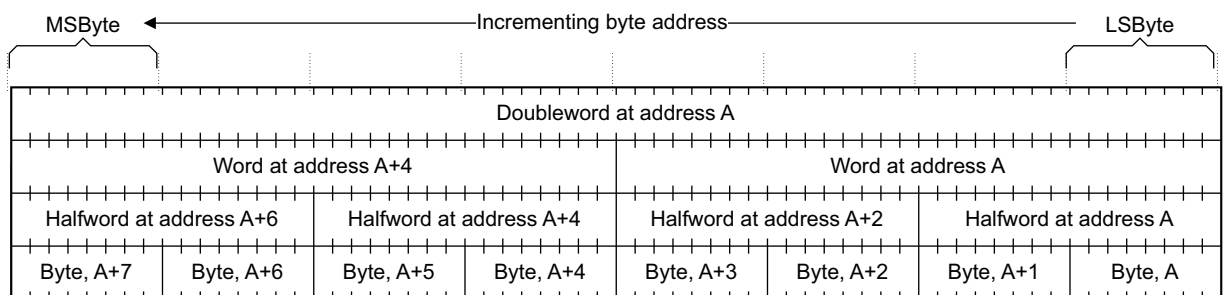

**MSByte** Most-significant byte.

**LSByte** Least-significant byte.

Big-endian memory system

Little-endian memory system

In this figure, *Byte, A+1* is an abbreviation for *Byte at address A+1*

**Figure E2-2** Endianness relationships in AArch32 state

### E2.6.2 Instruction endianness

In ARMv8-A, the mapping of instruction memory is always little-endian.

### E2.6.3 Data endianness

The size of the data value that is loaded or stored is the size that is used for the purpose of endian conversion for floating-point, Advanced SIMD, and general-purpose register loads and stores.

Table E2-4 shows the element sizes of all the load/store instructions, for all instruction sets.

**Table E2-4 Element size of load/store instructions**

Instructions	Element size
LDRB, LDREXB, LDRBT, LDRSB, LDRSBT, STRB, STREXB, STRBT, TBB	Byte
LDRH, LDREXH, LDRHT, LDRSH, LDRSHT, STRH, STREXH, STRHT, TBH	Halfword
LDR, LDRT, LDREX, STR, STRT, STREX	Word
LDRD, LDREXD, STRD, STREXD	Word
All forms of LDM, PUSH, POP, RFE, SRS, all forms of STM,	Word
LDC, STC	Word
Forms of VLDM, VLDR, VPOP, VPUSH, VSTM, VSTR that transfer 32-bit Si registers	Word
Forms of VLDM, VLDR, VPOP, VPUSH, VSTM, VSTR that transfer 64-bit Di registers	Doubleword
VLD1, VLD2, VLD3, VLD4, VST1, VST2, VST3, VST4	Element size of the Advanced SIMD access

CPSR.E determines the data endianness.

The data size used for endianness conversions:

- Is the size of the data value that is loaded or stored for Advanced SIMD and floating-point register and general-purpose register loads and stores.
- Is the size of the data element that is loaded or stored for Advanced SIMD element and data structure loads and stores. For more information see [Endianness in Advanced SIMD on page E2-2781](#).

#### Instructions to reverse bytes in registers

An application or device driver might have to interface to memory-mapped peripheral registers or shared memory structures that are not the same endianness as the internal data structures. Similarly, the endianness of the operating system might not match that of the peripheral registers or shared memory. In these cases, the PE requires an efficient method to transform explicitly the endianness of the data.

Table E2-5 shows the instructions that provide this functionality in the A32 and T32 instruction sets.

**Table E2-5 Byte reversal instructions**

Function	T32 / A32 Instruction	Notes
Reverse bytes in whole register	REV	For use with general purpose registers.
Reverse bytes in 16-bit halfwords	REV16	For use with general purpose registers.
Reverse bytes in halfword and sign-extend	REVSH	For use with general purpose registers.
Reverse elements in doublewords, vector	VREV64	For use with registers in the SIMD and floating-point register file
Reverse elements in words, vector	VREV32	For use with registers in the SIMD and floating-point register file
Reverse elements in halfwords, vector	VREV16	For use with registers in the SIMD and floating-point register file

## Endianness in Advanced SIMD

Advanced SIMD element Load/Store instructions transfer vectors of elements between memory and the SIMD and floating-point register file. An instruction specifies both the length of the transfer and the size of the data elements being transferred. This information is used by the PE to load and store data correctly in both big-endian and little-endian systems.

Consider, for example, the A32 or T32 instruction:

VLD1.16 {D0}, [R1]

This loads a 64-bit register with four 16-bit values. The four elements appear in the register in array order, with the lowest indexed element fetched from the lowest address. The order of bytes in the elements depends on the endianness configuration, as shown in Figure E2-3. Therefore, the order of the elements in the registers is the same regardless of the endianness configuration.

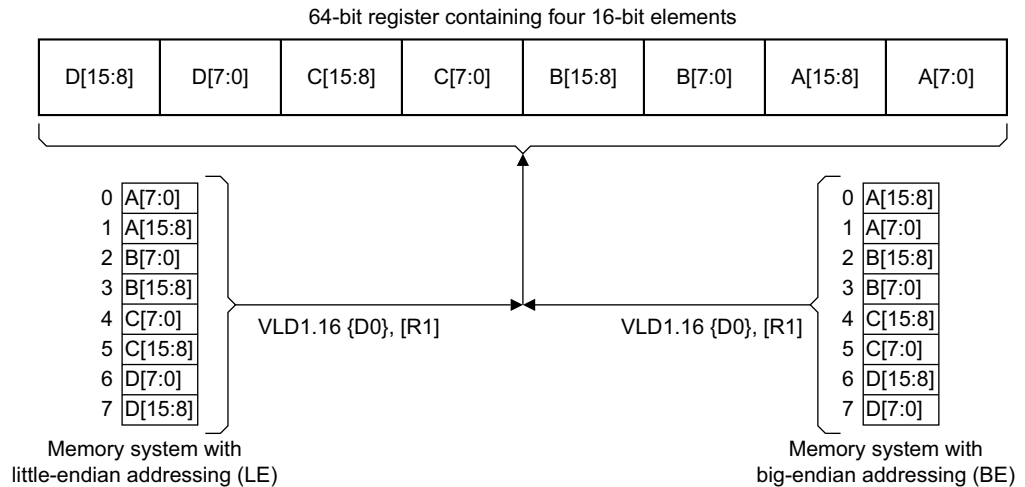

Figure E2-3 Advanced SIMD byte order example for AArch32 state

For information about the alignment of Advanced SIMD instructions see [Alignment support on page E2-2777](#).

The `BigEndian()` pseudocode function determines the current endianness of the data.

The `BigEndianReverse()` pseudocode function reverses the endianness of a bitstring.

The `BigEndian()` and `BigEndianReverse()` functions are defined in [Chapter J1 ARMv8 Pseudocode](#).

### E2.6.4 Endianness of memory-mapped peripherals

All memory-mapped peripherals defined in the ARM architecture must be little-endian.

Peripherals to which this requirement applies include:

- Memory-mapped register interfaces to a debugger, or to a cross-trigger interface, see [Chapter H8 About the External Debug Registers](#).
- The memory-mapped register interface to the system level implementation of the Generic Timer, see [Chapter I1 System Level Implementation of the Generic Timer](#).
- A memory-mapped register interface to the Performance Monitors, see [Chapter I2 Recommended External Interface to the Performance Monitors](#).
- Memory-mapped register interfaces to an ARM Generic Interface Controller, see the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0*.
- The memory-mapped register interface to an ARM trace component. See, for example, the *ARM® Embedded Trace Macrocell Architecture Specification, ETMv4*.

## E2.7 Memory types and attributes

In ARMv8 the ordering of accesses for addresses in memory, referred to as the memory order model, is defined by the memory attributes. The following sections describe this model:

- [Normal memory](#).
- [Device memory](#) on page E2-2786.
- [Memory access restrictions](#) on page E2-2791.

### E2.7.1 Normal memory

The Normal memory type attribute applies to most memory in a system. It indicates that the hardware is permitted by the architecture to perform speculative data read accesses to these locations, regardless of the access permissions for these locations.

The Normal memory type has the following properties:

- A write to a memory location with the Normal attribute completes in finite time. This means that it is globally observed for the shareability domain of the memory location in finite time. For a Non-cacheable location, the location is observed by all observers in finite time.
- A completed write to a memory location with the Normal attribute is globally observed for the shareability domain of the memory location in finite time without the need for explicit cache maintenance instructions or barriers. For a Non-cacheable location, the completed write is globally observed for all observers in finite time without the need for explicit cache maintenance instructions or barriers.
- Writes to a memory location with the Normal memory attribute that is Non-cacheable must reach the endpoint for that location in the memory system in finite time.
- Unaligned memory accesses can access Normal memory if the system is configured to generate such accesses.
- There is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register Load/Store instructions. See [Multi-register loads and stores that access Normal memory](#) on page E2-2786.

---

#### Note

- The Normal memory attribute is appropriate for locations of memory that are idempotent, meaning that they exhibit all of the following properties:
  - Read accesses can be repeated with no side-effects.
  - Repeated read accesses return the last value written to the resource being read.
  - Read accesses can fetch additional memory locations with no side-effects.
  - Write accesses can be repeated with no side-effects if the contents of the location accessed are unchanged between the repeated writes or as the result of an exception, as described in this section.
  - Unaligned accesses can be supported.
  - Accesses can be merged before accessing the target memory system.
- An instruction that generates a sequence of accesses as described in [Atomicity in the ARM architecture](#) on page E2-2758 might be abandoned as a result of an exception being taken during the sequence of accesses. On return from the exception the instruction is restarted, and therefore one or more of the memory locations might be accessed multiple times. This can result in repeated write accesses to a location that has been changed between the write accesses.

---

The following sections describe the other attributes for Normal memory:

- [Shareable Normal memory](#) on page E2-2783.
- [Non-shareable Normal memory](#) on page E2-2784.
- [Cacheability attributes for Normal memory](#) on page E2-2784.

See also:

- [Multi-register loads and stores that access Normal memory on page E2-2786.](#)
- [Atomicity in the ARM architecture on page E2-2758.](#)
- [Memory barriers on page E2-2768.](#) For accesses to Normal memory, a DMB instruction is required to ensure the required ordering.
- [Concurrent modification and execution of instructions on page E2-2760.](#)

## Shareable Normal memory

A Normal memory location has a Shareability attribute that is defined as one of:

- Inner Shareable.
- Outer Shareable.
- Non-shareable.

The shareability attributes define the data coherency requirements of the location, that hardware must enforce. They do not affect the coherency requirements of instruction fetches, see [Synchronization and coherency issues between data and instruction accesses on page E2-2774.](#)

---

### Note

- System designers can use the Shareability attribute to specify the locations in Normal memory for which coherency must be maintained. However, software developers must not assume that specifying a memory location as Non-shareable permits software to make assumptions about the incoherency of the location between different PEs in a shared memory system. Such assumptions are not portable between different multiprocessing implementations that might use the Shareability attribute. Any multiprocessing implementation might implement caches that are shared, inherently, between different PEs.
- This architecture assumes that all PEs that use the same operating system or hypervisor are in the same Inner Shareable shareability domain.

---

## Shareable, Inner Shareable, and Outer Shareable Normal memory

The ARM architecture abstracts the system as a series of Inner and Outer Shareability domains.

Each Inner Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Inner Shareable attribute made by any member of that set.

Each Outer Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Outer Shareable attribute made by any member of that set.

The following properties also hold:

- Each observer is only a member of a single Inner Shareability domain.
- Each observer is only a member of a single Outer Shareability domain.
- All observers in an Inner Shareability domain are always members of the same Outer Shareability domain. This means that an Inner Shareability domain is a subset of an Outer Shareability domain, although it is not required to be a proper subset.

---

### Note

- Because all data accesses to Non-cacheable locations are data coherent to all observers, Non-cacheable locations are always treated as Outer Shareable.
- The Inner Shareable domain is expected to be the set of PEs controlled by a single hypervisor or operating system.

The details of the use of the Shareability attributes are system-specific. [Example E2-1](#) shows how they might be used.

### Example E2-1 Use of shareability attributes

---

In an implementation, a particular subsystem with two clusters of PEs has the requirement that:

- In each cluster, the data caches or unified caches of the PEs in the cluster are transparent for all data accesses to memory locations with the Inner Shareable attribute.
- However, between the two clusters, the caches:
  - Are not required to be coherent for data accesses that have only the Inner Shareable attribute.
  - Are coherent for data accesses that have the Outer Shareable attribute.

In this system, each cluster is in a different Shareability domain for the Inner Shareable attribute, but all components of the subsystem are in the same Shareability domain for the Outer Shareable attribute.

A system might implement two such subsystems. If the data caches or unified caches of one subsystem are not transparent to the accesses from the other subsystem, this system has two Outer Shareable Shareability domains.

---

Having two levels of shareability means system designers can reduce the performance and power overhead for shared memory locations that do not need to be part of the Outer Shareable Shareability domain.

For Shareable Normal memory, the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer in the same Shareability domain.

### Non-shareable Normal memory

For Normal memory locations, the Non-shareable attribute identifies Normal memory that is likely to be accessed only by a single PE.

A location in Normal memory with the Non-shareable attribute does not require the hardware to make data accesses by different observers coherent, unless the memory is Non-cacheable. For a Non-shareable location, if other observers share the memory system, software must use cache maintenance instructions, if the presence of caches might lead to coherency issues when communicating between the observers. This cache maintenance requirement is in addition to the barrier operations that are required to ensure memory ordering.

For Non-shareable Normal memory, it is IMPLEMENTATION DEFINED whether the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer.

### Cacheability attributes for Normal memory

In addition to being Outer Shareable, Inner Shareable or Non-shareable, each region of Normal memory is assigned a Cacheability attribute that is one of:

- Write-Through Cacheable.
- Write-Back Cacheable.
- Non-cacheable.

Also, for Write-Through Cacheable and Write-Back Cacheable Normal memory regions:

- A region might be assigned cache allocation hints for read and write accesses.
- It is IMPLEMENTATION DEFINED whether the cache allocation hints can have an additional attribute of Transient or Non-transient.

For more information see [Cacheability, cache allocation hints, and cache transient hints on page G3-4528](#).

A memory location can be marked as having different cacheability attributes, for example when using aliases in a virtual to physical address mapping:

- If the attributes differ only in the cache allocation hint this does not affect the behavior of accesses to that location.
- For other cases see [Mismatched memory attributes on page E2-2792](#).

The cacheability attributes provide a mechanism of coherency control with observers that lie outside the Shareability domain of a region of memory. In some cases, the use of Write-Through Cacheable or Non-cacheable regions of memory might provide a better mechanism for controlling coherency than the use of hardware coherency mechanisms or the use of cache maintenance routines. To this end, the architecture requires the following properties for Non-cacheable or Write-Through Cacheable memory:

- A completed write to a memory location that is Non-cacheable or Write-Through Cacheable for a level of cache made by an observer accessing the memory system inside the level of cache is visible to all observers accessing the memory system outside the level of cache without the need of explicit cache maintenance.
- A completed write to a memory location that is Non-cacheable for a level of cache made by an observer accessing the memory system outside the level of cache is visible to all observers accessing the memory system inside the level of cache without the need of explicit cache maintenance.

---

**Note**

Implementations can use the cache allocation hints to indicate a probable performance benefit of caching. For example, a programmer might know that a piece of memory is not going to be accessed again and would be better treated as Non-cacheable. The distinction between memory regions with attributes that differ only in the cache allocation hints exists only as a hint for performance.

---

For Normal memory, the ARM architecture provides cacheability attributes that are defined independently for each of two conceptual levels of cache, the *inner* and the *outer* cache. The relationship between these conceptual levels of cache and the implemented physical levels of cache is IMPLEMENTATION DEFINED, and can differ from the boundaries between the Inner and Outer Shareability domains. However:

- Inner refers to the innermost caches, meaning the caches that are closest to the PE, and always includes the lowest level of cache.
- No cache that is controlled by the Inner cacheability attributes can lie outside a cache that is controlled by the Outer cacheability attributes.
- An implementation might not have any outer cache.

[Example E2-2](#), [Example E2-3 on page E2-2786](#), and [Example E2-4 on page E2-2786](#) describe the possible ways of implementing a system with three levels of cache, *level 1* (L1) to *level 3* (L3).

---

**Note**

- L1 cache is the level closest to the PE, see [Memory hierarchy on page E2-2772](#).
  - When managing coherency, system designs must consider both the inner and outer cacheability attributes, as well as the Shareability attributes. This is because hardware might have to manage the coherency of caches at one conceptual level, even when another conceptual level has the Non-cacheable attribute.
- 

### Example E2-2 Implementation with two inner and one outer cache levels

---

Implement the three levels of cache in the system, L1 to L3, with:

- The Inner cacheability attribute applied to L1 and L2 cache.
  - The Outer cacheability attribute applied to L3 cache.
-

### Example E2-3 Implementation with three inner and no outer cache levels

---

Implement the three levels of cache in the system, L1 to L3, with the Inner cacheability attribute applied to L1, L2, and L3 cache. Do not use the Outer cacheability attribute.

---

### Example E2-4 Implementation with one inner and two outer cache levels

---

Implement the three levels of cache in the system, L1 to L3, with:

- The Inner cacheability attribute applied to L1 cache.
  - The Outer cacheability attribute applied to L2 and L3 cache.
- 

### Multi-register loads and stores that access Normal memory

For all instructions that load or store more than one general-purpose register from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load or store instructions.

For all instructions that load or store more than one general-purpose register from an Exception level the order in which the registers are accessed is not defined by the architecture.

For all instructions that load or store one or more registers from the SIMD and floating-point register file from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load or store instructions.

## E2.7.2 Device memory

The Device memory type attributes define memory locations where an access to the location can cause side-effects, or where the value returned for a load can vary depending on the number of loads performed. Typically, the Device memory attributes are used for memory-mapped peripherals and similar locations.

The attributes for ARMv8 Device memory are:

**Gathering** Identified as G or nG, see [Gathering on page E2-2788](#).

**Reordering** Identified as R or nR, see [Reordering on page E2-2789](#).

#### Early Write Acknowledgement hint

Identified as E or nE, see [Early Write Acknowledgement on page E2-2790](#).

The ARMv8 Device memory types are:

<b>Device-nGnRnE</b>	Device non-Gathering, non-Reordering, No Early write acknowledgement. Equivalent to the Strongly-ordered memory type in earlier versions of the architecture.
<b>Device-nGnRE</b>	Device non-Gathering, non-Reordering, Early Write Acknowledgement. Equivalent to the Device memory type in earlier versions of the architecture.
<b>Device-nGRE</b>	Device non-Gathering, Reordering, Early Write Acknowledgement. ARMv8 adds this memory type to the translation table formats found in earlier versions of the architecture. The use of barriers is required to order accesses to Device-nGRE memory. The Device-nGRE memory type is introduced into the AArch32 translation table formats when the PE is using the Long Descriptor Translation Table format.
<b>Device-GRE</b>	Device Gathering, Reordering, Early Write Acknowledgement.

ARMv8 adds this memory type to the translation table formats found in earlier versions of the architecture. Device-GRE memory has the fewest constraints. It behaves similar to Normal memory, with the restriction that speculative accesses to Device-GRE memory is forbidden.

The Device-GRE memory type is introduced into the AArch32 translation table formats when the PE is using the Long Descriptor Translation Table format.

Collectively these are referred to as *any Device memory type*. Going down the list, the memory types are described as getting *weaker*; conversely the going up the list the memory types are described as getting *stronger*.

---

**Note**

- As the list of types shows, these additional attributes are hierarchical. For example, a memory location that permits Gathering must also permit Reordering and Early Write Acknowledgement.
  - The architecture does not require an implementation to distinguish between each of these memory types and ARM recognizes that not all implementations will do so. The subsection that describes each of the attributes, describes the implementation rules for the attribute.
  - Earlier versions of the ARM architecture defined the following memory types:
    - Strongly-ordered memory. This is the equivalent of the Device-nGnRE memory type.
    - Device memory. This is the equivalent of the Device-nGnRE memory type.
- 

All of these memory types have the following properties:

- Speculative data accesses are not permitted to any memory location with any Device memory attribute. This means that each memory access to any Device memory type must be one that would be generated by a simple sequential execution of the program.

An exception to this applies:

- Reads generated by the Advanced SIMD and floating-point instructions can access bytes that are not explicitly accessed by the instruction if the bytes accessed are in a 16-byte window, aligned to 16-bytes, that contains at least one byte that is explicitly accessed by the instruction.

---

**Note**

- An instruction that generates a sequence of accesses as described in [Atomicity in the ARM architecture on page E2-2758](#) might be abandoned as a result of an exception being taken during the sequence of accesses. On return from the exception the instruction is restarted, and therefore one or more of the memory locations might be accessed multiple times. This can result in repeated accesses to a location where the program only defines a single access. For this reason, ARM strongly recommends that no accesses to Device memory are performed from a single instruction that spans the boundary of a translation granule or which in some other way could lead to some of the accesses being aborted.
  - Write speculation that is visible to other observers is prohibited for all memory types.
- 

- A write to a memory location with any Device memory attribute completes in finite time. This means that it is globally observed for all observers in the system in finite time.
- If a location with any Device memory attribute changes without an explicit write by an observer, this change must also be globally observed for all observers in the system in finite time. Such a change might occur in a peripheral location that holds status information.
- A completed write to a memory location with any Device memory attribute is globally observed for all observers in finite time without the need for explicit maintenance.
- Data accesses to memory locations are coherent for all observers in the system, and correspondingly are treated as being Outer Shareable.
- A memory location with any Device memory attribute cannot be allocated into a cache.
- Writes to a memory location with any Device memory attribute must reach the endpoint for that address in the memory system in finite time. Typically, the endpoint is a peripheral or some physical memory.

- All accesses to memory with any Device memory attribute must be aligned. Any unaligned access generates an Alignment fault at the first stage of translation that defined the location as being Device.

---

**Note**

In the Non-secure PL1&0 translation regime in systems where `HCR.TGE==1` and `HCR.DC==0`, any Alignment fault that results from the fact that all locations are treated as Device is a fault at the first stage of translation. This causes the value of `HSR.ISS.[24]` to be 0.

---

- Hardware does not prevent speculative instruction fetches from a memory location with any of the Device memory attributes unless the memory location is also marked as Execute-never for all Exception levels.

---

**Note**

This means that to prevent speculative instruction fetches from memory locations with Device memory attributes, any location that is assigned any Device memory type must also be marked as Execute-never for all Exception levels. Failure to mark a memory location with any Device memory attribute as Execute-never for all Exception levels is a programming error.

---

See also [Memory access restrictions on page E2-2791](#).

The memory types for Translation table walks cannot be defined as any Device memory type within the TCR. For the Non-secure EL1&0 translation regime, the memory accesses made during a stage 1 translation table walk are subject to a stage 2 translation, and as a result of this second stage of translation, the accesses from the first stage translation table walk might be made to memory locations with any Device memory type. These accesses might be made speculatively. When the value of the `HCR.PTW` bit is 1, a stage 2 permission fault is generated if a first stage translation table walk is made to any Device memory type.

For instruction fetches, if branches cause the program counter to point to an area of memory with the Device attribute which is not marked as Execute-never for the current Exception level, an implementation can either:

- Treat the instruction fetch as if it were to a memory location with the Normal Non-cacheable attribute.
- Take a Permission fault.

## Gathering

In the Device memory attribute:

**G** Indicates that the location has the Gathering attribute.

**nG** Indicates that the location does not have the Gathering attribute, meaning it is non-Gathering.

The Gathering attribute determines whether it is permissible for either:

- Multiple memory accesses of the same type, read or write, to the same memory location to be merged into a single transaction.
- Multiple memory accesses of the same type, read or write, to different memory locations to be merged into a single memory transaction on an interconnect.

For memory types with the Gathering attribute, either of these behaviors is permitted, provided that the ordering and coherency rules of the memory location are followed.

For memory types with the non-Gathering attribute, neither of these behaviors is permitted. As a result:

- The number of memory accesses that are made corresponds to the number that would be generated by a simple sequential execution of the program.
- All access occur at their programmed size, except that there is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register Load/Store instructions. See [Multi-register loads and stores that access Device memory on page E2-2790](#).

Gathering between memory accesses separated by a memory barrier that affects those memory accesses is not permitted. This applies if one memory access is in Group A and one memory access is in Group B. That is, gathering is not permitted between a memory access in Group A and a memory access in Group B if the two accesses are separated by a barrier that affects at least one of the accesses.

Gathering between two memory accesses generated by a Load-Acquire/Store-Release is not permitted.

A read from a memory location with the non-Gathering attribute cannot come from a cache or a buffer, but must come from the endpoint for that address in the memory system. Typically this is a peripheral or physical memory.

---

**Note**

- A read from a memory location with the Gathering attribute can come from intermediate buffering of a previous write, provided that:
    - The accesses are not separated by a DMB or DSB barrier that affects both of the accesses, for example if one access is in Group A and the other is in Group B.
    - The accesses are not separated by other ordering constructions that require that the accesses are in order. Such a construction might be a combination of Load-Acquire and Store-Release.
    - The accesses are not generated by a Store-Release instruction.
  - The ARM architecture only defines programmer visible behavior. Therefore, gathering can be performed if a programmer cannot tell whether gathering has occurred.
- 

An implementation is permitted to perform an access with the Gathering attribute in a manner consistent with the requirements specified by the Non-gathering attribute.

An implementation is not permitted to perform an access with the Non-gathering attribute in a manner consistent with the relaxations allowed by the Gathering attribute.

## Reordering

In the Device memory attribute:

- |           |   |
|-----------|---|
| <b>R</b>  | Indicates that the location has the Reordering attribute.   |
| <b>nR</b> | Indicates that the location does not have the Reordering attribute, meaning it is non-Reordering. |

For all memory types with the non-Reordering attribute, the order of memory accesses arriving at a single peripheral of IMPLEMENTATION DEFINED size, as defined by the peripheral, must be the same order that occurs in a simple sequential execution of the program. That is, the accesses appear in program order. This ordering applies to all accesses using any of the memory types with the non-Reordering attribute. As a result, if there is a mixture of Device-nGnRE and Device-nGnRnE accesses to the same peripheral, these occur in program order. If the memory accesses are not to a peripheral, then this attribute imposes no restrictions.

---

**Note**

- The IMPLEMENTATION DEFINED size of the single peripheral is the same as applies for the ordering guarantee provided by the DMB instruction.
  - The ARM architecture only defines programmer visible behavior. Therefore, reordering can be performed if a programmer cannot tell whether reordering has occurred.
- 

An implementation is permitted to perform an access with the Reordering attribute in a manner consistent with the requirements specified by the non-Reordering attribute.

An additional relaxation is that an implementation is not permitted to perform an access with the non-Reordering attribute in a manner consistent with the relaxations allowed by the Reordering attribute.

The non-Reordering attribute does not require any additional ordering, other than that which applies to Normal memory, between:

- Accesses with the non-Reordering attribute and accesses with the Reordering attribute.

- Accesses with the non-Reordering attribute and accesses to Normal memory.
- Accesses with the non-Reordering attribute and accesses to different peripherals of IMPLEMENTATION DEFINED size.

## Early Write Acknowledgement

In the Device memory attribute:

- E** Indicates that the location has the Early Write Acknowledgement attribute.  
**nE** Indicates that the location has the No Early Write Acknowledgement attribute.

Early Write Acknowledgement is a hint to the platform memory system. Assigning the No Early Write Acknowledgement attribute to a Device memory location recommends that only the endpoint of the write access returns a write acknowledgement of the access, and that no earlier point in the memory system returns a write acknowledge. This means that a DSB barrier, executed by the PE that performed the write to the No Early Write Acknowledgement location, completes only after the write has reached its endpoint in the memory system. Typically, this endpoint is a peripheral or physical memory.

When the Early Write Acknowledgement attribute is assigned to a Device memory location, there is no such recommendation for the handling of accesses to that location.

### ———— Note ————

- The Early Write Acknowledgement hint has no effect on the ordering rules. The purpose of signaling no Early Write Acknowledgement is to signal to the interconnect that the peripheral requires the ability to signal the acknowledgement. The No Write Acknowledgement signal also provides an additional semantic that can be interpreted by the driver that is accessing the peripheral.
- This attribute is treated as a hint, as the exact nature of the interconnects attached to a PE is outside the scope of the ARM architecture definition, and not all interconnects provide a mechanism to ensure that a write has reached the physical endpoint of the memory system.
- ARM recommends that writes with the No Early Write Acknowledgement hint are used for PCIe configuration writes. However, the mechanisms by which PCIe configuration writes are identified are IMPLEMENTATION DEFINED.
- ARM strongly recommends that the Early Write Acknowledgement hint is not ignored by a PE, but is made available for use by the system.

Because the No Early Write Acknowledgement attribute is a hint:

- An implementation is permitted to perform an access with the Early Write Acknowledgement attribute in a manner consistent with the requirements specified by the No Early Write Acknowledgement attribute.
- An implementation is permitted to perform an access with the No Early Write Acknowledgement attribute in a manner consistent with the relaxations allowed by the Early Write Acknowledgement attribute.

## Multi-register loads and stores that access Device memory

For all instructions that load or store more than one general-purpose register there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load and store instructions.

For all instructions that load or store one or more registers from the SIMD and floating-point register file there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load and store instructions.

For an LDRD, STRD, or LDM instruction with a register list that includes the PC, or an STM instruction with a register list that includes the PC, the order in which the registers are accessed is not defined by the architecture.

For a load or store of an Advanced SIMD element or structure, the order in which the registers are accessed is not defined by the architecture.

In ARMv8.0 only, for a VLDM, VSTM, LDM and STM instruction with a register list that does not include the PC, all registers are accessed in ascending address order for Device accesses with the non-Reordering attribute.

For a VLDM and VSTM instruction with a register list that does not include the PC, all registers are accessed in ascending address order for Device accesses with the non-Reordering attribute.

For a LDM and STM instruction with a register list that does not include the PC:

- When ARMv8.2-LSMAOC is not implemented, all registers are accessed in ascending address order for Device accesses with the non-Reordering attribute.
- When ARMv8.2-LSMAOC is implemented, and when SCTL.RLSMAOE is 1, then behavior at that Exception level is as if ARMv8.2-LSMAOC is not implemented.
- When ARMv8.2-LSMAOC is implemented, and when SCTL.RLSMAOE is 0, then memory accesses are not required to be ordered at that Exception level.

### E2.7.3 Memory access restrictions

The following restrictions apply to memory accesses:

- For accesses to any two bytes,  $p$  and  $q$ , that are generated by the same instruction:
  - The bytes  $p$  and  $q$  must have the same memory type and Shareability attributes. otherwise the results are CONSTRAINED UNPREDICTABLE. For example, an LDC, LDM, LDRD STC, STM or STRD instruction, or an unaligned load or store that spans the boundary between Normal memory and Device memory is CONSTRAINED UNPREDICTABLE.
  - Except for possible differences in the cache allocation hints, ARM deprecates having different cacheability attributes for bytes  $p$  and  $q$ .

For the permitted CONSTRAINED UNPREDICTABLE behavior, see [Crossing a page boundary with different memory types or Shareability attributes on page K1-6105](#).

- If the accesses of an instruction that causes multiple accesses to any type of Device memory cross a 4KB address boundary then behavior is CONSTRAINED UNPREDICTABLE and [Crossing a 4KB boundary with a Device access on page K1-6106](#) describes the permitted behaviors.

———— **Note** ————

- The boundary referred to is between two Device memory regions that are both of 4KB and aligned to 4KB.
- This restriction means it is important that an access to a volatile memory device is not made using a single instruction that crosses a 4KB address boundary.
- ARM expects this restriction to constrain the placing of volatile memory devices in the system memory map, rather than expecting a compiler to be aware of the alignment of memory accesses.

## E2.8 Mismatched memory attributes

In the ARMv8 architecture mismatched memory attributes are controlled by privileged software. For more information, see [Chapter G4 The AArch32 Virtual Memory System Architecture](#).

Physical memory locations are accessed with *mismatched attributes* if all accesses to the location do not use a common definition of all of the following attributes of that location:

- Memory type, Device or Normal.
- Shareability.
- Cacheability, for the same level of the inner or outer cache, but excluding any cache allocation hints.

Collectively these are referred to as memory attributes.

---

### Note

The terms *location* and *memory location* refer to any byte within the current coherency granule and are used interchangeably.

---

When a memory location is accessed with mismatched attributes the only software visible effects are one or more of the following:

- Uniprocessor semantics for reads and writes to that memory location might be lost. This means:
  - A read of the memory location by one agent might not return the value most recently written to that memory location by the same agent.
  - Multiple writes to the memory location by one agent with different memory attributes might not be ordered in program order.
- There might be a loss of coherency when multiple agents attempt to access a memory location.
- There might be a loss of properties derived from the memory type, as described in later bullets in this section.
- If all Load-Exclusive/Store-Exclusive instructions executed across all threads to access a given memory location do not use consistent memory attributes, the Exclusives monitor state becomes UNKNOWN.
- Bytes written without the Write-Back cacheable attribute within the same Write-Back granule as bytes written with the Write-Back cacheable attribute might have their values reverted to the old values as a result of cache Write-Back.

The loss of properties associated with mismatched memory type attributes refers only to the following properties of Device memory that are additional to the properties of Normal memory:

- Prohibition of speculative read accesses.
- Prohibition on Gathering.
- Prohibition on Re-ordering.

For the following situations, when a physical memory location is accessed with mismatched attributes, a more restrictive set of behaviors applies. The description of each situation also describes the behaviors that apply:

1. If the only memory type mismatch associated with a memory location across all users of the memory location is between different types of Device memory, then all accesses might take the properties of the weakest Device memory type.
2. Any agent that reads that memory location using the same common definition of the Shareability and Cacheability attributes is guaranteed to access it coherently, to the extent required by that common definition of the memory attributes, only if all the following conditions are met:
  - All writes are performed to an alias of the memory location that uses the same definition of the Shareability and Cacheability attributes.
  - Either:
    - In the Non-secure PL1&0 translation regime, [HCR2](#).MIOCNCE has a value of 0.
    - All aliases with write permission have the Inner Cacheability attribute the same as the Outer Cacheability attribute.

- Either:
  - All writes are performed to an alias of the memory location that has Inner Cacheability and Outer Cacheability attributes both as Non-cacheable.
  - All aliases to a memory location use a definition of the Shareability attributes that encompasses all the agents with permission to access the location.
- 3. The possible software-visible effects caused by mismatched attributes for a memory location are defined more precisely if all of the mismatched attributes define the memory location as one of:
  - Any Device memory type.
  - Normal Inner Non-cacheable, Outer Non-cacheable memory.

In these cases, the only permitted software-visible effects of the mismatched attributes are one or more of the following:

- Possible loss of properties derived from the memory type when multiple agents attempt to access the memory location.
- Possible reordering of memory transactions to the same memory location with different memory attributes, potentially leading to a loss of coherency or uniprocessor semantics. Any possible loss of coherency or uniprocessor semantics can be avoided by inserting DMB barrier instructions between accesses to the same memory location that might use different attributes.

Where there is a loss of the uniprocessor semantics, ordering, or coherency, the following approaches can be used:

1. If the mismatched attributes for a memory location all assign the same Shareability attribute to the location, any loss of uniprocessor semantics, ordering, or coherency within a Shareability domain can be avoided by use of software cache management. To do so, software must use the techniques that are required for the software management of the ordering or coherency of cacheable locations between agents in different shareability domains. This means:
  - Before writing to a location not using the Write-Back attribute, software must invalidate, or clean, a location from the caches if any agent might have written to the location with the Write-Back attribute. This avoids the possibility of overwriting the location with stale data.
  - After writing to a location with the Write-Back attribute, software must clean the location from the caches, to make the write visible to external memory.
  - Before reading the location with a cacheable attribute, software must invalidate, or clean and invalidate, the location from the caches, to ensure that any value held in the caches reflects the last value made visible in external memory.
  - Executing a DMB barrier instruction, with scope that applies to the common Shareability of the accesses, between any accesses to the same memory location that use different attributes.

———— **Note** ————

In AArch32 state, cache maintenance instructions can only be accessed from an Exception level that is higher than EL0, and therefore require a system call. For information on system calls, see [Exception-generating and exception-handling instructions on page F1-2827](#). For information about the AArch32 cache maintenance instructions, see [AArch32 cache and branch predictor support on page G3-4525](#).

In all cases:

- Location refers to any byte within the current coherency granule.
- A clean and invalidate instruction can be used instead of a clean instruction, or instead of an invalidate instruction.
- In the sequences outlined in this section, all cache maintenance instructions and memory transactions must be completed, or ordered by the use of barrier operations, if they are not naturally ordered by the use of a common address, see [Ordering of cache and branch predictor maintenance instructions on page G3-4543](#).

---

**Note**

---

With software management of coherency, race conditions can cause loss of data. A race condition occurs when different agents write simultaneously to bytes that are in the same location, and the invalidate, write, clean sequence of one agent overlaps with the equivalent sequence of another agent. A race condition also occurs if the first operation of either sequence is a clean, rather than an invalidate.

---

2. If the mismatched attributes for a location mean that multiple cacheable accesses to the location might be made with different Shareability attributes, then ordering and coherency are guaranteed only if:
  - Each PE that accesses the location with a cacheable attribute performs a clean and invalidate of the location before and after accessing that location.
  - A DMB barrier with scope that covers the full Shareability of the accesses is placed between any accesses to the same memory location that use different attributes.

---

**Note**

---

The Note in rule 1 of this list, about possible race conditions, also applies to this rule.

---

In addition, if multiple agents attempt to use Load-Exclusive or Store-Exclusive instructions to access a location, and the accesses from the different agents have different memory attributes associated with the location, the Exclusives monitor state becomes UNKNOWN.

ARM strongly recommends that software does not use mismatched attributes for aliases of the same location. An implementation might not optimize the performance of a system that uses mismatched aliases.

## E2.9 Synchronization and semaphores

ARMv8 provides non-blocking synchronization of shared memory, using *synchronization primitives*. The information in this section about memory accesses by synchronization primitives applies to accesses to both Normal and Device memory.

### ———— Note ————

Use of the ARMv8 synchronization primitives scales for multiprocessing system designs.

Table E2-6 shows the synchronization primitives and the associated CLREX instruction.

**Table E2-6 Synchronization primitives and associated instruction, T32 and A32 instruction sets**

Transaction size	Additional semantics	Load-Exclusive <sup>a</sup>	Store-Exclusive <sup>a</sup>	Other <sup>a</sup>
Byte	-	LDREXB	STREXB	-
	Load-Acquire/Store-Release	LDAEXB	STLEXB	-
Halfword	-	LDREXH	STREXH	-
	Load-Acquire/Store-Release	LDAEXH	STLEXH	-
Word	-	LDREX	STREX	-
	Load-Acquire/Store-Release	LDAEX	STLEX	-
Doubleword	-	LDREXD	STREXD	-
	Load-Acquire/Store-Release	LDAEXD	STLEXD	-
None	Clear-Exclusive	-	-	CLREX

a. Instruction in the T32 and A32 instruction sets.

Except for the row showing the CLREX instruction, the two instructions in a single row are a Load-Exclusive/Store-Exclusive instruction pair. The model for the use of a Load-Exclusive/Store-Exclusive instruction pair accessing a non-aborting memory address *x* is:

- The Load-Exclusive instruction reads a value from memory address *x*.
- The corresponding Store-Exclusive instruction succeeds in writing back to memory address *x* only if no other observer, process, or thread has performed a more recent store to address *x*. The Store-Exclusive instruction returns a status bit that indicates whether the memory write succeeded.

A Load-Exclusive instruction marks a small block of memory for exclusive access. The size of the marked block is IMPLEMENTATION DEFINED, see [Marking and the size of the marked memory block on page E2-2801](#). A Store-Exclusive instruction to any address in the marked block clears the marking.

### ———— Note ————

In this section, the term PE includes any observer that can generate a Load-Exclusive or a Store-Exclusive instruction.

The following sections give more information:

- [Exclusive access instructions and Non-shareable memory locations on page E2-2796](#).
- [Exclusive access instructions and shareable memory locations on page E2-2798](#).
- [Marking and the size of the marked memory block on page E2-2801](#).
- [Context switch support on page E2-2802](#).
- [Load-Exclusive and Store-Exclusive instruction usage restrictions on page E2-2802](#).
- [Use of WFE and SEV instructions by spin-locks on page E2-2804](#).

## E2.9.1 Exclusive access instructions and Non-shareable memory locations

For memory locations for which the Shareability attribute is Non-shareable, the exclusive access instructions rely on a *local Exclusives monitor*, or *local monitor*, that marks any address from which the PE executes a Load-Exclusive instruction. Any non-aborted attempt by the same PE to use a Store-Exclusive instruction to modify any address is guaranteed to clear the marking.

A Load-Exclusive instruction performs a load from memory, and:

- The executing PE marks the physical memory address for exclusive access.
- The local monitor of the executing PE transitions to the Exclusive Access state.

A Store-Exclusive instruction performs a conditional store to memory that depends on the state of the local monitor:

### If the local monitor is in the Exclusive Access state

- If the address of the Store-Exclusive instruction is the same as the address that has been marked in the monitor by an earlier Load-Exclusive instruction, then the store occurs. Otherwise, it is IMPLEMENTATION DEFINED whether the store occurs.
- A status value is returned to a register:
  - If the store took place the status value is 0.
  - Otherwise, the status value is 1.
- The local monitor of the executing PE transitions to the Open Access state.

When an Exclusives monitor is in the Exclusive Access state the monitor is *set*.

### If the local monitor is in the Open Access state

- No store takes place.
- A status value of 1 is returned to a register.
- The local monitor remains in the Open Access state.

When an Exclusives monitor is in the Exclusive Access state the monitor is *clear*.

The Store-Exclusive instruction defines the register to which the status value is returned.

When a PE writes using any instruction other than a Store-Exclusive instruction:

- If the write is to a physical address that is not marked as Exclusive Access by its local monitor and that local monitor is in the Exclusive Access state it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.
- If the write is to a physical address that is marked as Exclusive Access by its local monitor it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.

It is IMPLEMENTATION DEFINED whether a store to a marked physical address causes a mark in the local monitor to be cleared if that store is by an observer other than the one that caused the physical address to be marked.

Figure E2-4 on page E2-2797 shows the state machine for the local monitor and the effect of each of the operations shown in the figure.

Operations marked \* are possible alternative IMPLEMENTATION DEFINED options.

In the diagram: LoadExc1 represents any Load-Exclusive instruction

StoreExc1 represents any Store-Exclusive instruction

Store represents any other store instruction.

Any LoadExc1 operation updates the marked address to the most significant bits of the address x used for the operation.

**Figure E2-4 Local monitor state machine diagram**

For more information about marking see [Marking and the size of the marked memory block](#) on page E2-2801.

#### ———— Note ————

For the local monitor state machine, as shown in [Figure E2-4](#):

- The IMPLEMENTATION DEFINED options for the local monitor are consistent with the local monitor being constructed so that it does not hold any physical address, but instead treats any access as matching the address of the previous Load-Exclusive instruction.
- A local monitor implementation can be unaware of Load-Exclusive and Store-Exclusive instructions from other PEs.
- The architecture does not require a load instruction, by another PE, that is not a Load-Exclusive instruction, to have any effect on the local monitor.
- It is IMPLEMENTATION DEFINED whether the transition from Exclusive Access to Open Access state occurs when the Store or StoreExc1 is from another observer.

### Changes to the local monitor state resulting from speculative execution

The architecture permits a local monitor to transition to the Open Access state as a result of speculation, or from some other cause. This is in addition to the transitions to Open Access state caused by the architectural execution of an operation shown in [Figure E2-4](#).

An implementation must ensure that:

- The local monitor cannot be seen to transition to the Exclusive Access state except as a result of the architectural execution of one of the operations shown in [Figure E2-4](#).
- Any transition of the local monitor to the Open Access state not caused by the architectural execution of an operation shown in [Figure E2-4](#) must not indefinitely delay forward progress of execution.

## E2.9.2 Exclusive access instructions and shareable memory locations

In the context of this section, a shareable memory location is a memory location that has, or is treated as if it has, a Shareability attribute of Inner Shareable or Outer Shareable.

For shareable memory locations, exclusive access instructions rely on:

- A *local monitor* for each PE in the system, that marks any address from which the PE executes a Load-Exclusive. The local monitor operates as described in *Exclusive access instructions and Non-shareable memory locations on page E2-2796*, except that for shareable memory any Store-Exclusive is then subject to checking by the global monitor if it is described in that section as doing at least one of the following:
  - Updating memory.
  - Returning a status value of 0.

The local monitor can ignore accesses from other PEs in the system.

- A *global monitor* that marks a physical address as exclusive access for a particular PE. This marking is used later to determine whether a Store-Exclusive to that address that has not been failed by the local monitor can occur. Any successful write to the marked block by any other observer in the Shareability domain of the memory location is guaranteed to clear the marking. For each PE in the system, the global monitor:
  - Can hold at least one marked block.
  - Maintains a state machine for each marked block it can hold.

### ———— Note ————

For each PE, the architecture only requires global monitor support for a single marked address. Any situation that might benefit from the use of multiple marked addresses on a single PE is CONstrained UNPREDICTABLE, see *Load-Exclusive and Store-Exclusive instruction usage restrictions on page E2-2802*.

### ———— Note ————

The global monitor can either reside in a block that is part of the hardware on which the PE executes or exist as a secondary monitor at the memory interfaces. The IMPLEMENTATION DEFINED aspects of the monitors mean that the global monitor and local monitor can be combined into a single unit, provided that the unit performs the global monitor and local monitor functions defined in this manual.

For shareable memory locations, in some implementations and for some memory types, the properties of the global monitor require functionality outside the PE. Some system implementations might not implement this functionality for all locations of memory. In particular, this can apply to:

- Any type of memory in the system implementation that does not support hardware cache coherency.
- Non-cacheable memory, or memory treated as Non-cacheable, in an implementation that does support hardware cache coherency.

In such a system, it is defined by the system:

- Whether the global monitor is implemented.
- If the global monitor is implemented, which address ranges or memory types it monitors.

### ———— Note ————

To support the use of the Load-Exclusive/Store-Exclusive mechanism when address translation is disabled, a system might define at least one location of memory, of at least the size of the translation granule, in the system memory map to support the global monitor for all PEs within a common Inner Shareable domain. However, this is not an architectural requirement. Therefore, architecturally-compliant software that requires mutual exclusion must not rely on using the Load-Exclusive/Store-Exclusive mechanism, and must instead use a software algorithm such as Lamport's Bakery algorithm to achieve mutual exclusion.

Because implementations can choose which memory types are treated as Non-cacheable, the only memory types for which it is architecturally guaranteed that a global Exclusives monitor is implemented are:

- Inner Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hint and Write allocation hint and not transient.
- Outer Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hint and Write allocation hints and not transient.

The set of memory types that support atomic instructions must include all of the memory types for which a global monitor is implemented.

If the global monitor is not implemented for an address range or memory type, then performing a Load-Exclusive/Store-Exclusive instruction to such a location has one or more of the following effects:

- The instruction generates an external abort.
  - The instruction generates an IMPLEMENTATION DEFINED MMU fault. This is reported using the Fault status code of:
    - **DFSR.STATUS** = 0b110101 when using the Long-descriptor translation table format. The fault can also be reported in the **HSR.ISS[5:0]** field for exceptions to Hyp mode.
    - **DFSR.FS** = 0b10101 when using the Short-descriptor translation table format.
- If the IMPLEMENTATION DEFINED MMU fault is generated for the Non-secure PL1&0 translation regime then:
- If the fault is generated because of the memory type defined in the first stage of translation, or if the second stage of translation is disabled, then this is a first stage fault and the exception is taken to EL1.
  - Otherwise, the fault is a second stage fault and the exception is taken to EL2.
- The priority of this fault is IMPLEMENTATION DEFINED.
- The instruction is treated as a NOP.
  - The Load-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN.
  - The Store-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN.
  - The value held in the result register of the Store-Exclusive instruction becomes UNKNOWN.

In addition, for write transactions generated by non-PE observers that do not implement exclusive accesses or other atomic access mechanisms, the effect that writes have on the global and local monitors used by an ARM PE is IMPLEMENTATION DEFINED. The writes might not clear the global monitors of other PEs for:

- Some address ranges.
- Some memory types.

## Operation of the global Exclusives monitor

A Load-Exclusive instruction from shareable memory performs a load from memory, and causes the physical address of the access to be marked as exclusive access for the requesting PE. This access can also cause the exclusive access mark to be removed from any other physical address that has been marked by the requesting PE.

### ———— Note —————

The global monitor only supports a single outstanding exclusive access to shareable memory for each PE.

A Load-Exclusive instruction by one PE has no effect on the global monitor state for any other PE.

A Store-Exclusive instruction performs a conditional store to memory:

- The store is guaranteed to succeed only if the physical address accessed is marked as exclusive access for the requesting PE and both the local monitor and the global monitor state machines for the requesting PE are in the Exclusive Access state. In this case:
  - A status value of 0 is returned to a register to acknowledge the successful store.
  - The final state of the global monitor state machine for the requesting PE is IMPLEMENTATION DEFINED.
  - If the address accessed is marked for exclusive access in the global monitor state machine for any other PE then that state machine transitions to Open Access state.
- If no address is marked as exclusive access for the requesting PE, the store does not succeed:
  - A status value of 1 is returned to a register to indicate that the store failed.
  - The global monitor is not affected and remains in Open Access state for the requesting PE.
- If a different physical address is marked as exclusive access for the requesting PE, it is IMPLEMENTATION DEFINED whether the store succeeds or not:
  - If the store succeeds a status value of 0 is returned to a register, otherwise a value of 1 is returned.
  - If the global monitor state machine for the PE was in the Exclusive Access state before the Store-Exclusive instruction it is IMPLEMENTATION DEFINED whether that state machine transitions to the Open Access state.

The Store-Exclusive instruction defines the register to which the status value is returned.

In a shared memory system, the global monitor implements a separate state machine for each PE in the system. The state machine for accesses to shareable memory by PE(n) can respond to all the shareable memory accesses visible to it. This means it responds to:

- Accesses generated by PE(n).
- Accesses generated by the other observers in the Shareability domain of the memory location. These accesses are identified as (!n).

In a shared memory system, the global monitor implements a separate state machine for each observer that can generate a Load-Exclusive or a Store-Exclusive instruction in the system.

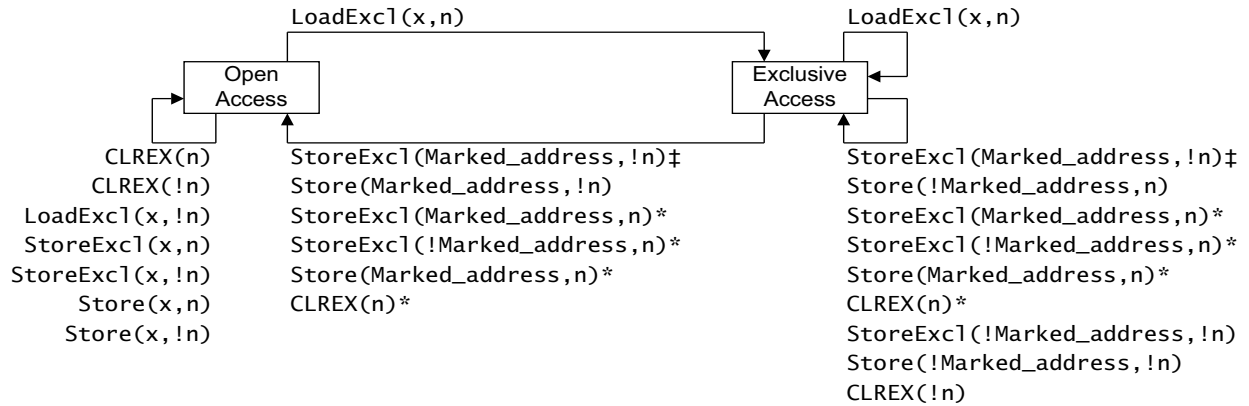

A global monitor:

- In the Exclusive Access state is *set*.
- In the Open Access state is *clear*.

#### **Clear global monitor event**

Whenever the global monitor state for a PE changes from Exclusive access to Open access, an event is generated and held in the Event register for that PE. This register is used by the Wait for Event mechanism, see [Wait For Event and Send Event](#) on page G1-4403.

Figure E2-5 on page E2-2801 shows the state machine for PE(n) in a global monitor.

‡StoreExc1(Marked\_address, !n) clears the monitor only if the StoreExc1 updates memory

Operations marked \* are possible alternative IMPLEMENTATION DEFINED options.

In the diagram: LoadExc1 represents any Load-Exclusive instruction

StoreExc1 represents any Store-Exclusive instruction

Store represents any other store instruction.

Any LoadExc1 operation updates the marked address to the most significant bits of the address x used for the operation.

**Figure E2-5 Global monitor state machine diagram for PE(n) in a multiprocessor system**

For more information about marking see [Marking and the size of the marked memory block](#).

#### ———— Note ————

For the global monitor state machine, as shown in [Figure E2-5](#):

- The architecture does not require a load instruction by another PE, that is not a Load-Exclusive instruction, to have any effect on the global monitor.
- Whether a Store-Exclusive instruction successfully updates memory or not depends on whether the address accessed matches the marked shareable memory address for the PE issuing the Store-Exclusive instruction, and whether the local and global monitors are in the exclusive state. For this reason, [Figure E2-5](#) only shows how the operations by (!n) cause state transitions of the state machine for PE(n).
- A Load-Exclusive instruction can only update the marked shareable memory address for the PE issuing the Load-Exclusive instruction.
- When the global monitor is in the Exclusive Access state, it is IMPLEMENTATION DEFINED whether a CLREX instruction causes the global monitor to transition from Exclusive Access to Open Access state.
- It is IMPLEMENTATION DEFINED:
  - Whether a modification to a Non-shareable memory location can cause a global monitor to transition from Exclusive Access to Open Access state.
  - Whether a Load-Exclusive instruction to a Non-shareable memory location can cause a global monitor to transition from Open Access to Exclusive Access state.

### E2.9.3 Marking and the size of the marked memory block

When a Load-Exclusive instruction is executed, the resulting marked block ignores the least significant bits of the 64-bit memory address.

When a Load-Exclusive instruction is executed, a marked block of size  $2^a$  bytes is created by ignoring the least significant bits of the memory address. A marked address is any address within this marked block. The size of the marked memory block is called the *Exclusives reservation granule*. The Exclusives reservation granule is IMPLEMENTATION DEFINED in the range 4 - 512 words.

---

**Note**

This definition means that the Exclusives reservation granule is:

- 4 words in an implementation where  $a$  is 4.
- 512 words in an implementation where  $a$  is 11.

For example, in an implementation where  $a$  is 4, a successful LDREXB of address 0x341B4 defines a marked block using bits[47:4] of the address. This means that the four words of memory from 0x341B0 to 0x341BF are marked for exclusive access.

---

In some implementations the CTR identifies the Exclusives reservation granule, see [CTR](#). Otherwise, software must assume that the maximum Exclusives reservation granule, 512 words, is implemented.

## E2.9.4 Context switch support

An exception return clears the local monitor. As a result, performing a CLREX instruction as part of a context switch is not required in most situations.

---

**Note**

Context switching is not an application level operation. However, this information is included here to complete the description of the exclusive operations.

---

## E2.9.5 Load-Exclusive and Store-Exclusive instruction usage restrictions

The Load-Exclusive and Store-Exclusive instructions are intended to work together as a pair, for example a LDREX/STREX pair or a LDREXB/STREXB pair. To support different implementations of these functions, software must follow the notes and restrictions given in this subsection.

The following notes describe use of a Load-Exclusive/ Store-Exclusive instruction pair, LoadExc1/StoreExc1, to indicate the use of any of the Load-Exclusive/Store-Exclusive instruction pairs shown in [Table E2-6 on page E2-2795](#). In this context, a LoadExc1/StoreExc1 pair comprises two instructions in the same thread of execution:

- The exclusives support a single outstanding exclusive access for each PE thread that is executed. The architecture makes use of this by not requiring an address or size check as part of the `IsExclusiveLocal()` function. If the target virtual address of a StoreExc1 is different from the virtual address of the preceding LoadExc1 instruction in the same thread of execution, behavior can be CONSTRAINED UNPREDICTABLE with the following behavior:
  - The StoreExc1 either passes or fails, and the status value returned by the StoreExc1 is UNKNOWN.

---

**Note**

This means the StoreExc1 might pass for some instances of a LoadExc1/StoreExc1 pair with mismatched addresses, and fail for other instances of a LoadExc1/StoreExc1 pair with mismatched addresses.

---

- The data at the address accessed by the LoadExc1, and at the address accessed by the StoreExc1, is UNKNOWN.

This means software can rely on a LoadExc1/StoreExc1 pair to eventually succeed only if the LoadExc1 and the StoreExc1 are executed with the same virtual address.

- If two StoreExc1 instructions are executed without an intervening LoadExc1 instruction the second StoreExc1 instruction returns a status value of 1. This means that:
  - ARM recommends that, in a given thread of execution, every StoreExc1 instruction has a preceding LoadExc1 instruction associated with it.

It is not necessary for every LoadExc1 instruction to have a subsequent StoreExc1 instruction.

- An implementation of the Load-Exclusive and Store-Exclusive instructions can require that, in any thread of execution, the transaction size of a StoreExc1 instruction is the same as the transaction size of the preceding LoadExc1 instruction executed in that thread. If the transaction size of a StoreExc1 instruction is different from the preceding LoadExc1 instruction in the same thread of execution, behavior can be CONSTRAINED UNPREDICTABLE with the following behavior:

— The StoreExc1 either passes or fails, and the status value returned by the StoreExc1 is UNKNOWN.

———— **Note** —————

This means the StoreExc1 might pass for some instances of a LoadExc1/StoreExc1 pair with mismatched transaction sizes, and fail for other instances of a LoadExc1/StoreExc1 pair with mismatched transaction sizes.

— The block of data of the size of the larger of the transaction sizes used by the LoadExc1/StoreExc1 pair at the address accessed by the LoadExc1/StoreExc1 pair, is UNKNOWN.

This means software can rely on a LoadExc1/StoreExc1 pair to eventually succeed only if the LoadExc1 and the StoreExc1 have the same transaction size.

- LoadExc1/StoreExc1 loops are guaranteed to make forward progress only if, for any LoadExc1/StoreExc1 loop within a single thread of execution, the software meets all of the following conditions:

- 1 Between the Load-Exclusive and the Store-Exclusive, there are no explicit memory accesses, preloads, direct or indirect System register writes, address translation instructions, cache or TLB maintenance instructions, exception generating instructions, exception returns, or indirect branches.
- 2 Between the Store-Exclusive returning a failing result and the retry of the corresponding Load-Exclusive:
  - There are no stores or PLDW instructions to any address within the Exclusives reservation granule accessed by the Store-Exclusive.
  - There are no loads or preloads to any address within the Exclusives reservation granule accessed by the Store-Exclusive that use a different VA alias to that address.
  - There are no direct or indirect System register writes, other than changes to the flag fields in the **CPSR** or **FPSCR**, caused by data processing or comparison instructions.
  - There are no direct or indirect address translation instructions, cache or TLB maintenance instructions, exception generating instructions, exception returns, or indirect branches.
  - All loads and stores are to a block of contiguous virtual memory of not more than 512 bytes in size.

The Exclusives monitor can be cleared at any time without an application-related cause, provided that such clearing is not systematically repeated so as to prevent the forward progress in finite time of at least one of the threads that is accessing the Exclusives monitor.

- Implementations can benefit from keeping the LoadExc1 and StoreExc1 operations close together in a single thread of execution. This minimizes the likelihood of the Exclusives monitor state being cleared between the LoadExc1 instruction and the StoreExc1 instruction. Therefore, for best performance, ARM strongly recommends a limit of 128 bytes between LoadExc1 and StoreExc1 instructions in a single thread of execution.
- The architecture sets an upper limit of 2048 bytes on the Exclusives reservation granule that can be marked as exclusive. For performance reasons, ARM recommends that objects that are accessed by exclusive accesses are separated by the size of the Exclusives reservation granule. This is a performance guideline rather than a functional requirement.
- After taking a Data Abort exception, the state of the Exclusives monitors is UNKNOWN.
- For the memory location accessed by a LoadExc1/StoreExc1 pair, if the memory attributes for a StoreExc1 instruction are different from the memory attributes for the preceding LoadExc1 instruction in the same thread of execution, behavior is CONSTRAINED UNPREDICTABLE. Where this occurs because the translation of the accessed address changes between the LoadExc1 instruction and the StoreExc1 instruction, the CONSTRAINED UNPREDICTABLE behavior is as follows:
  - The StoreExc1 either passes or fails, and the status value returned by the StoreExc1 is UNKNOWN.

---

**Note**

This means the StoreExc1 might pass for some instances of a LoadExc1/StoreExc1 pair with changed memory attributes, and fail for other instances of a LoadExc1/StoreExc1 pair with changed memory attributes.

- 
- The data at the address accessed by the StoreExc1 is UNKNOWN.

---

**Note**

Another bullet point in this list covers the case where the memory attributes of a LoadExc1/StoreExc1 pair differ as a result of using different virtual addresses with different attributes that point to the same physical address.

- 
- The effect of a data or unified cache invalidate, clean, or clean and invalidate instruction on a local or global Exclusives monitor that is in the Exclusive Access state is CONSTRAINED UNPREDICTABLE, and the instruction might clear the monitor, or it might leave it in the Exclusive Access state. For address-based maintenance instructions, this also applies to the monitors of other PEs in the same Shareability domain as the PE executing the cache maintenance instruction, as determined by the Shareability domain of the address being maintained.

---

**Note**

ARM strongly recommends that implementations ensure that the use of such maintenance instructions by a PE in the Non-secure state cannot cause a denial of service on a PE in the Secure state.

- 
- If the mapping of the virtual to physical address is changed between the LoadExc1 instruction and the StoreExc1 instruction, and the change is performed using a break-before-make sequence as described in [Using break-before-make when updating translation table entries on page G4-4633](#), if the StoreExc1 is performed after another write to the same physical address as the StoreExc1, and that other write was performed after the old translation was properly invalidated and that invalidation was properly synchronized, then the StoreExc1 will not pass its monitor check.

---

**Note**

ARM expects that, in many implementations, either:

- The TLB invalidation will clear either the local or global monitor.
- The physical address will be checked between the LoadExc1 and StoreExc1.

---

**Note**

In the event of repeatedly-contending LoadExc1/StoreExc1 instruction sequences from multiple PEs, an implementation must ensure that forward progress is made by at least one PE.

## E2.9.6 Use of WFE and SEV instructions by spin-locks

ARMv8 provides Wait For Event, Send Event, and Send Event Local instructions, WFE, SEV, SEVL, that can assist with reducing power consumption and bus contention caused by PEs repeatedly attempting to obtain a spin-lock. These instructions can be used at the application level, but a complete understanding of what they do depends on a system level understanding of exceptions. They are described in [Wait For Event and Send Event on page G1-4403](#). However, in ARMv8, when the global monitor for a PE changes from Exclusive Access state to Open Access state, an event is generated.

---

**Note**

This is equivalent to issuing an SEVL instruction on the PE for which the monitor state has changed. It removes the need for spinlock code to include an SEV instruction after clearing a spinlock.

# Part F

## **The AArch32 Instruction Sets**

# Chapter F1

## The AArch32 Instruction Sets Overview

This chapter describes the T32 and A32 instruction sets. It contains the following sections:

- *Support for instructions in different versions of the ARM architecture* on page F1-2808.
- *Unified Assembler Language* on page F1-2809.
- *Branch instructions* on page F1-2811.
- *Data-processing instructions* on page F1-2812.
- *PSTATE and banked register access instructions* on page F1-2820.
- *Load/store instructions* on page F1-2821.
- *Load/store multiple instructions* on page F1-2824.
- *Miscellaneous instructions* on page F1-2825.
- *Exception-generating and exception-handling instructions* on page F1-2827.
- *System register access instructions* on page F1-2828.
- *Advanced SIMD and floating-point load/store instructions* on page F1-2829.
- *Advanced SIMD and floating-point register transfer instructions* on page F1-2831.
- *Advanced SIMD data-processing instructions* on page F1-2832.
- *Floating-point data-processing instructions* on page F1-2840.

## F1.1 Support for instructions in different versions of the ARM architecture

This manual describes the ARM AArch32 instruction sets, T32 and A32, for the ARMv8 architecture. Therefore, it indicates how any options or extensions in the ARMv8 architecture affect the available instructions.

This manual does not provide any information about which T32 and A32 instructions were supported in specific earlier versions of the architecture. For this information, see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

## F1.2 Unified Assembler Language

This manual uses the ARM *Unified Assembler Language* (UAL). This assembly language syntax provides a canonical form for all T32 and A32 instructions.

UAL describes the syntax for the mnemonic and the operands of each instruction. In addition, it assumes that instructions and data items can be given labels. It does not specify the syntax to be used for labels, nor what assembler directives and options are available. See your assembler documentation for these details.

Most earlier ARM assembly language mnemonics are still supported as synonyms, as described in the instruction details.

### ———— **Note** ————

Most earlier T32 assembly language mnemonics are *not* supported.

UAL includes *instruction selection* rules that specify which instruction encoding is selected when more than one can provide the required functionality. For example, both 16-bit and 32-bit encodings exist for an `ADD R0, R1, R2` instruction. The most common instruction selection rule is that when both a 16-bit encoding and a 32-bit encoding are available, the 16-bit encoding is selected, to optimize code density.

Syntax options exist to override the normal instruction selection rules and ensure that a particular encoding is selected. These are useful when disassembling code, to ensure that subsequent assembly produces the original code, and in some other situations.

### F1.2.1 Conditional instructions

For maximum portability of UAL assembly language between the T32 and A32 instruction sets, ARM recommends that:

- IT instructions are written before conditional instructions in the correct way for the T32 instruction set.
- When assembling to the A32 instruction set, assemblers check that any IT instructions are correct, but do not generate any code for them.

Although other T32 instructions are unconditional, all instructions that are made conditional by an IT instruction must be written with a condition. These conditions must match the conditions imposed by the IT instruction. For example, an `ITEE EQ` instruction imposes the EQ condition on the first two following instructions, and the NE condition on the next two. Those four instructions must be written with EQ, EQ, NE and NE conditions respectively.

Some instructions cannot be made conditional by an IT instruction. Some instructions can be conditional if they are the last instruction in the IT block, but not otherwise.

The branch instruction encodings that include a Condition code field cannot be made conditional by an IT instruction. If the assembler syntax indicates a conditional branch that correctly matches a preceding IT instruction, it is assembled using a branch instruction encoding that does not include a Condition code field.

### ———— **Note** ————

For performance reasons ARMv8 deprecates many uses of IT, see [Partial deprecation of IT on page F1-2826](#). As described in that section, an implementation can include ITD controls that disable those uses of IT, making them UNDEFINED.

### F1.2.2 Use of labels in UAL instruction syntax

The UAL syntax for some instructions includes the label of an instruction or a literal data item that is at a fixed offset from the instruction being specified. The assembler must:

1. Calculate the PC or `Align(PC, 4)` value of the instruction. The PC value of an instruction is its address plus 4 for a T32 instruction, or plus 8 for an A32 instruction. The `Align(PC, 4)` value of an instruction is its PC value ANDed with `0xFFFFF0` to force it to be word-aligned. There is no difference between the PC and `Align(PC, 4)` values for an A32 instruction, but there can be for a T32 instruction.

2. Calculate the offset from the PC or `Align(PC, 4)` value of the instruction to the address of the labeled instruction or literal data item.
3. Assemble a *PC-relative* encoding of the instruction, that is, one that reads its PC or `Align(PC, 4)` value and adds the calculated offset to form the required address.

---

**Note**

---

For instructions that can encode a subtraction operation, if the instruction cannot encode the calculated offset but can encode minus the calculated offset, the instruction encoding specifies a subtraction of minus the calculated offset.

---

The syntax of the following instructions includes a label:

- B, BL, and BLX (immediate). The assembler syntax for these instructions always specifies the label of the instruction that they branch to. Their encodings specify a sign-extended immediate offset that is added to the PC value of the instruction to form the target address of the branch.
- CBNZ and CBZ. The assembler syntax for these instructions always specifies the label of the instruction that they branch to. Their encodings specify a zero-extended immediate offset that is added to the PC value of the instruction to form the target address of the branch. They do not support backward branches.
- LDR, LDRB, LDRD, LDRH, LDRSB, LDRSH, PLD, PLDW, PLI, and VLDR. The normal assembler syntax of these load instructions can specify the label of a literal data item that is to be loaded. The encodings of these instructions specify a zero-extended immediate offset that is either added to or subtracted from the `Align(PC, 4)` value of the instruction to form the address of the data item. A few such encodings perform a fixed addition or a fixed subtraction and must only be used when that operation is required, but most contain a bit that specifies whether the offset is to be added or subtracted.

When the assembler calculates an offset of 0 for the normal syntax of these instructions, it must assemble an encoding that adds 0 to the `Align(PC, 4)` value of the instruction. Encodings that subtract 0 from the `Align(PC, 4)` value cannot be specified by the normal syntax.

There is an alternative syntax for these instructions that specifies the addition or subtraction and the immediate offset explicitly. In this syntax, the label is replaced by `[PC, #+/-<imm>]`, where:

- +/-            Is + or omitted to specify that the immediate offset is to be added to the `Align(PC, 4)` value, or - if it is to be subtracted.
- <imm>        Is the immediate offset.

This alternative syntax makes it possible to assemble the encodings that subtract 0 from the `Align(PC, 4)` value, and to disassemble them to a syntax that can be re-assembled correctly.

- ADR. The normal assembler syntax for this instruction can specify the label of an instruction or literal data item whose address is to be calculated. Its encoding specifies a zero-extended immediate offset that is either added to or subtracted from the `Align(PC, 4)` value of the instruction to form the address of the data item, and some opcode bits that determine whether it is an addition or subtraction.

When the assembler calculates an offset of 0 for the normal syntax of this instruction, it must assemble the encoding that adds 0 to the `Align(PC, 4)` value of the instruction. The encoding that subtracts 0 from the `Align(PC, 4)` value cannot be specified by the normal syntax.

There is an alternative syntax for this instruction that specifies the addition or subtraction and the immediate value explicitly, by writing them as additions `ADD <Rd>, PC, #<imm>` or subtractions `SUB <Rd>, PC, #<imm>`. This alternative syntax makes it possible to assemble the encoding that subtracts 0 from the `Align(PC, 4)` value, and to disassemble it to a syntax that can be re-assembled correctly.

---

**Note**

---

ARM recommends that where possible, software avoids using:

- The alternative syntax for the ADR, LDC, LDR, LDRB, LDRD, LDRH, LDRSB, LDRSH, PLD, PLI, PLDW, and VLDR instructions.
  - The encodings of these instructions that subtract 0 from the `Align(PC, 4)` value.
-

## F1.3 Branch instructions

Table F1-1 summarizes the branch instructions in the T32 and A32 instruction sets. In addition to providing for changes in the flow of execution, some branch instructions can change instruction set.

**Table F1-1 Branch instructions**

Instruction	See	Range, T32	Range, A32
Branch to target address	<a href="#">B on page F5-3051</a>	±16MB	±32MB
Compare and Branch on Nonzero, Compare and Branch on Zero	<a href="#">CBNZ, CBZ on page F5-3074</a>	0-126 bytes	<sup>a</sup>
Call a subroutine	<a href="#">BL, BLX (immediate) on page F5-3067</a>	±16MB	±32MB
Call a subroutine, change instruction set <sup>b</sup>		±16MB	±32MB
Call a subroutine, optionally change instruction set	<a href="#">BLX (register) on page F5-3069</a>	Any	Any
Branch to target address, change instruction set	<a href="#">BX on page F5-3071</a>	Any	Any
Change to Jazelle state	<a href="#">BXJ on page F5-3073</a>	-	-
Table Branch (byte offsets)	<a href="#">TBB, TBH on page F5-3589</a>	0-510 bytes	<sup>a</sup>
Table Branch (halfword offsets)		0-131070 bytes	

a. These instructions do not exist in the A32 instruction set.

b. The range is determined by the instruction set of the BLX instruction, not of the instruction it branches to.

Branches to loaded and calculated addresses can be performed by LDR, LDM and data-processing instructions. For details see [Load/store instructions on page F1-2821](#), [Load/store multiple instructions on page F1-2824](#), [Standard data-processing instructions on page F1-2812](#), and [Shift instructions on page F1-2814](#).

In addition to the branch instructions shown in Table F1-1:

- In the A32 instruction set, a data-processing instruction that targets the PC behaves as a branch instruction. For more information, see [Data-processing instructions on page F1-2812](#).
- In the T32 and A32 instruction sets, a load instruction that targets the PC behaves as a branch instruction. For more information, see [Load/store instructions on page F1-2821](#).

## F1.4 Data-processing instructions

Core data-processing instructions belong to one of the following groups:

- [Standard data-processing instructions](#).  
These instructions perform basic data-processing operations, and share a common format with some variations.
- [Shift instructions on page F1-2814](#).
- [Multiply instructions on page F1-2814](#).
- [Saturating instructions on page F1-2816](#).
- [Saturating addition and subtraction instructions on page F1-2816](#).
- [Packing and unpacking instructions on page F1-2817](#).
- [Parallel addition and subtraction instructions on page F1-2818](#).
- [Divide instructions on page F1-2819](#).
- [Miscellaneous data-processing instructions on page F1-2819](#).

For related Advanced SIMD and floating-point instructions see [Advanced SIMD data-processing instructions on page F1-2832](#) and [Floating-point data-processing instructions on page F1-2840](#).

### F1.4.1 Standard data-processing instructions

These instructions generally have a destination register Rd, a first operand register Rn, and a second operand. The second operand can be another register Rm, or an immediate constant.

If the second operand is an immediate constant, it can be:

- Encoded directly in the instruction.
- A *modified immediate constant* that uses 12 bits of the instruction to encode a range of constants. T32 and A32 instructions have slightly different ranges of modified immediate constants. For more information, see [Modified immediate constants in T32 instructions on page F2-2863](#) and [Modified immediate constants in A32 instructions on page F2-2864](#).

If the second operand is another register, it can optionally be shifted in any of the following ways:

LSL	Logical Shift Left by 1-31 bits.
LSR	Logical Shift Right by 1-32 bits.
ASR	Arithmetic Shift Right by 1-32 bits.
ROR	Rotate Right by 1-31 bits.
RRX	Rotate Right with Extend. For details see <a href="#">Shift and rotate operations on page E1-2730</a> .

In T32 code, the amount to shift by is always a constant encoded in the instruction. In A32 code, the amount to shift by is either a constant encoded in the instruction, or the value of a register, Rs.

For instructions other than CMN, CMP, TEQ, and TST, the result of the data-processing operation is placed in the destination register. In the A32 instruction set, the destination register can be the PC, causing the result to be treated as a branch address. In the T32 instruction set, this is only permitted for some 16-bit forms of the ADD and MOV instructions.

These instructions can optionally set the Condition flags, according to the result of the operation. If they do not set the flags, existing flag settings from a previous instruction are preserved.

[Table F1-2 on page F1-2813](#) summarizes the main data-processing instructions in the T32 and A32 instruction sets. Generally, each of these instructions is described in three sections in [Chapter F2 About the T32 and A32 Instruction Descriptions](#), one section for each of the following:

- INSTRUCTION (immediate) where the second operand is a modified immediate constant.
- INSTRUCTION (register) where the second operand is a register, or a register shifted by a constant.
- INSTRUCTION (register-shifted register) where the second operand is a register shifted by a value obtained from another register. These are only available in the A32 instruction set.

**Table F1-2 Standard data-processing instructions**

Instruction	Mnemonic	Notes
Add with Carry	ADC	-
Add	ADD	T32 instruction set permits use of a modified immediate constant or a zero-extended 12-bit immediate constant.
Form PC-relative Address	ADR	First operand is the PC. Second operand is an immediate constant. T32 instruction set uses a zero-extended 12-bit immediate constant. Operation is an addition or a subtraction.
Bitwise AND	AND	-
Bitwise Bit Clear	BIC	-
Compare Negative	CMN	Sets flags. Like ADD but with no destination register.
Compare	CMP	Sets flags. Like SUB but with no destination register.
Bitwise Exclusive OR	EOR	-
Copy operand to destination	MOV	Has only one operand, with the same options as the second operand in most of these instructions. If the operand is a shifted register, the instruction is an LSL, LSR, ASR, or ROR instruction instead. For details see <a href="#">Shift instructions on page F1-2814</a> . The T32 and A32 instruction sets permit use of a modified immediate constant or a zero-extended 16-bit immediate constant.
Bitwise NOT	MVN	Has only one operand, with the same options as the second operand in most of these instructions.
Bitwise OR NOT	ORN	Not available in the A32 instruction set.
Bitwise OR	ORR	-
Reverse Subtract	RSB	Subtracts first operand from second operand. This permits subtraction from constants and shifted registers.
Reverse Subtract with Carry	RSC	Not available in the T32 instruction set.
Subtract with Carry	SBC	-
Subtract	SUB	T32 instruction set permits use of a modified immediate constant or a zero-extended 12-bit immediate constant.
Test Equivalence	TEQ	Sets flags. Like EOR but with no destination register.
Test	TST	Sets flags. Like AND but with no destination register.

## F1.4.2 Shift instructions

Table F1-3 lists the shift instructions in the T32 and A32 instruction sets.

**Table F1-3 Shift instructions**

Instruction	See
Arithmetic Shift Right	<i>ASR (immediate)</i> on page F5-3043 <i>ASR (register)</i> on page F5-3045 <i>ASRS (immediate)</i> on page F5-3047 <i>ASRS (register)</i> on page F5-3049
Logical Shift Left	<i>LSL (immediate)</i> on page F5-3233 <i>LSL (register)</i> on page F5-3235 <i>LSLs (immediate)</i> on page F5-3237 <i>LSLs (register)</i> on page F5-3239
Logical Shift Right	<i>LSR (immediate)</i> on page F5-3241 <i>LSR (register)</i> on page F5-3243 <i>LSRS (immediate)</i> on page F5-3245 <i>LSRS (register)</i> on page F5-3247
Rotate Right	<i>ROR (immediate)</i> on page F5-3366 <i>ROR (register)</i> on page F5-3368 <i>RORS (immediate)</i> on page F5-3370 <i>RORS (register)</i> on page F5-3372
Rotate Right with Extend	<i>RRX</i> on page F5-3374 <i>RRXS</i> on page F5-3376

In the A32 instruction set only, the destination register of these instructions can be the PC, causing the result to be treated as an address to branch to.

## F1.4.3 Multiply instructions

These instructions can operate on signed or unsigned quantities. In some types of operation, the results are the same whether the operands are signed or unsigned.

- [Table F1-4](#) summarizes the multiply instructions where there is no distinction between signed and unsigned quantities.  
The least significant 32 bits of the result are used. More significant bits are discarded.
- [Table F1-5 on page F1-2815](#) summarizes the signed multiply instructions.
- [Table F1-6 on page F1-2815](#) summarizes the unsigned multiply instructions.

**Table F1-4 General multiply instructions**

Instruction	See	Operation (number of bits)
Multiply Accumulate	<i>MLA, MLAS</i> on page F5-3253	$32 = 32 + 32 \times 32$
Multiply and Subtract	<i>MLS</i> on page F5-3255	$32 = 32 - 32 \times 32$
Multiply	<i>MUL, MULS</i> on page F5-3290	$32 = 32 \times 32$

**Table F1-5 Signed multiply instructions**

Instruction	See	Operation (number of bits)
Signed Multiply Accumulate (halfwords)	<a href="#">SMLABB, SMLABT, SMLATB, SMLATT</a> on page F5-3431	$32 = 32 + 16 \times 16$
Signed Multiply Accumulate Dual	<a href="#">SMLAD, SMLADX</a> on page F5-3433	$32 = 32 + 16 \times 16 + 16 \times 16$
Signed Multiply Accumulate Long	<a href="#">SMLAL, SMLALS</a> on page F5-3435	$64 = 64 + 32 \times 32$
Signed Multiply Accumulate Long (halfwords)	<a href="#">SMLALBB, SMLALBT, SMLALTB, SMLALTT</a> on page F5-3437	$64 = 64 + 16 \times 16$
Signed Multiply Accumulate Long Dual	<a href="#">SMLALD, SMLALDX</a> on page F5-3440	$64 = 64 + 16 \times 16 + 16 \times 16$
Signed Multiply Accumulate (word by halfword)	<a href="#">SMLAWB, SMLAWT</a> on page F5-3442	$32 = 32 + 32 \times 16^a$
Signed Multiply Subtract Dual	<a href="#">SMLSDD, SMLSDDX</a> on page F5-3444	$32 = 32 + 16 \times 16 - 16 \times 16$
Signed Multiply Subtract Long Dual	<a href="#">SMLSDD, SMLSDDX</a> on page F5-3446	$64 = 64 + 16 \times 16 - 16 \times 16$
Signed Most Significant Word Multiply Accumulate	<a href="#">SMMLA, SMMLAR</a> on page F5-3448	$32 = 32 + 32 \times 32^b$
Signed Most Significant Word Multiply Subtract	<a href="#">SMMLS, SMMLSR</a> on page F5-3450	$32 = 32 - 32 \times 32^b$
Signed Most Significant Word Multiply	<a href="#">SMMUL, SMMULR</a> on page F5-3452	$32 = 32 \times 32^b$
Signed Dual Multiply Add	<a href="#">SMUAD, SMUADX</a> on page F5-3454	$32 = 16 \times 16 + 16 \times 16$
Signed Multiply (halfwords)	<a href="#">SMULBB, SMULBT, SMULTB, SMULTT</a> on page F5-3456	$32 = 16 \times 16$
Signed Multiply Long	<a href="#">SMULL, SMULLS</a> on page F5-3458	$64 = 32 \times 32$
Signed Multiply (word by halfword)	<a href="#">SMULWB, SMULWT</a> on page F5-3460	$32 = 32 \times 16^a$
Signed Dual Multiply Subtract	<a href="#">SMUSD, SMUSDX</a> on page F5-3462	$32 = 16 \times 16 - 16 \times 16$

a. The most significant 32 bits of the 48-bit product are used. Less significant bits are discarded.

b. The most significant 32 bits of the 64-bit product are used. Less significant bits are discarded.

**Table F1-6 Unsigned multiply instructions**

Instruction	See	Operation (number of bits)
Unsigned Multiply Accumulate Accumulate Long	<a href="#">UMAAL</a> on page F5-3624	$64 = 32 + 32 + 32 \times 32$
Unsigned Multiply Accumulate Long	<a href="#">UMLAL, UMLALS</a> on page F5-3626	$64 = 64 + 32 \times 32$
Unsigned Multiply Long	<a href="#">UMULL, UMULLS</a> on page F5-3628	$64 = 32 \times 32$

#### F1.4.4 Saturating instructions

Table F1-7 lists the saturating instructions in the T32 and A32 instruction sets. For more information, see [Pseudocode description of saturation on page E1-2731](#).

**Table F1-7 Saturating instructions**

Instruction	See	Operation
Signed Saturate	<a href="#">SSAT on page F5-3468</a>	Saturates optionally shifted 32-bit value to selected range
Signed Saturate 16	<a href="#">SSAT16 on page F5-3470</a>	Saturates two 16-bit values to selected range
Unsigned Saturate	<a href="#">USAT on page F5-3646</a>	Saturates optionally shifted 32-bit value to selected range
Unsigned Saturate 16	<a href="#">USAT16 on page F5-3648</a>	Saturates two 16-bit values to selected range

#### F1.4.5 Saturating addition and subtraction instructions

Table F1-8 lists the saturating addition and subtraction instructions in the T32 and A32 instruction sets. For more information, see [Pseudocode description of saturation on page E1-2731](#).

**Table F1-8 Saturating addition and subtraction instructions**

Instruction	See	Operation
Saturating Add	<a href="#">QADD on page F5-3336</a>	Add, saturating result to the 32-bit signed integer range
Saturating Subtract	<a href="#">QSUB on page F5-3349</a>	Subtract, saturating result to the 32-bit signed integer range
Saturating Double and Add	<a href="#">QADD on page F5-3336</a>	Doubles one value and adds a second value, saturating the doubling and the addition to the 32-bit signed integer range
Saturating Double and Subtract	<a href="#">QDSUB on page F5-3345</a>	Doubles one value and subtracts the result from a second value, saturating the doubling and the subtraction to the 32-bit signed integer range

**F1.4.6 Packing and unpacking instructions**

Table F1-9 lists the packing and unpacking instructions in the T32 and A32 instruction sets.

**Table F1-9 Packing and unpacking instructions**

Instruction	See	Operation
Pack Halfword	<a href="#">PKHBT, PKHTB on page F5-3312</a>	Combine halfwords
Signed Extend and Add Byte	<a href="#">SXTAB on page F5-3577</a>	Extend 8 bits to 32 and add
Signed Extend and Add Byte 16	<a href="#">SXTAB16 on page F5-3579</a>	Dual extend 8 bits to 16 and add
Signed Extend and Add Halfword	<a href="#">SXTAH on page F5-3581</a>	Extend 16 bits to 32 and add
Signed Extend Byte	<a href="#">SXTB on page F5-3583</a>	Extend 8 bits to 32
Signed Extend Byte 16	<a href="#">SXTB16 on page F5-3585</a>	Dual extend 8 bits to 16
Signed Extend Halfword	<a href="#">SXTH on page F5-3587</a>	Extend 16 bits to 32
Unsigned Extend and Add Byte	<a href="#">UXTAB on page F5-3656</a>	Extend 8 bits to 32 and add
Unsigned Extend and Add Byte 16	<a href="#">UXTAB16 on page F5-3658</a>	Dual extend 8 bits to 16 and add
Unsigned Extend and Add Halfword	<a href="#">UXTAH on page F5-3660</a>	Extend 16 bits to 32 and add
Unsigned Extend Byte	<a href="#">UXTB on page F5-3662</a>	Extend 8 bits to 32
Unsigned Extend Byte 16	<a href="#">UXTB16 on page F5-3664</a>	Dual extend 8 bits to 16
Unsigned Extend Halfword	<a href="#">UXTH on page F5-3666</a>	Extend 16 bits to 32

### F1.4.7 Parallel addition and subtraction instructions

These instructions perform additions and subtractions on the values of two registers and write the result to a destination register, treating the register values as sets of two halfwords or four bytes. That is, they perform SIMD additions or subtractions on the general-purpose registers.

These instructions consist of a prefix followed by a main instruction mnemonic. The prefixes are as follows:

S	Signed arithmetic modulo $2^8$ or $2^{16}$ .
Q	Signed saturating arithmetic.
SH	Signed arithmetic, halving the results.
U	Unsigned arithmetic modulo $2^8$ or $2^{16}$ .
UQ	Unsigned saturating arithmetic.
UH	Unsigned arithmetic, halving the results.

The main instruction mnemonics are as follows:

ADD16	Adds the top halfwords of two operands to form the top halfword of the result, and the bottom halfwords of the same two operands to form the bottom halfword of the result.
ASX	Exchanges halfwords of the second operand, and then adds top halfwords and subtracts bottom halfwords.
SAX	Exchanges halfwords of the second operand, and then subtracts top halfwords and adds bottom halfwords.
SUB16	Subtracts each halfword of the second operand from the corresponding halfword of the first operand to form the corresponding halfword of the result.
ADD8	Adds each byte of the second operand to the corresponding byte of the first operand to form the corresponding byte of the result.
SUB8	Subtracts each byte of the second operand from the corresponding byte of the first operand to form the corresponding byte of the result.

The instruction set permits all 36 combinations of prefix and main instruction operand, as [Table F1-10](#) shows.

See also [Advanced SIMD parallel addition and subtraction on page F1-2833](#).

**Table F1-10 Parallel addition and subtraction instructions**

Main instruction	Signed	Saturating	Signed halving	Unsigned	Unsigned saturating	Unsigned halving
ADD16, add, two halfwords	SADD16	QADD16	SHADD16	UADD16	UQADD16	UHADD16
ASX, add and subtract with exchange	SASX	QASX	SHASX	UASX	UQASX	UHASX
SAX, subtract and add with exchange	SSAX	QSAX	SHSAX	USAX	UQSAX	UHSAX
SUB16, subtract, two halfwords	SSUB16	QSUB16	SHSUB16	USUB16	UQSUB16	UHSUB16
ADD8, add, four bytes	SADD8	QADD8	SHADD8	UADD8	UQADD8	UHADD8
SUB8, subtract, four bytes	SSUB8	QSUB8	SHSUB8	USUB8	UQSUB8	UHSUB8

### F1.4.8 Divide instructions

In ARMv8, signed and unsigned integer divide instructions are included in both the T32 instruction set and the A32 instruction set. For more information about their implementation in previous versions of the ARM architecture see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

For descriptions of the instructions see:

- [SDIV on page F5-3407](#).
- [UDIV on page F5-3610](#).

For the SDIV and UDIV instructions, division by zero always returns a zero result.

The `ID_ISAR0.Divide_instrs` field indicates the level of support for these instructions. The field value of `0b0010` indicates they are implemented in both the T32 and A32 instruction sets.

### F1.4.9 Miscellaneous data-processing instructions

[Table F1-11](#) lists the miscellaneous data-processing instructions in the T32 and A32 instruction sets. Immediate values in these instructions are simple binary numbers.

**Table F1-11 Miscellaneous data-processing instructions**

Instruction	See	Notes
BitField Clear	<a href="#">BFC on page F5-3054</a>	-
BitField Insert	<a href="#">BFI on page F5-3056</a>	-
Count Leading Zeros	<a href="#">CLZ on page F5-3076</a>	-
Move Top	<a href="#">MOVT on page F5-3269</a>	Moves 16-bit immediate value to top halfword. Bottom halfword unchanged.
Reverse Bits	<a href="#">RBIT on page F5-3355</a>	-
Byte-Reverse Word	<a href="#">REV on page F5-3357</a>	-

Unsigned BitField Extract	<a href="#">UBFX on page F5-3606</a>	-
Unsigned Sum of Absolute Differences	<a href="#">USAD8 on page F5-3642</a>	-
Unsigned Sum of Absolute Differences and Accumulate	<a href="#">USADA8 on page F5-3644</a>	-

## F1.5 PSTATE and banked register access instructions

These instructions transfer PE state information to or from a general-purpose register.

### F1.5.1 PSTATE access instructions

PSTATE holds process state information, see *Process state, PSTATE* on page E1-2734. In AArch32 state:

- At EL1 or higher, **PSTATE** is accessible using the *Current Program Status Register (CPSR)*.
- At EL0, a subset of the **CPSR** is accessible as the *Application Program Status Register (APSR)*.
- On taking an exception, the contents of the **CPSR** are copied to the *Saved Program Status Register (SPSR)* of the mode from which the exception is taken.

The MRS and MSR instructions move the contents of the **CPSR**, **APSR**, or the **SPSR** of the current mode to or from a general-purpose register, see:

- *MRS* on page F5-3275.
- *MSR (immediate)* on page F5-3285.
- *MSR (register)* on page F5-3287.

When executed at EL0, MRS and MSR instructions can only access the **APSR**.

The **PSTATE** Condition flags, **PSTATE**.{N, Z, C, V} are set by the execution of data-processing instructions, and can control the execution of conditional instructions. However, software can set the Condition flags explicitly using the MSR instruction, and can read the current state of the Condition flags explicitly using the MRS instruction.

In addition, at EL1 or higher, software can use the CPS instruction to change the **PSTATE**.M field and the **PSTATE**.{A, I, F} interrupt mask bits, see *CPS, CPSID, CPSIE* on page F5-3089.

### F1.5.2 Banked register access instructions

At EL1 or higher, the MRS (Banked register) and MSR (Banked register) instructions move the contents of a Banked general-purpose register, the **SPSR**, or the **ELR\_hyp**, to or from a general-purpose register. See:

- *MRS (Banked register)* on page F5-3277.
- *MSR (Banked register)* on page F5-3281.

## F1.6 Load/store instructions

Table F1-12 summarizes the general-purpose register load/store instructions in the T32 and A32 instruction sets. Some of these instructions can also operate on the PC. See also:

- [Load/store multiple instructions on page F1-2824](#).
- [Synchronization and semaphores on page E2-2795](#), for more information about the Load-Exclusive and Store-Exclusive instructions.
- [Load-Acquire, Store-Release on page E2-2770](#), for more information about the Load-Acquire/Store-Release and Load-Acquire Exclusive/Store-Release Exclusive instructions.
- [Advanced SIMD and floating-point load/store instructions on page F1-2829](#).

Load/store instructions have several options for addressing memory. For more information, see [Addressing modes on page F1-2822](#).

**Table F1-12 Load/store instructions**

Data type	Load	Store	Unprivileged		Exclusive		Load-Acquire	Store-Release	Exclusive	
			Load	Store	Load	Store			Load-Acquire	Store-Release
32-bit word	LDR	STR	LDRT	STRT	LDREX	STREX	LDA	STL	LDAEX	STLEX
16-bit halfword	-	STRH	-	STRHT	-	STREXH	LDAH	STLH	LDAEXH	STLEXH
16-bit unsigned halfword	LDRH	-	LDRHT	-	LDREXH	-	-	-	-	-
16-bit signed halfword	LDRSH	-	LDRSHT	-	-	-	-	-	-	-
8-bit byte	-	STRB	-	STRBT	-	STREXB	LDAB	STLB	LDAEXB	STLEXB
8-bit unsigned byte	LDRB	-	LDRBT	-	LDREXB	-	-	-	-	-
8-bit signed byte	LDRSB	-	LDRSBT	-	-	-	-	-	-	-
Two 32-bit words	LDRD	STRD	-	-	-	-	-	-	-	-
64-bit doubleword	-	-	-	-	LDREXD	STREXD	-	-	LDAEXD	STLEXD

### F1.6.1 Loads to the PC

The LDR instruction can load a value into the PC. The value loaded is treated as an interworking address, as described by the `LoadWritePC()` pseudocode function in [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).

### F1.6.2 Halfword and byte loads and stores

Halfword and byte stores store the least significant halfword or byte from the register, to 16 or 8 bits of memory respectively. There is no distinction between signed and unsigned stores.

Halfword and byte loads load 16 or 8 bits from memory into the least significant halfword or byte of a register. Unsigned loads zero-extend the loaded value to 32 bits, and signed loads sign-extend the value to 32 bits.

### F1.6.3 Load unprivileged and Store unprivileged

When executing at EL0, a Load unprivileged or Store unprivileged instruction operates in exactly the same way as the corresponding ordinary load or store instruction. For example, an LDRT instruction executes in exactly the same way as the equivalent LDR instruction. When executed at PL1, Load unprivileged and Store unprivileged instructions behave as they would if they were executed at EL0. For example, an LDRT instruction executes in exactly the way that the equivalent LDR instruction would execute at EL0. In particular, the instructions make unprivileged memory accesses.

#### ———— Note ————

As described in [Security state, Exception levels, and AArch32 execution privilege on page G1-4318](#), execution at PL1 describes all of the following:

- Execution at Non-secure EL1 using AArch32.
- Execution at Secure EL1 using AArch32 when EL3 is not implemented.
- Execution at Secure EL1 using AArch32 when EL3 is implemented and is using AArch64.
- Execution at Secure EL3 when EL3 is implemented and is using AArch32.

The Load unprivileged and Store unprivileged instructions are CONSTRAINED UNPREDICTABLE if executed at EL2, see [Execution of Load/Store unprivileged instructions in Hyp mode on page K1-6115](#).

For more information about execution privilege, see [About access permissions on page G4-4605](#).

### F1.6.4 Load-Exclusive and Store-Exclusive

Load-Exclusive and Store-Exclusive instructions provide shared memory synchronization. For more information, see [Synchronization and semaphores on page E2-2795](#).

### F1.6.5 Load-Acquire and Store-Release

Load-Acquire and Store-Release instructions provide memory barriers. Load-Acquire Exclusive and Store-Release Exclusive instructions provide memory barriers with shared memory synchronization. For more information, see [Load-Acquire, Store-Release on page E2-2770](#).

### F1.6.6 Addressing modes

The address for a load or store is formed from two parts: a value from a base register, and an offset.

The base register can be any one of the general-purpose registers R0-R12, SP, or LR.

For loads, the base register can be the PC. This provides PC-relative addressing for position-independent code. Instructions marked (literal) in their title in [Chapter F2 About the T32 and A32 Instruction Descriptions](#) are PC-relative loads.

The offset takes one of three formats:

<b>Immediate</b>	The offset is an unsigned number that can be added to or subtracted from the base register value. Immediate offset addressing is useful for accessing data elements that are a fixed distance from the start of the data object, such as structure fields, stack offsets and input/output registers.
<b>Register</b>	The offset is a value from a general-purpose register. The value can be added to, or subtracted from, the base register value. Register offsets are useful for accessing arrays or blocks of data.
<b>Scaled register</b>	The offset is a general-purpose register, shifted by an immediate value, then added to or subtracted from the base register. This means an array index can be scaled by the size of each array element.

The offset and base register can be used in three different ways to form the memory address. The addressing modes are described as follows:

<b>Offset</b>	The offset is added to or subtracted from the base register to form the memory address.
<b>Pre-indexed</b>	The offset is added to or subtracted from the base register to form the memory address. The base register is then updated with this new address, to permit automatic indexing through an array or memory block.
<b>Post-indexed</b>	The value of the base register alone is used as the memory address. The offset is then added to or subtracted from the base register. The result is stored back in the base register, to permit automatic indexing through an array or memory block.

---

**Note**

Not every variant is available for every instruction, and the range of permitted immediate values and the options for scaled registers vary from instruction to instruction. See [Chapter F2 About the T32 and A32 Instruction Descriptions](#) for full details for each instruction.

---

## F1.7 Load/store multiple instructions

Load Multiple instructions load from memory a subset, or possibly all, of the general-purpose registers and the PC.

Store Multiple instructions store to memory a subset, or possibly all, of the general-purpose registers.

The memory locations are consecutive word-aligned words. The addresses used are obtained from a base register, and can be either above or below the value in the base register. The base register can optionally be updated by the total size of the data transferred.

[Table F1-13](#) summarizes the load/store multiple instructions in the T32 and A32 instruction sets.

**Table F1-13 Load/store multiple instructions**

Instruction	See
Load Multiple, Increment After or Full Descending	<a href="#">LDM, LDMIA, LDMFD on page F5-3144</a>
Load Multiple, Decrement After or Full Ascending <sup>a</sup>	<a href="#">LMDA, LDMFA on page F5-3152</a>
Load Multiple, Decrement Before or Empty Ascending	<a href="#">LDMDB, LDMEA on page F5-3154</a>
Load Multiple, Increment Before or Empty Descending <sup>a</sup>	<a href="#">LDMIB, LDMED on page F5-3157</a>
Pop multiple registers off the stack <sup>b</sup>	<a href="#">POP on page F5-3325</a>
Push multiple registers onto the stack <sup>c</sup>	<a href="#">PUSH on page F5-3331</a>
Store Multiple, Increment After or Empty Ascending	<a href="#">STM, STMIA, STMEA on page F5-3495</a>
Store Multiple, Decrement After or Empty Descending <sup>a</sup>	<a href="#">STMDA, STMED on page F5-3501</a>
Store Multiple, Decrement Before or Full Descending	<a href="#">STMDB, STMFD on page F5-3503</a>
Store Multiple, Increment Before or Full Ascending <sup>a</sup>	<a href="#">STMIB, STMFA on page F5-3506</a>

a. Not available in the T32 instruction set.

b. This instruction is equivalent to an LDM instruction with the SP as base register, and base register updating.

c. This instruction is equivalent to an STMDB instruction with the SP as base register, and base register updating.

When executing at EL1, variants of the LDM and STM instructions load and store User mode registers. Another system level variant of the LDM instruction performs an exception return.

### F1.7.1 Loads to the PC

The LDM, LMDA, LDMDB, LDMIB, and POP instructions can load a value into the PC. The value loaded is treated as an interworking address, as described by the [LoadWritePC\(\)](#) pseudocode function in [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).

## F1.8 Miscellaneous instructions

Table F1-14 summarizes the miscellaneous instructions in the T32 and A32 instruction sets.

**Table F1-14 Miscellaneous instructions**

Instruction	See
Clear-Exclusive	<a href="#">CLREX</a> on page F5-3075
Data Memory Barrier	<a href="#">DMB</a> on page F5-3103
Data Synchronization Barrier	<a href="#">DSB</a> on page F5-3106
Instruction Synchronization Barrier	<a href="#">ISB</a> on page F5-3125
If-Then	<a href="#">IT</a> on page F5-3126 <sup>a</sup>
No Operation	<a href="#">NOP</a> on page F5-3299
Preload Data	<a href="#">PLD</a> , <a href="#">PLDW (immediate)</a> on page F5-3314 <a href="#">PLD (literal)</a> on page F5-3316 <a href="#">PLD</a> , <a href="#">PLDW (register)</a> on page F5-3318
Preload Instruction	<a href="#">PLI (immediate, literal)</a> on page F5-3320 <a href="#">PLI (register)</a> on page F5-3323
Set Endianness	<a href="#">SETEND</a> on page F5-3411 <sup>b</sup>
Set Privileged Access Never	<a href="#">SETPAN</a> on page F5-3412
Send Event	<a href="#">SEV</a> on page F5-3413
Send Event Local	<a href="#">SEVL</a> on page F5-3415
Wait For Event	<a href="#">WFE</a> on page F5-3668
Wait For Interrupt	<a href="#">WFI</a> on page F5-3670
Yield	<a href="#">YIELD</a> on page F5-3672 <sup>c</sup>

- a. For performance reasons, ARM deprecates many uses of the IT instruction, see [Partial deprecation of IT](#) on page F1-2826.
- b. ARM deprecates any use of the SETEND instruction.
- c. See also [The Yield instruction](#).

### Note

Previous versions of the architecture defined the DBG instruction, that could provide a hint to the debug system, in this group. In ARMv8, this instruction executes as a NOP. ARM deprecates any use of the DBG instruction.

### F1.8.1 The Yield instruction

In a *Symmetric Multithreading* (SMT) design, a thread can use the YIELD instruction to give a hint to the PE that it is running on. The YIELD hint indicates that whatever the thread is currently doing is of low importance, and so could yield. For example, the thread might be sitting in a spin-lock. A similar use might be in modifying the arbitration priority of the snoop bus in a multiprocessor (MP) system. Defining such an instruction permits binary compatibility between SMT and SMP systems.

AArch32 state defines a YIELD instruction as a specific NOP (No Operation) hint instruction.

The YIELD instruction has no effect in a single-threaded system, but developers of such systems can use the instruction to flag its intended use on migration to a multiprocessor or multithreading system. Operating systems can use YIELD in places where a yield hint is wanted, knowing that it will be treated as a NOP if there is no implementation benefit.

## F1.8.2 Partial deprecation of IT

ARMv8-A deprecates some uses of the T32 IT instruction, for performance reasons. All uses of IT that apply to instructions other than a single subsequent 16-bit instruction from a restricted set are deprecated, as are explicit references to the PC within that single 16-bit instruction. This permits the non-deprecated forms of IT and subsequent instructions to be treated as a single 32-bit conditional instruction. Table F1-15 shows the restricted set of 16-bit instructions that are not deprecated when used in conjunction with IT.

**Table F1-15 Non-deprecated IT 16-bit conditional instructions**

Non-deprecated 16-bit instructions	Class	Notes
MOV, MVN	Move	Deprecated when Rm or Rd is the PC.
LDR, LDRB, LDRH, LDRSB, LDRSH	Load	Deprecated for PC-relative load literal forms
STR, STRB, STRH	Store	-
ADD, ADC, RSB, SBC, SUB	Add/Subtract	Deprecated for ADD SP, SP, #imm, SUB SP, SP, #imm, and when Rm, Rdn, or Rdm is the PC
CMP, CMN	Compare	Deprecated when Rm or Rn is the PC
MUL	Multiply	-
ASR, LSL, LSR, ROR	Shift	-
AND, BIC, EOR, ORR, TST	Logical	-
BX, BLX	Branch to register	Deprecated when Rm is the PC

The full ARMv7 IT instruction functionality remains available in order to execute legacy T32 code. It is IMPLEMENTATION DEFINED whether an ARMv8 implementation provides an ITD control, that software can use to disable the deprecated uses of the IT instruction. In an implementation that included the ITD control, setting an ITD field to 1 disables the deprecated uses of the IT instruction, making those uses of the IT instruction UNDEFINED. The ITD control fields are:

**HSCTLR.ITD** When EL2 is using AArch32, makes execution of the deprecated uses of the IT UNDEFINED at EL2.

**SCTLR.ITD** When EL1 is using AArch32, makes execution of the deprecated uses of the IT UNDEFINED at EL0 and EL1.

**SCTLR\_EL1.ITD**

When EL1 is using AArch64, makes execution of the deprecated uses of the IT UNDEFINED at EL0 when EL0 is using AArch32.

## F1.9 Exception-generating and exception-handling instructions

The following instructions are intended specifically to cause a synchronous exception to occur:

- The SVC instruction generates a Supervisor Call exception. For more information, see [Supervisor Call \(SVC\) exception on page G1-4380](#).
- The Breakpoint instruction BKPT provides software breakpoints. For more information, see [Breakpoint Instruction exceptions on page G2-4467](#).
- In an implementation that includes EL3, when executing at EL1 or higher, the SMC instruction generates a Secure Monitor Call exception. For more information, see [Secure Monitor Call \(SMC\) exception on page G1-4382](#).
- In an implementation that includes EL2, in software executing in a Non-secure EL1 mode, the HVC instruction generates a Hypervisor Call exception. For more information, see [Hypervisor Call \(HVC\) exception on page G1-4383](#).

For an exception taken to an EL1 mode:

- The system level variants of the SUBS and LDM instructions can perform a return from an exception.

### ———— Note ————

The variants of SUBS include MOVS. See the references to [Subtract \(exception return\)](#), [Move \(exception return\)](#), and [Load Multiple \(exception return\)](#) in [Table F1-16](#) for more information.

- The SRS instruction can be used near the start of the handler, to store return information. The RFE instruction can then perform a return from the exception using the stored return information.

In an implementation that includes EL2, the ERET instruction performs a return from an exception taken to Hyp mode.

For more information, see [Exception return to an Exception level using AArch32 on page G1-4360](#).

[Table F1-16](#) summarizes the instructions, in the T32 and A32 instruction sets, for generating or handling an exception. Except for BKPT and SVC, these are system level instructions.

**Table F1-16 Exception-generating and exception-handling instructions**

Instruction	See
Supervisor Call	<a href="#">SVC on page F5-3575</a>
Breakpoint	<a href="#">BKPT on page F5-3065</a>
Secure Monitor Call	<a href="#">SMC on page F5-3429</a>
Return From Exception	<a href="#">RFE, RFEDA, RFEDB, RFEIA, RFEIB on page F5-3363</a>
Subtract (exception return) <sup>a</sup>	<a href="#">SUB, SUBS (immediate) on page F5-3560<sup>a</sup></a>
Move (exception return) <sup>a</sup>	<a href="#">MOV, MOVS (register) on page F5-3260<sup>a</sup></a>
Hypervisor Call	<a href="#">HVC on page F5-3123</a>
Exception Return	<a href="#">ERET on page F5-3117</a>
Load Multiple (exception return)	<a href="#">LDM (exception return) on page F5-3148</a>
Store Return State	<a href="#">SRS, SRSDA, SRSDB, SRSIA, SRSIB on page F5-3464</a>

a. The A32 instruction set includes other instruction forms that can be used for an exception return, that have previously been described as variants of SUBS PC, LR. ARM deprecates any use of these instruction forms.

## F1.10 System register access instructions

The System register encoding space is indexed using the parameters {coproc, opc1, CRn, CRm, opc2}, see [The AArch32 System register interface on page G1-4408](#). This encoding space provides System registers and System instructions. In ARMv8, the only permitted values of coproc are 0b1110 and 0b1111, and the following instructions give access to this encoding space:

- Instructions that transfer data between general-purpose registers and System registers. See:
  - [MCR on page F5-3249](#).
  - [MCRR on page F5-3251](#).
  - [MRC on page F5-3271](#).
  - [MRRC on page F5-3273](#).
- Instructions that load or store from memory to a System register. See:
  - [LDC \(immediate\) on page F5-3140](#).
  - [LDC \(literal\) on page F5-3142](#).
  - [STC on page F5-3478](#).

### ————— Note —————

The System register encoding space with coproc==0b101x is redefined to provide some of the Advanced SIMD and floating-point functionality. That is, to:

- Initiate a floating-point data-processing operation, see [Floating-point data-processing instructions on page F1-2840](#).
- Transfer data between general-purpose registers and the Advanced SIMD and floating-point registers, see [Advanced SIMD and floating-point register transfer instructions on page F1-2831](#).
- Load or store data to the Advanced SIMD and floating-point registers, see [Advanced SIMD and floating-point load/store instructions on page F1-2829](#).

System register access instructions are part of the instruction stream executed by the PE, and therefore any System register access instruction that cannot be executed by the implementation causes an Undefined Instruction exception. In ARMv8-A and ARMv8-R, the instruction encodings in the System register access instruction encoding space are unallocated, and generate Undefined Instruction exceptions, except for:

- The instructions summarized in this section that access the coproc==0b111x encoding space.
- The instructions in the coproc==0b101x encoding space that are redefined to provide Advanced SIMD and floating-point functionality, as summarized in the Note in this section.

## F1.11 Advanced SIMD and floating-point load/store instructions

Table F1-17 summarizes the SIMD and floating-point register file load/store instructions in the Advanced SIMD and floating-point instruction sets.

Advanced SIMD also provides instructions for loading and storing multiple elements, or structures of elements, see [Element and structure load/store instructions](#).

**Table F1-17 SIMD and floating-point register file load/store instructions**

Instruction	See	Operation
Vector Load Multiple	<a href="#">VLDM, VLDMDB, VLDMIA</a> on page F6-3935	Load 1-16 consecutive 64-bit registers, Advanced SIMD and floating-point. Load 1-16 consecutive 32-bit registers, floating-point only.
Vector Load Register	<a href="#">VLDL (immediate)</a> on page F6-3940 <a href="#">VLDL (literal)</a> on page F6-3943	Load one 64-bit register, Advanced SIMD and floating-point. Load one 32-bit register, floating-point only.
Vector Store Multiple	<a href="#">VSTM, VSTMDB, VSTMIA</a> on page F6-4268	Store 1-16 consecutive 64-bit registers, Advanced SIMD and floating-point. Store 1-16 consecutive 32-bit registers, floating-point only.
Vector Store Register	<a href="#">VSTR</a> on page F6-4273	Store one 64-bit register, Advanced SIMD and floating-point. Store one 32-bit register, floating-point only.

### F1.11.1 Element and structure load/store instructions

Table F1-18 shows the element and structure load/store instructions available in the Advanced SIMD instruction set. Loading and storing structures of more than one element automatically de-interleaves or interleaves the elements, see [Figure F1-1 on page F1-2830](#) for an example of de-interleaving. Interleaving is the inverse process.

**Table F1-18 Element and structure load/store instructions**

Instruction	See
Load single element	
Multiple elements	<a href="#">VLD1 (multiple single elements)</a> on page F6-3889
To one lane	<a href="#">VLD1 (single element to one lane)</a> on page F6-3881
To all lanes	<a href="#">VLD1 (single element to all lanes)</a> on page F6-3886
Load 2-element structure	
Multiple structures	<a href="#">VLD2 (multiple 2-element structures)</a> on page F6-3906
To one lane	<a href="#">VLD2 (single 2-element structure to one lane)</a> on page F6-3897
To all lanes	<a href="#">VLD2 (single 2-element structure to all lanes)</a> on page F6-3903
Load 3-element structure	
Multiple structures	<a href="#">VLD3 (multiple 3-element structures)</a> on page F6-3920
To one lane	<a href="#">VLD3 (single 3-element structure to one lane)</a> on page F6-3911
To all lanes	<a href="#">VLD3 (single 3-element structure to all lanes)</a> on page F6-3917

**Table F1-18 Element and structure load/store instructions (continued)**

Instruction	See
Load 4-element structure	
Multiple structures	<i>VLD4 (multiple 4-element structures) on page F6-3932</i>
To one lane	<i>VLD4 (single 4-element structure to one lane) on page F6-3923</i>
To all lanes	<i>VLD4 (single 4-element structure to all lanes) on page F6-3929</i>
Store single element	
Multiple elements	<i>VST1 (multiple single elements) on page F6-4231</i>
From one lane	<i>VST1 (single element from one lane) on page F6-4226</i>
Store 2-element structure	
Multiple structures	<i>VST2 (multiple 2-element structures) on page F6-4245</i>
From one lane	<i>VST2 (single 2-element structure from one lane) on page F6-4239</i>
Store 3-element structure	
Multiple structures	<i>VST3 (multiple 3-element structures) on page F6-4256</i>
From one lane	<i>VST3 (single 3-element structure from one lane) on page F6-4250</i>
Store 4-element structure	
Multiple structures	<i>VST4 (multiple 4-element structures) on page F6-4265</i>
From one lane	<i>VST4 (single 4-element structure from one lane) on page F6-4259</i>

Figure F1-1 shows the de-interleaving of a VLD3.16 (multiple 3-element structures) instruction:

**Figure F1-1 De-interleaving an array of 3-element structures**

Figure F1-1 shows the VLD3.16 instruction operating to three 64-bit registers that comprise four 16-bit elements:

- Different instructions in this group would produce similar figures, but operate on different numbers of registers. For example, VLD4 and VST4 instructions operate on four registers.
- Different element sizes would produce similar figures but with 8-bit or 32-bit elements.
- These instructions operate only on doubleword (64-bit) registers.

## F1.12 Advanced SIMD and floating-point register transfer instructions

Table F1-19 summarizes the SIMD and floating-point register file transfer instructions in the Advanced SIMD and floating-point instruction sets. These instructions transfer data between the general-purpose registers and the registers in the SIMD and floating-point register file.

Advanced SIMD vectors, and single-precision and double-precision floating-point registers, are all views of the same register file. For details see *The SIMD and floating-point register file* on page E1-2740.

**Table F1-19 SIMD and floating-point register file transfer instructions**

Instruction	See
Copy element from general-purpose register to every element of an Advanced SIMD vector	<i>VDUP (general-purpose register)</i> on page F6-3851
Copy byte, halfword, or word from general-purpose register to a register in the SIMD and floating-point register file	<i>VMOV (general-purpose register to scalar)</i> on page F6-4002
Copy byte, halfword, or word from a register in the SIMD and floating-point register file to a general-purpose register	<i>VMOV (scalar to general-purpose register)</i> on page F6-4006
Copy from half-precision floating-point register to general-purpose register, or from general-purpose register to half-precision floating-point register Only supported if ARMv8.2-FP16 is implemented	<i>VMOV (between general-purpose register and half-precision)</i> on page F6-3990
Copy from single-precision floating-point register to general-purpose register, or from general-purpose register to single-precision floating-point register	<i>VMOV (between general-purpose register and single-precision)</i> on page F6-4004
Copy two words from general-purpose registers to consecutive single-precision floating-point registers, or from consecutive single-precision floating-point registers to general-purpose registers	<i>VMOV (between two general-purpose registers and two single-precision registers)</i> on page F6-4008
Copy two words from general-purpose registers to a doubleword register in the SIMD and floating-point register file, or from a doubleword register in the SIMD and floating-point register file to general-purpose registers	<i>VMOV (between two general-purpose registers and a doubleword floating-point register)</i> on page F6-3988
Copy from an Advanced SIMD and floating-point System Register to a general-purpose register	<i>VMRS</i> on page F6-4017
Copy from a general-purpose register to an Advanced SIMD and floating-point System Register	<i>VMSR</i> on page F6-4020

## F1.13 Advanced SIMD data-processing instructions

Advanced SIMD data-processing instructions process registers containing vectors of elements of the same type packed together, enabling the same operation to be performed on multiple items in parallel.

Instructions operate on vectors held in 64-bit or 128-bit registers. [Figure F1-2](#) shows an operation on two 64-bit operand vectors, generating a 64-bit vector result.

### ———— Note ————

[Figure F1-2](#) and other similar figures show 64-bit vectors that consist of four 16-bit elements, and 128-bit vectors that consist of four 32-bit elements. Other element sizes produce similar figures, but with one, two, eight, or sixteen operations performed in parallel instead of four.

**Figure F1-2 Advanced SIMD instruction operating on 64-bit registers**

Many Advanced SIMD instructions have variants that produce vectors of elements double the size of the inputs. In this case, the number of elements in the result vector is the same as the number of elements in the operand vectors, but each element, and the whole vector, is double the size.

[Figure F1-3](#) shows an example of an Advanced SIMD instruction operating on 64-bit registers, and generating a 128-bit result.

**Figure F1-3 Advanced SIMD instruction producing wider result**

There are also Advanced SIMD instructions that have variants that produce vectors containing elements half the size of the inputs. [Figure F1-4 on page F1-2833](#) shows an example of an Advanced SIMD instruction operating on one 128-bit register, and generating a 64-bit result.

**Figure F1-4 Advanced SIMD instruction producing narrower result**

Some Advanced SIMD instructions do not conform to these standard patterns. Their operation patterns are described in the individual instruction descriptions.

Advanced SIMD instructions that perform floating-point arithmetic use the ARM standard floating-point arithmetic defined in *Floating-point and Advanced SIMD support* on page A1-48.

### F1.13.1 Advanced SIMD parallel addition and subtraction

Table F1-20 shows the Advanced SIMD parallel add and subtract instructions.

**Table F1-20 Advanced SIMD parallel add and subtract instructions**

Instruction	See
Vector Add	<a href="#">VADD (integer) on page F6-3737</a> <a href="#">VADD (floating-point) on page F6-3733</a>

Vector Shift Right and Accumulate	<a href="#">VSRA</a> on page F6-4222
Vector Shift Right and Insert	<a href="#">VSRI</a> on page F6-4224

## F1.13.5 Advanced SIMD multiply instructions

Table F1-24 summarizes the Advanced SIMD multiply instructions.

**Table F1-24 Advanced SIMD multiply instructions**

Instruction	See
Vector Multiply Accumulate	<i>VMLA (integer)</i> on page F6-3966 <i>VMLA (floating-point)</i> on page F6-3962 <i>VMLA (by scalar)</i> on page F6-3968
Vector Multiply Accumulate Long	<i>VMLAL (integer)</i> on page F6-3971 <i>VMLAL (by scalar)</i> on page F6-3973
Vector Multiply Subtract	<i>VMLS (integer)</i> on page F6-3979 <i>VMLS (floating-point)</i> on page F6-3975 <i>VMLS (by scalar)</i> on page F6-3981
Vector Multiply Subtract Long	<i>VMSL (integer)</i> on page F6-3984 <i>VMSL (by scalar)</i> on page F6-3986
Vector Multiply	<i>VMUL (integer and polynomial)</i> on page F6-4026 <i>VMUL (floating-point)</i> on page F6-4022 <i>VMUL (by scalar)</i> on page F6-4028
Vector Multiply Long	<i>VMULL (integer and polynomial)</i> on page F6-4031 <i>VMULL (by scalar)</i> on page F6-4033
Vector Fused Multiply Accumulate	<i>VFMA</i> on page F6-3861
Vector Fused Multiply Subtract	<i>VFMS</i> on page F6-3865
Vector Saturating Doubling Multiply Accumulate Long	<i>VQDMLAL</i> on page F6-4088
Vector Saturating Doubling Multiply Subtract Long	<i>VQDMSL</i> on page F6-4091
Vector Saturating Doubling Multiply Returning High Half	<i>VQDMULH</i> on page F6-4094
Vector Saturating Doubling Multiply Long	<i>VQDMULL</i> on page F6-4097
Vector Saturating Rounding Doubling Multiply Accumulate Returning High Half	<i>VQRDMLAH</i> on page F6-4104
Vector Saturating Rounding Doubling Multiply Subtract Returning High Half	<i>VQRDMLSH</i> on page F6-4108
Vector Saturating Rounding Doubling Multiply Returning High Half	<i>VQRDMULH</i> on page F6-4112

Advanced SIMD multiply instructions can operate on vectors of:

- 8-bit, 16-bit, or 32-bit unsigned integers.
- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit polynomials over  $\{0, 1\}$ . *VMUL* and *VMULL* are the only instructions that operate on polynomials. *VMULL* produces a 16-bit polynomial over  $\{0, 1\}$ .
- Single-precision (32-bit) or half-precision (16-bit) floating-point numbers.

They can also act on one vector and one scalar.

Long instructions have doubleword (64-bit) operands, and produce quadword (128-bit) results. Other Advanced SIMD multiply instructions can have either doubleword or quadword operands, and produce results of the same size.

Floating-point multiply instructions can operate on:

- **Half-precision (16-bit) floating-point numbers.**
- Single-precision (32-bit) floating-point numbers.
- Double-precision (64-bit) floating-point numbers.

## F1.13.6 Miscellaneous Advanced SIMD data-processing instructions

Table F1-25 shows miscellaneous Advanced SIMD data-processing instructions.

**Table F1-25 Miscellaneous Advanced SIMD data-processing instructions**

# Chapter F2

## About the T32 and A32 Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- *Format of instruction descriptions* on page F2-2844.
- *Standard assembler syntax fields* on page F2-2848.
- *Conditional execution* on page F2-2849.
- *Shifts applied to a register* on page F2-2852.
- *Memory accesses* on page F2-2854.
- *Encoding of lists of general-purpose registers and the PC* on page F2-2855.
- *General information about the T32 and A32 instruction descriptions* on page F2-2856.
- *Additional pseudocode support for instruction descriptions* on page F2-2868.
- *Additional information about Advanced SIMD and floating-point instructions* on page F2-2869.

## F2.1 Format of instruction descriptions

The instruction descriptions in [Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions](#) and [Chapter F6 T32 and A32 Advanced SIMD and floating-point Instruction Descriptions](#) normally use the following format:

- Instruction section title.
- Introduction to the instruction.
- A description of each encoding of the instruction.
- Assembler syntax.
- Pseudocode describing how the instruction operates.
- Notes, if applicable.

Each of these items is described in more detail in the following subsections.

### F2.1.1 Instruction section title

The instruction section title gives the base mnemonic for the instruction or instructions described in the section. When one mnemonic has multiple forms described in separate instruction sections, this is followed by a short description of the form in parentheses. The most common use of this is to distinguish between forms of an instruction in which one of the operands is an immediate value and forms in which it is a register.

### F2.1.2 Introduction to the instruction

The introduction to the instruction briefly describes the main features of the instruction. This description is not necessarily complete and is not definitive. If there is any conflict between it and the more detailed information that follows, the latter takes priority.

### F2.1.3 Instruction encodings

This is a list of one or more instruction encodings. Each instruction encoding is labelled as:

- A1, A2, A3 ... for the first, second, third and any additional A32 encodings.
- T1, T2, T3 ... for the first, second, third and any additional T32 encodings.

Each instruction encoding description consists of:

- An assembly syntax that ensures that the assembler selects the encoding in preference to any other encoding. In some cases, multiple syntax variants are given. These are written in a typewriter font using the conventions described in [Assembler syntax prototype line conventions on page F2-2846](#). The correct one to use can be indicated by:
  - A subheading that identifies the encodings that correspond to the syntax. See, for example, the subheading *Flag setting, rotate right with extend variant* in the description of the A1 encoding of the ADC, ADCS (register) instructions in [A1 on page F5-3007](#).
  - An annotation to the syntax, such as *Inside IT block* or *Outside IT block*. See, for example, the syntax descriptions of the T1 encoding of the ADC, ADCS (register) instructions in [T1 on page F5-3008](#).

In other cases, the correct one to use can be determined by looking at the assembler syntax description and using it to determine which syntax corresponds to the instruction being disassembled.

There is usually more than one syntax variant that ensures re-assembly to any particular encoding, and the exact set of syntaxes that do so usually depends on the register numbers, immediate constants and other operands to the instruction. For example, when assembling to the T32 instruction set, the syntax `AND R0, R0`, `R8` ensures selection of a 32-bit encoding but `AND R0, R0, R1` selects a 16-bit encoding.

For each instruction encoding belonging to a target instruction set, an assembler can use this information to determine whether it can use that encoding to encode the instruction requested by the UAL source. If multiple encodings can encode the instruction then:

- If both a 16-bit encoding and a 32-bit encoding can encode the instruction, the architecture *prefers* the 16-bit encoding. This means the assembler must use the 16-bit encoding rather than the 32-bit encoding.  
Software can use the .W and .N qualifiers to specify the required encoding width, see [Standard assembler syntax fields on page F2-2848](#).
- If multiple encodings of the same length can encode the instruction, the *Assembler syntax* subsection says which encoding is preferred, and how software can, instead, select the other encodings.  
Each encoding also documents UAL syntax that selects it in preference to any other encoding.

If no encodings of the target instruction set can encode the instruction requested by the UAL source, normally the assembler generates an error saying that the instruction is not available in that instruction set.

———— **Note** —————

In some cases, an instruction is available in one instruction set but not in another. The *Assembler syntax* subsection identifies many of these cases. For example, the A32 instructions with bits<31:28> == 0b1111 described in [Branch, branch with link, and block data transfer on page F4-2970](#), [System register access, Advanced SIMD, floating-point, and Supervisor call on page F4-2972](#), and [Unconditional instructions on page F4-2983](#) cannot have a Condition code, but the equivalent T32 instructions often can, and this usually appears in the *Assembler syntax* subsection as a statement that the A32 instruction cannot be conditional.

However, some such cases are too complex to describe in the available space, so the definitive test of whether an instruction is available in a given instruction set is whether there is an available encoding for it in that instruction set.

The assembly syntax given for an encoding is therefore a suitable one for a disassembler to disassemble that encoding to. However, disassemblers might wish to use simpler syntaxes when they are suitable for the operand combination, in order to produce more readable disassembled code.

- An encoding diagram, where:
  - For a 32-bit A32 encoding diagram, the bits are numbered from 31 to 0.
  - For a 16-bit T32 encoding diagram, the bits are numbered from 15 to 0.  
This halfword can be described as hw1 of the instruction.
  - For a 32-bit T32 encoding diagram, the bits are numbered from 15 to 0 for each halfword, as a reminder that a 32-bit T32 instruction consists of two consecutive halfwords rather than a word.  
In this case, the left-hand halfword in the diagram is identified as hw1, and the right-hand halfword is identified as hw2.

Where instructions are stored using the standard little-endian instruction endianness:

- The encoding diagram for an A32 instruction at address A shows, from left to right, the bytes at addresses A+3, A+2, A+1, A.
- The encoding diagram for a 32-bit T32 instruction shows bytes in the order A+1, A for hw1, followed by bytes A+3, A+2 for hw2.
- Encoding-specific pseudocode. This is pseudocode that translates the encoding-specific instruction fields into inputs to the encoding-independent pseudocode in the *Operation* subsection, and that picks out any special cases in the encoding. For a detailed description of the pseudocode used and of the relationship between the encoding diagram, the encoding-specific pseudocode and the encoding-independent pseudocode, see [Appendix K10 ARM Pseudocode Definition](#).

## F2.1.4 Assembler symbols

The *Assembly symbols* describes the standard UAL syntax for the instruction.

Each syntax description consists of the following elements:

- Descriptions of all of the variable or optional fields of the syntax.  
Some syntax fields are standardized across all or most instructions. [Standard assembler syntax fields on page F2-2848](#) describes these fields.  
By default, syntax fields that specify registers, such as <Rd>, <Rn>, or <Rt>, can be any of R0-R12 or LR in T32 instructions, and any of R0-R12, SP or LR in A32 instructions. These require that the encoding-specific pseudocode set the corresponding integer variable (such as d, n, or t) to the corresponding register number, using 0-12 for R0-R12, 13 for SP, or 14 for LR:
  - Normally, software can do this by setting the corresponding field in the instruction, typically named Rd, Rn, Rt, to the binary encoding of that number.
  - In the case of 16-bit T32 encodings, the field is normally of length 3, and so the encoding is only available when the assembler syntax specifies one of R0-R7. Such encodings often use a register field name like Rdn. This indicates that the encoding is only available if <Rd> and <Rn> specify the same register, and that the register number of that register is encoded in the field if they do.The description of a syntax field that specifies a register sometimes extends or restricts the permitted range of registers or documents other differences from the default rules for such fields. Examples of extensions are permitting the use of the SP in a T32 instruction, or permitting the use of the PC, identified using register number 15.
- Where appropriate, text that briefly describes changes from the pre-UAL assembler syntax. Where present, this usually consists of an alternative pre-UAL form of the assembler mnemonic. The pre-UAL assembler syntax does not conflict with UAL. ARM recommends that it is supported, as an optional extension to UAL, so that pre-UAL assembler source files can be assembled.

### Assembler syntax prototype line conventions

The following conventions are used in assembler syntax prototype lines and their subfields:

- |     |   |
|-----|---|
| < > | <p>Any item bracketed by &lt; and &gt; is a short description of a type of value to be supplied by the user in that position. A longer description of the item is normally supplied by subsequent text. Such items often correspond to a similarly named field in an encoding diagram for an instruction. When the correspondence only requires the binary encoding of an integer value or register number to be substituted into the instruction encoding, it is not described explicitly. For example, if the assembler syntax for an instruction contains an item &lt;Rn&gt; and the instruction encoding diagram contains a 4-bit field named Rn, the number of the register specified in the assembler syntax is encoded in binary in the instruction field.</p> <p>If the correspondence between the assembler syntax item and the instruction encoding is more complex than simple binary encoding of an integer or register number, the item description indicates how it is encoded. This is often done by specifying a required output from the encoding-specific pseudocode, such as add = TRUE. The assembler must only use encodings that produce that output.</p> |
| { } | <p>Any item bracketed by { and } is optional. A description of the item and of how its presence or absence is encoded in the instruction is normally supplied by subsequent text.</p> <p>Many instructions have an optional destination register. Unless otherwise stated, if such a destination register is omitted, it is the same as the immediately following source register in the instruction syntax.</p>  |
| #   | <p>In the assembler syntax, numeric constants are normally preceded by a #. Some UAL instruction syntax descriptions explicitly show this # as optional. Any UAL assembler:</p> <ul style="list-style-type: none"><li>• Must treat the # as optional where an instruction syntax description shows it as optional.</li><li>• Can treat the # either as mandatory or as optional where an instruction syntax description does not show it as optional.</li></ul>   |

---

**Note**

---

ARM recommends that UAL assemblers treat all uses of # shown in this manual as optional.

---

**spaces** Single spaces are used for clarity, to separate items. When a space is obligatory in the assembler syntax, two or more consecutive spaces are used.

**+/-** This indicates an optional + or - sign. If neither is coded, + is assumed.

All other characters must be encoded precisely as they appear in the assembler syntax. Apart from { and }, the special characters described above do not appear in the basic forms of assembler instructions documented in this manual. In a few places, the { and } characters must be encoded as part of a variable item. When this happens, the long description of the variable item indicates how they must be used.

### F2.1.5 Pseudocode describing how the instruction operates

The *Operation for all classes* subsection contains encoding-independent pseudocode that describes the main operation of the instruction. For a detailed description of the pseudocode used and of the relationship between the encoding diagram, the encoding-specific pseudocode and the encoding-independent pseudocode, see [Appendix K10 ARM Pseudocode Definition](#).

## F2.2 Standard assembler syntax fields

The following assembler syntax fields are standard across all or most instructions:

<C> Is an optional field. It specifies the condition under which the instruction is executed. See [Conditional execution on page F2-2849](#) for the range of available conditions and their encoding. If <C> is omitted, it defaults to *always* (AL).

<q> Specifies optional assembler qualifiers on the instruction. The following qualifiers are defined:

.N Meaning narrow, specifies that the assembler must select a 16-bit encoding for the instruction. If this is not possible, an assembler error is produced.

.W Meaning wide, specifies that the assembler must select a 32-bit encoding for the instruction. If this is not possible, an assembler error is produced.

If neither .W nor .N is specified, the assembler can select either 16-bit or 32-bit encodings. If both are available, it must select a 16-bit encoding. In a few cases, more than one encoding of the same length can be available for an instruction. The rules for selecting between such encodings are instruction-specific and are part of the instruction description. The assembler syntax includes a mandatory .W qualifier, along with a note describing the cases in which it applies, where this qualifier is required to select a particular encoding for an instruction. Additional assembler syntax will describe the syntax when the conditions are not met.

---

### **Note**

---

When assembling to the A32 instruction set, the .N qualifier produces an assembler error and the .W qualifier has no effect.

---

## F2.3 Conditional execution

Most T32 and A32 instructions can be executed conditionally, based on the values of the APSR Condition flags. [Table F2-1](#) lists the available conditions.

**Table F2-1 Condition codes**

cond	Mnemonic extension	Meaning (integer)	Meaning (floating-point) <sup>a</sup>	Condition flags
0000	EQ	Equal	Equal	$Z == 1$
0001	NE	Not equal	Not equal, or unordered	$Z == 0$
0010	CS <sup>b</sup>	Carry set	Greater than, equal, or unordered	$C == 1$
0011	CC <sup>c</sup>	Carry clear	Less than	$C == 0$
0100	MI	Minus, negative	Less than	$N == 1$
0101	PL	Plus, positive or zero	Greater than, equal, or unordered	$N == 0$
0110	VS	Overflow	Unordered	$V == 1$
0111	VC	No overflow	Not unordered	$V == 0$
1000	HI	Unsigned higher	Greater than, or unordered	$C == 1$ and $Z == 0$
1001	LS	Unsigned lower or same	Less than or equal	$C == 0$ or $Z == 1$
1010	GE	Signed greater than or equal	Greater than or equal	$N == V$
1011	LT	Signed less than	Less than, or unordered	$N != V$
1100	GT	Signed greater than	Greater than	$Z == 0$ and $N == V$
1101	LE	Signed less than or equal	Less than, equal, or unordered	$Z == 1$ or $N != V$
1110	None (AL) <sup>d</sup>	Always (unconditional)	Always (unconditional)	Any

a. Unordered means at least one NaN operand.

b. HS (unsigned higher or same) is a synonym for CS.

c. LO (unsigned lower) is a synonym for CC.

d. AL is an optional mnemonic extension for always, except in IT instructions. For details see [IT on page F5-3126](#).

In T32 instructions, the condition, if it is not AL, is normally encoded in a preceding IT instruction. For more information see [Conditional instructions on page F1-2809](#) and [IT on page F5-3126](#). Some conditional branch instructions do not require a preceding IT instruction, because they include a Condition code in their encoding.

For performance reasons, ARMv8 deprecates the use of IT other than with a single 16-bit T32 instruction from a specified subset of the 16-bit T32 instructions, see [Partial deprecation of IT on page F1-2826](#). In addition, implementations can provide a set of ITD control fields, [SCTLR.ITD](#), [SCTLR\\_EL1.ITD](#), and [HSCTLR.ITD](#), to disable these deprecated uses, making them UNDEFINED. For more information see:

- [Disabling or enabling PL0 and PL1 use of AArch32 deprecated functionality on page G1-4421](#).
- [Disabling or enabling EL2 use of AArch32 deprecated functionality on page G1-4430](#).

In A32 instructions, bits[31:28] of the instruction contain either:

- The Condition code, see [The Condition code field in A32 instruction encodings on page F2-2850](#).
- 0b1111 for some A32 instructions that can only be executed unconditionally.

ARM deprecates the conditional execution of any instruction encoding provided by Advanced SIMD that is not also provided by floating-point, and strongly recommends that:

- For A32 instructions, any such Advanced SIMD instruction that can be conditionally executed is executed with the <c> field omitted or set to AL.

**Note**

This applies only to VDUP, see [VDUP \(general-purpose register\) on page F6-3851](#). The other A32 instructions do not permit conditional execution.

- For T32 instructions, such Advanced SIMD instructions are never included in an IT block. This means they must be specified with the <c> field omitted or set to AL.

This deprecation does not apply to Advanced SIMD instruction encodings that are also available as floating-point instruction encodings. That is, it does not apply to the Advanced SIMD encodings of the instructions described in the following sections:

- [VLDM, VLDMDB, VLDMIA on page F6-3935](#).
- [VLDLDR \(immediate\) on page F6-3940](#) and [VLDLDR \(literal\) on page F6-3943](#).
- [VMOV \(general-purpose register to scalar\) on page F6-4002](#).
- [VMOV \(between two general-purpose registers and a doubleword floating-point register\) on page F6-3988](#).
- [VMRS on page F6-4017](#).
- [VMSR on page F6-4020](#).
- [VPOP on page F6-4080](#).
- [VPUSH on page F6-4082](#).
- [VSTM, VSTMDB, VSTMLA on page F6-4268](#).
- [VSTR on page F6-4273](#).

See also [Conditional execution of undefined instructions on page G1-4378](#).

### F2.3.1 The Condition code field in A32 instruction encodings

Every conditional A32 instruction contains a 4-bit Condition code field, the cond field, in bits 31 to 28:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
cond																															

This field contains one of the values 0b0000-0b1110, as shown in [Table F2-1 on page F2-2849](#). Most instruction mnemonics can be extended with the letters defined in the [Mnemonic extension on page F2-2849](#) column of that table.

If the *always* (AL) condition is specified, the instruction is executed irrespective of the value of the Condition flags. The absence of a Condition code on an instruction mnemonic implies the AL Condition code.

### F2.3.2 Pseudocode description of conditional execution

The [AArch32.CurrentCond\(\)](#) function returns a 4-bit condition specifier as follows:

- For A32 instructions, it returns bits[31:28] of the instruction.
- For the T1 and T3 encodings of the Branch instruction (see [B on page F5-3051](#)), it returns the 4-bit cond field of the encoding.
- For all other T32 instructions:
  - If PSTATE.IT<3:0> != '0000' it returns PSTATE.IT<7:4>.
  - If PSTATE.IT<7:0> == '00000000' it returns '1110'.
  - Otherwise, execution of the instruction is CONSTRAINED UNPREDICTABLE.

For more information, see [Process state, PSTATE on page E1-2734](#).

The `ConditionPassed()` function uses this condition specifier and the Condition flags to determine whether the instruction must be executed, by calling the `ConditionHolds()` function.

Chapter J1 *ARMv8 Pseudocode* includes the definitions of these functions.

*Undefined Instruction exception* on page G1-4376 describes the handling of conditional instructions that are UNDEFINED, UNPREDICTABLE, or CONSTRAINED UNPREDICTABLE. The pseudocode in the manual, as a sequential description of the instructions, has limitations in this respect. For more information, see *Limitations of the instruction pseudocode* on page K10-6256.

## F2.4 Shifts applied to a register

A32 register offset load/store word and unsigned byte instructions can apply a wide range of different constant shifts to the offset register. Both T32 and A32 data-processing instructions can apply the same range of different constant shifts to the second operand register. For details see [Constant shifts](#).

A32 data-processing instructions can apply a register-controlled shift to the second operand register.

### F2.4.1 Constant shifts

These are the same in T32 and A32 instructions, except that the input bits come from different positions.

<shift> is an optional shift to be applied to <Rm>. It can be any one of:

<b>(omitted)</b>	No shift.
LSL #<n>	Logical shift left <n> bits. 1 <= <n> <= 31.
LSR #<n>	Logical shift right <n> bits. 1 <= <n> <= 32.
ASR #<n>	Arithmetic shift right <n> bits. 1 <= <n> <= 32.
ROR #<n>	Rotate right <n> bits. 1 <= <n> <= 31.
RRX	Rotate right one bit, with extend. Bit[0] is written to shifter_carry_out, bits[31:1] are shifted right one bit, and the Carry flag is shifted into bit[31].

#### ————— Note —————

Assemblers can permit the use of some or all of ASR #0, LSL #0, LSR #0, and ROR #0 to specify that no shift is to be performed. This is not standard UAL, and the encoding selected for T32 instructions might vary between UAL assemblers if it is used. To ensure disassembled code assembles to the original instructions, disassemblers must omit the shift specifier when the instruction specifies no shift.

Similarly, assemblers can permit the use of #0 in the immediate forms of ASR, LSL, LSR, and ROR instructions to specify that no shift is to be performed, that is, that a MOV (register) instruction is wanted. Again, this is not standard UAL, and the encoding selected for T32 instructions might vary between UAL assemblers if it is used. To ensure disassembled code assembles to the original instructions, disassemblers must use the MOV (register) syntax when the instruction specifies no shift.

### Encoding

The assembler encodes <shift> into two type bits and five immediate bits, as follows:

<b>(omitted)</b>	type = 0b00, immediate = 0.
LSL #<n>	type = 0b00, immediate = <n>.
LSR #<n>	type = 0b01. If <n> < 32, immediate = <n>. If <n> == 32, immediate = 0.
ASR #<n>	type = 0b10. If <n> < 32, immediate = <n>. If <n> == 32, immediate = 0.
ROR #<n>	type = 0b11, immediate = <n>.
RRX	type = 0b11, immediate = 0.

## F2.4.2 Register controlled shifts

These are only available in A32 instructions.

<type> is the type of shift to apply to the value read from <Rm>. It must be one of:

ASR	Arithmetic shift right, encoded as type = 0b10.
LSL	Logical shift left, encoded as type = 0b00.
LSR	Logical shift right, encoded as type = 0b01.
ROR	Rotate right, encoded as type = 0b11.

The bottom byte of <Rs> contains the shift amount.

## F2.4.3 Pseudocode description of instruction-specified shifts and rotates

The pseudocode enumeration `SRTType{}` defines the shift types. Shift and rotate instruction decode is described by the pseudocode function:

- `DecodeImmShift()` for a constant shift.
- `DecodeRegShift()` for a register controlled shift.

Shift and rotate operations are made by the pseudocode function `Shift()`.

## F2.5 Memory accesses

Commonly, the following addressing modes are permitted for memory access instructions:

### Offset addressing

The offset value is applied to an address obtained from the base register. The result is used as the address for the memory access. The value of the base register is unchanged.

The assembly language syntax for this mode is:

[<Rn>, <offset>]

### Pre-indexed addressing

The offset value is applied to an address obtained from the base register. The result is used as the address for the memory access, and written back into the base register.

The assembly language syntax for this mode is:

[<Rn>, <offset>]!

### Post-indexed addressing

The address obtained from the base register is used, unchanged, as the address for the memory access. The offset value is applied to the address, and written back into the base register.

The assembly language syntax for this mode is:

[<Rn>], <offset>

In each case, <Rn> is the base register. <offset> can be:

- An immediate constant, such as <imm8> or <imm12>.
- An index register, <Rm>.
- A shifted index register, such as <Rm>, LSL #<shift>.

For information about unaligned access, endianness, and exclusive access, see:

- [Alignment support on page E2-2777](#).
- [Endian support on page E2-2779](#).
- [Synchronization and semaphores on page E2-2795](#).

## F2.6 Encoding of lists of general-purpose registers and the PC

A number of instructions operate on lists of general-purpose registers. For some load instructions, the list of registers to be loaded can include the PC. For these instructions, the assembler syntax includes a <registers> field, that provides a list of the registers to be operated on, with list entries separated by commas.

The registers list is encoded in the instruction encoding. Most often, this is done using an 8-bit, 13-bit, or 16-bit register\_list field. This section gives more information about these and other possible register list encodings.

In a register\_list field, each bit corresponds to a single register, and if the <registers> field of the assembler instruction includes Rt then register\_list<t> is set to 1, otherwise it is set to 0.

The full rules for the encoding of lists of general-purpose registers, and possibly the PC, are:

- Except for the cases listed here, 16-bit T32 encodings use an 8-bit register list, and can access only registers R0-R7.

The exceptions to this rule are:

- The T1 encoding of POP uses an 8-bit register list, and an additional bit, P, that corresponds to the PC. This means it can access any of R0-R7 and the PC.
- The T1 encoding of PUSH uses an 8-bit register list, and an additional bit, M, that corresponds to the LR. This means it can access any of R0-R7 and the LR.

- 32-bit T32 encodings of load operations use a 13-bit register list, and two additional bits, M, corresponding to the LR, and P, corresponding to the PC. This means these instructions can access any of R0-R12 and the LR and PC.
- 32-bit T32 encodings of store operations use a 13-bit register list, and one additional bit, M, corresponding to the LR. This means these instructions can access any of R0-R12 and the LR.
- Except for the case listed here, A32 encodings use a 16-bit register list. This means these instructions can access any of R0-R12 and the SP, LR, and PC.

The exception to this rule is:

- The system instructions LDM (exception return) and LDM (User registers) use a 15-bit register list. This means these instructions can access any of R0-R12 and the SP and LR.

- The T3 and A2 encodings of POP, and the T3 and A2 encodings of PUSH, access a single register from the set of registers {R0-R12, LR, PC} and encode the register number in the Rt field.

---

### **Note**

POP is a load operation, and PUSH is a store operation.

---

In every case, the encoding-specific pseudocode converts the register list into a 32-bit variable, registers, with a bit corresponding to each of the registers R0-R12, SP, LR, and PC.

---

### **Note**

Some floating-point and Advanced SIMD instructions operate on lists of SIMD and floating-point registers. The assembler syntax of these instructions includes a <list> field that specifies the registers to be operated on, and the description of the instruction in [Alphabetical list of T32 and A32 base instruction set instructions on page F5-3004](#) defines the use and encoding of this field.

---

## F2.7 General information about the T32 and A32 instruction descriptions

Chapter F3 *T32 Instruction Set Encoding* describes the T32 instruction encodings, and Chapter F4 *A32 Instruction Set Encoding* describes the A32 instruction encodings. The following subsections give more information about the descriptions of these instructions and their encodings:

- *UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space.*
- *T32 and A32 Advanced SIMD and floating-point instruction encodings on page F2-2857.*
- *The PC and the use of 0b1111 as a register specifier in T32 and A32 instructions on page F2-2861.*
- *The SP and the use of 0b1101 as a register specifier in T32 and A32 instructions on page F2-2862.*
- *Modified immediate constants in T32 and A32 instructions on page F2-2862.*

### F2.7.1 UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space

An attempt to execute an unallocated instruction results in either:

- Unpredictable behavior. The instruction is described as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE. ARMv8-A greatly reduces the architecturally UNPREDICTABLE behavior in AArch32 state. Most cases that earlier versions of the architecture describe as UNPREDICTABLE become either:
  - CONSTRAINED UNPREDICTABLE, meaning the architecture defines a limited range of permitted behaviors.
  - Fully predictable.

For more information see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

- An Undefined Instruction exception. The instruction is described as UNDEFINED.

An instruction is UNDEFINED if it is declared as UNDEFINED in an instruction description, or in Chapter F3 *T32 Instruction Set Encoding* or Chapter F4 *A32 Instruction Set Encoding*.

An instruction is UNPREDICTABLE only if:

- It is declared as UNPREDICTABLE in an instruction description or in Chapter F3 or Chapter F4, and [Appendix K1](#) does not redefine the behavior as CONSTRAINED UNPREDICTABLE.
- The pseudocode for that encoding does not indicate that a different special case applies, and a bit marked (0) or (1) in the encoding diagram of an instruction is not 0 or 1 respectively. In most cases, ARMv8 makes these cases CONSTRAINED UNPREDICTABLE, as described in *SBZ or SBO fields T32 and A32 in instructions on page K1-6100*.

Unless otherwise specified, T32 and A32 instructions provided as part of an architectural extension, or by an optional feature of the architecture, are UNDEFINED in an implementation that does not include that extension or feature.

#### ———— **Note** —————

Examples of where this rule applies are:

- The instructions provided by the Cryptographic Extension.
- The system instructions that provide access to the System registers of the OPTIONAL Performance Monitors Extension.
- The Advanced SIMD and floating-point instructions.

For more information about UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction behavior, see [Undefined Instruction exception on page G1-4376](#).

For more information about the behavior of T32 and A32 instructions in earlier versions of the architecture see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

## F2.7.2 T32 and A32 Advanced SIMD and floating-point instruction encodings

The T32 and A32 encodings of Advanced SIMD and floating-point instructions that are described in [Chapter F3 T32 Instruction Set Encoding](#) and in [Chapter F4 A32 Instruction Set Encoding](#) are common to the T32 and A32 instruction sets. This means:

- The instruction groups, and the set of instructions in each group, are identical for T32 and A32.
- For each instruction:
  - Each T32 encoding is exactly equivalent to an A32 encoding.
  - There is no T32 encoding without an equivalent A32 encoding, and no A32 encoding without an equivalent T32 encoding.

### Note

- In the T32 instruction sets, the Advanced SIMD and floating-point instructions have 32-bit encodings.
- In the base instruction sets, some instructions are common to the T32 and A32 instruction sets, whereas other instructions have equivalent but not identical functionality in the two instruction sets.

32-bit T32 encodings are described as two contiguous halfwords, {hw1:hw2}, as described in [Instruction encodings on page F2-2844](#). In general:

- hw1 of a T32 encoding maps onto bits[31:16] of an equivalent A32 encoding.
- hw2 of a T32 encoding maps onto bits[15:0] of an equivalent A32 encoding.

However, the different structures of the T32 instruction encoding space and the A32 instruction encoding space mean that:

- For a given Advanced SIMD and floating-point instruction group:
  - The positions of the fields that identify the instruction, or instruction encoding, within the instruction group might differ between the T32 encodings and the A32 encodings.
  - However, the field values that identify the instruction of instruction encoding are identical for the T32 encoding and the A32 encoding.

The remainder of this section describes the equivalence of the T32 and A32 encodings for each of the Advanced SIMD and floating-point instruction groups.

### Advanced SIMD data-processing

The T32 encoding of the Advanced SIMD data-processing group is:

The A32 encoding of the Advanced SIMD data-processing group is:

The encodings in this group are identified by:

- hw1[15:13] of the T32 encoding is equivalent to bits[27:25] of the A32 encoding, and:
  - Has the value 0b111 in the T32 encoding.
  - Has the value 0b001 in the A32 encoding.
- hw1[11:8] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and has the value 0b111.

This table shows the equivalence of the fields that identify the instructions, or instruction encodings, within this group:

T32 encoding	A32 encoding	Field size
op0:op1	op0	2 bits
op2	op1	15 bits
op3	op2	1 bit
op4	op3	1 bit

### Advanced SIMD element or structure load/store

The T32 encoding of the Advanced SIMD element or structure load/store group is:

The A32 encoding of the Advanced SIMD element or structure load/store group is:

The encodings in this group are identified by:

- hw1[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and has the value 0b1111.
- hw1[11:8] of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and:
  - Has the value 0b1001 in the T32 encoding.
  - Has the value 0b0100 in the A32 encoding.
- hw1[4] of the T32 encoding is equivalent to bit[20] of the A32 encoding, and has the value 0b0.

op0, op1, and op2 are the fields that identify the instructions, or instruction encodings, within this group, and they are in equivalent positions in the T32 and A32 encodings.

## Floating-point and Advanced SIMD load/store and 64-bit register moves

The T32 encoding of the Floating-point and Advanced SIMD load/store and 64-bit register moves group is:

The A32 encoding of the Floating-point and Advanced SIMD load/store and 64-bit register moves group is:

The encodings in the group are identified by:

- hw1[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
  - Has the value 0b1110 in the T32 encoding.
  - Can have any value other than 0b1111 in the A32 encoding.
 This range of values is required because A32 instructions in this group can be executed conditionally, see [Conditional execution on page F2-2849](#).
- hw1[11:9] of the T32 encoding is equivalent to bits[27:25] of the A32 encoding, and has the value 0b110.
- hw2[11:9] of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value 0b101.

op0 is the field that identifies the instructions, or instruction encodings, within this group, and is in equivalent positions in the T32 and A32 encodings.

## Floating-point and Advanced SIMD 32-bit register moves

The T32 encoding of the Floating-point and Advanced SIMD 32-bit register moves group is:

The A32 encoding of the Advanced SIMD 32-bit register moves group is:

The encodings in this group are identified by:

- hw1[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
  - Has the value 0b1110 in the T32 encoding.
  - Can have any value other than 0b1111 in the A32 encoding.
 This range of values is required because A32 instructions in this group can be executed conditionally, see [Conditional execution on page F2-2849](#).
- hw1[11:8] of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and has the value 0b1110.

- hw2[11:9] of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value 0b101.
- hw2[4:0] of the T32 encoding is equivalent to bits[4:0] of the A32 encoding, and has the value 0b11111.

op0 is the field that identifies the instructions, or instruction encodings, within this group, and is in equivalent positions in the T32 and A32 encodings.

## Floating-point data-processing

The T32 encoding of the Floating-point data-processing group is:

The A32 encoding of the Floating-point data-processing group is:

The encodings in this group are identified by:

- hw1[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
  - In the T32 encoding, hw1[15:13] has the value 0b111, and hw1[12] is the op0 parameter used in identifying instruction encodings within this group.
  - In the A32 encoding, is the cond field and also implies the value of bit[28] of some A32 instruction encodings within this group, as the following table shows:

cond	Significance of bit[28] in A32 encodings
!= 0b1111	Part of the cond field.
0b1111	Has fixed value of 1.

The range of cond values other than 0b1111 is required because A32 instructions in this group can be executed conditionally, see [Conditional execution on page F2-2849](#).

- hw1[11:8] of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and has the value 0b1110.
- hw2[11:9] of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value 0b101.
- hw2[4] of the T32 encoding is equivalent to bit[4] of the A32 encoding, and has the value 0b0.

This table shows the equivalence of the fields that identify the instructions, or instruction encodings, within this group:

T32 encoding	A32 encoding
op0	Bit[28] of the instruction encoding is 1 when cond is 0b1111.
op1	op0
op2	op1
op3	op2

### F2.7.3 The PC and the use of 0b1111 as a register specifier in T32 and A32 instructions

Restrictions on the use of PC or 0b1111 as a register specifier differ between the T32 and the A32 instruction sets, as described in:

- [T32 restrictions on the use of the PC, and use of 0b1111 as a register specifier.](#)
- [A32 restrictions on the use of PC or 0b1111 as a register specifier on page F2-2862.](#)

#### T32 restrictions on the use of the PC, and use of 0b1111 as a register specifier

The use of 0b1111 as a register specifier is not normally permitted in T32 instructions. When a value of 0b1111 is permitted, a variety of meanings is possible. For register reads, these meanings include:

- Read the PC value, that is, the address of the current instruction + 4. The base register of the table branch instructions TBB and TBH can be the PC. This means branch tables can be placed in memory immediately after the instruction.

#### ———— **Note** ————

ARM deprecates use of the PC as the base register in the STC instruction.

- Read the word-aligned PC value, that is, the address of the current instruction + 4, with bits[1:0] forced to zero. The base register of LDC, LDR, LDRB, LDRD (pre-indexed, no writeback), LDRH, LDRSB, and LDRSH instructions can be the word-aligned PC. This provides PC-relative data addressing. In addition, some encodings of the ADD and SUB instructions permit their source registers to be 0b1111 for the same purpose.
- Read zero. This is done in some cases when one instruction is a special case of another, more general instruction, but with one operand zero. In these cases, the instructions are listed on separate pages, with a special case in the pseudocode for the more general instruction cross-referencing the other page.

For register writes, these meanings include:

- The PC can be specified as the destination register of an LDR instruction. This is done by encoding Rt as 0b1111. The loaded value is treated as an address, and the effect of execution is a branch to that address. Bit[0] of the loaded value selects whether to execute A32 or T32 instructions after the branch.
- Some other instructions write the PC in similar ways. An instruction can specify that the PC is written:
  - Implicitly, for example, branch instructions.
  - Explicitly by a register specifier of 0b1111, for example 16-bit MOV (register) instructions.
  - Explicitly by using a register mask, for example LDM instructions.

The address to branch to can be:

- A loaded value, for example, RFE.
- A register value, for example, BX.
- The result of a calculation, for example, TBB or TBH.

The method of choosing the instruction set used after the branch can be:

- Similar to the LDR case, for example, LDM or BX.
  - A fixed instruction set other than the one currently being used, for example, the immediate form of BLX.
  - Unchanged, for example, branch instructions or 16-bit MOV (register) instructions.
  - Set from the [SPSR.T](#) bit, for RFE and SUBS PC, LR, #imm8.
- Discard the result of a calculation. This is done in some cases when one instruction is a special case of another, more general instruction, but with the result discarded. In these cases, the instructions are listed on separate pages, with a special case in the pseudocode for the more general instruction cross-referencing the other page.
  - If the destination register specifier of an LDRB, LDRH, LDRSB, or LDRSH instruction is 0b1111, the instruction is a memory hint instead of a load operation.
  - If the destination register specifier of an MRC instruction is 0b1111, bits[31:28] of the value transferred from the System register are written to the N, Z, C, and V Condition flags in the APSR, and bits[27:0] are discarded.

### A32 restrictions on the use of PC or 0b1111 as a register specifier

In A32 instructions, the use of 0b1111 as a register specifier specifies the PC.

Many instructions are CONSTRAINED UNPREDICTABLE if they use 0b1111 as a register specifier. This is specified by pseudocode in the instruction description. ARMv8-A constrains the resulting CONSTRAINED UNPREDICTABLE behavior, see [Using R15 on page K1-6097](#).

#### ———— Note ————

ARM deprecates use of the PC as the base register in any store instruction.

## F2.7.4 The SP and the use of 0b1101 as a register specifier in T32 and A32 instructions

In the T32 and A32 instruction sets, ARM recommends that the use of 0b1101 as a register specifier specifies the SP.

#### ———— Note ————

- The recommendation that the register specifier 0b1101 is only used to specify the SP applies to both the T32 and the A32 instruction sets.
- Despite this recommendation, T32 instructions that can access R13, or the SP, behave predictably in ARMv8. This differs from ARMv7, where many uses of R13 are defined as UNPREDICTABLE. For more information about these cases see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

## F2.7.5 Modified immediate constants in T32 and A32 instructions

The following sections describe the encoding of modified immediate constants:

- [Modified immediate constants in T32 instructions on page F2-2863](#).
- [Modified immediate constants in A32 instructions on page F2-2864](#).
- [Modified immediate constants in T32 and A32 Advanced SIMD instructions on page F2-2865](#).
- [Modified immediate constants in T32 and A32 floating-point instructions on page F2-2866](#).

## Modified immediate constants in T32 instructions

The encoding of a modified immediate constant in a 32-bit T32 instruction is:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
					i											imm3								a	b	c	d	e	f	g	h

Table F2-2 shows the range of modified immediate constants available in T32 data-processing instructions, and their encoding in the a, b, c, d, e, f, g, h, and i bits, and the imm3 field, in the instruction.

**Table F2-2 Encoding of modified immediates in T32 data-processing instructions**

i:imm3:a	<const> <sup>a</sup>
0000x	00000000 00000000 00000000 abcdefgh
0001x	00000000 abcdefgh 00000000 abcdefgh <sup>b</sup>
0010x	abcdefgh 00000000 abcdefgh 00000000 <sup>b</sup>
0011x	abcdefgh abcdefgh abcdefgh abcdefgh <sup>b</sup>
01000	1bcdefgh 00000000 00000000 00000000
01001	01bcdefg h0000000 00000000 00000000 <sup>c</sup>
01010	001bcdef gh000000 00000000 00000000
01011	0001bcde fgh00000 00000000 00000000 <sup>c</sup>
.	.
.	. 8-bit values shifted to other positions
.	.
11101	00000000 00000000 000001bc defgh000 <sup>c</sup>
11110	00000000 00000000 0000001b cdefgh00
11111	00000000 00000000 00000001 bcdefgh0 <sup>c</sup>

- This table shows the immediate constant value in binary form, to relate abcdefgh to the encoding diagram. In assembly syntax, the immediate value is specified in the usual way (a decimal number by default).
- ARM deprecates using a modified immediate with abcdefgh == 00000000, and these cases are CONSTRAINED UNPREDICTABLE, see [UNPREDICTABLE cases in immediate constants in T32 data-processing instructions](#) on page K1-6100.
- Not available in A32 instructions if h == 1.

### Note

As the footnotes to Table F2-2 show, the range of values available in T32 modified immediate constants is slightly different from the range of values available in A32 instructions. See [Modified immediate constants in A32 instructions](#) on page F2-2864 for the A32 values.

### Carry out

A logical instruction with i:imm3:a == '00xxx' does not affect the Carry flag. Otherwise, a logical flag-setting instruction sets the Carry flag to the value of bit[31] of the modified immediate constant.

### Operation of modified immediate constants, T32 instructions

For a T32 data-processing instruction, the `T32ExpandImm()` pseudocode function returns the value of the 32-bit immediate constant, calling `T32ExpandImm_C()` to evaluate the constant.

## Modified immediate constants in A32 instructions

The encoding of a modified immediate constant in an A32 instruction is:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
																				rotation		a	b	c	d	e	f	g	h							

Table F2-3 shows the range of modified immediate constants available in A32 data-processing instructions, and their encoding in the a, b, c, d, e, f, g, and h bits and the rotation field in the instruction.

**Table F2-3 Encoding of modified immediates in A32 processing instructions**

rotation	<const> <sup>a</sup>
0000	00000000 00000000 00000000 abcdefgh
0001	gh000000 00000000 00000000 00abcdef
0010	efgh0000 00000000 00000000 0000abcd
0011	cdefgh00 00000000 00000000 000000ab
0100	abcdefgh 00000000 00000000 00000000
.	.
.	8-bit values shifted to other even-numbered positions
.	.
1001	00000000 00abcdef gh000000 00000000
.	.
.	8-bit values shifted to other even-numbered positions
.	.
1110	00000000 00000000 0000abcd efgh0000
1111	00000000 00000000 000000ab cdefgh00

a. This table shows the immediate constant value in binary form, to relate abcdefgh to the encoding diagram. In assembly syntax, the immediate value is specified in the usual way (a decimal number by default).

### Note

The range of values available in A32 modified immediate constants is slightly different from the range of values available in 32-bit T32 instructions. See [Modified immediate constants in T32 instructions](#) on page F2-2863.

### Carry out

A logical instruction with the rotation field set to 0b0000 does not affect APSR.C. Otherwise, a logical flag-setting instruction sets APSR.C to the value of bit[31] of the modified immediate constant.

### Constants with multiple encodings

Some constant values have multiple possible encodings. In this case, a UAL assembler must select the encoding with the lowest unsigned value of the rotation field. This is the encoding that appears first in Table F2-3. For example, the constant #3 must be encoded with (rotation, abcdefgh) == (0b0000, 0b00000011), not (0b0001, 0b00001100), (0b0010, 0b00110000), or (0b0011, 0b11000000).

In particular, this means that all constants in the range 0-255 are encoded with rotation == 0b0000, and permitted constants outside that range are encoded with rotation != 0b0000. A flag-setting logical instruction with a modified immediate constant therefore leaves APSR.C unchanged if the constant is in the range 0-255 and sets it to the most significant bit of the constant otherwise. This matches the behavior of T32 modified immediate constants for all constants that are permitted in both the A32 and T32 instruction sets.

An alternative syntax is available for a modified immediate constant that permits the programmer to specify the encoding directly. In this syntax, `#<const>` is instead written as `#<byte>`, `#<rot>`, where:

`<byte>` Is the numeric value of `abcdefgh`, in the range 0-255.

`<rot>` Is twice the numeric value of rotation, an even number in the range 0-30.

This syntax permits all A32 data-processing instructions with modified immediate constants to be disassembled to assembler syntax that assembles to the original instruction.

This syntax also makes it possible to write variants of some flag-setting logical instructions that have different effects on APSR.C to those obtained with the normal `#<const>` syntax. For example, `ANDS R1, R2, #12, #2` has the same behavior as `ANDS R1, R2, #3` except that it sets APSR.C to 0 instead of leaving it unchanged. Such variants of flag-setting logical instructions do not have equivalents in the T32 instruction set, and ARM deprecates their use.

### Operation of modified immediate constants, A32 instructions

For an A32 data-processing instruction, the `A32ExpandImm()` pseudocode function returns the value of the 32-bit immediate constant, calling `A32ExpandImm_C()` to evaluate the constant.

### Modified immediate constants in T32 and A32 Advanced SIMD instructions

Table F2-4 shows the modified immediate constants available with Advanced SIMD instructions, and how they are encoded.

**Table F2-4 Modified immediate values for Advanced SIMD instructions**

op	cmode	Constant <sup>a</sup>	<dt> <sup>b</sup>	Notes
-	000x	00000000 00000000 00000000 abcdefgh 00000000 00000000 00000000 abcdefgh	I32	c
	001x	00000000 00000000 abcdefgh 00000000 00000000 00000000 abcdefgh 00000000	I32	c, d
	010x	00000000 abcdefgh 00000000 00000000 00000000 abcdefgh 00000000 00000000	I32	c, d
	011x	abcdefgh 00000000 00000000 00000000 abcdefgh 00000000 00000000 00000000	I32	c, d
	100x	00000000 abcdefgh 00000000 abcdefgh 00000000 abcdefgh 00000000 abcdefgh	I16	c
	101x	abcdefgh 00000000 abcdefgh 00000000 abcdefgh 00000000 abcdefgh 00000000	I16	c, d
	1100	00000000 00000000 abcdefgh 11111111 00000000 00000000 abcdefgh 11111111	I32	d, e
	1101	00000000 abcdefgh 11111111 11111111 00000000 abcdefgh 11111111 11111111	I32	d, e
0	1110	abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh	I8	f
	1111	aBbbbbc defgh000 00000000 00000000 aBbbbbc defgh000 00000000 00000000	F32	f, g
1	1110	aaaaaaaa bbbbbbbb cccccccc dddddddd eeeeeeee ffffffff gggggggg hhhhhhhh	I64	f
	1111	UNDEFINED	-	-

- In this table, the immediate value is shown in binary form, to relate `abcdefgh` to the encoding diagram. In assembler syntax, the constant is specified by a data type and a value of that type. That value is specified in the normal way (a decimal number by default) and is replicated enough times to fill the 64-bit immediate. For example, a data type of I32 and a value of 10 specify the 64-bit constant `0x0000000A0000000A`.
- This specifies the data type used when the instruction is disassembled. On assembly, the data type must be matched in the table if possible. Other data types are permitted as pseudo-instructions when a program is assembled, provided the 64-bit constant specified by the data type and value is available for the instruction. If a constant is available in more than one way, the first entry in this table that can produce it is used. For example, `VMOV.I64 D0, #0x8000000080000000` does not specify a 64-bit constant that is available from the I64 line of the table, but does specify one that is available from the fourth I32 line or the F32 line. It is assembled to the first of these, and therefore is disassembled as `VMOV.I32 D0, #0x80000000`.
- This constant is available for the VBIC, VMOV, VMVN, and VORR instructions.

- d. CONSTRAINED UNPREDICTABLE if  $abcdefgh == 0b00000000$ , see [UNPREDICTABLE cases in immediate constants in Advanced SIMD instructions on page K1-6101](#). The required behavior is that these encodings produce an immediate constant of zero.
- e. This constant is available for the VMOV and VMVN instructions only.
- f. This constant is available for the VMOV instruction only.
- g. In this entry,  $B = \text{NOT}(b)$ . The bit pattern represents the floating-point number  $(-1)^S \times 2^{\text{exp}} \times \text{mantissa}$ , where  $S = \text{UInt}(a)$ ,  $\text{exp} = \text{UInt}(\text{NOT}(b):c:d)-3$  and  $\text{mantissa} = (16 + \text{UInt}(e:f:g:h))/16$ .

### Operation of modified immediate constants, Advanced SIMD instructions

For a T32 or A32 Advanced SIMD instruction that uses a modified immediate constant, the operation described by the [AdvSIMDExpandImm\(\)](#) pseudocode function returns the value of the 64-bit immediate constant.

### Modified immediate constants in T32 and A32 floating-point instructions

[Table F2-5](#) shows the immediate constants available in the VMOV (immediate) floating-point instruction, and [Table F2-6](#) shows the resulting floating-point values.

**Table F2-5 Floating-point modified immediate constants**

Data type	imm4H	imm4L	Constant <sup>a</sup>
F16	abcd	efgh	aBbbcd ef gh000000
F32	abcd	efgh	aBbbbbc defgh000 00000000 00000000
F64	abcd	efgh	aBbbbbb bcd efgh 00000000 00000000 00000000 00000000 00000000 00000000

- a. In this column,  $B = \text{NOT}(b)$ . The bit pattern represents the floating-point number  $(-1)^S \times 2^{\text{exp}} \times \text{mantissa}$ , where  $S = \text{UInt}(a)$ ,  $\text{exp} = \text{UInt}(\text{NOT}(b):c:d)-3$  and  $\text{mantissa} = (16 + \text{UInt}(e:f:g:h))/16$ .

**Table F2-6 Floating-point constant values**

**Operation of modified immediate constants, floating-point instructions**

For a T32 or A32 floating-point instruction that uses a modified immediate constant, the operation described by the [VFPEExpandImm\(\)](#) pseudocode function returns the value of the immediate constant.

## F2.8 Additional pseudocode support for instruction descriptions

Earlier sections of this chapter include pseudocode that describes features of the execution of A32 and T32 instructions, see:

- [Pseudocode description of conditional execution on page F2-2850.](#)
- [Pseudocode description of instruction-specified shifts and rotates on page F2-2853](#)

The following subsection gives additional pseudocode support functions for some of the instructions described in [Alphabetical list of T32 and A32 base instruction set instructions on page F5-3004](#). See also [Pseudocode support for the Banked register transfer instructions on page F5-3677](#).

### F2.8.1 Pseudocode description of operations for System register access instructions

The [AArch32.CheckSystemAccess\(\)](#) pseudocode function determines whether a System register access instruction is accepted for execution.

The [AArch32.SysRegRead\(\)](#) function obtains the word for an MRC instruction from the System register.

The [AArch32.SysRegRead64\(\)](#) function obtains the two words for an MRRC instruction from the System register.

#### ———— **Note** ————

The relative significance of the two words returned is IMPLEMENTATION DEFINED, but all uses within this manual present the two words in the order (most significant, least significant).

The [AArch32.SysRegWrite\(\)](#) procedure sends the word for an MCR instruction to the System register.

The [AArch32.SysRegWrite64\(\)](#) procedure sends the two words for an MCRR instruction to the System register.

#### ———— **Note** ————

The relative significance of word2 and word1 is IMPLEMENTATION DEFINED, but all uses within this manual treat word2 as more significant than word1.

The [CP14DebugInstrDecode\(\)](#) pseudocode function decodes an accepted access to a debug System register in the (coproc==0b1110) encoding space.

The [CP14JazelleInstrDecode\(\)](#) pseudocode function decodes an accepted access to a Jazelle System register. These registers are in the (coproc==0b1110) encoding space.

The [CP14TraceInstrDecode\(\)](#) pseudocode function decodes an accepted access to a Trace System register. These registers are in the (coproc==0b1110) encoding space.

The [CP15InstrDecode\(\)](#) pseudocode function decodes an accepted access to a System register in the (coproc==0b1111) encoding space.

### F2.8.2 Pseudocode details of system calls

The [AArch32.CallSupervisor\(\)](#) pseudocode function generates a Supervisor Call exception. Valid execution of the SVC instruction calls this function.

The [AArch32.CallHypervisor\(\)](#) pseudocode function generates an HVC exception. Valid execution of the HVC instruction calls this function.

## F2.9 Additional information about Advanced SIMD and floating-point instructions

The following subsections give additional information about the Advanced SIMD and floating-point instructions:

- [Advanced SIMD and floating-point instruction syntax.](#)
- [The Advanced SIMD addressing mode.](#)
- [Advanced SIMD instruction modifiers on page F2-2870.](#)
- [Advanced SIMD operand shapes on page F2-2870.](#)
- [Data type specifiers on page F2-2871.](#)
- [Register specifiers on page F2-2872.](#)
- [Register lists on page F2-2873.](#)
- [Register encoding on page F2-2873.](#)
- [Advanced SIMD scalars on page F2-2874.](#)

### ———— Note ————

The Advanced SIMD architecture, its associated implementations, and supporting software, are commonly referred to as NEON™ technology.

### F2.9.1 Advanced SIMD and floating-point instruction syntax

Advanced SIMD and floating-point instructions use the general conventions of the T32 and A32 instruction sets.

Advanced SIMD and floating-point data-processing instructions use the following general format:

$V\{<modifier>\}<operation>\{<shape>\}\{<c>\}\{<q>\}\{<dt>\} \{<dest>,\} <src1>, <src2>$

All Advanced SIMD and floating-point instructions begin with a *v*. This distinguishes Advanced SIMD vector and floating-point instructions from scalar instructions.

The main operation is specified in the *<operation>* field. It is usually a three letter mnemonic the same as or similar to the corresponding scalar integer instruction.

The *<c>* and *<q>* fields are standard assembler syntax fields. For details see [Standard assembler syntax fields on page F2-2848.](#)

### F2.9.2 The Advanced SIMD addressing mode

All the element and structure load/store instructions use this addressing mode. There is a choice of three formats:

- |                      |   |
|----------------------|---|
| $[<Rn>\{<align>\}]$  | The address is contained in general-purpose register <i>Rn</i> .<br><i>Rn</i> is not updated by this instruction.<br>Encoded as <i>Rm</i> = 0b1111.<br>If <i>Rn</i> is encoded as 0b1111, the instruction is CONSTRAINED UNPREDICTABLE.   |
| $[<Rn>\{<align>\}]!$ | The address is contained in general-purpose register <i>Rn</i> .<br><i>Rn</i> is updated by this instruction: <i>Rn</i> = <i>Rn</i> + <i>transfer_size</i><br>Encoded as <i>Rm</i> = 0b1101.<br><i>transfer_size</i> is the number of bytes transferred by the instruction. This means that, after the instruction is executed, <i>Rn</i> points to the address in memory immediately following the last address loaded from or stored to.<br>If <i>Rn</i> is encoded as 0b1111, the instruction is CONSTRAINED UNPREDICTABLE.<br>This addressing mode can also be written as:<br>$[<Rn>\{<align>\}], \#<transfer\_size>$<br>However, disassembly produces the $[<Rn>\{<align>\}]!$ form. |

[<Rn>{:<align>}], <Rm>

The address is contained in general-purpose register <Rn>.

Rn is updated by this instruction:  $Rn = Rn + Rm$

Encoded as  $Rm = Rm$ . Rm must not be encoded as 0b1111 or 0b1101, the PC or the SP.

If Rn is encoded as 0b1111, the instruction is CONSTRAINED UNPREDICTABLE.

The CONSTRAINED UNPREDICTABLE behavior of encodings where Rn is 0b1111 is that the instruction is either UNDEFINED or executes as a NOP, see [CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instruction encodings on page K1-6107](#).

In all cases, <align> specifies an alignment, as specified by the individual instruction descriptions.

Previous versions of the manual used the @ character for alignment. So, for example, the first format in this section was shown as [<Rn>{@<align>}]. Both @ and : are supported. However, to ensure portability of code to assemblers that treat @ as a comment character, : is preferred.

### F2.9.3 Advanced SIMD instruction modifiers

The <modifier> field provides additional variants of some instructions. [Table F2-7](#) provides definitions of the modifiers. Modifiers are not available for every instruction.

**Table F2-7 Advanced SIMD instruction modifiers**

<modifier>	Meaning
Q	The operation uses saturating arithmetic.
R	The operation performs rounding.
D	The operation doubles the result (before accumulation, if any).
H	The operation halves the result.

### F2.9.4 Advanced SIMD operand shapes

The <shape> field provides additional variants of some instructions. [Table F2-8](#) provides definitions of the shapes. Operand shapes are not available for every instruction.

**Table F2-8 Advanced SIMD operand shapes**

<shape>	Meaning	Typical register shape
(none)	The operands and result are all the same width.	Dd, Dn, Dm    Qd, Qn, Qm
L	Long operation - result is twice the width of both operands	Qd, Dn, Dm
N	Narrow operation - result is half the width of both operands	Dd, Qn, Qm
W	Wide operation - result and first operand are twice the width of the second operand	Qd, Qn, Dm

#### Note

- Some assemblers support a Q shape specifier, that requires all operands to be Q registers. An example of using this specifier is `VADDQ.S32 q0, q1, q2`. This is not standard UAL, and ARM recommends that programmers do not use a Q shape specifier.
- A disassembler must not generate any shape specifier not shown in [Table F2-8](#).

## F2.9.5 Data type specifiers

The <dt> field normally contains one data type specifier. Unless the assembler syntax description for the instruction indicates otherwise, this indicates the data type contained in:

- The second operand, if any.
- The operand, if there is no second operand.
- The result, if there are no operand registers.

The data types of the other operand and result are implied by the <dt> field combined with the instruction shape. For information about data type formats see [Data types supported by the Advanced SIMD implementation on page E1-2742](#).

In the instruction syntax descriptions in [Chapter F2 About the T32 and A32 Instruction Descriptions](#), the <dt> field is usually specified as a single field. However, where more convenient, it is sometimes specified as a concatenation of two fields, <type><size>.

### Syntax flexibility

There is some flexibility in the data type specifier syntax:

- Software can specify three data types, specifying the result and both operand data types. For example:  
VSUBW.I16.I16.S8 Q3, Q5, D0 instead of VSUBW.S8 Q3, Q5, D0
- Software can specify two data types, specifying the data types of the two operands. The data type of the result is implied by the instruction shape. For example:  
VSUBW.I16.S8 Q3, Q5, D0 instead of VSUBW.S8 Q3, Q5, D0
- Software can specify two data types, specifying the data types of the single operand and the result. For example:  
VMOVN.I16.I32 D0, Q1 instead of VMOVN.I32 D0, Q1
- Where an instruction requires a less specific data type, software can instead specify a more specific type, as shown in [Table F2-9](#).
- Where an instruction does not require a data type, software can provide one.
- The F32 data type can be abbreviated to F.
- The F64 data type can be abbreviated to D.

In all cases, if software provides additional information, the additional information must match the instruction shape. Disassembly does not regenerate this additional information.

**Table F2-9 Data type specification flexibility**

Specified data type	Permitted more specific data types				
None	Any				
.I<size>	-	.S<size>	.U<size>	-	-
.8	.I8	.S8	.U8	.P8	-
.16	.I16	.S16	.U16	.P16	.F16
.32	.I32	.S32	.U32	-	.F32 or .F
.64	.I64	.S64	.U64	-	.F64 or .D

## F2.9.6 Register specifiers

The <dest>, <src1>, and <src2> fields contain register specifiers, or in some cases scalar specifiers or register lists. [Table F2-10](#) shows the register and scalar specifier formats that appear in the instruction descriptions.

If <dest> is omitted, it is the same as <src1>.

**Table F2-10 Advanced SIMD and floating-point register specifier formats**

<specifier>	Usual meaning <sup>a</sup>	Used in
<Qd>	A quadword destination register for the result vector.	Advanced SIMD
<Qn>	A quadword source register for the first operand vector.	Advanced SIMD
<Qm>	A quadword source register for the second operand vector.	Advanced SIMD
<Dd>	A doubleword destination register for the result vector.	Both
<Dn>	A doubleword source register for the first operand vector.	Both
<Dm>	A doubleword source register for the second operand vector.	Both
<Sd>	A singleword destination register for the result vector.	Floating-point
<Sn>	A singleword source register for the first operand vector.	Floating-point
<Sm>	A singleword source register for the second operand vector.	Floating-point
<Dd[x]>	A destination scalar for the result. Element x of vector <Dd>.	Advanced SIMD
<Dn[x]>	A source scalar for the first operand. Element x of vector <Dn>.	Both <sup>b</sup>
<Dm[x]>	A source scalar for the second operand. Element x of vector <Dm>.	Advanced SIMD
<Rt>	A general-purpose register, used for a source or destination address.	Both
<Rt2>	A general-purpose register, used for a source or destination address.	Both
<Rn>	A general-purpose register, used as a load or store base address.	Both
<Rm>	A general-purpose register, used as a post-indexed address source.	Both

a. In some instructions the roles of registers are different.

b. In the floating-point instructions, <Dn[x]> is used only in *VMOV* (scalar to general-purpose register), see [VMOV \(scalar to general-purpose register\)](#) on page F6-4006.

## Register lists

A register list is a list of register specifiers separated by commas and enclosed in brackets { and }. There are restrictions on what registers can appear in a register list. These restrictions are described in the individual instruction descriptions. [Table F2-11](#) shows some register list formats, with examples of actual register lists corresponding to those formats.

### Note

Register lists must not wrap around the end of the register bank.

## Syntax flexibility

There is some flexibility in the register list syntax:

- Where a register list contains consecutive registers, they can be specified as a range, instead of listing every register, for example {D0-D3} instead of {D0, D1, D2, D3}.
- Where a register list contains an even number of consecutive doubleword registers starting with an even numbered register, it can be written as a list of quadword registers instead, for example {Q1, Q2} instead of {D2-D5}.
- Where a register list contains only one register, the enclosing braces can be omitted, for example VLD1.8 D0, [R0] instead of VLD1.8 {D0}, [R0].

### Table F2-11 Example register lists

Format	Example	Alternative
{<Dd>}	{D3}	D3
{<Dd>, <Dd+1>, <Dd+2>}	{D3, D4, D5}	{D3-D5}
{<Dd[x]>, <Dd+2[x]>}	{D0[3], D2[3]}	-
{<Dd[>]}	{D7[]}	D7[ ]

### F2.9.8 Register encoding

An Advanced SIMD register is either:

- *Quadword*, meaning it is 128 bits wide.
- *Doubleword*, meaning it is 64 bits wide.

Some instructions have options for either doubleword or quadword registers. This is normally encoded in Q, bit[6], as Q = 0 for doubleword operations, or Q = 1 for quadword operations.

A floating-point register is either:

- Double-precision, meaning it is 64 bits wide.
- Single-precision, meaning it is 32 bits wide.

This is encoded in the `sz` field, `bit[8]`, as `sz = 1` for double-precision operations, or `sz = 0` for single-precision operations.

The T32 instruction encoding of Advanced SIMD or floating-point registers is:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
									D	Vn							Vd								sz	N	Q	M					Vm			

The A32 instruction encoding of Advanced SIMD or floating-point registers is:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
									D				Vn			Vd						sz	N	Q	M				Vm		

Some instructions use only one or two registers, and use the unused register fields as additional opcode bits.

Table F2-12 shows the encodings for the registers.

**Table F2-12 Encoding of register numbers**

Register mnemonic	Usual usage	Register number encoded in <sup>a</sup>	Notes <sup>a</sup>	Used in
<Qd>	Destination (quadword)	D, Vd (bits[22, 15:13])	bit[12] == 0 <sup>b</sup>	Advanced SIMD
<Qn>	First operand (quadword)	N, Vn (bits[7, 19:17])	bit[16] == 0 <sup>b</sup>	Advanced SIMD
<Qm>	Second operand (quadword)	M, Vm (bits[5, 3:1])	bit[0] == 0 <sup>b</sup>	Advanced SIMD
<Dd>	Destination (doubleword)	D, Vd (bits[22, 15:12])	-	Both
<Dn>	First operand (doubleword)	N, Vn (bits[7, 19:16])	-	Both
<Dm>	Second operand (doubleword)	M, Vm (bits[5, 3:0])	-	Both
<Sd>	Destination (single-precision)	Vd, D (bits[15:12, 22])	-	Floating-point
<Sn>	First operand (single-precision)	Vn, N (bits[19:16, 7])	-	Floating-point
<Sm>	Second operand (single-precision)	Vm, M (bits[3:0, 5])	-	Floating-point

- a. Bit numbers given for the A32 instruction encoding. See the figures in this section for the equivalent bits in the T32 encoding.  
b. If this bit is 1, the instruction is UNDEFINED.

## F2.9.9 Advanced SIMD scalars

Advanced SIMD scalars can be 8-bit, 16-bit, 32-bit, or 64-bit. Instructions other than multiply instructions can access any element in the register set. The instruction syntax refers to the scalars using an index into a doubleword vector. The descriptions of the individual instructions contain details of the encodings.

Table F2-13 shows the form of encoding for scalars used in multiply instructions. These instructions cannot access scalars in some registers. The descriptions of the individual instructions contain cross references to this section where appropriate.

32-bit Advanced SIMD scalars, when used as single-precision floating-point numbers, are equivalent to Floating-point single-precision registers. That is, Dm[x] in a 32-bit context ( $0 \leq m \leq 15$ ,  $0 \leq x \leq 1$ ) is equivalent to S[2m + x].

**Table F2-13 Encoding of scalars in multiply instructions**

Scalar mnemonic	Usual usage	Scalar size	Register specifier	Index specifier	Accessible registers
<Dm[x]>	Second operand	16-bit	Vm[2:0]	M, Vm[3]	D0-D7
		32-bit	Vm[3:0]	M	D0-D15

# Chapter F3

## T32 Instruction Set Encoding

This chapter describes the encoding of the T32 instruction set. It contains the following sections:

- [T32 instruction set encoding on page F3-2876.](#)
- [About the T32 Advanced SIMD and floating-point instructions and their encoding on page F3-2941.](#)

In this chapter:

- In the decode tables, an entry of - for a field value means the value of the field does not affect the decoding.
- In the decode diagrams, a shaded field indicates that the bits in that field are not used in that level of decode.

## F3.1 T32 instruction set encoding

The T32 instruction stream is a sequence of halfword-aligned halfwords. Each T32 instruction is either a single 16-bit halfword in that stream, or a 32-bit instruction consisting of two consecutive halfwords in that stream.

If the value of bits[15:11] of the halfword being decoded is one of the following, the halfword is the first halfword of a 32-bit instruction:

- 0b11101.
- 0b11110.
- 0b11111.

Otherwise, the halfword is a 16-bit instruction.

The T32 instruction encoding is:

Table F3-1 Main encoding table for the T32 instruction set

Decode fields		Decode group or instruction page
op0	op1	
!= 111	-	<i>16-bit</i>
111	00	<i>B - T2 variant</i>
111	!= 00	<i>32-bit on page F3-2887</i>

### F3.1.1 16-bit

This section describes the encoding of the 16-bit group. This section is decoded from *T32 instruction set encoding*.

This decode also imposes the constraint:

- op0<5:3> != 111.

Table F3-2 Encoding table for the 16-bit group

### Add PC/SP (immediate)

This section describes the encoding of the Add PC/SP (immediate) instruction class. This section is decoded from [16-bit on page F3-2876](#).

Table with 2 columns: Decode fields, Instruction page. It lists the SP field with values 0 and 1, corresponding to ADR and ADD, ADDS (SP plus immediate) instructions.

Load/store multiple

This section describes the encoding of the Load/store multiple instruction class. This section is decoded from 16-bit on page F3-2876.

Table with 2 columns: Decode fields, Instruction page. It lists the L field with values 0 and 1, corresponding to STM, STMIA, STMEA and LDM, LDMIA, LDMFD instructions.

F3.1.2 Shift (immediate), add, subtract, move, and compare

This section describes the encoding of the Shift (immediate), add, subtract, move, and compare group. This section is decoded from 16-bit on page F3-2876.

Table F3-3 Encoding table for the Shift (immediate), add, subtract, move, and compare group

Table with 4 columns: Decode fields (op0, op1, op2), Decode group or instruction page. It lists various instruction combinations and their corresponding pages.

### Add, subtract (three low registers)

This section describes the encoding of the Add, subtract (three low registers) instruction class. This section is decoded from *Shift (immediate)*, *add, subtract, move, and compare* on page F3-2880.

## F3.2 About the T32 Advanced SIMD and floating-point instructions and their encoding

The Advanced SIMD and floating-point instructions are common to the T32 and A32 instruction sets. These instructions perform Advanced SIMD and floating-point operations on a common register file, the SIMD&FP register file. This means:

- In general, the instructions that load or store registers in this file, or move data between general-purpose registers and this register file, are common to the Advanced SIMD and floating-point instructions.
- There are distinct Advanced SIMD data-processing instructions and floating-point data-processing instructions.

All T32 Advanced SIMD and floating-point instructions have 32-bit encodings. Different groups of these instructions are decoded from different points in the 32-bit T32 instruction decode structure. [Table F3-23](#) shows these instruction groups, and where each group is decoded from the overall T32 decode structure:

**Table F3-23 Advanced SIMD and floating-point instructions in the T32 decode structure**

Advanced SIMD and floating-point instruction group	T32 decode is from
<i>Advanced SIMD load/store and 64-bit move on page F3-2894</i>	<i>System register access, Advanced SIMD, and floating-point on page F3-2893</i>
<i>Floating-point data-processing on page F3-2898</i>	<i>System register access, Advanced SIMD, and floating-point on page F3-2893</i>
<i>Advanced SIMD and floating-point 32-bit move on page F3-2902</i>	<i>System register access, Advanced SIMD, and floating-point on page F3-2893</i>
<i>Advanced SIMD data-processing on page F3-2904</i>	<i>System register access, Advanced SIMD, and floating-point on page F3-2893</i>
<i>Advanced SIMD element or structure load/store on page F3-2922</i>	<i>32-bit on page F3-2887</i>

# Chapter F4

## A32 Instruction Set Encoding

This chapter describes the encoding of the A32 instruction set. It contains the following sections:

- [A32 instruction set encoding on page F4-2944.](#)
- [About the A32 Advanced SIMD and floating-point instructions and their encoding on page F4-3001.](#)

In this chapter:

- In the decode tables, an entry of - for a field value means the value of the field does not affect the decoding.
- In the decode diagrams, a shaded field indicates that the bits in that field are not used in that level of decode.

### F4.1 A32 instruction set encoding

The A32 instruction stream is a sequence of word-aligned words. Each A32 instruction is either a single 32-bit word in that stream.

Most A32 instructions can be conditional, with a condition determined by bits[31:28] of the instruction, the cond field. For more information see [The Condition code field in A32 instruction encodings](#) on page F2-2850. This applies to all instructions except those with the cond field equal to 0b111.

The behavior of an attempt to execute an unallocated instruction is described in *UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space* on page F2-2856.

For more information on A32 instruction encodings see [Chapter F2 About the T32 and A32 Instruction Descriptions](#).

The A32 instruction encoding is:

## F4.2 About the A32 Advanced SIMD and floating-point instructions and their encoding

The Advanced SIMD and floating-point instructions are common to the T32 and A32 instruction sets. These instructions perform Advanced SIMD and floating-point operations on a common register file, the SIMD&FP register file. This means:

- In general, the instructions that load or store registers in this file, or move data between general-purpose registers and this register file, are common to the Advanced SIMD and floating-point instructions.
- There are distinct Advanced SIMD data-processing instructions and floating-point data-processing instructions.

All A32 Advanced SIMD and floating-point instructions have 32-bit encodings. Different groups of these instructions are decoded from different points in the 32-bit A32 instruction decode structure. [Table F4-24](#) shows these instruction groups, and where each group is decoded from the overall A32 decode structure:

**Table F4-24 Advanced SIMD and floating-point instructions in the A32 decode structure**

Advanced SIMD and floating-point instruction group	A32 decode is from
<i>Advanced SIMD load/store and 64-bit move on page F4-2973</i>	<i>System register access, Advanced SIMD, floating-point, and Supervisor call on page F4-2972</i>

<i>Advanced SIMD element or structure load/store on page F4-2997</i>	<i>Unconditional instructions on page F4-2983</i>

# Chapter F5

## T32 and A32 Base Instruction Set Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- [\*Alphabetical list of T32 and A32 base instruction set instructions\*](#) on page F5-3004.
- [\*Encoding and use of Banked register transfer instructions\*](#) on page F5-3674.

## F5.1 Alphabetical list of T32 and A32 base instruction set instructions

This section lists every instruction in the T32 and A32 base instruction sets. For details of the format used see [Format of instruction descriptions on page F2-2844](#).

This section is formatted so that each instruction description starts on a new page.

## F5.1.1 ADC, ADCS (immediate)

Add with Carry (immediate) adds an immediate value and the Carry flag value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733*.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores **PSTATE** from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See *Illegal return events from AArch32 state on page G1-4361*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

### A1

!=1111		0 0 1 0		1 0 1		S		Rn			Rd		imm12				
cond																	

#### ADC variant

Applies when S == 0.

ADC{<C>}{<q>} {<Rd>}, {<Rn>, #<const>}

#### ADCS variant

Applies when S == 1.

ADCS{<C>}{<q>} {<Rd>}, {<Rn>, #<const>}

#### Decode for all variants of this encoding

d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = A32ExpandImm(imm12);

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7			0
1	1	1	1	0	i	0	1	0	1	0	S	Rn	0	imm3	Rd	imm8						

#### ADC variant

Applies when S == 0.

ADC{<C>}{<q>} {<Rd>}, {<Rn>, #<const>}

#### ADCS variant

Applies when S == 1.

ADCS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

### Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> <li>For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</li> <li>For the ADCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_&lt;current_mode&gt;.</li> </ul> For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
<Rn>	For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
<const>	For encoding A1: an immediate value. See <a href="#">Modified immediate constants in A32 instructions on page F2-2864</a> for the range of values. For encoding T1: an immediate value. See <a href="#">Modified immediate constants in T32 instructions on page F2-2863</a> for the range of values.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(R[n], imm32, PSTATE.C);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

## F5.1.2 ADC, ADCS (register)

Add with Carry (register) adds a register value, the Carry flag value, and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
  - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

### ADC, rotate right with extend variant

Applies when S == 0 && imm3 == 000 && imm2 == 00 && type == 11.

ADC{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

### ADC, shift or rotate by value variant

Applies when S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11).

ADC<c>{<q>} {<Rd>}, <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1  
ADC{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

### ADCS, rotate right with extend variant

Applies when S == 1 && imm3 == 000 && imm2 == 00 && type == 11.

ADCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

### ADCS, shift or rotate by value variant

Applies when S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11).

ADCS.W {<Rd>}, <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1  
ADCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

### Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	<p>For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as &lt;Rn&gt;. ARM deprecates using the PC as the destination register, but if the PC is used:</p> <ul style="list-style-type: none"> <li>For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</li> <li>For the ADCS variant, the instruction performs an exception return, that restores <a href="#">PSTATE</a> from <code>SPSR_&lt;current_mode&gt;</code>.</li> </ul> <p>For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as &lt;Rn&gt;.</p>								
<Rn>	<p>For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.</p> <p>For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.</p>								
<Rm>	<p>For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.</p> <p>For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.</p>								
<shift>	<p>Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:</p> <table> <tr> <td>LSL</td><td>when type = 00</td></tr> <tr> <td>LSR</td><td>when type = 01</td></tr> <tr> <td>ASR</td><td>when type = 10</td></tr> <tr> <td>ROR</td><td>when type = 11</td></tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<amount>	<p>For encoding A1: is the shift amount, in the range 1 to 31 (when &lt;shift&gt; = LSL or ROR) or 1 to 32 (when &lt;shift&gt; = LSR or ASR) encoded in the "imm5" field as &lt;amount&gt; modulo 32.</p> <p>For encoding T2: is the shift amount, in the range 1 to 31 (when &lt;shift&gt; = LSL or ROR) or 1 to 32 (when &lt;shift&gt; = LSR or ASR) encoded in the "imm3:imm2" field as &lt;amount&gt; modulo 32.</p>								

In T32 assembly:

- Outside an IT block, if ADCS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ADCS <Rd>, <Rn> had been written.
- Inside an IT block, if ADC<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ADC<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc_v) = AddWithCarry(R[n], shifted, PSTATE.C);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);

```

```
else  
    R[d] = result;  
    if setflags then  
        PSTATE.<N,Z,C,V> = nzcvc;
```

### F5.1.3 ADC, ADCS (register-shifted register)

Add with Carry (register-shifted register) adds a register value, the Carry flag value, and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

#### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
!	1	1	1	1	0	0	0	0	1	0	1	S	Rn	Rd	Rs	0	type	1	Rm		
cond																					

#### Flag setting variant

Applies when S == 1.

ADCS{<C>}{<q>} {<Rd>}, {<Rn>, <Rm>, <type> <Rs>

#### Not flag setting variant

Applies when S == 0.

ADC{<C>}{<q>} {<Rd>}, {<Rn>, <Rm>, <type> <Rs>

#### Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table> <tr> <td>LSL</td><td>when type = 00</td></tr> <tr> <td>LSR</td><td>when type = 01</td></tr> <tr> <td>ASR</td><td>when type = 10</td></tr> <tr> <td>ROR</td><td>when type = 11</td></tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(R[n], shifted, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcvc;
```

## F5.1.4 ADD, ADDS (immediate)

Add (immediate) adds an immediate value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rdn>	Is the general-purpose source and destination register, encoded in the "Rdn" field.
<imm8>	Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used: <ul style="list-style-type: none"> <li>For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</li> <li>For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_&lt;current_mode&gt;. ARM deprecates use of this instruction.</li> </ul> For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
<Rn>	For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see <a href="#">ADD, ADDS (SP plus immediate)</a> . If the PC is used, see <a href="#">ADR</a> . For encoding T1: is the general-purpose source register, encoded in the "Rn" field. For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see <a href="#">ADD, ADDS (SP plus immediate)</a> .
<imm3>	Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.
<imm12>	Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
<const>	For encoding A1: an immediate value. See <a href="#">Modified immediate constants in A32 instructions on page F2-2864</a> for the range of values. For encoding T3: an immediate value. See <a href="#">Modified immediate constants in T32 instructions on page F2-2863</a> for the range of values.

When multiple encodings of the same length are available for an instruction, encoding T3 is preferred to encoding T4 (if encoding T4 is required, use the ADDW syntax). Encoding T1 is preferred to encoding T2 if <Rd> is specified and encoding T2 is preferred to encoding T1 if <Rd> is omitted.

### Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(R[n], imm32, '0');
    if d == 15 then // Can only occur for A32 encoding
      if setflags then
        ALUExceptionReturn(result);
      else
```

```
        ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        (result, nzcvc) = AddWithCarry(R[n], imm32, '0');
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

## F5.1.5 ADD, ADDS (register)

Add (register) adds a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<Rdn> Is the general-purpose source and destination register, encoded in the "DN:Rdn" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).

The assembler language allows <Rdn> to be specified once or twice in the assembler syntax. When used inside an IT block, and <Rdn> and <Rm> are in the range R0 to R7, <Rdn> must be specified once so that encoding T2 is preferred to encoding T1. In all other cases there is no difference in behavior when <Rdn> is specified once or twice.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR\_<current\_mode>. ARM deprecates use of this instruction.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field.

When used inside an IT block, <Rd> must be specified. When used outside an IT block, <Rd> is optional, and:

- If omitted, this register is the same as <Rn>.
- If present, encoding T1 is preferred to encoding T2.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used. If the SP is used, see [ADD, ADDS \(SP plus register\)](#).

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T3: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see [ADD, ADDS \(SP plus register\)](#).

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T3: is the second general-purpose source register, encoded in the "Rm" field.

For encoding T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL when type = 00

LSR when type = 01

ASR when type = 10

ROR when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

Inside an IT block, if ADD<c> <Rd>, <Rn>, <Rd> cannot be assembled using encoding T1, it is assembled using encoding T2 as though ADD<c> <Rd>, <Rn> had been written. To prevent this happening, use the .w qualifier.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(R[n], shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

## F5.1.6 ADD, ADDS (register-shifted register)

Add (register-shifted register) adds a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0

cond																								

#### Flag setting variant

Applies when S == 1.

ADDS{<C>}{<Q>} {<Rd>}, {<Rn>, <Rm>, <type> <Rs>

#### Not flag setting variant

Applies when S == 0.

ADD{<C>}{<Q>} {<Rd>}, {<Rn>, <Rm>, <type> <Rs>

#### Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <ul style="list-style-type: none"> <li>LSL when type = 00</li> <li>LSR when type = 01</li> <li>ASR when type = 10</li> <li>ROR when type = 11</li> </ul>
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(R[n], shifted, '0');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcvc;
```

## F5.1.7 ADD, ADDS (SP plus immediate)

Add to SP (immediate) adds an immediate value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The ADDS variant of the instruction performs an exception return without the use of the stack. ARM deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(SP, imm32, '0');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;

```

## F5.1.8 ADD, ADDS (SP plus register)

Add to SP (register) adds an optionally-shifted register value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The ADDS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores **PSTATE** from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

if (d == 15 && !setflags) || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

$\langle\text{c}\rangle$	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
$\langle\text{q}\rangle$	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
$\langle\text{Rdm}\rangle$	Is the general-purpose destination and second source register, encoded in the "Rdm" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a> .								
$\langle\text{Rd}\rangle$	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> <li>For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</li> <li>For the ADDS variant, the instruction performs an exception return, that restores <b>PSTATE</b> from <b>SPSR_&lt;current_mode&gt;</b>.</li> </ul> For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.								
$\langle\text{Rm}\rangle$	For encoding A1 and T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.  For encoding T3: is the second general-purpose source register, encoded in the "Rm" field.								
$\langle\text{shift}\rangle$	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table> <tr> <td>LSL</td><td>when type = 00</td></tr> <tr> <td>LSR</td><td>when type = 01</td></tr> <tr> <td>ASR</td><td>when type = 10</td></tr> <tr> <td>ROR</td><td>when type = 11</td></tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
$\langle\text{amount}\rangle$	For encoding A1: is the shift amount, in the range 1 to 31 (when $\langle\text{shift}\rangle$ = LSL or ROR) or 1 to 32 (when $\langle\text{shift}\rangle$ = LSR or ASR) encoded in the "imm5" field as $\langle\text{amount}\rangle$ modulo 32.  For encoding T3: is the shift amount, in the range 1 to 31 (when $\langle\text{shift}\rangle$ = LSL or ROR) or 1 to 32 (when $\langle\text{shift}\rangle$ = LSR or ASR) encoded in the "imm3:imm2" field as $\langle\text{amount}\rangle$ modulo 32.								

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(SP, shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

## F5.1.9 ADD (immediate, to PC)

Add to PC adds an immediate value to the Align(PC, 4) value to form a PC-relative address, and writes the result to the destination register. ARM recommends that, where possible, software avoids using this alias

This instruction is a pseudo-instruction of the [ADR](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [ADR](#).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of [ADR](#) gives the operational pseudocode for this instruction.

### A1

and is never the preferred disassembly.

## Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).

For encoding T1 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<label> For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the ADR instruction to this label.

If the offset is zero or positive, encoding A1 is used, with imm32 equal to the offset.

If the offset is negative, encoding A2 is used, with imm32 equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of imm32.

Permitted values of the size of the offset are any of the constants described in [Modified immediate constants in A32 instructions on page F2-2864](#).

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the ADR instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the ADR instruction to this label.

If the offset is zero or positive, encoding T3 is used, with imm32 equal to the offset.

If the offset is negative, encoding T2 is used, with imm32 equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of imm32.

Permitted values of the size of the offset are 0-4095.

<imm8> Is an unsigned immediate, a multiple of 4, in the range 0 to 1020, encoded in the "imm8" field as <imm8>/4.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> An immediate value. See [Modified immediate constants in A32 instructions on page F2-2864](#) for the range of values.

## Operation for all encodings

The description of [ADR](#) gives the operational pseudocode for this instruction.

## F5.1.10 ADR

Form PC-relative address adds an immediate value to the PC value to form a PC-relative address, and writes the result to the destination register.

This instruction is used by the pseudo-instructions [ADD \(immediate, to PC\)](#) and [SUB \(immediate, from PC\)](#). The pseudo-instruction is never the preferred disassembly.

if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Alias conditions

Alias or pseudo-instruction	of variant	is preferred when
<a href="#">ADD (immediate, to PC)</a>	-	Never
<a href="#">SUB (immediate, from PC)</a>	T2	i:imm3:imm8 == '000000000000'
<a href="#">SUB (immediate, from PC)</a>	A2	imm12 == '000000000000'

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	For encoding A1 and A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a> . For encoding T1, T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.
<label>	For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the A1ign(PC, 4) value of the ADR instruction to this label. If the offset is zero or positive, encoding A1 is used, with imm32 equal to the offset. If the offset is negative, encoding A2 is used, with imm32 equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of imm32.

Permitted values of the size of the offset are any of the constants described in [Modified immediate constants in A32 instructions on page F2-2864](#).

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label.

If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset.

If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`.

Permitted values of the size of the offset are 0-4095.

The instruction aliases permit the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2809](#).

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if d == 15 then          // Can only occur for A32 encodings
        ALUWritePC(result);
    else
        R[d] = result;
```

### F5.1.11 AND, ANDS (immediate)

Bitwise AND (immediate) performs a bitwise AND of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ANDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The AND variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2733.
- The ANDS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores **PSTATE** from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-4361.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] AND imm32;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

## F5.1.12 AND, ANDS (register)

Bitwise AND (register) performs a bitwise AND of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ANDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The AND variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733*.
- The ANDS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores **PSTATE** from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See *Illegal return events from AArch32 state on page G1-4361*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

## T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	0	0	0	0	0	0	0	0	0	Rm	Rdn			

### T1 variant

AND<c>{<q>} {<Rdn>}, <Rdn>, <Rm> // Inside IT block  
ANDS{<q>} {<Rdn>}, <Rdn>, <Rm> // Outside IT block

### Decode for this encoding

```
d = UInt(Rdn); n = UInt(Rdn); m = UInt(Rm); setflags = !InITBlock();
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

## T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	3	0
1	1	1	0	1	0	1	0	0	0	0	S	Rn	(0)	imm3	Rd	imm2	type	Rm						

### AND, rotate right with extend variant

Applies when S == 0 && imm3 == 000 && imm2 == 00 && type == 11.

AND{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

### AND, shift or rotate by value variant

Applies when S == 0 && !(imm3 == 000 && imm2 == 00 && type == 11).

AND<c>.W {<Rd>}, <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1  
AND{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

### ANDS, rotate right with extend variant

Applies when S == 1 && imm3 == 000 && Rd != 1111 && imm2 == 00 && type == 11.

ANDS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

### ANDS, shift or rotate by value variant

Applies when S == 1 && !(imm3 == 000 && imm2 == 00 && type == 11) && Rd != 1111.

ANDS.W {<Rd>}, <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1  
ANDS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

### Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE TST (register);
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	<p>For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as &lt;Rn&gt;. ARM deprecates using the PC as the destination register, but if the PC is used:</p> <ul style="list-style-type: none"> <li>For the AND variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</li> <li>For the ANDS variant, the instruction performs an exception return, that restores <a href="#">PSTATE</a> from <code>SPSR_&lt;current_mode&gt;</code>.</li> </ul> <p>For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as &lt;Rn&gt;.</p>								
<Rn>	<p>For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.</p> <p>For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.</p>								
<Rm>	<p>For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.</p> <p>For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.</p>								
<shift>	<p>Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:</p> <table> <tr> <td>LSL</td><td>when type = 00</td></tr> <tr> <td>LSR</td><td>when type = 01</td></tr> <tr> <td>ASR</td><td>when type = 10</td></tr> <tr> <td>ROR</td><td>when type = 11</td></tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<amount>	<p>For encoding A1: is the shift amount, in the range 1 to 31 (when &lt;shift&gt; = LSL or ROR) or 1 to 32 (when &lt;shift&gt; = LSR or ASR) encoded in the "imm5" field as &lt;amount&gt; modulo 32.</p> <p>For encoding T2: is the shift amount, in the range 1 to 31 (when &lt;shift&gt; = LSL or ROR) or 1 to 32 (when &lt;shift&gt; = LSR or ASR) encoded in the "imm3:imm2" field as &lt;amount&gt; modulo 32.</p>								

In T32 assembly:

- Outside an IT block, if ANDS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ANDS <Rd>, <Rn> had been written.
- Inside an IT block, if AND<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though AND<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);

```

```
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

### F5.1.13 AND, ANDS (register-shifted register)

Bitwise AND (register-shifted register) performs a bitwise AND of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

#### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0										
!=1111				0	0	0	0	0	0	0	S	Rn				Rd				Rs				0	type	1	Rm				
cond																															

#### Flag setting variant

Applies when S == 1.

ANDS{<C>}{<Q>} {<Rd>}, {<Rn>, <Rm>, <type> <Rs>

#### Not flag setting variant

Applies when S == 0.

AND{<C>}{<Q>} {<Rd>}, {<Rn>, <Rm>, <type> <Rs>

#### Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <ul style="list-style-type: none"> <li>LSL when type = 00</li> <li>LSR when type = 01</li> <li>ASR when type = 10</li> <li>ROR when type = 11</li> </ul>
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

## F5.1.14 ASR (immediate)

Arithmetic Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	7	6	5	4	3	0

is equivalent to

MOV{<C>}{<q>} <Rd>, <Rm>, ASR <Rs>

and is always the preferred disassembly.

ASR{<C>}{<q>} {<Rd>}, {<Rm>, <Rs>}

is equivalent to

MOV{<C>}{<q>} <Rd>, <Rm>, ASR <Rs>

and is always the preferred disassembly.

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rdm>	Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	Is the first general-purpose source register, encoded in the "Rm" field.
<Rs>	Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

### Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

## F5.1.16 ASRS (immediate)

Arithmetic Shift Right, setting flags (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR\_<current\_mode>.
- The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	7	6	5	4	3	0
!=1111	0	0	0	1	1	0	1	1	(0)	(0)	(0)	(0)	Rd	imm5	1	0	0	Rm				
cond				S												type						

### MOVS, shift or rotate by value variant

ASRS{<C>}{<Q>} {<Rd>}, {<Rm>}, #<imm>

is equivalent to

MOVS{<C>}{<Q>} <Rd>, <Rm>, ASR #<imm>

and is always the preferred disassembly.

### T2

15	14	13	12	11	10	6	5	3	2	0
0	0	0	1	0	imm5	Rm	Rd			
op										

### T2 variant

ASRS{<Q>} {<Rd>}, {<Rm>}, #<imm> // Outside IT block

is equivalent to

MOVS{<Q>} <Rd>, <Rm>, ASR #<imm>

and is the preferred disassembly when !InITBlock().

### T3

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	6	5	4	3	0

S																type										

### ***MOVS, shift or rotate by value variant***

ASRS.W {<Rd>,} <Rm>, #<imm> // Outside IT block, and <Rd>, <Rm>, <imm> can be represented in T2

is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>

and is always the preferred disassembly.

ASRS{<c>}{<q>} {<Rd>}. <Rm>. #<imm>

is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>

and is always the preferred disassembly.

## Assembler symbols

<C> See *Standard assembler syntax fields* on page F2-2848.

<q> See *Standard assembler syntax fields* on page F2-2848.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction performs an exception return, that restores **PSTATE** from SPSR <current mode>.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

<imm> For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as <imm> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as  $\langle \text{imm} \rangle \bmod 32$ .

## Operation for all encodings

The description of **MOV, MOVS (register)** gives the operational pseudocode for this instruction.

### F5.1.17 ASRS (register)

Arithmetic Shift Right, setting flags (register) shifts a register value right by a variable number of bits, shifting in copies of its sign bit, writes the result to the destination register, and updates the condition flags based on the result. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the [MOV, MOVS \(register-shifted register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register-shifted register\)](#).
- The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

For encoding T1: see [Standard assembler syntax fields on page F2-2848](#). Must not be AL or omitted.  
For encoding T3: see [Standard assembler syntax fields on page F2-2848](#). <c> must not be AL or omitted.
- <q> See [Standard assembler syntax fields on page F2-2848](#).
- <label> For encoding A1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset.  
Permitted offsets are multiples of 4 in the range –33554432 to 33554428.  
For encoding T1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –256 to 254.  
For encoding T2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –2048 to 2046.  
For encoding T3: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset.  
Permitted offsets are even numbers in the range –1048576 to 1048574.

For encoding T4: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset.

Permitted offsets are even numbers in the range  $-16777216$  to  $16777214$ .

### **Operation for all encodings**

```
if ConditionPassed() then
    EncodingSpecificOperations();
    BranchWritePC(PC + imm32);
```

## F5.1.19 BFC

Bit Field Clear clears any number of adjacent bits at any position in a register, without affecting the other bits in the register.

### A1

31	28	27	26	25	24	23	22	21	20	16	15	12	11	7	6	5	4	3	2	1	0
!=1111	0	1	1	1	1	1	0	msb			Rd	lsb			0	0	1	1	1	1	1
cond																					

### A1 variant

BFC{<c>}{<q>} <Rd>, #<lsb>, #<width>

### Decode for this encoding

```
d = UInt(Rd); msbit = UInt(msb); lsb = UInt(lsb);
if d == 15 then UNPREDICTABLE;
```

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	6	5	4	0
1	1	1	1	0	(0)	1	1	0	1	1	0	1	1	1	1	0	imm3		Rd		imm2	(0)	msb		

### T1 variant

BFC{<c>}{<q>} <Rd>, #<lsb>, #<width>

### Decode for this encoding

```
d = UInt(Rd); msbit = UInt(msb); lsb = UInt(imm3:imm2);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<lsb>	For encoding A1: is the least significant bit to be cleared, in the range 0 to 31, encoded in the "lsb" field.  For encoding T1: is the least significant bit that is to be cleared, in the range 0 to 31, encoded in the "imm3:imm2" field.
<width>	Is the number of bits to be cleared, in the range 1 to 32-<lsb>, encoded in the "msb" field as <lsb>+<width>-1.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if msbit >= lsbit then
        R[d]<msbit:lsbit> = Replicate('0', msbit-lsbit+1);
        // Other bits of R[d] are unchanged
    else
        UNPREDICTABLE;
```

## CONSTRAINED UNPREDICTABLE behavior

If  $msbit < lsbit$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

## F5.1.20 BFI

Bit Field Insert copies any number of low order bits from a register into the same number of adjacent bits at any position in the destination register.

### A1

31	28	27	26	25	24	23	22	21	20	16	15	12	11	7	6	5	4	3	0

#### Decode for this encoding

```
if Rn == '1111' then SEE BFC;
d = UInt(Rd); n = UInt(Rn); msbit = UInt(msb); lsbit = UInt(imm3:imm2);
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.
<lsb>	For encoding A1: is the least significant destination bit, in the range 0 to 31, encoded in the "lsb" field.  For encoding T1: is the least significant destination bit, in the range 0 to 31, encoded in the "imm3:imm2" field.
<width>	Is the number of bits to be copied, in the range 1 to 32-<lsb>, encoded in the "msb" field as <lsb>+<width>-1.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if msbit >= lsbit then
        R[d]<msbit:lsbit> = R[n]<(msbit-lsbit):0>;
        // Other bits of R[d] are unchanged
    else
        UNPREDICTABLE;
```

## CONSTRAINED UNPREDICTABLE behavior

If  $msbit < lsbit$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

## F5.1.21 BIC, BICS (immediate)

Bitwise Bit Clear (immediate) performs a bitwise AND of a register value and the complement of an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores **PSTATE** from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11			0

Applies when S == 0.

BIC{<C>}{<q>} {<Rd>}, {<Rn>, #<const>}

#### BICS variant

Applies when S == 1.

BICS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

### Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> <li>For the BIC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</li> <li>For the BICS variant, the instruction performs an exception return, that restores PSTATE from SPSR_&lt;current_mode&gt;.</li> </ul> For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
<Rn>	For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
<const>	For encoding A1: an immediate value. See <a href="#">Modified immediate constants in A32 instructions on page F2-2864</a> for the range of values. For encoding T1: an immediate value. See <a href="#">Modified immediate constants in T32 instructions on page F2-2863</a> for the range of values.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] AND NOT(imm32);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

## F5.1.22 BIC, BICS (register)

Bitwise Bit Clear (register) performs a bitwise AND of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### Not flag setting variant

Applies when S == 0.

BIC{<c>}{<q>} {<Rd>}, {<Rn>}, <Rm>, <type> <Rs>

#### Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <ul style="list-style-type: none"> <li>LSL when type = 00</li> <li>LSR when type = 01</li> <li>ASR when type = 10</li> <li>ROR when type = 11</li> </ul>
<Rs>	Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND NOT(shifted);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

## F5.1.24 BKPT

Breakpoint causes a Breakpoint Instruction exception.

Breakpoint is always unconditional, even when inside an IT block.

### A1

31	28	27	26	25	24	23	22	21	20	19				8	7	6	5	4	3	0												
!=1111		0		0		0		1		0		0		1		0		imm12					0		1		1		1		imm4	
cond																																

#### A1 variant

BKPT{<q>} {#}<imm>

#### Decode for this encoding

```
imm16 = imm12:imm4;
if cond != '1110' then UNPREDICTABLE; // BKPT must be encoded with AL condition
```

#### CONSTRAINED UNPREDICTABLE behavior

If cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

### T1

15	14	13	12	11	10	9	8	7			0
1	0	1	1	1	1	1	0	imm8			

#### T1 variant

BKPT{<q>} {#}<imm>

#### Decode for this encoding

```
imm16 = ZeroExtend(imm8, 16);
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<q> See [Standard assembler syntax fields on page F2-2848](#). An BKPT instruction must be unconditional.

- <imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value:
- Is recorded in the Comment field of [ESR\\_ELx](#).ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
  - Is ignored otherwise.
- For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. This value:
- Is recorded in the Comment field of [ESR\\_ELx](#).ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
  - Is ignored otherwise.

### Operation for all encodings

```
EncodingSpecificOperations();  
AArch32.SoftwreBreakpoint(imm16);
```

### F5.1.25 BL, BLX (immediate)

Branch with Link calls a subroutine at a PC-relative address, and setting LR to the return address.

Branch with Link and Exchange Instruction Sets (immediate) calls a subroutine at a PC-relative address, setting LR to the return address, and changes the instruction set from A32 to T32, or from T32 to A32.

**Decode for this encoding**

```
I1 = NOT(J1 EOR S); I2 = NOT(J2 EOR S); imm32 = SignExtend(S:I1:I2:imm10:imm11:'0', 32);
targetInstrSet = InstrSet_T32;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

## T2

## T2 variant

BLX{<c>}{<q>} <label>

## Decode for this encoding

```
if H == '1' then UNDEFINED;
I1 = NOT(J1 EOR S); I2 = NOT(J2 EOR S); imm32 = SignExtend(S:I1:I2:imm10H:imm10L:'00', 32);
targetInstrSet = InstrSet_A32;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	For encoding A1, T1 and T2: see <a href="#">Standard assembler syntax fields on page F2-2848</a> . For encoding A2: see <a href="#">Standard assembler syntax fields on page F2-2848</a> . <c> must be AL or omitted.
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<label>	For encoding A1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding that sets imm32 to that offset.  Permitted offsets are multiples of 4 in the range –33554432 to 33554428.  For encoding A2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BLX instruction to this label, then selects an encoding with imm32 set to that offset.  Permitted offsets are even numbers in the range –33554432 to 33554430.  For encoding T1: the label of the instruction that is to be branched to.  The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding with imm32 set to that offset.  Permitted offsets are even numbers in the range –16777216 to 16777214.  For encoding T2: the label of the instruction that is to be branched to.  The assembler calculates the required value of the offset from the Align(PC, 4) value of the BLX instruction to this label, then selects an encoding with imm32 set to that offset.  Permitted offsets are multiples of 4 in the range –16777216 to 16777212.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if CurrentInstrSet() == InstrSet_A32 then
        LR = PC - 4;
    else
        LR = PC<31:1> : '1';
    if targetInstrSet == InstrSet_A32 then
        targetAddress = Align(PC,4) + imm32;
    else
        targetAddress = PC + imm32;
    SelectInstrSet(targetInstrSet);
    BranchWritePC(targetAddress);
```

## F5.1.26 BLX (register)

Branch with Link and Exchange (register) calls a subroutine at an address specified in the register, and if necessary changes to the instruction set indicated by bit[0] of the register value. If the value in bit[0] is 0, the instruction set after the branch will be A32. If the value in bit[0] is 1, the instruction set after the branch will be T32.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	0
!=1111	0	0	0	1	0	0	1	0	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	0	0	1	1	Rm	
cond																											

### A1 variant

BLX{<c>}{<q>} <Rm>

### Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
```

### T1

15	14	13	12	11	10	9	8	7	6		3	2	1	0
0	1	0	0	0	1	1	1	1		Rm	(0)	(0)	(0)	

### T1 variant

BLX{<c>}{<q>} <Rm>

### Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
if InITBBlock() && !LastInITBBlock() then UNPREDICTABLE;
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<Rm> Is the general-purpose register holding the address to be branched to, encoded in the "Rm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    target = R[m];
    if CurrentInstrSet() == InstrSet_A32 then
        next_instr_addr = PC - 4;
        LR = next_instr_addr;
    else
```

```
    next_instr_addr = PC - 2;  
    LR = next_instr_addr<31:1> : '1';  
    BXWritePC(target);
```

## F5.1.27 BX

Branch and Exchange causes a branch to an address and instruction set specified by a register.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	0
!=1111	0	0	0	1	0	0	1	0	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	0	0	0	1	Rm	
cond																											

### A1 variant

BX{<c>}{<q>} <Rm>

### Decode for this encoding

m = UInt(Rm);

### T1

15	14	13	12	11	10	9	8	7	6		3	2	1	0
0	1	0	0	0	1	1	1	0		Rm	(0)	(0)	(0)	

### T1 variant

BX{<c>}{<q>} <Rm>

### Decode for this encoding

m = UInt(Rm);  
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<Rm> For encoding A1: is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The PC can be used.

For encoding T1: is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The PC can be used.

### Note

If <Rm> is the PC at a non word-aligned address, it results in UNPREDICTABLE behavior because the address passed to the BXWritePC() pseudocode function has bits<1:0> = '10'.

## Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    BXWritePC(R[m]);
```

## F5.1.28 BXJ

Branch and Exchange, previously Branch and Exchange Jazelle.

In ARMv8, BXJ behaves as a BX instruction, see [BX](#). This means it causes a branch to an address and instruction set specified by a register.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	0
!=1111	0	0	0	1	0	0	1	0	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	0	0	1	0	Rm	
cond																											

#### A1 variant

BXJ{<C>}{<q>} <Rm>

#### Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
```

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	1	1	1	0	0	Rm	1	0	(0)	0	(1)	(1)	(1)	(1)	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)

#### T1 variant

BXJ{<C>}{<q>} <Rm>

#### Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<Rm> Is the general-purpose register holding the address to be branched to, encoded in the "Rm" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    BXWritePC(R[m]);
```

## F5.1.29 CBNZ, CBZ

Compare and Branch on Nonzero and Compare and Branch on Zero compare the value in a register with zero, and conditionally branch forward a constant value. They do not affect the condition flags.

**T1**

15	14	13	12	11	10	9	8	7		3	2	0
1	0	1	1	op	0	i	1		imm5			Rn

### **CBNZ variant**

Applies when op == 1.

CBNZ{<q>} <Rn>, <label>

### **CBZ variant**

Applies when op == 0.

CBZ{<q>} <Rn>, <label>

### **Decode for all variants of this encoding**

```
n = UInt(Rn); imm32 = ZeroExtend(i:imm5:'0', 32); nonzero = (op == '1');
if InITBlock() then UNPREDICTABLE;
```

### **Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### **Assembler symbols**

<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	Is the general-purpose register to be tested, encoded in the "Rn" field.
<label>	Is the program label to be conditionally branched to. Its offset from the PC, a multiple of 2 and in the range 0 to 126, is encoded as "i:imm5" times 4.

### **Operation**

```
EncodingSpecificOperations();
if nonzero != IsZero(R[n]) then
    BranchWritePC(PC + imm32);
```

## F5.1.30 CLREX

Clear-Exclusive clears the local monitor of the executing PE.

### A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	1	0	1	0	1	1	1	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(0)	(0)	(0)	(0)	0	0	0	1	(1)	(1)	(1)	(1)

### A1 variant

CLREX{<c>}{<q>}

### Decode for this encoding

// No additional decoding required

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	1	1	1	0	1	1	(1)	(1)	(1)	(1)	1	0	(0)	0	(1)	(1)	(1)	(1)	0	0	1	0	(1)	(1)	(1)	(1)

### T1 variant

CLREX{<c>}{<q>}

### Decode for this encoding

// No additional decoding required

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F2-2848](#). Must be AL or omitted.  
For encoding T1: see [Standard assembler syntax fields on page F2-2848](#).
- <q> See [Standard assembler syntax fields on page F2-2848](#).

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    ClearExclusiveLocal(ProcessorID());
```

## F5.1.31 CLZ

Count Leading Zeros returns the number of binary zero bits before the first binary one bit in a value.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0
!=1111	0	0	0	1	0	1	1	0	(1)	(1)	(1)	(1)	Rd	(1)	(1)	(1)	(1)	0	0	0	1	Rm			
cond																									

### A1 variant

CLZ{<c>}{<q>} <Rd>, <Rm>

### Decode for this encoding

d = UInt(Rd); m = UInt(Rm);  
if d == 15 || m == 15 then UNPREDICTABLE;

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	0	1	0	1	1	Rn	1	1	1	1	Rd	1	0	0	0	Rm			

### T1 variant

CLZ{<c>}{<q>} <Rd>, <Rm>

### Decode for this encoding

d = UInt(Rd); m = UInt(Rm); n = UInt(Rn);  
if m != n || d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

### CONSTRAINED UNPREDICTABLE behavior

If m != n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction executes with the additional decode: m = UInt(Rn);.
- The value in the destination register is UNKNOWN.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field.  
For encoding T1: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = CountLeadingZeroBits(R[m]);
    R[d] = result<31:0>;
```

## F5.1.32 CMN (immediate)

Compare Negative (immediate) adds a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11				0
!=1111	0	0	1	1	0	1	1	1		Rn	(0)	(0)	(0)	(0)						imm12
cond																				

### A1 variant

CMN{<c>}{<q>} <Rn>, #<const>

#### Decode for this encoding

n = UInt(Rn); imm32 = A32ExpandImm(imm12);

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	10	9	8	7			0
1	1	1	1	0	i	0	1	0	0	0	1		Rn	0	imm3	1	1	1	1					imm8

### T1 variant

CMN{<c>}{<q>} <Rn>, #<const>

#### Decode for this encoding

n = UInt(Rn); imm32 = T32ExpandImm(i:imm3:imm8);  
if n == 15 then UNPREDICTABLE;

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
<const>	For encoding A1: an immediate value. See <a href="#">Modified immediate constants in A32 instructions on page F2-2864</a> for the range of values. For encoding T1: an immediate value. See <a href="#">Modified immediate constants in T32 instructions on page F2-2863</a> for the range of values.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(R[n], imm32, '0');
    PSTATE.<N,Z,C,V> = nzcvc;
```

### F5.1.33 CMN (register)

Compare Negative (register) adds a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

#### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0	
!=1111				0 0 0 1 0		1 1 1		Rn			(0)(0)(0)(0)				imm5			type		0		Rm	
cond																							

#### **Rotate right with extend variant**

Applies when imm5 == 00000 && type == 11.

CMN{<c>}{<q>} <Rn>, <Rm>, RRX

#### **Shift or rotate by value variant**

Applies when !(imm5 == 00000 && type == 11).

CMN{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

#### **Decode for all variants of this encoding**

n = UInt(Rn); m = UInt(Rm);  
(shift\_t, shift\_n) = DecodeImmShift(type, imm5);

#### T1

15	14	13	12	11	10	9	8	7	6	5	3	2	0
0	1	0	0	0	0	1	0	1	1	Rm		Rn	

#### **T1 variant**

CMN{<c>}{<q>} <Rn>, <Rm>

#### **Decode for this encoding**

n = UInt(Rn); m = UInt(Rm);  
(shift\_t, shift\_n) = (SRTYPE\_LSL, 0);

#### T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	1	1	0	0	0	1	Rn	(0)	imm3	1	1	1	1	imm2	type					Rm	

#### **Rotate right with extend variant**

Applies when imm3 == 000 && imm2 == 00 && type == 11.

CMN{<c>}{<q>} <Rn>, <Rm>, RRX

#### **Shift or rotate by value variant**

Applies when !(imm3 == 000 && imm2 == 00 && type == 11).

CMN{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1  
CMN{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

### Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.  For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.  For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:  LSL          when type = 00 LSR          when type = 01 ASR          when type = 10 ROR          when type = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.  For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(R[n], shifted, '0');
    PSTATE.<N,Z,C,V> = nzcvc;
```

### F5.1.34 CMN (register-shifted register)

Compare Negative (register-shifted register) adds a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

#### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	0	0	0	0	1	1	1	Rn	(0)	(0)	(0)	(0)	Rs	0	type	1	Rm			
cond																							

#### A1 variant

CMN{<C>}{<Q>} <Rn>, <Rm>, <type> <Rs>

#### Decode for this encoding

```
n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<Q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table> <tr> <td>LSL</td><td>when type = 00</td></tr> <tr> <td>LSR</td><td>when type = 01</td></tr> <tr> <td>ASR</td><td>when type = 10</td></tr> <tr> <td>ROR</td><td>when type = 11</td></tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

#### Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(R[n], shifted, '0');
    PSTATE.<N,Z,C,V> = nzcvc;
```

### F5.1.35 CMP (immediate)

Compare (immediate) subtracts an immediate value from a register value. It updates the condition flags based on the result, and discards the result.

#### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11				0

cond																				

#### A1 variant

CMP{<c>}{<q>} <Rn>, #<const>

#### Decode for this encoding

n = UInt(Rn); imm32 = A32ExpandImm(imm12);

#### T1

15	14	13	12	11	10	8	7				0
0	0	1	0	1		Rn					imm8

#### T1 variant

CMP{<c>}{<q>} <Rn>, #<imm8>

#### Decode for this encoding

n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);

#### T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	10	9	8	7			0
1	1	1	1	0	i	0	1	1	0	1	1		Rn	0	imm3	1	1	1	1					imm8

#### T2 variant

CMP{<c>}.W <Rn>, #<const> // <Rd>, <const> can be represented in T1

CMP{<c>}{<q>} <Rn>, #<const>

#### Decode for this encoding

n = UInt(Rn); imm32 = T32ExpandImm(i:imm3:imm8);  
if n == 15 then UNPREDICTABLE;

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1: is a general-purpose source register, encoded in the "Rn" field. For encoding T2: is the general-purpose source register, encoded in the "Rn" field.
<imm8>	Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
<const>	For encoding A1: an immediate value. See <a href="#">Modified immediate constants in A32 instructions on page F2-2864</a> for the range of values. For encoding T2: an immediate value. See <a href="#">Modified immediate constants in T32 instructions on page F2-2863</a> for the range of values.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(R[n], NOT(imm32), '1');
    PSTATE.<N,Z,C,V> = nzcvc;
```

### F5.1.36 CMP (register)

Compare (register) subtracts an optionally-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

#### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0
!=1111	0	0	0	1	0	1	0	1		Rn	(0)	(0)	(0)	(0)		imm5	type	0		Rm		
cond																						

#### Rotate right with extend variant

Applies when imm5 == 00000 && type == 11.

CMP{<c>}{<q>} <Rn>, <Rm>, RRX

#### Shift or rotate by value variant

Applies when !(imm5 == 00000 && type == 11).

CMP{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

#### Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm5);
```

#### T1

15	14	13	12	11	10	9	8	7	6	5	3	2	0
0	1	0	0	0	0	1	0	1	0		Rm		Rn

#### T1 variant

CMP{<c>}{<q>} <Rn>, <Rm> // <Rn> and <Rm> both from R0-R7

#### Decode for this encoding

```
n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

#### T2

15	14	13	12	11	10	9	8	7	6	3	2	0
0	1	0	0	0	1	0	1	N		Rm		Rn

#### T2 variant

CMP{<c>}{<q>} <Rn>, <Rm> // <Rn> and <Rm> not both from R0-R7

#### Decode for this encoding

```
n = UInt(N:Rn); m = UInt(Rm);
(shift_t, shift_n) = (SRTYPE_LSL, 0);
if n < 8 && m < 8 then UNPREDICTABLE;
if n == 15 || m == 15 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $n < 8$  &&  $m < 8$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The condition flags become UNKNOWN.

### T3

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	1	1	1	0	1	1	Rn	(0)	imm3	1	1	1	1	imm2	type	Rm					

### Rotate right with extend variant

Applies when  $imm3 == 000$  &&  $imm2 == 00$  &&  $type == 11$ .

CMP{<c>}{<q>} <Rn>, <Rm>, RRX

### Shift or rotate by value variant

Applies when  $!(imm3 == 000 \text{ \&\& } imm2 == 00 \text{ \&\& } type == 11)$ .

CMP{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1 or T2

CMP{<c>}{<q>} <Rn>, <Rm>, <shift> #<amount>

### Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1 and T3: is the first general-purpose source register, encoded in the "Rn" field. For encoding T2: is the first general-purpose source register, encoded in the "N:Rn" field.
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1, T2 and T3: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: LSL when type = 00

LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(R[n], NOT(shifted), '1');
    PSTATE.<N,Z,C,V> = nzcvc;
```

### F5.1.37 CMP (register-shifted register)

Compare (register-shifted register) subtracts a register-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

#### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	8	7	6	5	4	3	0
!	1	1	1	1	0	0	0	1	0	1	Rn	(0)	(0)	(0)	(0)	Rs	0	type	1	Rm			
cond																							

#### A1 variant

CMP{<C>}{<Q>} <Rn>, <Rm>, <type> <Rs>

#### Decode for this encoding

```
n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
shift_t = DecodeRegShift(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<Q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table> <tr> <td>LSL</td><td>when type = 00</td></tr> <tr> <td>LSR</td><td>when type = 01</td></tr> <tr> <td>ASR</td><td>when type = 10</td></tr> <tr> <td>ROR</td><td>when type = 11</td></tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

#### Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(R[n], NOT(shifted), '1');
    PSTATE.<N,Z,C,V> = nzc;
```

## F5.1.38 CPS, CPSID, CPSIE

Change PE State changes one or more of the [PSTATE](#).{A, I, F} interrupt mask bits and, optionally, the [PSTATE](#).M mode field, without changing any other [PSTATE](#) bits.

CPS is treated as NOP if executed in User mode unless it is defined as being CONSTRAINED UNPREDICTABLE elsewhere in this section.

The PE checks whether the value being written to [PSTATE](#).M is legal. See [Illegal changes to PSTATE.M on page G1-4336](#).

### A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	0			
1	1	1	1	0	0	0	1	0	0	0	0	imod	M	0	(0)	(0)	(0)	(0)	(0)	(0)	(0)	(0)	A	I	F	0	mode				

#### CPS variant

Applies when `imod == 00 && M == 1`.

`CPS{<q>} #<mode> // Cannot be conditional`

#### CPSID variant

Applies when `imod == 11 && M == 0`.

`CPSID{<q>} <iflags> // Cannot be conditional`

#### CPSID variant

Applies when `imod == 11 && M == 1`.

`CPSID{<q>} <iflags> , #<mode> // Cannot be conditional`

#### CPSIE variant

Applies when `imod == 10 && M == 0`.

`CPSIE{<q>} <iflags> // Cannot be conditional`

#### CPSIE variant

Applies when `imod == 10 && M == 1`.

`CPSIE{<q>} <iflags> , #<mode> // Cannot be conditional`

#### Decode for all variants of this encoding

```
if mode != '00000' && M == '0' then UNPREDICTABLE;
if (imod<1> == '1' && A:I:F == '000') || (imod<1> == '0' && A:I:F != '000') then UNPREDICTABLE;
enable = (imod == '10'); disable = (imod == '11'); changemode = (M == '1');
affectA = (A == '1'); affectI = (I == '1'); affectF = (F == '1');
if (imod == '00' && M == '0') || imod == '01' then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If `imod == '01'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

If `imod == '00' && M == '0'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

If `mode != '00000' && M == '0'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: `changemode = TRUE`.
- The instruction executes as described, and the value specified by `mode` is ignored. There are no additional side-effects.

If `imod<1> == '1' && A:I:F == '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction behaves as if `imod<1> == '0'`.
- The instruction behaves as if `A:I:F` has an UNKNOWN nonzero value.

If `imod<1> == '0' && A:I:F != '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction behaves as if `imod<1> == '1'`.
- The instruction behaves as if `A:I:F == '000'`.

## T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	1	1	0	1	1	0	0	1	1	im	(0)	A	I	F

### CPSID variant

Applies when `im == 1`.

`CPSID{<q>} <iflags> // Not permitted in IT block`

### CPSIE variant

Applies when `im == 0`.

`CPSIE{<q>} <iflags> // Not permitted in IT block`

### Decode for all variants of this encoding

```
if A:I:F == '000' then UNPREDICTABLE;
enable = (im == '0'); disable = (im == '1'); changemode = FALSE;
affectA = (A == '1'); affectI = (I == '1'); affectF = (F == '1');
if InITBlock() then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If A:I:F == '000', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

### T2

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	0

CPS{<q>} #<mode> // Not permitted in IT block

#### CPSID variant

Applies when imod == 11 && M == 0.

CPSID.W <iflags> // Not permitted in IT block

#### CPSID variant

Applies when imod == 11 && M == 1.

CPSID{<q>} <iflags>, #<mode> // Not permitted in IT block

#### CPSIE variant

Applies when imod == 10 && M == 0.

CPSIE.W <iflags> // Not permitted in IT block

#### CPSIE variant

Applies when imod == 10 && M == 1.

CPSIE{<q>} <iflags>, #<mode> // Not permitted in IT block

### Decode for all variants of this encoding

```

if imod == '00' && M == '0' then SEE "Hint instructions";
if mode != '00000' && M == '0' then UNPREDICTABLE;
if (imod<1> == '1' && A:I:F == '000') || (imod<1> == '0' && A:I:F != '000') then UNPREDICTABLE;
enable = (imod == '10'); disable = (imod == '11'); changemode = (M == '1');
affectA = (A == '1'); affectI = (I == '1'); affectF = (F == '1');
if imod == '01' || InITBlock() then UNPREDICTABLE;

```

### CONSTRAINED UNPREDICTABLE behavior

If imod == '01', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

If mode != '00000' && M == '0', then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.
- The instruction executes with the additional decode: changemode = TRUE.
- The instruction executes as described, and the value specified by mode is ignored. There are no additional side-effects.

If `imod<1> == '1' && A:I:F == '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction behaves as if `imod<1> == '0'`.
- The instruction behaves as if A:I:F has an UNKNOWN nonzero value.

If `imod<1> == '0' && A:I:F != '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction behaves as if `imod<1> == '1'`.
- The instruction behaves as if A:I:F == '000'.

## Notes for all encodings

Hint instructions: In encoding T2, if the `imod` field is `00` and the `M` bit is `0`, a hint instruction is encoded. To determine which hint instruction, see [Branches and miscellaneous control on page F3-2916](#).

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<code>&lt;q&gt;</code>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .						
<code>&lt;iflags&gt;</code>	Is a sequence of one or more of the following, specifying which interrupt mask bits are affected: <table> <tr> <td><code>a</code></td><td>Sets the A bit in the instruction, causing the specified effect on <a href="#">PSTATE.A</a>, the SError interrupt mask bit.</td></tr> <tr> <td><code>i</code></td><td>Sets the I bit in the instruction, causing the specified effect on <a href="#">PSTATE.I</a>, the IRQ interrupt mask bit.</td></tr> <tr> <td><code>f</code></td><td>Sets the F bit in the instruction, causing the specified effect on <a href="#">PSTATE.F</a>, the FIQ interrupt mask bit.</td></tr> </table>	<code>a</code>	Sets the A bit in the instruction, causing the specified effect on <a href="#">PSTATE.A</a> , the SError interrupt mask bit.	<code>i</code>	Sets the I bit in the instruction, causing the specified effect on <a href="#">PSTATE.I</a> , the IRQ interrupt mask bit.	<code>f</code>	Sets the F bit in the instruction, causing the specified effect on <a href="#">PSTATE.F</a> , the FIQ interrupt mask bit.
<code>a</code>	Sets the A bit in the instruction, causing the specified effect on <a href="#">PSTATE.A</a> , the SError interrupt mask bit.						
<code>i</code>	Sets the I bit in the instruction, causing the specified effect on <a href="#">PSTATE.I</a> , the IRQ interrupt mask bit.						
<code>f</code>	Sets the F bit in the instruction, causing the specified effect on <a href="#">PSTATE.F</a> , the FIQ interrupt mask bit.						
<code>&lt;mode&gt;</code>	Is the number of the mode to change to, in the range 0 to 31, encoded in the "mode" field.						

## Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
    EncodingSpecificOperations();
    if PSTATE.EL != EL0 then
        if enable then
            if affectA then PSTATE.A = '0';
            if affectI then PSTATE.I = '0';
            if affectF then PSTATE.F = '0';
        if disable then
            if affectA then PSTATE.A = '1';

            if affectF then PSTATE.F = '1';
        if changemode then
            // AArch32.WriteModeByInstr() sets PSTATE.IL to 1 if this is an illegal mode change.

```

```
        AArch32.WriteModeByInstr(mode);
else
    EncodingSpecificOperations();
    if PSTATE.EL != EL0 then
        if enable then
            if affectA then PSTATE.A = '0';
            if affectI then PSTATE.I = '0';
            if affectF then PSTATE.F = '0';
        if disable then
            if affectA then PSTATE.A = '1';
            if affectI then PSTATE.I = '1';
            if affectF then PSTATE.F = '1';
    if changemode then
        // AArch32.WriteModeByInstr() sets PSTATE.IL to 1 if this is an illegal mode change.
        AArch32.WriteModeByInstr(mode);
```

## F5.1.39 CRC32

CRC32 performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x04C11DB7 is used for the CRC calculation.

In ARMv8-A, this is an OPTIONAL instruction, and in ARMv8.1 it is mandatory for all implementations to implement it.

### ———— Note ————

[ID\\_ISAR5](#).CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

## A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0
!=1111	0	0	0	1	0	sz	0	Rn		Rd	(0)	(0)	0	(0)	0	1	0	0		Rm			
cond						C																	

### CRC32B variant

Applies when sz == 00.

CRC32B{<q>} <Rd>, <Rn>, <Rm>

### CRC32H variant

Applies when sz == 01.

CRC32H{<q>} <Rd>, <Rn>, <Rm>

### CRC32W variant

Applies when sz == 10.

CRC32W{<q>} <Rd>, <Rn>, <Rm>

### Decode for all variants of this encoding

```
if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if cond != '1110' then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If size == 64, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: size = 32;.

If cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction executes unconditionally.
- The instruction executes conditionally.

## T1

### CRC32H variant

Applies when sz == 01.

CRC32H{<q>} <Rd>, <Rn>, <Rm>

### CRC32W variant

Applies when sz == 10.

CRC32W{<q>} <Rd>, <Rn>, <Rm>

### Decode for all variants of this encoding

```
if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If size == 64, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: size = 32;.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> . An CRC32 instruction must be unconditional.
<Rd>	Is the general-purpose accumulator output register, encoded in the "Rd" field.
<Rn>	Is the general-purpose accumulator input register, encoded in the "Rn" field.
<Rm>	Is the general-purpose data source register, encoded in the "Rm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();

    acc = R[n];           // accumulator
    val = R[m]<size-1:0>; // input value
    poly = (if crc32c then 0x1EDC6F41 else 0x04C11DB7)<31:0>;
    tempacc = BitReverse(acc):Zeros(size);
    tempval = BitReverse(val):Zeros(32);
    // Poly32Mod2 on a bitstring does a polynomial Modulus over {0,1} operation
    R[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));
```

## F5.1.40 CRC32C

CRC32C performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x1EDC6F41 is used for the CRC calculation.

In ARMv8-A, this is an OPTIONAL instruction, and in ARMv8.1 it is mandatory for all implementations to implement it.

### ————— Note —————

[ID\\_ISAR5](#).CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

## A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0	
!=1111				0 0 0 1 0		sz		0		Rn			Rd		(0)(0)		1		(0)		0 1 0 0		Rm	
cond											C													

### CRC32CB variant

Applies when sz == 00.

CRC32CB{<q>} <Rd>, <Rn>, <Rm>

### CRC32CH variant

Applies when sz == 01.

CRC32CH{<q>} <Rd>, <Rn>, <Rm>

### CRC32CW variant

Applies when sz == 10.

CRC32CW{<q>} <Rd>, <Rn>, <Rm>

### Decode for all variants of this encoding

```

if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if cond != '1110' then UNPREDICTABLE;

```

### CONSTRAINED UNPREDICTABLE behavior

If size == 64, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: size = 32;.

If cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction executes unconditionally.
- The instruction executes conditionally.

## T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	0	1	1	0	1		Rn	1	1	1	1		Rd	1	0		sz		Rm

C

### CRC32CB variant

Applies when sz == 00.

CRC32CB{<q>} <Rd>, <Rn>, <Rm>

### CRC32CH variant

Applies when sz == 01.

CRC32CH{<q>} <Rd>, <Rn>, <Rm>

### CRC32CW variant

Applies when sz == 10.

CRC32CW{<q>} <Rd>, <Rn>, <Rm>

### Decode for all variants of this encoding

```

if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;

```

### CONSTRAINED UNPREDICTABLE behavior

If size == 64, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: size = 32;.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> . An CRC32C instruction must be unconditional.
<Rd>	Is the general-purpose accumulator output register, encoded in the "Rd" field.
<Rn>	Is the general-purpose accumulator input register, encoded in the "Rn" field.
<Rm>	Is the general-purpose data source register, encoded in the "Rm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();

    acc = R[n];           // accumulator
    val = R[m]<size-1:0>; // input value
    poly = (if crc32c then 0x1EDC6F41 else 0x04C11DB7)<31:0>;
    tempacc = BitReverse(acc):Zeros(size);
    tempval = BitReverse(val):Zeros(32);
    // Poly32Mod2 on a bitstring does a polynomial Modulus over {0,1} operation
    R[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));
```

## F5.1.41 DBG

In ARMv8, DBG executes as a NOP. ARM deprecates any use of the DBG instruction.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	0

cond																												

### A1 variant

DBG{<c>}{<q>} #<option>

### Decode for this encoding

// DBG executes as a NOP. The 'option' field is ignored

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	1	1	1	0	1	0	(1)	(1)	(1)	(1)	1	0	(0)	0	(0)	0	0	0	1	1	1	1	option	

### T1 variant

DBG{<c>}{<q>} #<option>

### Decode for this encoding

// DBG executes as a NOP. The 'option' field is ignored

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<option> Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "option" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
```

## F5.1.42 DCPS1, DCPS2, DCPS3

DCPSx, Debug Change PE State to ELx, where x is 1, 2, or 3.

When executed in Debug state, the target Exception level of the instruction is:

- ELx, if the instruction is executed at an Exception level lower than ELx.
- Otherwise, the Exception level at which the instruction is executed.

On executing a DCPSx instruction in Debug state when the instruction is not UNDEFINED:

- If the instruction is executed at an Exception level that is lower than the target Exception level the PE enters the target Exception level, ELx, and:
  - If ELx is using AArch64, the PE selects SP\_ELx.
  - If the target Exception level is EL1 using AArch32 the PE enters Supervisor mode.
  - If the instruction was executed in Non-secure state and the target Exception level is EL2 using AArch32 the PE enters Hyp mode.
  - If the target Exception level is EL3 using AArch32 the PE enters Supervisor mode and SCR.NS is set to 0.
- Otherwise, there is no change to the Exception level and:
  - If the instruction was executed at EL1 the PE enters Supervisor mode.
  - If the instruction was executed at EL2 the PE remains in Hyp mode.
  - If the instruction was a DCPS1 instruction executed at EL3 the PE enters Supervisor mode and SCR.NS is set to 0.
  - If the instruction was a DCPS3 instruction executed at EL3 the PE enters Monitor mode and SCR.NS is set to 0.

These instructions are always UNDEFINED in Non-debug state.

DCPS1 is UNDEFINED at EL0 in Non-secure state if either:

- EL2 is implemented and using AArch64 and  $HCR\_EL2.TGE == 1$ .
- EL2 is implemented and using AArch32 and  $HCR.TGE == 1$ .

DCPS2 is UNDEFINED at all Exception levels if EL2 is not implemented.

DCPS2 is UNDEFINED in the following states if EL2 is implemented:

- At EL0 and EL1 in Secure state.
- At EL3 if EL3 is using AArch32.

DCPS3 is UNDEFINED at all Exception levels if either:

- $EDSCR.SDD == 1$ .
- EL3 is not implemented.

On executing a DCPSx instruction that is not UNDEFINED and targets ELx:

- If ELx is using AArch64:
  - ELR\_ELx, SPSR\_ELx, and ESR\_ELx become UNKNOWN.
  - DLR\_EL0 and DSPSR\_EL0 become UNKNOWN.
- If ELx is using AArch32 DLR and DSPSR become UNKNOWN and:
  - If the target Exception level is EL1 or EL3, the LR and SPSR of the target PE mode become UNKNOWN.
  - If the target Exception level is EL2, then ELR\_hyp, SPSR\_hyp, and HSR become UNKNOWN.

For more information on the operation of these instructions, see [DCPS<n>](#) on page H2-5461.

## T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	For encoding A1: see <a href="#">Standard assembler syntax fields</a> on page F2-2848. Must be AL or omitted. For encoding T1: see <a href="#">Standard assembler syntax fields</a> on page F2-2848.
<q>	See <a href="#">Standard assembler syntax fields</a> on page F2-2848.
<option>	Specifies an optional limitation on the barrier operation. Values are: <ul style="list-style-type: none"> <li>SY Full system is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Can be omitted. This option is referred to as the full system barrier. Encoded as option = 0b1111.</li> <li>ST Full system is the required shareability domain, writes are the required access type, both before and after the barrier instruction. SYST is a synonym for ST. Encoded as option = 0b1110.</li> <li>LD Full system is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1101.</li> </ul>

ISH	Inner Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b1011.
ISHST	Inner Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b1010.
ISHLD	Inner Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1001.
NSH	Non-shareable is the required shareability domain, reads and writes are the required access, both before and after the barrier instruction. Encoded as option = 0b0111.
NSHST	Non-shareable is the required shareability domain, writes are the required access type before the barrier instruction, and reads and writes are the required type after the barrier instruction. Encoded as option = 0b0110.
NSHLD	Non-shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0101.
OSH	Outer Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b0011.
OSHST	Outer Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b0010.
OSHLD	Outer Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0001.

For more information on whether an access is before or after a barrier instruction, see [Data Memory Barrier \(DMB\) on page E2-2769](#). All other encodings of option are reserved. It is IMPLEMENTATION DEFINED whether options other than SY are implemented. All unsupported and reserved options must execute as a full system DMB operation, but software must not rely on this behavior.

#### Note

The instruction supports the following alternative <option> values, but ARM recommends that software does not use these alternative values:

- SH as an alias for ISH.
- SHST as an alias for ISHST.
- UN as an alias for NSH.
- UNST as an alias for NSHST.

## Operation for all encodings

```

// No additional decoding required

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	For encoding A1: see <a href="#">Standard assembler syntax fields on page F2-2848</a> . Must be AL or omitted. For encoding T1: see <a href="#">Standard assembler syntax fields on page F2-2848</a> .						
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .						
<option>	Specifies an optional limitation on the barrier operation. Values are: <table> <tr> <td>SY</td><td>Full system is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Can be omitted. This option is referred to as the full system barrier. Encoded as option = 0b1111.</td></tr> <tr> <td>ST</td><td>Full system is the required shareability domain, writes are the required access type, both before and after the barrier instruction. SYST is a synonym for ST. Encoded as option = 0b1110.</td></tr> <tr> <td>LD</td><td>Full system is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1101.</td></tr> </table>	SY	Full system is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Can be omitted. This option is referred to as the full system barrier. Encoded as option = 0b1111.	ST	Full system is the required shareability domain, writes are the required access type, both before and after the barrier instruction. SYST is a synonym for ST. Encoded as option = 0b1110.	LD	Full system is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1101.
SY	Full system is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Can be omitted. This option is referred to as the full system barrier. Encoded as option = 0b1111.						
ST	Full system is the required shareability domain, writes are the required access type, both before and after the barrier instruction. SYST is a synonym for ST. Encoded as option = 0b1110.						
LD	Full system is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1101.						

ISH	Inner Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b1011.
ISHST	Inner Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b1010.
ISHLD	Inner Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1001.
NSH	Non-shareable is the required shareability domain, reads and writes are the required access, both before and after the barrier instruction. Encoded as option = 0b0111.
NSHST	Non-shareable is the required shareability domain, writes are the required access type before the barrier instruction, and reads and writes are the required type after the barrier instruction. Encoded as option = 0b0110.
NSHLD	Non-shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0101.
OSH	Outer Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b0011.
OSHST	Outer Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b0010.
OSHLD	Outer Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0001.

For more information on whether an access is before or after a barrier instruction, see [Data Synchronization Barrier \(DSB\)](#) on page E2-2769. All other encodings of option are reserved. It is IMPLEMENTATION DEFINED whether options other than SY are implemented. All unsupported and reserved options must execute as a full system DSB operation, but software must not rely on this behavior.

#### Note

The instruction supports the following alternative <option> values, but ARM recommends that software does not use these alternative values:

- SH as an alias for ISH.
- SHST as an alias for ISHST.
- UN as an alias for NSH.
- UNST as an alias for NSHST.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    case option of
        when '0001' domain = MReqDomain_OuterShareable; types = MReqTypes_Reads;
        when '0010' domain = MReqDomain_OuterShareable; types = MReqTypes_Writes;
        when '0011' domain = MReqDomain_OuterShareable; types = MReqTypes_All;
        when '0101' domain = MReqDomain_Nonshareable; types = MReqTypes_Reads;
        when '0110' domain = MReqDomain_Nonshareable; types = MReqTypes_Writes;
        when '0111' domain = MReqDomain_Nonshareable; types = MReqTypes_All;
        when '1001' domain = MReqDomain_InnerShareable; types = MReqTypes_Reads;
        when '1010' domain = MReqDomain_InnerShareable; types = MReqTypes_Writes;
        when '1011' domain = MReqDomain_InnerShareable; types = MReqTypes_All;
        when '1101' domain = MReqDomain_FullSystem; types = MReqTypes_Reads;
        when '1110' domain = MReqDomain_FullSystem; types = MReqTypes_Writes;
        otherwise domain = MReqDomain_FullSystem; types = MReqTypes_All;

    if HaveEL(EL2) && !IsSecure() && PSTATE.EL IN {EL0,EL1} then
        if HCR.BSU == '11' then

```

```
        domain = MBReqDomain_FullSystem;
    if HCR.BSU == '10' && domain != MBReqDomain_FullSystem then
        domain = MBReqDomain_OuterShareable;
    if HCR.BSU == '01' && domain == MBReqDomain_Nonshareable then
        domain = MBReqDomain_InnerShareable;

    DataSynchronizationBarrier(domain, types);
```

## F5.1.45 EOR, EORS (immediate)

Bitwise Exclusive OR (immediate) performs a bitwise Exclusive OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores **PSTATE** from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> <li>For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</li> <li>For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_&lt;current_mode&gt;.</li> </ul> For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
<Rn>	For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
<const>	For encoding A1: an immediate value. See <a href="#">Modified immediate constants in A32 instructions on page F2-2864</a> for the range of values. For encoding T1: an immediate value. See <a href="#">Modified immediate constants in T32 instructions on page F2-2863</a> for the range of values.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] EOR imm32;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUEXCEPTIONReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

## F5.1.46 EOR, EORS (register)

Bitwise Exclusive OR (register) performs a bitwise Exclusive OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-2733.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores **PSTATE** from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-4361.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

### Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE TEQ (register);
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	<p>For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as &lt;Rn&gt;. ARM deprecates using the PC as the destination register, but if the PC is used:</p> <ul style="list-style-type: none"> <li>For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</li> <li>For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_&lt;current_mode&gt;.</li> </ul> <p>For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as &lt;Rn&gt;.</p>								
<Rn>	<p>For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.</p> <p>For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.</p>								
<Rm>	<p>For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.</p> <p>For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.</p>								
<shift>	<p>Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:</p> <table> <tr> <td>LSL</td><td>when type = 00</td></tr> <tr> <td>LSR</td><td>when type = 01</td></tr> <tr> <td>ASR</td><td>when type = 10</td></tr> <tr> <td>ROR</td><td>when type = 11</td></tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<amount>	<p>For encoding A1: is the shift amount, in the range 1 to 31 (when &lt;shift&gt; = LSL or ROR) or 1 to 32 (when &lt;shift&gt; = LSR or ASR) encoded in the "imm5" field as &lt;amount&gt; modulo 32.</p> <p>For encoding T2: is the shift amount, in the range 1 to 31 (when &lt;shift&gt; = LSL or ROR) or 1 to 32 (when &lt;shift&gt; = LSR or ASR) encoded in the "imm3:imm2" field as &lt;amount&gt; modulo 32.</p>								

In T32 assembly:

- Outside an IT block, if EORS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EORS <Rd>, <Rn> had been written
- Inside an IT block, if EOR<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EOR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);

```

```
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

## F5.1.47 EOR, EORS (register-shifted register)

Bitwise Exclusive OR (register-shifted register) performs a bitwise Exclusive OR of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

### A1

```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <ul style="list-style-type: none"> <li>LSL when type = 00</li> <li>LSR when type = 01</li> <li>ASR when type = 10</li> <li>ROR when type = 11</li> </ul>
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

## F5.1.48 ERET

Exception Return.

The PE branches to the address held in the register holding the preferred return address, and restores [PSTATE](#) from `SPSR_<current_mode>`.

The register holding the preferred return address is:

- [ELR\\_hyp](#), when executing in Hyp mode.
- LR, when executing in a mode other than Hyp mode, User mode, or System mode.

The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state on page G1-4361*.

Exception Return is CONSTRAINED UNPREDICTABLE in User mode and System mode.

In Debug state, the T1 encoding of ERET executes the DRPS operation.

### Assembler symbols

- <q> See [Standard assembler syntax fields on page F2-2848](#). An HLT instruction must be unconditional.
- <imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value is for assembly and disassembly only. It is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

For encoding T1: is a 6-bit unsigned immediate, in the range 0 to 63, encoded in the "imm6" field. This value is for assembly and disassembly only. It is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

### Operation for all encodings

```
EncodingSpecificOperations();  
Halt(DebugHalt_HaltInstruction);
```

## F5.1.51 HVC

Hypervisor Call causes a Hypervisor Call exception. For more information see [Hypervisor Call \(HVC\) exception on page G1-4383](#). Non-secure software executing at EL1 can use this instruction to call the hypervisor to request a service.

The HVC instruction is:

- UNDEFINED in Secure state, and in User mode in Non-secure state.
- When [SCR.HCE](#) is set to 0, UNDEFINED in Non-secure EL1 modes and CONSTRAINED UNPREDICTABLE in Hyp mode.

On executing an HVC instruction, the [HSR](#) reports the exception as a Hypervisor Call exception, using the EC value 0x12, and captures the value of the immediate argument, see [Use of the HSR on page G4-4677](#).

### A1

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields](#) on page F2-2848. Must be AL or omitted.  
For encoding T1: see [Standard assembler syntax fields](#) on page F2-2848.
- <q> See [Standard assembler syntax fields](#) on page F2-2848.
- <option> Specifies an optional limitation on the barrier operation. Values are:  
SY Full system barrier operation, encoded as option = 0b1111. Can be omitted.  
All other encodings of option are reserved. The corresponding instructions execute as full system barrier operations, but must not be relied upon by software.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    InstructionSynchronizationBarrier();
```

## F5.1.53 IT

If-Then makes up to four following instructions (the IT block) conditional. The conditions for the instructions in the IT block are the same as, or the inverse of, the condition the IT instruction specifies for the first instruction in the block.

The IT instruction itself does not affect the condition flags, but the execution of the instructions in the IT block can change the condition flags.

16-bit instructions in the IT block, other than CMP, CMN and TST, do not set the condition flags. An IT instruction with the AL condition can change the behavior without conditional execution.

The architecture permits exception return to an instruction in the IT block only if the restoration of the CPSR restores ITSTATE to a state consistent with the conditions specified by the IT instruction. Any other exception return to an instruction in an IT block is UNPREDICTABLE. Any branch to a target instruction in an IT block is not permitted, and if such a branch is made it is UNPREDICTABLE what condition is used when executing that target instruction and any subsequent instruction in the IT block.

Many uses of the IT instruction are deprecated for performance reasons, and an implementation might include ITD controls that can disable those uses of IT, making them UNDEFINED.

For more information see [Conditional execution on page F2-2849](#) and [Conditional instructions on page F1-2809](#). The first of these sections includes more information about the ITD controls.

### T1

15	14	13	12	11	10	9	8	7	4	3	0
1	0	1	1	1	1	1	1	firstcond	!=0000		
mask											

#### T1 variant

IT{<x>{<y>{<z>}}}{<q>} <cond>

#### Decode for this encoding

```
if mask == '0000' then SEE "Related encodings";
if firstcond == '1111' || (firstcond == '1110' && BitCount(mask) != 1) then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If firstcond == '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: firstcond = '1110';.

If firstcond == '1110' && BitCount(mask) != 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: [Miscellaneous 16-bit instructions on page F3-2883](#).

## Assembler symbols

- <x>            The condition for the second instruction in the IT block. If omitted, the "mask" field is set to 0b1000. If present it is encoded in the "mask[3]" field:
- |   |                  |
|---|------------------|
| T | firstcond[0]     |
| E | NOT firstcond[0] |
- <y>            The condition for the third instruction in the IT block. If omitted and <x> is present, the "mask[2:0]" field is set to 0b100. If <y> is present it is encoded in the "mask[2]" field:
- |   |                  |
|---|------------------|
| T | firstcond[0]     |
| E | NOT firstcond[0] |
- <z>            The condition for the fourth instruction in the IT block. If omitted and <y> is present, the "mask[1:0]" field is set to 0b10. If <z> is present, the "mask[0]" field is set to 1, and it is encoded in the "mask[1]" field:
- |   |                  |
|---|------------------|
| T | firstcond[0]     |
| E | NOT firstcond[0] |
- <q>            See [Standard assembler syntax fields on page F2-2848](#).
- <cond>        The condition for the first instruction in the IT block, encoded in the "firstcond" field. See [Table F2-1 on page F2-2849](#) for the range of conditions available, and the encodings.

The conditions specified in an IT instruction must match those specified in the syntax of the instructions in its IT block. When assembling to A32 code, assemblers check IT instruction syntax for validity but do not generate assembled instructions for them. See [Conditional instructions on page F1-2809](#).

## Operation

```
EncodingSpecificOperations();  
AArch32.CheckITEnabled(mask);  
PSTATE.IT<7:0> = firstcond:mask;
```

## F5.1.54 LDA

Load-Acquire Word loads a word from memory and writes it to a register. The instruction also has memory ordering semantics as described in [Load-Acquire, Store-Release](#) on page E2-2770

For more information about support for shared memory see [Synchronization and semaphores](#) on page E2-2795. For information about memory accesses see [Memory accesses](#) on page F2-2854.

#### Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE;
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields</a> on page F2-2848.
<Q>	See <a href="#">Standard assembler syntax fields</a> on page F2-2848.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address, 1);
    R[t] = ZeroExtend(Mem0[address, 1], 32);
```

## F5.1.58 LDAEXD

Load-Acquire Exclusive Doubleword loads a doubleword from memory, writes it to two registers and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor
- Causes the executing PE to indicate an active exclusive access in the local monitor.

The instruction also acts as a barrier instruction with the ordering requirements described in [Load-Acquire, Store-Release on page E2-2770](#).

For more information about support for shared memory see [Synchronization and semaphores on page E2-2795](#). For information about memory accesses see [Memory accesses on page F2-2854](#).

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	2	1	0		
!=1111				0 0 0 1 1		0 1 1		Rn				Rt		(1)(1)		1 0		1 0 0 1		(1)(1)(1)(1)							
cond																											

#### A1 variant

LDAEXD{<C>}{<q>} <Rt>, <Rt2>, [<Rn>]

#### Decode for this encoding

```
t = UInt(Rt); t2 = t + 1; n = UInt(Rn);
if Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If Rt<0> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: t<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction executes as described, with no change to its behavior and no additional side effects.

If Rt == '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction is handled as described in [Using R15 on page K1-6097](#).

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	2	1	0
1	1	1	0	1	0	0	0	1	1	0	1	Rn	Rt	Rt2	1	1	1	1	(1)	(1)	(1)	(1)	(1)	(1)	(1)

#### T1 variant

LDAEXD{<C>}{<q>} <Rt>, <Rt2>, [<Rn>]

### Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn);  
if t == 15 || t2 == 15 || t == t2 || n == 15 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $t == t2$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14.  For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be $R(t+1)$ .  For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

### Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    address = R[n];  
    AArch32.SetExclusiveMonitors(address, 8);  
    value = MemO[address, 8];  
    // Extract words from 64-bit loaded value such that R[t] is  
    // loaded from address and R[t2] from address+4.  
    R[t] = if BigEndian() then value<63:32> else value<31:0>;  
    R[t2] = if BigEndian() then value<31:0> else value<63:32>;
```

## F5.1.59 LDAEXH

Load-Acquire Exclusive Halfword loads a halfword from memory, zero-extends it to form a 32-bit word, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

The instruction also has memory ordering semantics as described in [Load-Acquire, Store-Release](#) on page E2-2770.

```

## F5.1.61 LDC (immediate)

Load data to System register (immediate) calculates an address from a base register value and an immediate offset, loads a word from memory, and writes it to the **DBGDTRTXint** System register. It can use offset, post-indexed, pre-indexed, or unindexed addressing. For information about memory accesses see [Memory accesses on page F2-2854](#).

In an implementation that includes EL2, the permitted LDC access to **DBGDTRTXint** can be trapped to Hyp mode, meaning that an attempt to execute an LDC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [Trapping general Non-secure System register accesses to debug registers on page G1-4443](#).

For simplicity, the LDC pseudocode does not show this possible trap to Hyp mode.

```

#### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. If the PC is used, see <a href="#">LDC (literal)</a> .
<option>	Is an 8-bit immediate, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: <ul style="list-style-type: none"> <li>- when U = 0</li> <li>+ when U = 1</li> </ul>
<imm>	Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

#### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];

    // System register write to DBGDTRTXint.
    DBGDTR_EL0[] = MemA[address,4];

    if wback then R[n] = offset_addr;
```

## F5.1.62 LDC (literal)

Load data to System register (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to the [DBGDTRTXint](#) System register. For information about memory accesses see [Memory accesses on page F2-2854](#).

In an implementation that includes EL2, the permitted LDC access to [DBGDTRTXint](#) can be trapped to Hyp mode, meaning that an attempt to execute an LDC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [Trapping general Non-secure System register accesses to debug registers on page G1-4443](#).

For simplicity, the LDC pseudocode does not show this possible trap to Hyp mode.

LDC{<c>}{<q>} p14, c5, <label>  
LDC{<c>}{<q>} p14, c5, [PC, #{+/-}<imm>]

### Decode for this encoding

```
if P == '0' && U == '0' && W == '0' then UNDEFINED;
index = (P == '1'); add = (U == '1'); cp = 14; imm32 = ZeroExtend(imm8:'00', 32);
if W == '1' || (P == '0' && CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $W == '1' || P == '0'$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes as LDC (immediate) with writeback to the PC. The instruction is handled as described in [Using R15 on page K1-6097](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .				
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .				
<option>	Is an 8-bit immediate, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.				
<label>	<p>The label of the literal data item that is to be loaded into &lt;Rt&gt;. The assembler calculates the required value of the offset from the <code>Align(PC, 4)</code> value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020.</p> <p>If the offset is zero or positive, <code>imm32</code> is equal to the offset and <code>add == TRUE</code> (encoded as <code>U == 1</code>).</p> <p>If the offset is negative, <code>imm32</code> is equal to minus the offset and <code>add == FALSE</code> (encoded as <code>U == 0</code>).</p>				
+/-	<p>Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:</p> <table> <tr> <td>-</td><td>when <code>U = 0</code></td></tr> <tr> <td>+</td><td>when <code>U = 1</code></td></tr> </table>	-	when <code>U = 0</code>	+	when <code>U = 1</code>
-	when <code>U = 0</code>				
+	when <code>U = 1</code>				
<imm>	Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <code>&lt;imm&gt;/4</code> .				

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2809](#).

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    offset_addr = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    address = if index then offset_addr else Align(PC,4);

    // System register write to DBGDTRXint.
    DBGDTR_EL0[] = MemA[address,4];
```

## F5.1.63 LDM, LDMIA, LDMFD

Load Multiple (Increment After, Full Descending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the highest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2855](#).

ARMv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see [ARMv8.2-LSMAOC](#). The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#). Related system instructions are [LDM \(User registers\)](#) and [LDM \(exception return\)](#).

This instruction is used by the alias [POP \(multiple registers\)](#). See [Alias conditions on page F5-3146](#) for details of when each alias is preferred.

### A1

### A1 variant

LDM{IA}{<C>}{<q>} <Rn>{!}, <registers> // Preferred syntax  
LDMFD{<C>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

### Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

## T1

15	14	13	12	11	10	8	7		0
1	1	0	0	1	Rn	register_list			

### T1 variant

LDM{IA}{<C>}{<Q>} <Rn>{!}, <registers> // Preferred syntax  
LDMFD{<C>}{<Q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

### Decode for this encoding

```
n = UInt(Rn); registers = '00000000':register_list; wback = (registers<n> == '0');
if BitCount(registers) < 1 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

## T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12				0
1	1	1	0	1	0	0	0	1	0	W	1	Rn	P	M	(0)	register_list					
register_list<13>																					

### T2 variant

LDM{IA}{<C>}.W <Rn>{!}, <registers> // Preferred syntax, if <Rn>, '!' and <registers> can be represented in T1  
LDMFD{<C>}.W <Rn>{!}, <registers> // Alternate syntax, Full Descending stack, if <Rn>, '!' and <registers> can be represented in T1  
LDM{IA}{<C>}{<Q>} <Rn>{!}, <registers> // Preferred syntax  
LDMFD{<C>}{<Q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

### Decode for this encoding

```
n = UInt(Rn); registers = P:M:register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 2 || (P == '1' && M == '1') then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<13> == '1' then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If `wback && registers<n> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If `BitCount(registers) == 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction loads a single register using the specified addressing modes.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If `registers<13> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

If `P == '1' && M == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Alias conditions

Alias	of variant	is preferred when
<a href="#">POP (multiple registers)</a>	T2	<code>W == '1' &amp;&amp; Rn == '1101' &amp;&amp; BitCount(P:M:register_list) &gt; 1</code>
<a href="#">POP (multiple registers)</a>	A1	<code>W == '1' &amp;&amp; Rn == '1101' &amp;&amp; BitCount(register_list) &gt; 1</code>

## Assembler symbols

IA	Is an optional suffix for the Increment After form.
<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	For encoding A1 and T2: the address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

For encoding T1: the address adjusted by the size of the data loaded is written back to the base register. It is omitted if <Rn> is included in <registers>, otherwise it must be present.

<registers> For encoding A1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.

The PC can be in the list.

ARM deprecates using these instructions with both the LR and the PC in the list.

For encoding T1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register\_list" field.

For encoding T2: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register\_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0.

If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4]; address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] + 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

## F5.1.64 LDM (exception return)

Load Multiple (exception return) loads multiple registers from consecutive memory locations using an address from a base register. The [SPSR](#) of the current mode is copied to the [CPSR](#). An address adjusted by the size of the data loaded can optionally be written back to the base register.

The registers loaded include the PC. The word loaded for the PC is treated as an address and a branch occurs to that address.

Load Multiple (exception return) is:

- UNDEFINED in Hyp mode.
- UNPREDICTABLE in debug state, and in User mode and System mode.

### A1

### A1 variant

LDM{<amode>}{<c>}{<q>} <Rn>{!}, <registers\_with\_pc>^

### Decode for this encoding

```
n = UInt(Rn); registers = register_list;
wback = (W == '1'); increment = (U == '1'); wordhigher = (P == U);
if n == 15 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all the loads using the specified addressing mode and the content of the register being written back is UNKNOWN. In addition, if an exception occurs during the execution of this instruction, the base address might be corrupted so that the instruction cannot be repeated.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<amode> is one of:

DA	Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
FA	Full Ascending. For this instruction, a synonym for DA.
DB	Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.
EA	Empty Ascending. For this instruction, a synonym for DB.

IA	Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
FD	Full Descending. For this instruction, a synonym for IA.
IB	Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.
ED	Empty Descending. For this instruction, a synonym for IB.
<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
<registers_with_pc>	Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be loaded. The registers are loaded with the lowest-numbered register from the lowest memory address, through to the highest-numbered register from the highest memory address. The PC must be specified in the register list, and the instruction causes a branch to the address (data) loaded into the PC. See also <a href="#">Encoding of lists of general-purpose registers and the PC on page F2-2855</a> .

Instructions with similar syntax but without the PC included in the registers list are described in [LDM \(User registers\)](#).

## Operation

```

if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elseif PSTATE.M IN {M32_User, M32_System} then
        UNPREDICTABLE; // UNDEFINED or NOP
    else
        length = 4 * BitCount(registers) + 4;
        address = if increment then R[n] else R[n] - length;
        if wordhigher then address = address + 4;

        for i = 0 to 14
            if registers<i> == '1' then
                R[i] = MemA[address, 4]; address = address + 4;
            new_pc_value = MemA[address, 4];

        if wback && registers<n> == '0' then R[n] = if increment then R[n] + length else R[n] - length;
        if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;

        AArch32.ExceptionReturn(new_pc_value, SPSR[]);

```

## CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32\_User, M32\_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

## F5.1.65 LDM (User registers)

In an EL1 mode other than System mode, Load Multiple (User registers) loads multiple User mode registers from consecutive memory locations using an address from a base register. The registers loaded cannot include the PC. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Load Multiple (User registers) is UNDEFINED in Hyp mode, and UNPREDICTABLE in User and System modes.

ARMv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see [ARMv8.2-LSMAOC](#).

### A1

### A1 variant

LDM{<amode>}{<c>}{<q>} <Rn>, <registers\_without\_pc>^

### Decode for this encoding

```
n = UInt(Rn); registers = register_list; increment = (U == '1'); wordhigher = (P == U);
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<amode>	is one of:

## Operation

```

if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then UNDEFINED;
    elseif PSTATE.M IN {M32_User,M32_System} then UNPREDICTABLE;
    else
        length = 4*BitCount(registers);
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;
        for i = 0 to 14
            if registers<i> == '1' then // Load User mode register
                Rmode[i, M32_User] = MemA[address,4]; address = address + 4;

```

## CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32\_User,M32\_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

## F5.1.66 LMDMA, LDMFA

Load Multiple Decrement After (Full Ascending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations end at this address, and the address just below the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2855](#).

ARMv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see [ARMv8.2-LSMAOC](#). The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#). Related system instructions are [LDM \(User registers\)](#) and [LDM \(exception return\)](#).

### A1

### A1 variant

LMDMA{<C>}{<Q>} <Rn>{!}, <registers> // Preferred syntax  
LDMFA{<C>}{<Q>} <Rn>{!}, <registers> // Alternate syntax, Full Ascending stack

### Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
<registers>	Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The PC can be in the list. ARM deprecates using these instructions with both the LR and the PC in the list.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers) + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemA[address,4]; address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemA[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] - 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

## F5.1.67 LDMDB, LDMEA

Load Multiple Decrement Before (Empty Ascending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations end just below this address, and the address of the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2855](#).

ARMv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see [ARMv8.2-LSMAOC](#). The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#). Related system instructions are [LDM \(User registers\)](#) and [LDM \(exception return\)](#).

### A1

### A1 variant

LDMDB{<C>}{<q>} <Rn>{!}, <registers> // Preferred syntax  
LDMEA{<C>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack

### Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

### T1

### T1 variant

LDMDB{<C>}{<Q>} <Rn>{!}, <registers> // Preferred syntax  
LDMEA{<C>}{<Q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack

### Decode for this encoding

```
n = UInt(Rn); registers = P:M:register_list; wback = (W == '1');  
if n == 15 || BitCount(registers) < 2 || (P == '1' && M == '1') then UNPREDICTABLE;  
if wback && registers<n> == '1' then UNPREDICTABLE;  
if registers<13> == '1' then UNPREDICTABLE;  
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If BitCount(registers) == 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction loads a single register using the specified addressing modes.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If registers<13> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

If P == '1' && M == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

### Notes for all encodings

    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;

```

## F5.1.69 LDR (immediate)

Load Register (immediate) calculates an address from a base register value and an immediate offset, loads a word from memory, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses](#) on page F2-2854.

This instruction is used by the alias [POP \(single register\)](#). See [Alias conditions](#) on page F5-3161 for details of when each alias is preferred.

### A1

#### Offset variant

Applies when  $P == 1$  &&  $W == 0$ .

$LDR\{<C>\}\{<q>\} <Rt>, [<Rn> \{, \#\{+/-\}<imm>\}]$

#### Post-indexed variant

Applies when  $P == 0$  &&  $W == 0$ .

$LDR\{<C>\}\{<q>\} <Rt>, [<Rn>], \#\{+/-\}<imm>$

#### Pre-indexed variant

Applies when  $P == 1$  &&  $W == 1$ .

$LDR\{<C>\}\{<q>\} <Rt>, [<Rn>, \#\{+/-\}<imm>]!$

#### Decode for all variants of this encoding

```

if Rn == '1111' then SEE LDR (literal);
if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if wback && n == t then UNPREDICTABLE;

```

#### CONSTRAINED UNPREDICTABLE behavior

If  $wback$  &&  $n == t$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

### T1

### T1 variant

LDR{<C>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

### Decode for this encoding

t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm5:'00', 32);  
index = TRUE; add = TRUE; wback = FALSE;

### T2

15	14	13	12	11	10	8	7		0
1	0	0	1	1		Rt		imm8	

### T2 variant

LDR{<C>}{<q>} <Rt>, [SP{, #<+><imm>}]

### Decode for this encoding

t = UInt(Rt); n = 13; imm32 = ZeroExtend(imm8:'00', 32);  
index = TRUE; add = TRUE; wback = FALSE;

### T3

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11		0
1	1	1	1	1	0	0	0	1	1	0	1	!	1111		Rt		imm12	

Rn

### T3 variant

LDR{<C>}.W <Rt>, [<Rn> {, #<+><imm>}] // <Rt>, <Rn>, <imm> can be represented in T1 or T2  
LDR{<C>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

### Decode for this encoding

if Rn == '1111' then SEE LDR (literal);  
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32); index = TRUE; add = TRUE;  
wback = FALSE; if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;

### T4

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7		0
1	1	1	1	1	0	0	0	0	1	0	1	!	1111		Rt	1	P	U	W		imm8	

Rn

### Offset variant

Applies when P == 1 && U == 0 && W == 0.

LDR{<C>}{<q>} <Rt>, [<Rn> {, #-<imm>}]

### Post-indexed variant

Applies when P == 0 && W == 1.

LDR{<C>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

### Pre-indexed variant

Applies when P == 1 && W == 1.

LDR{<C>}{<Q>} <Rt>, [<Rn>, #<+/-><imm>]!

### Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDR (literal);
if P == '1' && U == '1' && W == '0' then SEE LDRT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn);
imm32 = ZeroExtend(imm8, 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
if (wback && n == t) || (t == 15 && InITBlock() && !LastInITBlock()) then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Alias conditions

Alias	of variant	is preferred when
<a href="#">POP (single register)</a>	A1 (post-indexed)	P == '0' && U == '1' && W == '0' && Rn == '1101' && imm12 == '000000000100'
<a href="#">POP (single register)</a>	T4 (post-indexed)	Rn == '1101' && U == '1' && imm8 == '00000100'

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a> . For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field. For encoding T3 and T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a> .
<Rn>	For encoding A1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field. For PC use see <a href="#">LDR (literal)</a> . For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: <div style="margin-left: 20px;">-           when U = 0  +           when U = 1</div>
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <imm>/4. For encoding T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 and encoded in the "imm8" field as <imm>/4. For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

## Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        data = MemU[address,4];
        if wback then R[n] = offset_addr;
        if t == 15 then
            if address<1:0> == '00' then
                LoadWritePC(data);
            else
                UNPREDICTABLE;
        else
            R[t] = data;
    else
        if ConditionPassed() then
            EncodingSpecificOperations();
            offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
            address = if index then offset_addr else R[n];
            data = MemU[address,4];
            if wback then R[n] = offset_addr;
            if t == 15 then
                if address<1:0> == '00' then
                    LoadWritePC(data);
                else
                    UNPREDICTABLE;
            else
                R[t] = data;

```

## F5.1.70 LDR (literal)

Load Register (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to a register. For information about memory accesses see [Memory accesses](#) on page F2-2854.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11			0
!=1111				0	1	0	P	U	0	W	1	1	1	1	Rt	imm12			
cond																			

#### A1 variant

Applies when  $!(P == 0 \ \&\& \ W == 1)$ .

LDR{<c>}{<q>} <Rt>, <label> // Normal form  
LDR{<c>}{<q>} <Rt>, [PC, #<+/-><imm>] // Alternative form

#### Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if wback then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDR \(immediate\)](#). The instruction uses post-indexed addressing when  $P == '0'$  and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15](#) on page K1-6097.

## Decode for this encoding

```
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');
if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .				
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .				
<Rt>	<p>For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</p> <p>For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.</p> <p>For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The SP can be used. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</p>				
<label>	<p>For encoding A1 and T2: the label of the literal data item that is to be loaded into &lt;Rt&gt;. The assembler calculates the required value of the offset from the <code>Align(PC, 4)</code> value of the instruction to this label. Permitted values of the offset are -4095 to 4095.</p> <p>If the offset is zero or positive, <code>imm32</code> is equal to the offset and <code>add == TRUE</code>, encoded as <code>U == 1</code>.</p> <p>If the offset is negative, <code>imm32</code> is equal to minus the offset and <code>add == FALSE</code>, encoded as <code>U == 0</code>.</p> <p>For encoding T1: the label of the literal data item that is to be loaded into &lt;Rt&gt;. The assembler calculates the required value of the offset from the <code>Align(PC, 4)</code> value of the instruction to this label. Permitted values of the offset are Multiples of four in the range 0 to 1020.</p>				
+/-	<p>Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:</p> <table> <tr> <td>-</td><td>when U = 0</td></tr> <tr> <td>+</td><td>when U = 1</td></tr> </table>	-	when U = 0	+	when U = 1
-	when U = 0				
+	when U = 1				
<imm>	<p>For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.</p> <p>For encoding T2: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.</p>				

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2809](#).

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,4];
    if t == 15 then
        if address<1:0> == '00' then
            LoadWritePC(data);
        else
            UNPREDICTABLE;
    else
        R[t] = data;
```

## F5.1.71 LDR (register)

Load Register (register) calculates an address from a base register value and an offset register value, loads a word from memory, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses, see [Memory accesses](#) on page F2-2854.

The T32 form of LDR (register) does not support register writeback.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	7	6	5	4	3	0
!=1111	0	1	1	P	U	0	W	1		Rn		Rt		imm5	type	0		Rm		
cond																				

#### Offset variant

Applies when P == 1 && W == 0.

LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]

#### Post-indexed variant

Applies when P == 0 && W == 0.

LDR{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}

#### Pre-indexed variant

Applies when P == 1 && W == 1.

LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!

#### Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE LDRT;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

// ARMv8-A removes UNPREDICTABLE for R13
```

## CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see <a href="#">LDRB (literal)</a> . For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: -           when U = 0 +           when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 5-bit unsigned immediate byte offset, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field. For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

## Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        R[t] = ZeroExtend(MemU[address,1], 32);
        if wback then R[n] = offset_addr;
    else
        if ConditionPassed() then
            EncodingSpecificOperations();
            offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
            address = if index then offset_addr else R[n];
            R[t] = ZeroExtend(MemU[address,1], 32);
            if wback then R[n] = offset_addr;

```

### F5.1.73 LDRB (literal)

Load Register Byte (literal) calculates an address from the PC value and an immediate offset, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2854](#).

#### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11			0
!=1111	0	1	0	P	U	1	W	1	1	1	1	1		Rt					
cond				imm12															

#### A1 variant

Applies when  $!(P == 0 \ \&\& \ W == 1)$ .

LDRB{<c>}{<q>} <Rt>, <label> // Normal form  
LDRB{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

#### Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRBT;
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;.
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDRB \(immediate\)](#). The instruction uses post-indexed addressing when  $P == '0'$  and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15 on page K1-6097](#).

#### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11				0
1	1	1	1	1	0	0	0	U	0	0	1	1	1	1	1	!=1111	imm12					
																Rt						
																imm12						

#### T1 variant

LDRB{<c>}{<q>} <Rt>, <label> // Preferred syntax  
LDRB{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax

#### Decode for this encoding

```
if Rt == '1111' then SEE PLD;
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<label>	<p>The label of the literal data item that is to be loaded into &lt;Rt&gt;. The assembler calculates the required value of the offset from the <code>Align(PC, 4)</code> value of the instruction to this label. Permitted values of the offset are -4095 to 4095.</p> <p>If the offset is zero or positive, <code>imm32</code> is equal to the offset and <code>add == TRUE</code>, encoded as <code>U == 1</code>.</p> <p>If the offset is negative, <code>imm32</code> is equal to minus the offset and <code>add == FALSE</code>, encoded as <code>U == 0</code>.</p>
+/-	<p>Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:</p> <p>-           when <code>U = 0</code></p> <p>+           when <code>U = 1</code></p>
<imm>	<p>For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.</p> <p>For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.</p>

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2809](#).

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    R[t] = ZeroExtend(MemU[address,1], 32);

```

## F5.1.74 LDRB (register)

Load Register Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses see [Memory accesses on page F2-2854](#).

LDRB{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1  
LDRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

### Decode for this encoding

```
if Rt == '1111' then SEE PLD;
if Rn == '1111' then SEE LDRB (literal);
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see <a href="#">Shifts applied to a register on page F2-2852</a> .
<imm>	If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    R[t] = ZeroExtend(MemU[address,1],32);
    if wback then R[n] = offset_addr;
```

## F5.1.75 LDRBT

Load Register Byte Unprivileged loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2854](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11			0
!=1111		0	1	0	0	U	1	1	1		Rn		Rt		imm12		
cond																	

### A1 variant

LDRBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}

### Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $n == 15$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 on page K1-6097](#).
- The instruction uses immediate offset addressing with the base register as PC, without writeback.

If  $n == t$  &&  $n != 15$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

### A2

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	7	6	5	4	3	0		
!=1111				0	1	1	0	U	1	1	1	Rn		Rt		imm5			type	0	Rm	
cond																						

## A2 variant

LDRBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}

### Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm); postindex = TRUE; add = (U == '1');
register_form = TRUE; (shift_t, shift_n) = DecodeImmShift(type, imm5);
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $n == t$  &&  $n != 15$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

## T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	0
1	1	1	1	0	0	0	0	0	0	1	1	1	1	Rt	1	1	1	0	imm8		

Rn

## T1 variant

LDRBT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]

### Decode for this encoding

```
if Rn == '1111' then SEE LDRB (literal);
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0
- + when U = 1

- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see [Shifts applied to a register on page F2-2852](#).
- + Specifies the offset is added to the base register.
- <imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.  
For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

### Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    R[t] = ZeroExtend(MemU_unpriv[address,1],32);
    if postindex then R[n] = offset_addr;
```

### CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRB (immediate).

## F5.1.76 LDRD (immediate)

Load Register Dual (immediate) calculates an address from a base register value and an immediate offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses](#) on page F2-2854.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0

cond										Rn											

#### Offset variant

Applies when P == 1 && W == 0.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #<+/-><imm>}]

#### Post-indexed variant

Applies when P == 0 && W == 0.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #<+/-><imm>

#### Pre-indexed variant

Applies when P == 1 && W == 1.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #<+/-><imm>]!

#### Decode for all variants of this encoding

```

if Rn == '1111' then SEE LDRD (literal);
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt); t2 = t+1; n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if wback && (n == t || n == t2) then UNPREDICTABLE;
if t2 == 15 then UNPREDICTABLE;

```

#### CONSTRAINED UNPREDICTABLE behavior

If wback && (n == t || n == t2), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If P == '0' && W == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

If Rt<0> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction executes with the additional decode:  $t<0> = '0'$ .
- The instruction executes with the additional decode:  $t2 = t$ .
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when  $Rt == '1111'$ .

## T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	0

if P == '0' && W == '0' then SEE "Related encodings";
if Rn == '1111' then SEE LDRD (literal);
t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if wback && (n == t || n == t2) then UNPREDICTABLE;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

```

### CONSTRAINED UNPREDICTABLE behavior

If  $wback$  &  $(n == t || n == t2)$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If  $t == t2$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: [Load/store dual, load/store exclusive, load-acquire/store-release, and table branch](#) on page F3-2913.

## Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields</a> on page F2-2848.
<q>	See <a href="#">Standard assembler syntax fields</a> on page F2-2848.
<Rt>	For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.  For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	For encoding A1: is the second general-purpose register to be transferred. This register must be <R(t+1)>.  For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. For PC use see <a href="#">LDRD (literal)</a> .
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:  -           when U = 0 +           when U = 1
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.  For encoding T1: is the unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 if omitted, and encoded in the "imm8" field as <imm>/4.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];

cond																							

### A1 variant

LDRD{<c>}{<q>} <Rt>, <Rt2>, <label> // Normal form  
LDRD{<c>}{<q>} <Rt>, <Rt2>, [PC, #{+/-}<imm>] // Alternative form

### Decode for this encoding

```
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt); t2 = t+1; imm32 = ZeroExtend(imm4H:imm4L, 32); add = (U == '1');
if t2 == 15 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If Rt<0> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: t<0> = '0';.
- The instruction executes with the additional decode: t2 = t;.
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when Rt == '1111'.

If P == '0' || W == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as if P == 1 and W == 0.'

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11	8	7		0
1	1	1	0	1	0	0	P	U	1	W	1	1	1	1	1	Rt	Rt2				imm8	

### T1 variant

Applies when !(P == 0 && W == 0).

LDRD{<c>}{<q>} <Rt>, <Rt2>, <label> // Normal form  
LDRD{<c>}{<q>} <Rt>, <Rt2>, [PC, #{+/-}<imm>] // Alternative form

### Decode for this encoding

```
if P == '0' && W == '0' then SEE "Related encodings";
t = UInt(Rt); t2 = UInt(Rt2);
imm32 = ZeroExtend(imm8:'00', 32); add = (U == '1');
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
if W == '1' then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $t == t2$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

If  $W == '1'$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses post-indexed addressing when  $P == '0'$  and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15 on page K1-6097](#).

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: [Load/store dual](#), [load/store exclusive](#), [load-acquire/store-release](#), and [table branch on page F3-2913](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14. For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	For encoding A1: is the second general-purpose register to be transferred. This register must be <R(t+1)>. For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<label>	For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the A1 ign(PC, 4) value of the instruction to this label. Any value in the range -255 to 255 is permitted. If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0. For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the A1 ign(PC, 4) value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020. If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is the optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2809](#).

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian() then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];

```

## F5.1.78 LDRD (register)

Load Register Dual (register) calculates an address from a base register value and a register offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F2-2854](#).

### A1

!=1111				0	0	0	P	U	0	W	0	Rn		Rt		(0)	(0)	(0)	(0)	1	1	0	1	Rm	
cond																									

#### Offset variant

Applies when  $P == 1 \ \&\& \ W == 0$ .

$LDRD\{<C>\}\{<Q>\} \ <Rt>, \ <Rt2>, \ [<Rn>, \ \{+/-\}<Rm>]$

#### Post-indexed variant

Applies when  $P == 0 \ \&\& \ W == 0$ .

$LDRD\{<C>\}\{<Q>\} \ <Rt>, \ <Rt2>, \ [<Rn>], \ \{+/-\}<Rm>$

#### Pre-indexed variant

Applies when  $P == 1 \ \&\& \ W == 1$ .

$LDRD\{<C>\}\{<Q>\} \ <Rt>, \ <Rt2>, \ [<Rn>, \ \{+/-\}<Rm>]!$

#### Decode for all variants of this encoding

```

if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt); t2 = t+1; n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if t2 == 15 || m == 15 || m == t || m == t2 then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If  $wback \ \&\& \ (n == t \ || \ n == t2)$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

If  $P == '0' \ \&\& \ W == '1'$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

If  $m == t \ || \ m == t2$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction loads register Rm with an UNKNOWN value.

If Rt<0> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: t<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when Rt == '1111'.

## Notes for all encodings

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.
<Rt2>	Is the second general-purpose register to be transferred. This register must be <R(t+1)>.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: <ul style="list-style-type: none"> <li>- when U = 0</li> <li>+ when U = 1</li> </ul>
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.

## Operation

```

if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + R[m]) else (R[n] - R[m]);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian() then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];

    if wback then R[n] = offset_addr;

```

## F5.1.79 LDREX

Load Register Exclusive calculates an address from a base register value and an immediate offset, loads a word from memory, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see [Synchronization and semaphores on page E2-2795](#). For information about memory accesses see [Memory accesses on page F2-2854](#).

#### Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address,1);
    R[t] = ZeroExtend(MemA[address,1], 32);
```

## F5.1.81 LDREXD

Load Register Exclusive Doubleword derives an address from a base register value, loads a 64-bit doubleword from memory, writes it to two registers and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see [Synchronization and semaphores on page E2-2795](#). For information about memory accesses see [Memory accesses on page F2-2854](#).

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	2	1	0

cond																									

#### A1 variant

LDREXD{<C>}{<q>} <Rt>, <Rt2>, [<Rn>]

#### Decode for this encoding

```
t = UInt(Rt); t2 = t + 1; n = UInt(Rn);
if Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If Rt<0> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: t<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction executes as described, with no change to its behavior and no additional side effects.

If Rt == '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction is handled as described in [Using R15 on page K1-6097](#).

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	2	1	0
1	1	1	0	1	0	0	0	1	1	0	1	Rn		Rt		Rt2		0	1	1	1	(1)	(1)	(1)	(1)

#### T1 variant

LDREXD{<C>}{<q>} <Rt>, <Rt2>, [<Rn>]

### Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn);
if t == 15 || t2 == 15 || t == t2 || n == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### CONSTRAINED UNPREDICTABLE behavior

If  $t == t2$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14.  For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be <R(t+1)>. For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address,8);
    value = MemA[address,8];

#### Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn);
if t == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address,2);
    R[t] = ZeroExtend(MemA[address,2], 32);
```

### F5.1.83 LDRH (immediate)

Load Register Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F2-2854](#).

#### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
!=1111	0	0	0	P	U	1	W	1	!=1111	Rt	imm4H	1	0	1	1	imm4L					
cond										Rn											

#### Offset variant

Applies when P == 1 && W == 0.

LDRH{<C>}{<Q>} <Rt>, [<Rn> {, #<+/-><imm>}]

#### Post-indexed variant

Applies when P == 0 && W == 0.

LDRH{<C>}{<Q>} <Rt>, [<Rn>], #<+/-><imm>

#### Pre-indexed variant

Applies when P == 1 && W == 1.

LDRH{<C>}{<Q>} <Rt>, [<Rn>, #<+/-><imm>]!

#### Decode for all variants of this encoding

```

if Rn == '1111' then SEE LDRH (literal);
if P == '0' && W == '1' then SEE LDRHT;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;

```

#### CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

#### T1

### Post-indexed variant

Applies when P == 0 && W == 1.

LDRH{<C>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

### Pre-indexed variant

Applies when P == 1 && W == 1.

LDRH{<C>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

### Decode for all variants of this encoding

```
if Rn == '1111' then SEE LDRH (literal);
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE PLDW (immediate);
if P == '1' && U == '1' && W == '0' then SEE LDRHT;
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see <a href="#">LDRH (literal)</a> . For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as <imm>/2. For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

### Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        data = MemU[address,2];
        if wback then R[n] = offset_addr;
        R[t] = ZeroExtend(data, 32);
    else
        if ConditionPassed() then
            EncodingSpecificOperations();
            offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
            address = if index then offset_addr else R[n];

```

```
data = MemU[address,2];  
if wback then R[n] = offset_addr;  
R[t] = ZeroExtend(data, 32);
```

## F5.1.84 LDRH (literal)

Load Register Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses](#) on page F2-2854.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	8	7	6	5	4	3	0
!=1111	0	0	0	P	U	1	W	1	1	1	1	1	Rt	imm4H	1	0	1	1	imm4L				
cond																							

### A1 variant

Applies when  $!(P == 0 \ \&\& \ W == 1)$ .

LDRH{<c>}{<q>} <Rt>, <label> // Normal form  
LDRH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

### Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRHT;
t = UInt(Rt); imm32 = ZeroExtend(imm4H:imm4L, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;.
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDRH \(immediate\)](#). The instruction uses post-indexed addressing when  $P == '0'$  and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15](#) on page K1-6097.

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11				0
1	1	1	1	1	0	0	0	U	0	1	1	1	1	1	1	!=1111	imm12					
Rt																						

### T1 variant

LDRH{<c>}{<q>} <Rt>, <label> // Preferred syntax  
LDRH{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax

### Decode for this encoding

```
if Rt == '1111' then SEE PLD (literal);
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .

Any value in the range -255 to 255 is permitted.</p> <p>If the offset is zero or positive, <math>\text{imm32}</math> is equal to the offset and <math>\text{add} == \text{TRUE}</math>, encoded as <math>U == 1</math>. If the offset is negative, <math>\text{imm32}</math> is equal to minus the offset and <math>\text{add} == \text{FALSE}</math>, encoded as <math>U == 0</math>.</p> <p>For encoding T1: the label of the literal data item that is to be loaded into &lt;Rt&gt;. The assembler calculates the required value of the offset from the <math>A1\text{ign}(PC, 4)</math> value of the instruction to this label. Permitted values of the offset are -4095 to 4095.</p> <p>If the offset is zero or positive, <math>\text{imm32}</math> is equal to the offset and <math>\text{add} == \text{TRUE}</math>, encoded as <math>U == 1</math>.</p> <p>If the offset is negative, <math>\text{imm32}</math> is equal to minus the offset and <math>\text{add} == \text{FALSE}</math>, encoded as <math>U == 0</math>.</p>				
+/-	<p>Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:</p> <table> <tr> <td>-</td><td>when <math>U = 0</math></td></tr> <tr> <td>+</td><td>when <math>U = 1</math></td></tr> </table>	-	when $U = 0$	+	when $U = 1$
-	when $U = 0$				
+	when $U = 1$				
<imm>	<p>For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.</p> <p>For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.</p>				

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2809](#).

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC, 4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address, 2];
    R[t] = ZeroExtend(data, 32);

```

## F5.1.85 LDRH (register)

Load Register Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see [Memory accesses on page F2-2854](#).

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0
!	1	1	1	1	0	0	0	P	U	0	W	1	Rn	Rt	(0)	(0)	(0)	(0)	1	0	1	1	Rm
cond																							

#### Offset variant

Applies when P == 1 && W == 0.

LDRH{<C>}{<Q>} <Rt>, [<Rn>, {+/-}<Rm>]

#### Post-indexed variant

Applies when P == 0 && W == 0.

LDRH{<C>}{<Q>} <Rt>, [<Rn>], {+/-}<Rm>

#### Pre-indexed variant

Applies when P == 1 && W == 1.

LDRH{<C>}{<Q>} <Rt>, [<Rn>, {+/-}<Rm>]!

#### Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE LDRHT;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRTYPE_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

### T1

15	14	13	12	11	10	9	8	6	5	3	2	0
0	1	0	1	1	0	1	Rm	Rn	Rt			

#### T1 variant

LDRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

### Decode for this encoding

```
if Rn == '1111' then SEE LDRH (literal);
if Rt == '1111' then SEE PLDW (register);
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<imm>	If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
```

```
offset_addr = if add then (R[n] + offset) else (R[n] - offset);  
address = if index then offset_addr else R[n];  
data = MemU[address,2];  
if wback then R[n] = offset_addr;  
R[t] = ZeroExtend(data, 32);
```

## F5.1.86 LDRHT

Load Register Halfword Unprivileged loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2854](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
1	1	1	1	0	0	0	0	U	1	1	1	Rn	Rt	imm4H	1	0	1	1	imm4L		
cond																					

### A1 variant

LDRHT{<c>}{<q>} <Rt>, [<Rn>] {, #<+/->imm}

### Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $n == 15$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 on page K1-6097](#).
- The instruction is treated as if bit[24] == '1' and bit[21] == '0'. The instruction uses immediate offset addressing with the base register as PC, without writeback.

If  $n == t$  &&  $n != 15$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

## A2

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:  -           when U = 0 +           when U = 1  For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:  -           when U = 0 +           when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.  For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

### Operation for all encodings

```

if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    data = MemU_unpriv(address, 2);
    if postindex then R[n] = offset_addr;
    R[t] = ZeroExtend(data, 32);

```

### CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRH (immediate).

## F5.1.87 LDRSB (immediate)

Load Register Signed Byte (immediate) calculates an address from a base register value and an immediate offset, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F2-2854](#).

### A1

### CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. For PC use see <a href="#">LDRSB (literal)</a> .
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    R[t] = SignExtend(MemU[address,1], 32);
    if wback then R[n] = offset_addr;

```

## F5.1.88 LDRSB (literal)

Load Register Signed Byte (literal) calculates an address from the PC value and an immediate offset, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses](#) on page F2-2854.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	8	7	6	5	4	3	0
!=1111	0	0	0	P	U	1	W	1	1	1	1	1	Rt	imm4H	1	1	0	1	imm4L				
cond																							

### A1 variant

Applies when  $!(P == 0 \ \&\& \ W == 1)$ .

LDRSB{<c>}{<q>} <Rt>, <label> // Normal form  
LDRSB{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

### Decode for this encoding

```
if P == '0' && W == '1' then SEE LDRSBT;
t = UInt(Rt); imm32 = ZeroExtend(imm4H:imm4L, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;.
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDRSB \(immediate\)](#). The instruction uses post-indexed addressing when  $P == '0'$  and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15](#) on page K1-6097.

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11				0

LDRSB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

### Decode for this encoding

```
if Rt == '1111' then SEE PLI;
if Rn == '1111' then SEE LDRSB (literal);
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<imm>	If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
```

```
offset_addr = if add then (R[n] + offset) else (R[n] - offset);  
address = if index then offset_addr else R[n];  
R[t] = SignExtend(MemU[address,1], 32);  
if wback then R[n] = offset_addr;
```

## F5.1.90 LDRSBT

Load Register Signed Byte Unprivileged loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2854](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRSBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
1	1	1	1	0	0	0	0	U	1	1	1	Rn	Rt	imm4H	1	1	0	1	imm4L		
cond																					

### A1 variant

LDRSBT{<C>}{<q>} <Rt>, [<Rn>] {, #<+/-><imm>}

### Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $n == 15$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 on page K1-6097](#).
- The instruction is treated as if  $\text{bit}[24] == '1'$  and  $\text{bit}[21] == '0'$ . The instruction uses immediate offset addressing with the base register as PC, without writeback.

If  $n == t \ \&\& \ n \neq 15$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

## A2

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

Rn																						

### T1 variant

LDRSBT{<C>}{<q>} <Rt>, [<Rn> {, #<+>}<imm>]

#### Decode for this encoding

```
if Rn == '1111' then SEE LDRSB (literal);
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

### Operation for all encodings

```

if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    R[t] = SignExtend(MemU_unpriv[address,1], 32);
    if postindex then R[n] = offset_addr;

```

### CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRSB (immediate).

## F5.1.91 LDRSH (immediate)

Load Register Signed Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F2-2854](#).

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<imm>	If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
offset_addr = if add then (R[n] + offset) else (R[n] - offset);
address = if index then offset_addr else R[n];
data = MemU[address,2];
if wback then R[n] = offset_addr;
R[t] = SignExtend(data, 32);
```

## F5.1.94 LDRSHT

Load Register Signed Halfword Unprivileged loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2854](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRSHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
1	1	1	1	0	0	0	0	U	1	1	1	Rn	Rt	imm4H	1	1	1	1	imm4L		
cond																					

### A1 variant

LDRSHT{<C>}{<q>} <Rt>, [<Rn>] {, #<+/-><imm>}

### Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $n == 15$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 on page K1-6097](#).
- The instruction is treated as if bit[24] == '1' and bit[21] == '0'. The instruction uses immediate offset addressing with the base register as PC, without writeback.

If  $n == t$  &&  $n != 15$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

## A2

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:  -           when U = 0 +           when U = 1  For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:  -           when U = 0 +           when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.  For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

### Operation for all encodings

```

if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    data = MemU_unpriv(address, 2);
    if postindex then R[n] = offset_addr;
    R[t] = SignExtend(data, 32);

```

### CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRSH (immediate).

## F5.1.95 LDRT

Load Register Unprivileged loads a word from memory, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-2854](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	Is the first general-purpose source register, encoded in the "Rm" field.
<Rs>	Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

### Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

## F5.1.98 LSLS (immediate)

Logical Shift Left, setting flags (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR\_<current\_mode>.
- The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

is equivalent to

MOV{<C>}{<q>} <Rd>, <Rm>, LSR <Rs>

and is always the preferred disassembly.

LSR{<C>}{<q>} {<Rd>}, <Rm>, <Rs>

is equivalent to

MOV{<C>}{<q>} <Rd>, <Rm>, LSR <Rs>

and is always the preferred disassembly.

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rdm>	Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	Is the first general-purpose source register, encoded in the "Rm" field.
<Rs>	Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

### Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

## F5.1.102 LSRS (immediate)

Logical Shift Right, setting flags (immediate) shifts a register value right by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR\_<current\_mode>.
- The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	7	6	5	4	3	0
!=1111	0	0	0	1	1	0	1	1	(0)	(0)	(0)	(0)	Rd	imm5	0	1	0	Rm				
cond				S												type						

### MOVS, shift or rotate by value variant

LSRS{<C>}{<q>} {<Rd>}, {<Rm>}, #<imm>

is equivalent to

MOVS{<C>}{<q>} <Rd>, <Rm>, LSR #<imm>

and is always the preferred disassembly.

### T2

15	14	13	12	11	10	6	5	3	2	0
0	0	0	0	1	imm5	Rm	Rd			
op										

### T2 variant

LSRS{<q>} {<Rd>}, {<Rm>}, #<imm> // Outside IT block

is equivalent to

MOVS{<q>} <Rd>, <Rm>, LSR #<imm>

and is the preferred disassembly when !InITBlock().

### T3

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	6	5	4	3	0		
1	1	1	0	1	0	1	0	0	1	0	1	1	1	1	1	(0)	imm3			Rd			imm2		0	1	Rm

### ***MOVS, shift or rotate by value variant***

LSRS.W {<Rd>,<Rm>,<imm> // Outside IT block, and <Rd>,<Rm>,<imm> can be represented in T2

is equivalent to

MOV<sub>S</sub>{<C>}{<Q>} <Rd>, <Rm>, LSR #<imm>

and is always the preferred disassembly.

```
LSRS{<c>}{<q>}{<Rd>}.<Rm>.#<imm>
```

is equivalent to

MOVS{<c>}{<a>} <Rd>, <Rm>, LSR #<imm>

and is always the preferred disassembly.

## Assembler symbols

<C> See *Standard assembler syntax fields* on page F2-2848.

<q> See *Standard assembler syntax fields* on page F2-2848.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. ARM deprecates using the PC as the destination register, but if the PC is used, the instruction performs an exception return, that restores **PSTATE** from SPSR <current mode>.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

<imm> For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as <imm> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as  $\langle \text{imm} \rangle \bmod 32$ .

## Operation for all encodings

The description of **MOV, MOVS (register)** gives the operational pseudocode for this instruction.

### F5.1.103 LSRS (register)

Logical Shift Right, setting flags (register) shifts a register value right by an immediate number of bits, shifting in zeros, writes the result to the destination register, and updates the condition flags based on the result. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the [MOV, MOVS \(register-shifted register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register-shifted register\)](#).
- The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

MOVS{<c>}{<q>} <Rd>, <Rm>, LSR <Rs>

and is always the preferred disassembly.

LSRS{<C>}{<Q>} {<Rd>}, {<Rm>}, <Rs>

is equivalent to

MOVS{<C>}{<Q>} <Rd>, <Rm>, LSR <Rs>

and is always the preferred disassembly.

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rdm>	Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	Is the first general-purpose source register, encoded in the "Rm" field.
<Rs>	Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

### Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

## F5.1.104 MCR

Move to System register from general-purpose register or execute a System instruction. This instruction copies the value of a general-purpose register to a System register, or executes a System instruction.

The System register and System instruction descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-2752](#) and [General behavior of System registers on page G6-4764](#).

In an implementation that includes EL2, MCR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-4427](#).

Because of the range of possible traps to Hyp mode, the MCR pseudocode does not show these possible traps.

### A1

#### A1 variant

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

#### Decode for this encoding

```
t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### T1

#### T1 variant

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

#### Decode for this encoding

```
t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<coproc>	Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values: p14           when coproc<0> = 0 p15           when coproc<0> = 1
<opc1>	Is the opc1 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc1" field.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<CRn>	Is the CRn parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRn" field.
<CRm>	Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.
<opc2>	Is the opc2 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc2" field.

The possible values of { <coproc>, <opc1>, <CRn>, <CRm>, <opc2> } encode the entire System register and System instruction encoding space. Not all of this space is allocated, and the System register and System instruction descriptions identify the allocated encodings.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    AArch32.SysRegWrite(cp, ThisInstr(), R[t]);
```

## F5.1.105 MCRR

Move to System register from two general-purpose registers. This instruction copies the values of two general-purpose registers to a System register.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-2752](#) and [General behavior of System registers on page G6-4764](#).

In an implementation that includes EL2, MCRR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCRR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-4427](#).

Because of the range of possible traps to Hyp mode, the MCRR pseudocode does not show these possible traps.

### A1

#### A1 variant

MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

#### Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### T1

#### T1 variant

MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

#### Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<coproc>	Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values: p14            when coproc<0> = 0 p15            when coproc<0> = 1
<opc1>	Is the opc1 parameter within the System register encoding space, in the range 0 to 15, encoded in the "opc1" field.
<Rt>	Is the first general-purpose register that is transferred into, encoded in the "Rt" field.
<Rt2>	Is the second general-purpose register that is transferred into, encoded in the "Rt2" field.
<CRm>	Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

The possible values of { <coproc>, <opc1>, <CRm> } encode the entire System register encoding space. Not all of this space is allocated, and the System register descriptions identify the allocated encodings.

For the permitted uses of these instructions, as described in this manual, <Rt2> transfers bits[63:32] of the selected System register, while <Rt> transfers bits[31:0].

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    value = R[t2]:R[t];
    AArch32.SysRegWrite64(cp, ThisInstr(), value);
```

## F5.1.106 MLA, MLAS

Multiply Accumulate multiplies two register values, and adds a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

In an A32 instruction, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0

1	1	1	1	1	0	1	1	0	0	0	0	Rn	!=1111	Rd	0	0	0	0	0	0	Rm		
														Ra									

#### T1 variant

MLA{<C>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

#### Decode for this encoding

```
if Ra == '1111' then SEE MUL;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra); setflags = FALSE;
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.

- <Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- <Ra> Is the third general-purpose source register holding the addend, encoded in the "Ra" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand1 = SInt(R[n]); // operand1 = UInt(R[n]) produces the same final results
operand2 = SInt(R[m]); // operand2 = UInt(R[m]) produces the same final results
addend   = SInt(R[a]); // addend   = UInt(R[a]) produces the same final results
result = operand1 * operand2 + addend;
R[d] = result<31:0>;
if setflags then
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result<31:0>);
    // PSTATE.C, PSTATE.V unchanged
```

## F5.1.107 MLS

Multiply and Subtract multiplies two register values, and subtracts the product from a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

1	1	1	1	1	0	1	1	0	0	0	0	Rn		Ra		Rd		0	0	0	1		Rm

### T1 variant

MLS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

### Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Ra> Is the third general-purpose source register holding the minuend, encoded in the "Ra" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand1 = SInt(R[n]); // operand1 = UInt(R[n]) produces the same final results
operand2 = SInt(R[m]); // operand2 = UInt(R[m]) produces the same final results
addend   = SInt(R[a]); // addend   = UInt(R[a]) produces the same final results
result = addend - operand1 * operand2;
R[d] = result<31:0>;
```

## F5.1.108 MOV, MOVS (immediate)

Move (immediate) writes an immediate value to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MOV variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = imm32;
    if d == 15 then          // Can only occur for encoding A1
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

## F5.1.109 MOV, MOVS (register)

Move (register) copies a value from a register to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The MOV variant of the instruction is a branch. In the T32 instruction set (encoding T1) this is a simple branch, and in the A32 instruction set it is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC](#) on page E1-2733.
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state](#) on page G1-4361.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is used by the aliases [ASRS \(immediate\)](#), [ASR \(immediate\)](#), [LSLS \(immediate\)](#), [LSL \(immediate\)](#), [LSRS \(immediate\)](#), [LSR \(immediate\)](#), [RORS \(immediate\)](#), [ROR \(immediate\)](#), [RRXS](#), and [RRX](#). See [Alias conditions](#) on page F5-3262 for details of when each alias is preferred.

ARM deprecates use of the instruction if &lt;Rn&gt; is not the LR, or if the optional shift or RRX argument is specified.</li> </ul> <p>For encoding T1: is the general-purpose destination register, encoded in the "D:Rd" field. If the PC is used:</p> <ul style="list-style-type: none"> <li>The instruction causes a branch to the address moved to the PC. This is a simple branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</li> <li>The instruction must either be outside an IT block or the last instruction of an IT block.</li> </ul> <p>For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.</p>								
<Rm>	<p>For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used. ARM deprecates use of the instruction if &lt;Rd&gt; is the PC.</p> <p>For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.</p>								
<shift>	<p>For encoding A1 and T3: is the type of shift to be applied to the source register, encoded in the "type" field. It can have the following values:</p> <table> <tr> <td>LSL</td><td>when type = 00</td></tr> <tr> <td>LSR</td><td>when type = 01</td></tr> <tr> <td>ASR</td><td>when type = 10</td></tr> <tr> <td>ROR</td><td>when type = 11</td></tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								

For encoding T2: is the type of shift to be applied to the source register, encoded in the "op" field. It can have the following values:

LSL           when op = 00  
LSR           when op = 01  
ASR           when op = 10

<amount>      For encoding A1 and T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = shifted;
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

## F5.1.110 MOV, MOVS (register-shifted register)

Move (register-shifted register) copies a register-shifted register value to the destination register. It can optionally update the condition flags based on the value.

This instruction is used by the aliases [ASRS \(register\)](#), [ASR \(register\)](#), [LSLS \(register\)](#), [LSL \(register\)](#), [LSRS \(register\)](#), [LSR \(register\)](#), [RORS \(register\)](#), and [ROR \(register\)](#). See [Alias conditions on page F5-3267](#) for details of when each alias is preferred.

### Flag setting variant

Applies when S == 1.

MOV<w>.W <Rd>, <Rm>, <type> <Rs> // Outside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1  
MOVS{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>

### Not flag setting variant

Applies when S == 0.

MOV<c>.W <Rd>, <Rm>, <type> <Rs> // Inside IT block, and <Rd>, <Rm>, <type>, <Rs> can be represented in T1  
MOV{<c>}{<q>} <Rd>, <Rm>, <type> <Rs>

### Decode for all variants of this encoding

```
d = UInt(Rd); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

Related encodings: In encoding T1, for an op field value that is not described above, see [Data-processing \(two low registers\) on page F3-2877](#).

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rdm>	Is the general-purpose source register and the destination register, encoded in the "Rdm" field.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	Is the general-purpose source register, encoded in the "Rm" field.

<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:  LSL           when type = 00  LSR           when type = 01  ASR           when type = 10  ROR           when type = 11
<Rs>	Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (result, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

## F5.1.111 MOV<sub>T</sub>

Move Top writes an immediate value to the top halfword of the destination register. It does not affect the contents of the bottom halfword.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11			0
1	1	1	1	1	0	1	0	0			imm4		Rd			imm12	
cond																	

#### A1 variant

MOV<sub>T</sub>{<c>}{<q>} <Rd>, #<imm16>

#### Decode for this encoding

```
d = UInt(Rd); imm16 = imm4:imm12;
if d == 15 then UNPREDICTABLE;
```

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7		0
1	1	1	1	0	i	1	0	1	1	0	0		imm4	0	imm3		Rd		imm8		

#### T1 variant

MOV<sub>T</sub>{<c>}{<q>} <Rd>, #<imm16>

#### Decode for this encoding

```
d = UInt(Rd); imm16 = imm4:i:imm3:imm8;
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<imm16>	For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field.  For encoding T1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    R[d]<31:16> = imm16;
    // R[d]<15:0> unchanged
```

## F5.1.112 MRC

Move to general-purpose register from System register. This instruction copies the value of a System register to a general-purpose register.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-2752](#) and [General behavior of System registers on page G6-4764](#).

In an implementation that includes EL2, MRC accesses to system control registers can be trapped to Hyp mode, meaning that an attempt to execute an MRC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-4427](#).

Because of the range of possible traps to Hyp mode, the MRC pseudocode does not show these possible traps.

### A1

#### A1 variant

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

#### Decode for this encoding

```
t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;
// ARMv8-A removes UNPREDICTABLE for R13
```

### T1

#### T1 variant

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

#### Decode for this encoding

```
t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;
// ARMv8-A removes UNPREDICTABLE for R13
```

### Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<coproc> Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values:

- p14 when coproc<0> = 0
- p15 when coproc<0> = 1

<opc1>	Is the opc1 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc1" field.
<Rt>	Is the general-purpose register to be transferred or APSR_nzcv (encoded as 0b1111), encoded in the "Rt" field. If APSR_nzcv is used, bits [31:28] of the transferred value are written to the <a href="#">PSTATE</a> condition flags.
<CRn>	Is the CRn parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRn" field.
<CRm>	Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.
<opc2>	Is the opc2 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc2" field.

The possible values of { <coproc>, <opc1>, <CRn>, <CRm>, <opc2> } encode the entire System register and System instruction encoding space. Not all of this space is allocated, and the System register and System instruction descriptions identify the allocated encodings.

### Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    bits(32) value = AArch32.SysRegRead(cp, ThisInstr());
    if t != 15 then
        R[t] = value;
    elseif AArch32.SysRegReadCanWriteAPSR(cp, ThisInstr()) then
        PSTATE.<N,Z,C,V> = value<31:28>;
        // value<27:0> are not used.
    else
        PSTATE.<N,Z,C,V> = bits(4) UNKNOWN;

```

## F5.1.113 MRRC

Move to two general-purpose registers from System register. This instruction copies the value of a System register to two general-purpose registers.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-2752](#) and [General behavior of System registers on page G6-4764](#).

In an implementation that includes EL2, MRRC accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MRRC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-4427](#).

Because of the range of possible traps to Hyp mode, the MRRC pseudocode does not show these possible traps.

### A1

### A1 variant

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

### Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### CONSTRAINED UNPREDICTABLE behavior

If t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

### T1

### T1 variant

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

### Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### CONSTRAINED UNPREDICTABLE behavior

If  $t == t2$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<coproc>	Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values: p14          when coproc<0> = 0 p15          when coproc<0> = 1
<opc1>	Is the opc1 parameter within the System register encoding space, in the range 0 to 15, encoded in the "opc1" field.
<Rt>	Is the first general-purpose register that is transferred into, encoded in the "Rt" field.
<Rt2>	Is the second general-purpose register that is transferred into, encoded in the "Rt2" field.
<CRm>	Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

The possible values of { <coproc>, <opc1>, <CRm> } encode the entire System register encoding space. Not all of this space is allocated, and the System register descriptions identify the allocated encodings.

For the permitted uses of these instructions, as described in this manual, <Rt2> transfers bits[63:32] of the selected System register, while <Rt> transfers bits[31:0].

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    value = AArch32.SysRegRead64(cp, ThisInstr());
    R[t] = value<31:0>;
    R[t2] = value<63:32>;
```

## F5.1.114 MRS

Move Special register to general-purpose register moves the value of the [APSR](#), [CPSR](#), or [SPSR](#)\_{current\_mode} into a general-purpose register.

ARM recommends the APSR form when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see [The Application Program Status Register, APSR](#) on page E1-2736.

An MRS that accesses the [SPSR](#) is UNPREDICTABLE if executed in User mode or System mode.

An MRS that is executed in User mode and accesses the [CPSR](#) returns an UNKNOWN value for the [CPSR](#).{E, A, I, F, M} fields.

#### T1 variant

MRS{<c>}{<q>} <Rd>, <spec\_reg>

#### Decode for this encoding

```
d = UInt(Rd); read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields</a> on page F2-2848.
<q>	See <a href="#">Standard assembler syntax fields</a> on page F2-2848.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<spec_reg>	Is the special register to be accessed, encoded in the "R" field. It can have the following values: CPSR APSR when R = 0 SPSR when R = 1

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
if read_spsr then
    if PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;
    else
        R[d] = SPSR[];
else
    // CPSR has same bit assignments as SPSR, but with the IT, J, SS, IL, and T bits masked out.
    bits(32) mask = '11111000 00001111 00000011 11011111';
    if HavePANExt() then
        mask<22> = '1';
    psr_val = GetPSRFromPSTATE() AND mask;
    if PSTATE.EL == EL0 then
        // If accessed from User mode return UNKNOWN values for E, A, I, F bits, bits<9:6>,
        // and for the M field, bits<4:0>
        psr_val<22> = bits(1) UNKNOWN;
        psr_val<9:6> = bits(4) UNKNOWN;
        psr_val<4:0> = bits(5) UNKNOWN;
    R[d] = psr_val;
```

## CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32\_User, M32\_System} && read\_spsr, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

## F5.1.115 MRS (Banked register)

Move to Register from Banked or Special register moves the value from the Banked general-purpose register or *SPSR* of the specified mode, or the value of *ELR\_hyp* on page G1-4331, to a general-purpose register.

MRS (Banked register) is UNPREDICTABLE if executed in User mode.

When EL3 is using AArch64, if an MRS (Banked register) instruction that is executed in a Secure EL1 mode would access *SPSR\_mon*, *SP\_mon*, or *LR\_mon*, it is trapped to EL3.

The effect of using an MRS (Banked register) instruction with a register argument that is not valid for the current mode is UNPREDICTABLE. For more information see *Usage restrictions on the Banked register transfer instructions* on page F5-3675.

            end
        end
    end
end

```

## CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.

## F5.1.116 MSR (Banked register)

Move to Banked or Special register from general-purpose register moves the value of a general-purpose register to the Banked general-purpose register or **SPSR** of the specified mode, or to *ELR\_hyp* on page G1-4331.

MSR (Banked register) is UNPREDICTABLE if executed in User mode.

When EL3 is using AArch64, if an MSR (Banked register) instruction that is executed in a Secure EL1 mode would access SPSR\_mon, SP\_mon, or LR\_mon, it is trapped to EL3.

The effect of using an MSR (Banked register) instruction with a register argument that is not valid for the current mode is UNPREDICTABLE. For more information see *Usage restrictions on the Banked register transfer instructions* on page F5-3675.

            end if
        end if
    end if
end if

```

## **CONSTRAINED UNPREDICTABLE behavior**

If `PSTATE.EL == EL0`, then one of the following behaviors must occur:

- The instruction is `UNDEFINED`.
- The instruction executes as `NOP`.

## F5.1.117 MSR (immediate)

Move immediate value to Special register moves selected bits of an immediate value to the corresponding bits in the [APSR](#), [CPSR](#), or [SPSR](#)\_*<current\_mode>*.

Because of the Do-Not-Modify nature of its reserved bits, the immediate form of MSR is normally only useful at the Application level for writing to APSR\_nzcvq (CPSR\_f).

If an MSR (immediate) moves selected bits of an immediate value to the [CPSR](#), the PE checks whether the value being written to [PSTATE.M](#) is legal. See *Illegal changes to PSTATE.M* on page G1-4336.

An MSR (immediate) executed in User mode:

- Is CONSTRAINED UNPREDICTABLE if it attempts to update the [SPSR](#).
- Otherwise, does not update any [CPSR](#) field that is accessible only at EL1 or higher,

An MSR (immediate) executed in System mode is CONSTRAINED UNPREDICTABLE if it attempts to update the [SPSR](#).

The [CPSR.E](#) bit is writable from any mode using an MSR instruction. ARM deprecates using this to change its value.

cond																				

### A1 variant

Applies when !(R == 0 && mask == 0000).

MSR{<c>}{<q>} <spec\_reg>, #<imm>

### Decode for this encoding

```
if mask == '0000' && R == '0' then SEE "Related encodings";
imm32 = A32ExpandImm(imm12); write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If mask == '0000' && R == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: [Move Special Register and Hints \(immediate\)](#) on page F4-2959.

### Assembler symbols

<c> See [Standard assembler syntax fields](#) on page F2-2848.

<q> See [Standard assembler syntax fields](#) on page F2-2848.

<spec\_reg> Is one of:

- APSR\_<bits>.

- CPSR\_<fields>.
- SPSR\_<fields>.

For CPSR and SPSR, <fields> is a sequence of one or more of the following:

- c mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.
- x mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.
- s mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.
- f mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

For APSR, <bits> is one of nzcvcq, g, or nzcvcqg. These map to the following CPSR\_<fields> values:

- APSR\_nzcvcq is the same as CPSR\_f (mask == '1000').
- APSR\_g is the same as CPSR\_s (mask == '0100').
- APSR\_nzcvcqg is the same as CPSR\_fs (mask == '1100').

ARM recommends the APSR\_<bits> forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see [The Application Program Status Register, APSR](#) on page E1-2736.

<imm> Is an immediate value. See [Modified immediate constants in A32 instructions](#) on page F2-2864 for the range of values.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if write_spsr then
        if PSTATE.M IN {M32_User, M32_System} then
            UNPREDICTABLE;
        else
            SPSRWriteByInstr(imm32, mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriteByInstr(imm32, mask);
```

## CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32\_User, M32\_System} && write\_spsr, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

## F5.1.118 MSR (register)

Move general-purpose register to Special register moves selected bits of a general-purpose register to the [APSR](#), [CPSR](#) or [SPSR](#) <current\_mode>.

Because of the Do-Not-Modify nature of its reserved bits, a read-modify-write sequence is normally required when the MSR instruction is being used at Application level and its destination is not APSR\_nzcvq (CPSR\_f).

If an MSR (register) moves selected bits of an immediate value to the [CPSR](#), the PE checks whether the value being written to [PSTATE.M](#) is legal. See *Illegal changes to PSTATE.M* on page G1-4336.

An MSR (register) executed in User mode:

- Is UNPREDICTABLE if it attempts to update the [SPSR](#).
- Otherwise, does not update any [CPSR](#) field that is accessible only at EL1 or higher.

An MSR (register) executed in System mode is UNPREDICTABLE if it attempts to update the [SPSR](#).

The [CPSR.E](#) bit is writable from any mode using an MSR instruction. ARM deprecates using this to change its value.

        else
            SPSRWriteByInstr(R[n], mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriteByInstr(R[n], mask);
```

## CONSTRAINED UNPREDICTABLE behavior

If write\_spsr && PSTATE.M IN {M32\_User,M32\_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.

## F5.1.119 MUL, MULS

Multiply multiplies two register values. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

Optionally, it can update the condition flags based on the result. In the T32 instruction set, this option is limited to only a few forms of the instruction. Use of this option adversely affects performance on many implementations.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rdm>	Is the second general-purpose source register holding the multiplier and the destination register, encoded in the "Rdm" field.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field. If omitted, <Rd> is used.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand1 = SInt(R[n]); // operand1 = UInt(R[n]) produces the same final results
    operand2 = SInt(R[m]); // operand2 = UInt(R[m]) produces the same final results
    result = operand1 * operand2;
    R[d] = result<31:0>;
    if setFlags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result<31:0>);
        // PSTATE.C, PSTATE.V unchanged
```

## F5.1.120 MVN, MVNS (immediate)

Bitwise NOT (immediate) writes the bitwise inverse of an immediate value to the destination register.

If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:

LSL	when type = 00
LSR	when type = 01
ASR	when type = 10
ROR	when type = 11

<amount> Is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR NOT(shifted);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

## F5.1.126 ORR, ORRS (immediate)

Bitwise OR (immediate) performs a bitwise (inclusive) OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores **PSTATE** from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

See <a href="#">Modified immediate constants in T32 instructions on page F2-2863</a> for the range of values.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] OR imm32;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

## F5.1.127 ORR, ORRS (register)

Bitwise OR (register) performs a bitwise (inclusive) OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores **PSTATE** from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

Related encodings: [Data-processing \(shifted register\)](#) on page F3-2888

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	<p>For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as &lt;Rn&gt;. ARM deprecates using the PC as the destination register, but if the PC is used:</p> <ul style="list-style-type: none"> <li>For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</li> <li>For the ORRS variant, the instruction performs an exception return, that restores <a href="#">PSTATE</a> from <code>SPSR_&lt;current_mode&gt;</code>.</li> </ul> <p>For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as &lt;Rn&gt;.</p>								
<Rn>	<p>For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.</p> <p>For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.</p>								
<Rm>	<p>For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.</p> <p>For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.</p>								
<shift>	<p>Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:</p> <table> <tr> <td>LSL</td><td>when type = 00</td></tr> <tr> <td>LSR</td><td>when type = 01</td></tr> <tr> <td>ASR</td><td>when type = 10</td></tr> <tr> <td>ROR</td><td>when type = 11</td></tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<amount>	<p>For encoding A1: is the shift amount, in the range 1 to 31 (when &lt;shift&gt; = LSL or ROR) or 1 to 32 (when &lt;shift&gt; = LSR or ASR) encoded in the "imm5" field as &lt;amount&gt; modulo 32.</p> <p>For encoding T2: is the shift amount, in the range 1 to 31 (when &lt;shift&gt; = LSL or ROR) or 1 to 32 (when &lt;shift&gt; = LSR or ASR) encoded in the "imm3:imm2" field as &lt;amount&gt; modulo 32.</p>								

In T32 assembly:

- Outside an IT block, if ORRS <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORRS <Rd>, <Rn> had been written.
- Inside an IT block, if ORR<c> <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR shifted;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);

```

```
else
  R[d] = result;
  if setflags then
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

## F5.1.128 ORR, ORRS (register-shifted register)

Bitwise OR (register-shifted register) performs a bitwise (inclusive) OR of a register value and a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.
<imm>	For encoding A1: the shift to apply to the value read from <Rm>, encoded in imm5. Is one of: omitted    No shift, encoded as 0b00000. 1-31       Left shift by specified number of bits, encoded as a binary number. For encoding A1: the shift to apply to the value read from <Rm>, encoded in imm5. Is one of: omitted    Instruction is a pseudo-instruction and is assembled as though PKHBT{<c>}{<q>} <Rd>, <Rm>, <Rn> had been written. 1-32       Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as 0b00000. Other shift amounts are encoded as binary numbers.

### ———— Note ————

An assembler can permit <imm> = 0 to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

For encoding T1: the shift to apply to the value read from <Rm>, encoded in imm3:imm2.

For PKHBT, it is one of:

omitted    No shift, encoded as 0b00000.

1-31       Left shift by specified number of bits, encoded as a binary number.

For PKHTB, it is one of:

omitted    Instruction is a pseudo-instruction and is assembled as though PKHBT{<c>}{<q>} <Rd>, <Rm>, <Rn> had been written.

1-32       Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as 0b00000. Other shift amounts are encoded as binary numbers.

### ———— Note ————

An assembler can permit <imm> = 0 to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand2 = Shift(R[m], shift_t, shift_n, PSTATE.C); // PSTATE.C ignored
R[d]<15:0> = if tbform then operand2<15:0> else R[n]<15:0>;
R[d]<31:16> = if tbform then R[n]<31:16>     else operand2<31:16>;
```

### F5.1.130 PLD, PLDW (immediate)

Preload Data (immediate) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-2775](#).

#### A1

#### Preload read variant

Applies when R == 1.

PLD{<C>}{<q>} [<Rn> {, #<+/-><imm>}]

#### Preload write variant

Applies when R == 0.

PLDW{<C>}{<q>} [<Rn> {, #<+/-><imm>}]

#### Decode for all variants of this encoding

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn); imm32 = ZeroExtend(imm12, 32); add = (U == '1'); is_pldw = (R == '0');
```

#### T1

Applies when W == 0.

PLD{<C>}{<q>} [<Rn> {, #<+><imm>}]

#### Preload write variant

Applies when W == 1.

PLDW{<C>}{<q>} [<Rn> {, #<+><imm>}]

#### Decode for all variants of this encoding

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn); imm32 = ZeroExtend(imm12, 32); add = TRUE; is_pldw = (W == '1');
```

## T2

### Preload read variant

Applies when W == 0.

PLD{<C>}{<Q>} [<Rn> {, #-<imm>}]

### Preload write variant

Applies when W == 1.

PLDW{<C>}{<Q>} [<Rn> {, #-<imm>}]

### Decode for all variants of this encoding

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn); imm32 = ZeroExtend(imm8, 32); add = FALSE; is_pldw = (W == '1');
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

- <C> For encoding A1: see [Standard assembler syntax fields on page F2-2848](#). Must be AL or omitted.  
For encoding T1 and T2: see [Standard assembler syntax fields on page F2-2848](#).
- <Q> See [Standard assembler syntax fields on page F2-2848](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field. If the PC is used, see [PLD \(literal\)](#).
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
  - when U = 0
  - + when U = 1
- + Specifies the offset is added to the base register.
- <imm> For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.  
For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.  
For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (R[n] + imm32) else (R[n] - imm32);
    if is_pldw then
        Hint_PreloadDataForWrite(address);
    else
        Hint_PreloadData(address);
```

## F5.1.131 PLD (literal)

Preload Data (literal) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The effect of a PLD instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-2775](#).

### A1 variant

PLD{<c>}{<q>} <label> // Normal form  
PLD{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative form

### Decode for this encoding

imm32 = ZeroExtend(imm12, 32); add = (U == '1');

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11								0		
1	1	1	1	1	0	0	0	U	0	(0)	1	1	1	1	1	1	1	1	1		imm12									

### T1 variant

PLD{<c>}{<q>} <label> // Preferred syntax  
PLD{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative syntax

### Decode for this encoding

imm32 = ZeroExtend(imm12, 32); add = (U == '1');

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	For encoding A1: see <a href="#">Standard assembler syntax fields on page F2-2848</a> . Must be AL or omitted. For encoding T1: see <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<label>	The label of the literal data item that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the A1 ign(PC, 4) value of the instruction to this label. The offset must be in the range –4095 to 4095.  If the offset is zero or positive, imm32 is equal to the offset and add == TRUE.  If the offset is negative, imm32 is equal to minus the offset and add == FALSE.

+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:  -           when U = 0 +           when U = 1
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.  For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2809](#).

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    Hint_PreloadData(address);
```

### F5.1.132 PLD, PLDW (register)

Preload Data (register) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-2775](#).

#### A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0
1	1	1	1	0	1	1	1	U	R	0	1	Rn	(1)	(1)	(1)	(1)	imm5	type	0	Rm				

#### Preload read, optional shift or rotate variant

Applies when R == 1 && !(imm5 == 00000 && type == 11).

PLD{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]

#### Preload read, rotate right with extend variant

Applies when R == 1 && imm5 == 00000 && type == 11.

PLD{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]

#### Preload write, optional shift or rotate variant

Applies when R == 0 && !(imm5 == 00000 && type == 11).

PLDW{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]

#### Preload write, rotate right with extend variant

Applies when R == 0 && imm5 == 00000 && type == 11.

PLDW{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]

#### Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm); add = (U == '1'); is_pldw = (R == '0');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 || (n == 15 && is_pldw) then UNPREDICTABLE;
```

#### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	6	5	4	3	0

Rn

#### Preload read variant

Applies when W == 0.

PLD{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]

#### Preload write variant

Applies when W == 1.

PLDW{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]

### Decode for all variants of this encoding

```
if Rn == '1111' then SEE PLD (literal);
n = UInt(Rn); m = UInt(Rm); add = TRUE; is_pldw = (W == '1');
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	For encoding A1: see <a href="#">Standard assembler syntax fields on page F2-2848</a> . <c> must be AL or omitted. For encoding T1: see <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used. For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:  -           when U = 0 +           when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the index register, encoded in the "type" field. It can have the following values:  LSL        when type = 00 LSR        when type = 01 ASR        when type = 10 ROR        when type = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
address = if add then (R[n] + offset) else (R[n] - offset);
if is_pldw then
    Hint_PreloadDataForWrite(address);
else
    Hint_PreloadData(address);
```

### F5.1.133 PLI (immediate, literal)

Preload Instruction signals the memory system that instruction memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as pre-loading the cache line containing the specified address into the instruction cache.

The effect of a PLI instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-2775](#).

#### A1

#### T1 variant

PLI{<c>}{<q>} [<Rn> {, #<+><imm>}]

#### Decode for this encoding

if Rn == '1111' then SEE encoding T3;  
n = UInt(Rn); imm32 = ZeroExtend(imm12, 32); add = TRUE;

#### T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7		0
1	1	1	1	1	0	0	1	0	0	0	1	!=1111		1	1	1	1	1	1	0	0			imm8

Rn

#### T2 variant

PLI{<c>}{<q>} [<Rn> {, #<-><imm>}]

#### Decode for this encoding

if Rn == '1111' then SEE encoding T3;  
n = UInt(Rn); imm32 = ZeroExtend(imm8, 32); add = FALSE;

## T3

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11									0
1	1	1	1	1	0	0	1	U	0	0	1	1	1	1	1	1	1	1	1	1									imm12

### T3 variant

PLI{<c>}{<q>} <label> // Preferred syntax  
PLI{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative syntax

### Decode for this encoding

```
n = 15; imm32 = ZeroExtend(imm12, 32); add = (U == '1');
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	For encoding A1: see <a href="#">Standard assembler syntax fields on page F2-2848</a> . Must be AL or omitted. For encoding T1, T2 and T3: see <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<label>	The label of the instruction that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. The offset must be in the range –4095 to 4095.  If the offset is zero or positive, imm32 is equal to the offset and add == TRUE. If the offset is negative, imm32 is equal to minus the offset and add == FALSE.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:  -           when U = 0 +           when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.  For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.  For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.  For encoding T3: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

For the literal forms of the instruction, encoding T3 is used, or Rn is encoded as 0b1111 in encoding A1, to indicate that the PC is the base register.

The alternative literal syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F1-2809](#).

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
base = if n == 15 then Align(PC,4) else R[n];
address = if add then (base + imm32) else (base - imm32);
Hint_PreloadInstr(address);
```

### F5.1.134 PLI (register)

Preload Instruction signals the memory system that instruction memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as pre-loading the cache line containing the specified address into the instruction cache.

The effect of a PLI instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-2775](#).

#### A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0
1	1	1	1	0	1	1	0	U	1	0	1	Rn	(1)	(1)	(1)	(1)	imm5	type	0				Rm	

#### Rotate right with extend variant

Applies when imm5 == 00000 && type == 11.

PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]

#### Shift or rotate by value variant

Applies when !(imm5 == 00000 && type == 11).

PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]

#### Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm); add = (U == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm5);
if m == 15 then UNPREDICTABLE;
```

#### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	0	0	1	0	0	0	1	!=1111	1	1	1	1	0	0	0	0	0	0	imm2		Rm		

Rn

#### T1 variant

PLI{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]

#### Decode for this encoding

```
if Rn == '1111' then SEE PLI (immediate, literal);
n = UInt(Rn); m = UInt(Rm); add = TRUE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<c> For encoding A1: see [Standard assembler syntax fields on page F2-2848](#). <c> must be AL or omitted.

	For encoding T1: see <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: <ul style="list-style-type: none"> <li>- when U = 0</li> <li>+ when U = 1</li> </ul>
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the index register, encoded in the "type" field. It can have the following values: <ul style="list-style-type: none"> <li>LSL when type = 00</li> <li>LSR when type = 01</li> <li>ASR when type = 10</li> <li>ROR when type = 11</li> </ul>
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.  For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    address = if add then (R[n] + offset) else (R[n] - offset);
    Hint_PreloadInstr(address);

```

## F5.1.135 POP

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2855](#).

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).

### T1

15	14	13	12	11	10	9	8	7							0
1	0	1	1	1	1	0	P		register_list						

#### T1 variant

```
POP{<c>}{<q>} <registers> // Preferred syntax
LDM{<c>}{<q>} SP!, <registers> // Alternate syntax
```

#### Decode for this encoding

```
registers = P:'0000000':register_list; UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2848](#).
- <q> See [Standard assembler syntax fields on page F2-2848](#).
- <registers> Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.
- The registers in the list must be in the range R0-R7, encoded in the "register\_list" field, and can optionally include the PC. If the PC is in the list, the "P" field is set to 1, otherwise this field defaults to 0.
- If the PC is in the list, the instruction must be either outside any IT block, or the last instruction in an IT block.

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = if UnalignedAllowed then MemU[address,4] else MemA[address,4];
            address = address + 4;
    if registers<15> == '1' then
        if UnalignedAllowed then
            if address<1:0> == '00' then
                LoadWritePC(MemU[address,4]);
            else
                UNPREDICTABLE;
        else
            LoadWritePC(MemA[address,4]);
    if registers<13> == '0' then SP = SP + 4*BitCount(registers);
    if registers<13> == '1' then SP = bits(32) UNKNOWN;
```

### F5.1.136 POP (multiple registers)

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data.

This instruction is an alias of the [LDM](#), [LDMIA](#), [LDMFD](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LDM](#), [LDMIA](#), [LDMFD](#).
- The description of [LDM](#), [LDMIA](#), [LDMFD](#) gives the operational pseudocode for this instruction.

#### A1

#### A1 variant

POP{<c>}{<q>} <registers>

is equivalent to

LDM{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when BitCount(register\_list) > 1.

#### T2

#### T2 variant

POP{<c>}.W <registers> // All registers in R0-R7, PC

is equivalent to

LDM{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when BitCount(P:M:register\_list) > 1.

POP{<c>}{<q>} <registers>

is equivalent to

LDM{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when BitCount(P:M:register\_list) > 1.

### Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<registers> For encoding A1: is a list of two or more registers to be loaded, separated by commas and surrounded by { and }. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2855](#).

If the SP is in the list, the value of the SP after such an instruction is UNKNOWN.

The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).

ARM deprecates the use of this instruction with both the LR and the PC in the list.

For encoding T2: is a list of two or more registers to be loaded, separated by commas and surrounded by { and }. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2855](#).

The registers in the list must be in the range R0-R12, encoded in the "register\_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0.

The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#). If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

### Operation for all encodings

The description of [LDM](#), [LDMIA](#), [LDMFD](#) gives the operational pseudocode for this instruction.

### F5.1.137 POP (single register)

Pop Single Register from Stack loads a single general-purpose register from the stack, loading from the address in SP, and updates SP to point just above the loaded data.

This instruction is an alias of the [LDR \(immediate\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LDR \(immediate\)](#).
- The description of [LDR \(immediate\)](#) gives the operational pseudocode for this instruction.

#### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11				0
1	1	1	1	0	1	0	0	1	1	1	0	1		Rt	0	0	0	0
cond					P	U	W			Rn								imm12

#### Post-indexed variant

POP{<c>}{<q>} <single\_register\_list>

is equivalent to

LDR{<c>}{<q>} <Rt>, [SP], #4

and is always the preferred disassembly.

#### T4

15	14	13	12	11	10	9	8	7	6	5	4	3	0		15	12	11	10	9	8	7				0			
1	1	1	1	1	0	0	0	0	1	0	1	1	1	0	1	Rt	1	0	1	1	0	0	0	0	0	1	0	0
Rn														P				U	W	imm8								

#### Post-indexed variant

POP{<c>}{<q>} <single\_register\_list>

is equivalent to

LDR{<c>}{<q>} <Rt>, [SP], #4

and is always the preferred disassembly.

### Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<single\_register\_list>

Is the general-purpose register <Rt> to be loaded surrounded by { and }.

<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).

For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC](#) on page E1-2733.

### Operation for all encodings

The description of [LDR \(immediate\)](#) gives the operational pseudocode for this instruction.

## F5.1.138 PUSH

Push Multiple Registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data.

The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2855](#).

### T1

15	14	13	12	11	10	9	8	7							0
1	0	1	1	0	1	0	M								register_list

### T1 variant

```
PUSH{<c>}{<q>} <registers> // Preferred syntax
STMDB{<c>}{<q>} SP!, <registers> // Alternate syntax
```

### Decode for this encoding

```
registers = '0':M:'000000':register_list; UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<registers>	Is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the LR. If the LR is in the list, the "M" field is set to 1, otherwise this field defaults to 0.

### Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            if i == 13 && i != LowestSetBit(registers) then // Only possible for encoding A1
                MemA[address,4] = bits(32) UNKNOWN;
```

```
        else
            if UnalignedAllowed then
                MemU[address,4] = R[i];
            else
                MemA[address,4] = R[i];
            address = address + 4;
    if registers<15> == '1' then // Only possible for encoding A1 or A2
        if UnalignedAllowed then
            MemU[address,4] = PCStoreValue();
        else
            MemA[address,4] = PCStoreValue();
    SP = SP - 4*BitCount(registers);
```

### F5.1.139 PUSH (multiple registers)

Push multiple registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data.

This instruction is an alias of the [STMDB](#), [STMFD](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [STMDB](#), [STMFD](#).
- The description of [STMDB](#), [STMFD](#) gives the operational pseudocode for this instruction.

#### A1

#### A1 variant

PUSH{<c>}{<q>} <registers>

is equivalent to

STMDB{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when BitCount(register\_list) > 1.

#### T1

#### T1 variant

PUSH{<c>}.W <registers> // A11 registers in R0-R7, LR

is equivalent to

STMDB{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when BitCount(M:register\_list) > 1.

PUSH{<c>}{<q>} <registers>

is equivalent to

STMDB{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when BitCount(M:register\_list) > 1.

### Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<registers> For encoding A1: is a list of two or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2855](#).

The SP and PC can be in the list. However:

- ARM deprecates the use of instructions that include the PC in the list.
- If the SP is in the list, and it is not the lowest-numbered register in the list, the instruction stores an UNKNOWN value for the SP.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also [Encoding of lists of general-purpose registers and the PC](#) on page F2-2855.

The registers in the list must be in the range R0-R12, encoded in the "register\_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

## Operation for all encodings

The description of [STMDB](#), [STMFD](#) gives the operational pseudocode for this instruction.

## F5.1.140 PUSH (single register)

Push Single Register to Stack stores a single general-purpose register to the stack, storing to the 32-bit word below the address in SP, and updates SP to point to the start of the stored data.

This instruction is an alias of the [STR \(immediate\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [STR \(immediate\)](#).
- The description of [STR \(immediate\)](#) gives the operational pseudocode for this instruction.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11				0
1	1	1	1	0	1	0	0	1	0	1	1	0	1	Rt	0	0	0	0
cond					P	U		W		Rn					imm12			

#### Pre-indexed variant

PUSH{<c>}{<q>} <single\_register\_list>

is equivalent to

STR{<c>}{<q>} <Rt>, [SP, #-4]!

and is always the preferred disassembly.

### T4

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7				0			
1	1	1	1	1	0	0	0	0	1	0	0	1	1	0	1	Rt	1	1	0	1	0	0	0	0	1	0	0
Rn																	P	U	W		imm8						

#### Pre-indexed variant

PUSH{<c>}{<q>} <single\_register\_list> // Standard syntax

is equivalent to

STR{<c>}{<q>} <Rt>, [SP, #-4]!

and is always the preferred disassembly.

### Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<single\_register\_list>

Is the general-purpose register <Rt> to be stored surrounded by { and }.

<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field.

### Operation for all encodings

The description of [STR \(immediate\)](#) gives the operational pseudocode for this instruction.

## F5.1.141 QADD

Saturating Add adds two register values, saturates the result to the 32-bit signed integer range  $-2^{31}$  to  $(2^{31} - 1)$ , and writes the result to the destination register. If saturation occurs, it sets [PSTATE.Q](#) to 1.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

### T1 variant

QADD{<c>}{<q>} {<Rd>}, {<Rm>}, <Rn>

### Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	Is the first general-purpose source register, encoded in the "Rm" field.
<Rn>	Is the second general-purpose source register, encoded in the "Rn" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (R[d], sat) = SignedSatQ(SInt(R[m]) + SInt(R[n]), 32);
    if sat then
        PSTATE.Q = '1';
```

## F5.1.142 QADD16

Saturating Add 16 performs two 16-bit integer additions, saturates the results to the 16-bit signed integer range  $-2^{15} \leq x \leq 2^{15} - 1$ , and writes the results to the destination register.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
diff = SInt(R[n]<15:0>) - SInt(R[m]<31:16>);
```

```
sum = SInt(R[n]<31:16>) + SInt(R[m]<15:0>);  
R[d]<15:0> = SignedSat(diff, 16);  
R[d]<31:16> = SignedSat(sum, 16);
```

## F5.1.145 QDADD

Saturating Double and Add adds a doubled register value to another register value, and writes the result to the destination register. Both the doubling and the addition have their results saturated to the 32-bit signed integer range  $-2^{31} \leq x \leq 2^{31} - 1$ . If saturation occurs in either operation, it sets [PSTATE.Q](#) to 1.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    sum = SInt(R[n]<15:0>) + SInt(R[m]<31:16>);
```

```
diff = SInt(R[n]<31:16>) - SInt(R[m]<15:0>);  
R[d]<15:0> = SignedSat(sum, 16);  
R[d]<31:16> = SignedSat(diff, 16);
```

## F5.1.148 QSUB

Saturating Subtract subtracts one register value from another register value, saturates the result to the 32-bit signed integer range  $-2^{31} \leq x \leq 2^{31} - 1$ , and writes the result to the destination register. If saturation occurs, it sets [PSTATE.Q](#) to 1.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

cond																									

### A1 variant

RBIT{<c>}{<q>} <Rd>, <Rm>

### Decode for this encoding

d = UInt(Rd); m = UInt(Rm);  
if d == 15 || m == 15 then UNPREDICTABLE;

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	0	1	0	0	1	Rn	1	1	1	1	Rd	1	0	1	0		Rm		

### T1 variant

RBIT{<c>}{<q>} <Rd>, <Rm>

### Decode for this encoding

d = UInt(Rd); m = UInt(Rm); n = UInt(Rn);  
if m != n || d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

### CONSTRAINED UNPREDICTABLE behavior

If m != n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: m = UInt(Rn);.
- The instruction executes with the additional decode: m = UInt(Rm);.
- The value in the destination register is UNKNOWN.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field.  
For encoding T1: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    bits(32) result;
    for i = 0 to 31
        result<31-i> = R[m]<i>;
    R[d] = result;
```

## F5.1.152 REV

Byte-Reverse Word reverses the byte order in a 32-bit register.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0

cond																									

#### A1 variant

REVSH{<c>}{<q>} <Rd>, <Rm>

#### Decode for this encoding

d = UInt(Rd); m = UInt(Rm);  
if d == 15 || m == 15 then UNPREDICTABLE;

### T1

15	14	13	12	11	10	9	8	7	6	5	3	2	0
1	0	1	1	1	0	1	0	1	1	Rm	Rd		

#### T1 variant

REVSH{<c>}{<q>} <Rd>, <Rm>

#### Decode for this encoding

d = UInt(Rd); m = UInt(Rm);

### T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	0	1	0	0	1	Rn	1	1	1	1	Rd	1	0	1	1			Rm	

#### T2 variant

REVSH{<c>}.W <Rd>, <Rm> // <Rd>, <Rm> can be represented in T1  
REVSH{<c>}{<q>} <Rd>, <Rm>

#### Decode for this encoding

d = UInt(Rd); m = UInt(Rm); n = UInt(Rn);  
if m != n || d == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13

#### CONSTRAINED UNPREDICTABLE behavior

If m != n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction executes with the additional decode:  $m = \text{UInt}(Rn);$ .
- The instruction executes with the additional decode:  $m = \text{UInt}(Rm);$ .
- The value in the destination register is UNKNOWN.

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field. For encoding T2: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    bits(32) result;
    result<31:8> = SignExtend(R[m]<7:0>, 24);
    result<7:0> = R[m]<15:8>;
    R[d] = result;
```

## F5.1.155 RFE, RFEDA, RFEDB, RFEIA, RFEIB

Return From Exception loads two consecutive memory locations using an address in a base register:

- The word loaded from the lower address is treated as an instruction address. The PE branches to it.
- The word loaded from the higher address is used to restore [PSTATE](#). This word must be in the format of an SPSR.

An address adjusted by the size of the data loaded can optionally be written back to the base register.

The PE checks the value of the word loaded from the higher address for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).

RFE is UNDEFINED in Hyp mode and CONSTRAINED UNPREDICTABLE in User mode.

### A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

IA	For encoding A1: is an optional suffix to indicate the Increment After variant. For encoding T2: is an optional suffix for the Increment After form.
<c>	For encoding A1: see <a href="#">Standard assembler syntax fields on page F2-2848</a> . <c> must be AL or omitted. For encoding T1 and T2: see <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

RFEFA, RFEFA, RFEFD, and RFEED are pseudo-instructions for RFEDA, RFEDB, RFEIA, and RFEIB respectively, referring to their use for popping data from Full Ascending, Empty Ascending, Full Descending, and Empty Descending stacks.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elseif PSTATE.EL == EL0 then
        UNPREDICTABLE; // UNDEFINED or NOP
    else
        address = if increment then R[n] else R[n]-8;
        if wordhigher then address = address+4;
        new_pc_value = MemA[address,4];
        spsr = MemA[address+4,4];
        if wback then R[n] = if increment then R[n]+8 else R[n]-8;
        AArch32.ExceptionReturn(new_pc_value, spsr);
```

## **CONSTRAINED UNPREDICTABLE behavior**

If `PSTATE.EL == EL0`, then one of the following behaviors must occur:

- The instruction is `UNDEFINED`.
- The instruction executes as `NOP`.

### F5.1.156 ROR (immediate)

Rotate Right (immediate) provides the value of the contents of a register rotated by a constant value. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

#### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	7	6	5	4	3	0

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(NOT(R[n]), imm32, '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

### F5.1.163 RSB, RSBS (register)

Reverse Subtract (register) subtracts a register value from an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the RSBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSB variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The RSBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
  - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setFlags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. ARM deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> <li>For the RSB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see <a href="#">Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733</a>.</li> <li>For the RSBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_&lt;current_mode&gt;.</li> </ul> For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.  For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values:  LSL           when type = 00 LSR           when type = 01 ASR           when type = 10 ROR           when type = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.  For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm3:imm2" field as <amount> modulo 32.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(NOT(R[n]), shifted, '1');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;

```

## F5.1.164 RSB, RSBS (register-shifted register)

Reverse Subtract (register-shifted register) subtracts a register value from a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
!=1111	0	0	0	0	0	1	1	S		Rn		Rd		Rs	0	type	1		Rm		
cond																					

#### Flag setting variant

Applies when S == 1.

RSBS{<C>}{<q>} {<Rd>}, {<Rn>}, <Rm>, <type> <Rs>

#### Not flag setting variant

Applies when S == 0.

RSB{<C>}{<q>} {<Rd>}, {<Rn>}, <Rm>, <type> <Rs>

#### Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

#### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<type>	Is the type of shift to be applied to the second source register, encoded in the "type" field. It can have the following values: <table> <tr> <td>LSL</td><td>when type = 00</td></tr> <tr> <td>LSR</td><td>when type = 01</td></tr> <tr> <td>ASR</td><td>when type = 10</td></tr> <tr> <td>ROR</td><td>when type = 11</td></tr> </table>	LSL	when type = 00	LSR	when type = 01	ASR	when type = 10	ROR	when type = 11
LSL	when type = 00								
LSR	when type = 01								
ASR	when type = 10								
ROR	when type = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

## Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(NOT(R[n]), shifted, '1');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcvc;
```

## F5.1.165 RSC, RSCS (immediate)

Reverse Subtract with Carry (immediate) subtracts a register value and the value of NOT (Carry flag) from an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the RSCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSC variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The RSCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores **PSTATE** from **SPSR\_<current\_mode>**.
  - The PE checks **SPSR\_<current\_mode>** for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

```

```
sum4 = SInt(R[n]<31:24>) + SInt(R[m]<31:24>);  
R[d]<7:0> = sum1<7:0>;  
R[d]<15:8> = sum2<7:0>;  
R[d]<23:16> = sum3<7:0>;  
R[d]<31:24> = sum4<7:0>;  
PSTATE.GE<0> = if sum1 >= 0 then '1' else '0';  
PSTATE.GE<1> = if sum2 >= 0 then '1' else '0';  
PSTATE.GE<2> = if sum3 >= 0 then '1' else '0';  
PSTATE.GE<3> = if sum4 >= 0 then '1' else '0';
```

## F5.1.170 SASX

Signed Add and Subtract with Exchange exchanges the two halfwords of the second operand, performs one 16-bit integer addition and one 16-bit subtraction, and writes the results to the destination register. It sets [PSTATE.GE](#) according to the results.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

### T1 variant

SASX{<c>}{<q>} {<Rd>}, {<Rn>}, <Rm>

### Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
diff = SInt(R[n]<15:0>) - SInt(R[m]<31:16>);
sum = SInt(R[n]<31:16>) + SInt(R[m]<15:0>);
```

```
R[d]<15:0> = diff<15:0>;  
R[d]<31:16> = sum<15:0>;  
PSTATE.GE<1:0> = if diff >= 0 then '11' else '00';  
PSTATE.GE<3:2> = if sum >= 0 then '11' else '00';
```

## F5.1.171 SBC, SBCS (immediate)

Subtract with Carry (immediate) subtracts an immediate value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SBCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The SBC variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-2733](#).
- The SBCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores **PSTATE** from SPSR\_<current\_mode>.
  - The PE checks SPSR\_<current\_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-4361](#).
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

cond																					

### A1 variant

SBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

### Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn);
lsbit = UInt(lsb); widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE;
```

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	0
1	1	1	1	0	(0)	1	1	0	1	0	0	Rn		0	imm3		Rd		imm2		(0)	widthm1	

### T1 variant

SBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

### Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn);
lsbit = UInt(imm3:imm2); widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.
<lsb>	For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field.  For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field.
<width>	Is the width of the field, in the range 1 to 32-<lsb>, encoded in the "widthm1" field as <width>-1.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    msbit = lsb + widthminus1;
    if msbit <= 31 then
        R[d] = SignExtend(R[n]<msbit:lsb>, 32);
    else
        UNPREDICTABLE;
```

## CONSTRAINED UNPREDICTABLE behavior

If `msbit > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

## F5.1.175 SDIV

Signed Divide divides a 32-bit signed integer register value by a 32-bit signed integer register value, and writes the result to the destination register. The condition flags are not affected.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
!=1111	0	1	1	1	0	0	0	1		Rd	(1)	(1)	(1)	(1)	Rm	0	0	0	1		Rn
cond										Ra											

#### A1 variant

SDIV{<C>}{<q>} {<Rd>}, {<Rn>}, <Rm>

#### Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction executes as described, and the register specified by Ra becomes UNKNOWN.

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	1	1	0	0	1	Rn	(1)	(1)	(1)	(1)	Rd	1	1	1	1	Rm	
Ra																							

#### T1 variant

SDIV{<C>}{<q>} {<Rd>}, {<Rn>}, <Rm>

#### Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

#### CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction executes as described, and the register specified by Ra becomes UNKNOWN.

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the dividend, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the divisor, encoded in the "Rm" field.

## Overflow

If the signed integer division  $0x80000000 / 0xFFFFFFFF$  is performed, the pseudocode produces the intermediate integer result  $+2^{31}$ , that overflows the 32-bit signed integer range. No indication of this overflow case is produced, and the 32-bit result written to <Rd> must be the bottom 32 bits of the binary representation of  $+2^{31}$ . So the result of the division is  $0x80000000$ .

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if SInt(R[m]) == 0 then
        result = 0;
    else
        result = RoundTowardsZero(Real(SInt(R[n])) / Real(SInt(R[m])));
    R[d] = result<31:0>;
```

## F5.1.176 SEL

Select Bytes selects each byte of its result from either its first operand or its second operand, according to the values of the [PSTATE.GE](#) flags.

### A1

### A1 variant

SETEND{<q>} <endian\_specifier> // Cannot be conditional

### Decode for this encoding

```
set_bigend = (E == '1');
```

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	1	1	0	1	1	0	0	1	0	(1)	E	(0)	(0)	(0)

### T1 variant

SETEND{<q>} <endian\_specifier> // Not permitted in IT block

### Decode for this encoding

```
set_bigend = (E == '1');
if InITBlock() then UNPREDICTABLE;
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<q> See [Standard assembler syntax fields on page F2-2848](#).

<endian\_specifier> Is the endianness to be selected, and the value to be set in [PSTATE.E](#), encoded in the "E" field. It can have the following values:

LE	when E = 0
BE	when E = 1

## Operation for all encodings

```
EncodingSpecificOperations();
AArch32.CheckSETENabled();
PSTATE.E = if set_bigend then '1' else '0';
```

## F5.1.178 SETPAN

Set Privileged Access Never writes a new value to [PSTATE.PAN](#).

This instruction is available only in privileged mode and it is a NOP when executed in User mode.

### A1

ARMv8.1

### A1 variant

SETPAN{<q>} #<imm> // Cannot be conditional

### Decode for this encoding

```
if !HavePANExt() then UNDEFINED;
value = imm1;
```

### T1

ARMv8.1

### T1 variant

SETPAN{<q>} #<imm> // Not permitted in IT block

### Decode for this encoding

```
if !HavePANExt() then UNDEFINED;
if InITBlock() then UNPREDICTABLE;
value = imm1;
```

### Assembler symbols

<q> See [Standard assembler syntax fields on page F2-2848](#).

<imm> Is the unsigned immediate 0 or 1, encoded in the "imm1" field.

### Operation for all encodings

```
EncodingSpecificOperations();
if PSTATE.EL != EL0 then
    PSTATE.PAN = value;
```

## F5.1.179 SEV

Send Event is a hint instruction. It causes an event to be signaled to all PEs in the multiprocessor system. For more information, see [Wait For Event and Send Event](#) on page G1-4403.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

SEV{<c>}.W

### Decode for this encoding

// No additional decoding required

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c> See [Standard assembler syntax fields](#) on page F2-2848.

<q> See [Standard assembler syntax fields](#) on page F2-2848.

## Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    SendEvent();
```

## F5.1.180 SEVL

Send Event Local is a hint instruction that causes an event to be signaled locally without requiring the event to be signaled to other PEs in the multiprocessor system. It can prime a wait-loop which starts with a WFE instruction.

### A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

```
diff4 = SInt(R[n]<31:24>) - SInt(R[m]<31:24>);  
R[d]<7:0> = diff1<8:1>;  
R[d]<15:8> = diff2<8:1>;  
R[d]<23:16> = diff3<8:1>;  
R[d]<31:24> = diff4<8:1>;
```

## F5.1.187 SMC

Secure Monitor Call causes a Secure Monitor Call exception. For more information see [Secure Monitor Call \(SMC\) exception on page G1-4382](#).

SMC is available only for software executing at EL1 or higher. It is UNDEFINED in User mode.

If the values of [HCR.TSC](#) and [SCR.SCD](#) are both 0, execution of an SMC instruction at EL1 or higher generates a Secure Monitor Call exception that is taken to EL3. When EL3 is using AArch32 this exception is taken to Monitor mode. When EL3 is using AArch64, it is the [SCR\\_EL3.SMD](#) bit, rather than the [SCR.SCD](#) bit, that can change the effect of executing an SMC instruction.

If the value of [HCR.TSC](#) is 1, execution of an SMC instruction in a Non-secure EL1 mode generates an exception that is taken to EL2, regardless of the value of [SCR.SCD](#). When EL2 is using AArch32, this is a Hyp Trap exception that is taken to Hyp mode. For more information see [Traps to Hyp mode of Non-secure EL1 execution of SMC instructions on page G1-4434](#).

If the value of [HCR.TSC](#) is 0 and the value of [SCR.SCD](#) is 1, the SMC instruction is:

- UNDEFINED in Non-secure state.
- CONSTRAINED UNPREDICTABLE if executed in Secure state at EL1 or higher.

            // SMC disabled.
            UNDEFINED;
        else
            if SCR.SCD == '1' then
                // SMC disabled
                if IsSecure() then
                    // Executes either as a NOP or UNALLOCATED.
                    c = ConstrainUnpredictable(Unpredictable_SMD);
                    assert c IN {Constraint_NOP, Constraint_UNDEF};
                    if c == Constraint_NOP then EndOfInstruction();
                    UNDEFINED;
                else
                    AArch64.CallSecureMonitor(Zeros(16));
            else
                AArch32.TakeSMCException();

```

## CONSTRAINED UNPREDICTABLE behavior

If SCR.SCD == '1' && IsSecure(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

## F5.1.188 SMLABB, SMLABT, SMLATB, SMLATT

Signed Multiply Accumulate (halfwords) performs a signed multiply accumulate operation. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is added to a 32-bit accumulate value and the result is written to the destination register.

If overflow occurs during the addition of the accumulate value, the instruction sets [PSTATE.Q](#) to 1. It is not possible for overflow to occur during the multiplication.

if result != SInt(result<31:0>) then // Signed overflow
    PSTATE.Q = '1';
```

## F5.1.189 SMLAD, SMLADX

Signed Multiply Accumulate Dual performs two signed 16 x 16-bit multiplications. It adds the products to a 32-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

This instruction sets [PSTATE.Q](#) to 1 if the accumulate operation overflows. Overflow cannot occur during the multiplications.

<RdLo>	Is the general-purpose source register holding the lower 32 bits of the addend, and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.
<RdHi>	Is the general-purpose source register holding the upper 32 bits of the addend, and the destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand2 = if m_swap then ROR(R[m],16) else R[m];
    product1 = SInt(R[n]<15:0>) * SInt(operand2<15:0>);
    product2 = SInt(R[n]<31:16>) * SInt(operand2<31:16>);
    result = product1 + product2 + SInt(R[dHi]:R[dLo]);
    R[dHi] = result<63:32>;
    R[dLo] = result<31:0>;
```

## F5.1.193 SMLAWB, SMLAWT

Signed Multiply Accumulate (word by halfword) performs a signed multiply accumulate operation. The multiply acts on a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are added to a 32-bit accumulate value and the result is written to the destination register. The bottom 16 bits of the 48-bit product are ignored.

If overflow occurs during the addition of the accumulate value, the instruction sets [PSTATE.Q](#) to 1. No overflow can occur during the multiplication.

result = SInt(R[n]) * SInt(operand2) + (SInt(R[a]) << 16);
R[d] = result<47:16>;
if (result >> 16) != SInt(R[d]) then // Signed overflow
    PSTATE.Q = '1';
```

## F5.1.194 SMLSD, SMLSDX

Signed Multiply Subtract Dual performs two signed 16 x 16-bit multiplications. It adds the difference of the products to a 32-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

This instruction sets [PSTATE.Q](#) to 1 if the accumulate operation overflows. Overflow cannot occur during the multiplications or subtraction.

    R[d] = result<31:0>;
    if result != SInt(result<31:0>) then // Signed overflow
        PSTATE.Q = '1';
```

## F5.1.195 SMLSLD, SMLSLDX

Signed Multiply Subtract Long Dual performs two signed 16 x 16-bit multiplications. It adds the difference of the products to a 64-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

Overflow is possible during this instruction, but only as a result of the 64-bit addition. This overflow is not detected if it occurs. Instead, the result wraps around modulo  $2^{64}$ .

### A1

Applies when N == 0 && M == 1.

SMULBT{<C>}{<q>} {<Rd>}, <Rn>, <Rm>

### **SMULTB variant**

Applies when N == 1 && M == 0.

SMULTB{<C>}{<q>} {<Rd>}, <Rn>, <Rm>

### **SMULTT variant**

Applies when N == 1 && M == 1.

SMULTT{<C>}{<q>} {<Rd>}, <Rn>, <Rm>

### **Decode for all variants of this encoding**

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
n_high = (N == '1'); m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### **Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### **Assembler symbols**

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the multiplicand in the bottom or top half (selected by <x>), encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <y>), encoded in the "Rm" field.

### **Operation for all encodings**

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand1 = if n_high then R[n]<31:16> else R[n]<15:0>;
    operand2 = if m_high then R[m]<31:16> else R[m]<15:0>;
    result = SInt(operand1) * SInt(operand2);
    R[d] = result<31:0>;
    // Signed overflow cannot occur
```

## F5.1.201 SMULL, SMULLS

Signed Multiply Long multiplies two 32-bit signed values to produce a 64-bit result.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
!=1111	0	0	0	0	1	1	0	S		RdHi		RdLo		Rm	1	0	0	1		Rn	
cond																					

#### Flag setting variant

Applies when S == 1.

SMULLS{<C>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

#### Not flag setting variant

Applies when S == 0.

SMULL{<C>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

#### Decode for all variants of this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If dHi == dLo, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	1	1	0	0	0		Rn		RdLo		RdHi	0	0	0	0		Rm

#### T1 variant

SMULL{<C>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

#### Decode for this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// ARMv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $dHi == dLo$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<RdLo>	Is the general-purpose destination register for the lower 32 bits of the result, encoded in the "RdLo" field.
<RdHi>	Is the general-purpose destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = SInt(R[n]) * SInt(R[m]);
    R[dHi] = result<63:32>;
    R[dLo] = result<31:0>;
    if setflags then
        PSTATE.N = result<63>;
        PSTATE.Z = IsZeroBit(result<63:0>);
        // PSTATE.C, PSTATE.V unchanged
```

## F5.1.202 SMULWB, SMULWT

Signed Multiply (word by halfword) multiplies a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are written to the destination register. The bottom 16 bits of the 48-bit product are ignored. No overflow is possible during this instruction.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	0	0	0	1	0	0	1	0	Rd	(0)	(0)	(0)	(0)	Rm	1	M	1	0	Rn	
cond																							

#### SMULWB variant

Applies when M == 0.

SMULWB{<C>}{<q>} {<Rd>}, {<Rn>}, <Rm>

#### SMULWT variant

Applies when M == 1.

SMULWT{<C>}{<q>} {<Rd>}, {<Rn>}, <Rm>

#### Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	1	0	0	1	1	Rn	1	1	1	1	Rd	0	0	0	M		Rm		

#### SMULWB variant

Applies when M == 0.

SMULWB{<C>}{<q>} {<Rd>}, {<Rn>}, <Rm>

#### SMULWT variant

Applies when M == 1.

SMULWT{<C>}{<q>} {<Rd>}, {<Rn>}, <Rm>

#### Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <y>), encoded in the "Rm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand2 = if m_high then R[m]<31:16> else R[m]<15:0>;
    product = SInt(R[n]) * SInt(operand2);
    R[d] = product<47:16>;
    // Signed overflow cannot occur
```

## F5.1.203 SMUSD, SMUSDX

Signed Multiply Subtract Dual performs two signed 16 x 16-bit multiplications. It subtracts one of the products from the other, and writes the result to the destination register.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

Overflow cannot occur.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	8	7	6	5	4	3	0

#### SMUSDX variant

Applies when M == 1.

SMUSDX{<C>}{<q>} {<Rd>}, {<Rn>}, <Rm>

#### Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand2 = if m_swap then ROR(R[m],16) else R[m];
    product1 = SInt(R[n]<15:0>) * SInt(operand2<15:0>);
    product2 = SInt(R[n]<31:16>) * SInt(operand2<31:16>);
    result = product1 - product2;
    R[d] = result<31:0>;
    // Signed overflow cannot occur
```

## F5.1.204 SRS, SRSDA, SRSDB, SRSIA, SRSIB

Store Return State stores the LR\_<current\_mode> and SPSR\_<current\_mode> to the stack of a specified mode. For information about memory accesses see [Memory accesses on page F2-2854](#).

SRS is UNDEFINED in Hyp mode.

SRS is CONSTRAINED UNPREDICTABLE if it is executed in User or System mode, or if the specified mode is any of the following:

- Not implemented.
- A mode that [Table G1-5 on page G1-4322](#) does not show.
- Hyp mode.
- Monitor mode, if the SRS instruction is executed in Non-secure state.

If EL3 is using AArch64 and an SRS instruction that is executed in a Secure EL1 mode specifies Monitor mode, it is trapped to EL3.

See [Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32 on page D1-1870](#).

### A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	0

## T2 variant

SRS{IA}{<c>}{<q>} SP{!}, #<mode>

### Decode for this encoding

wback = (W == '1'); increment = TRUE; wordhigher = FALSE;

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#), and particularly *SRS (T32)* on page K1-6108 and *SRS (A32)* on page K1-6108.

## Assembler symbols

IA	For encoding A1: is an optional suffix to indicate the Increment After variant. For encoding T2: is an optional suffix for the Increment After form.
<c>	For encoding A1: see <a href="#">Standard assembler syntax fields on page F2-2848</a> . <c> must be AL or omitted. For encoding T1 and T2: see <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
<mode>	Is the number of the mode whose Banked SP is used as the base register, encoded in the "mode" field. For details of PE modes and their numbers see <a href="#">AArch32 PE mode descriptions on page G1-4322</a> .

SRSFA, SRSEA, SRSFD, and SRSED are pseudo-instructions for SRSIB, SRSIA, SRSDB, and SRSDA respectively, referring to their use for pushing data onto Full Ascending, Empty Ascending, Full Descending, and Empty Descending stacks.

## Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        if PSTATE.EL == EL2 then           // UNDEFINED at EL2
            UNDEFINED;

        // Check for UNPREDICTABLE cases. The definition of UNPREDICTABLE does not permit these
        // to be security holes
        if PSTATE.M IN {M32_User, M32_System} then
            UNPREDICTABLE;
        elsif mode == M32_Hyp then         // Check for attempt to access Hyp mode SP

```

```

        UNPREDICTABLE;
    elseif mode == M32_Monitor then // Check for attempt to access Monitor mode SP
        if !HaveEL(EL3) || !IsSecure() then
            UNPREDICTABLE;
        elseif !ELUsingAArch32(EL3) then
            AArch64.MonitorModeTrap();
    elseif BadMode(mode) then
        UNPREDICTABLE;

    base = Rmode[13,mode];
    address = if increment then base else base-8;
    if wordhigher then address = address+4;
    MemA[address,4] = LR;
    MemA[address+4,4] = SPSR[];
    if wback then Rmode[13,mode] = if increment then base+8 else base-8;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        if PSTATE.EL == EL2 then // UNDEFINED at EL2
            UNDEFINED;

        // Check for UNPREDICTABLE cases. The definition of UNPREDICTABLE does not permit these
        // to be security holes
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
        elseif mode == M32_Hyp then // Check for attempt to access Hyp mode SP
            UNPREDICTABLE;
        elseif mode == M32_Monitor then // Check for attempt to access Monitor mode SP
            if !HaveEL(EL3) || !IsSecure() then
                UNPREDICTABLE;
            elseif !ELUsingAArch32(EL3) then
                AArch64.MonitorModeTrap();
        elseif BadMode(mode) then
            UNPREDICTABLE;

        base = Rmode[13,mode];
        address = if increment then base else base-8;
        if wordhigher then address = address+4;
        MemA[address,4] = LR;
        MemA[address+4,4] = SPSR[];
        if wback then Rmode[13,mode] = if increment then base+8 else base-8;

```

## CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32\_User,M32\_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

If mode == M32\_Hyp, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

If mode == M32\_Monitor && (!HaveEL(EL3) || !IsSecure()), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

If BadMode(mode), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction stores to the stack of the mode in which it is executed.
- The instruction stores to an UNKNOWN address, and if the instruction specifies writeback then any general-purpose register that can be accessed from the current Exception level without a privilege violation becomes UNKNOWN.

## F5.1.205 SSAT

Signed Saturate saturates an optionally-shifted signed value to a selectable signed range.

This instruction sets [PSTATE.Q](#) to 1 if the operation saturates.

### A1 variant

SSAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>

### Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); saturate_to = UInt(sat_imm)+1;
if d == 15 || n == 15 then UNPREDICTABLE;
```

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	0	(0)	1	1	0	0	1	0	Rn	0	0	0	0	Rd	0	0	(0)	(0)	sat	imm		

### T1 variant

SSAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>

### Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); saturate_to = UInt(sat_imm)+1;
if d == 15 || n == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<imm>	Is the bit position for saturation, in the range 1 to 16, encoded in the "sat_imm" field as <imm>-1.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.

## Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result1, sat1) = SignedSatQ(SInt(R[n]<15:0>), saturate_to);
    (result2, sat2) = SignedSatQ(SInt(R[n]<31:16>), saturate_to);
```

```
R[d]<15:0> = SignExtend(result1, 16);  
R[d]<31:16> = SignExtend(result2, 16);  
if sat1 || sat2 then  
    PSTATE.Q = '1';
```

## F5.1.207 SSAX

Signed Subtract and Add with Exchange exchanges the two halfwords of the second operand, performs one 16-bit integer subtraction and one 16-bit addition, and writes the results to the destination register. It sets [PSTATE.GE](#) according to the results.

### A1

R[d]<31:24> = diff4<7:0>;  
PSTATE.GE<0> = if diff1 >= 0 then '1' else '0';  
PSTATE.GE<1> = if diff2 >= 0 then '1' else '0';  
PSTATE.GE<2> = if diff3 >= 0 then '1' else '0';  
PSTATE.GE<3> = if diff4 >= 0 then '1' else '0';
```

## F5.1.210 STC

Store data to System register calculates an address from a base register value and an immediate offset, and stores a word from the [DBGDTRRXint](#) System register to memory. It can use offset, post-indexed, pre-indexed, or unindexed addressing. For information about memory accesses see [Memory accesses](#) on page F2-2854.

In an implementation that includes EL2, the permitted STC access to [DBGDTRRXint](#) can be trapped to Hyp mode, meaning that an attempt to execute an STC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [Trapping general Non-secure System register accesses to debug registers](#) on page G1-4443.

For simplicity, the STC pseudocode does not show this possible trap to Hyp mode.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	10	9	8	7		0
!=1111		1	1	0	P	U	0	W	0	Rn		0	1	0	1	1	1	1	0	imm8		
cond																						

#### Offset variant

Applies when P == 1 && W == 0.

STC{<c>}{<q>} p14, c5, [<Rn>{, #<+/-><imm>}]

#### Post-indexed variant

Applies when P == 0 && W == 1.

STC{<c>}{<q>} p14, c5, [<Rn>], #<+/-><imm>

#### Pre-indexed variant

Applies when P == 1 && W == 1.

STC{<c>}{<q>} p14, c5, [<Rn>, #<+/-><imm>]!

#### Unindexed variant

Applies when P == 0 && U == 1 && W == 0.

STC{<c>}{<q>} p14, c5, [<Rn>], <option>

#### Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then UNDEFINED;
n = UInt(Rn); cp = 14;
imm32 = ZeroExtend(imm8:'00', 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If n == 15 && wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15](#) on page K1-6097.

## T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7					0
1	1	1	0	1	1	0	P	U	0	W	0		Rn	0	1	0	1	1	1	1	0						imm8

### Offset variant

Applies when P == 1 && W == 0.

STC{<c>}{<q>} p14, c5, [<Rn>{, #{+/-}<imm>}]

### Post-indexed variant

Applies when P == 0 && W == 1.

STC{<c>}{<q>} p14, c5, [<Rn>], #{+/-}<imm>

### Pre-indexed variant

Applies when P == 1 && W == 1.

STC{<c>}{<q>} p14, c5, [<Rn>, #{+/-}<imm>]!

### Unindexed variant

Applies when P == 0 && U == 1 && W == 0.

STC{<c>}{<q>} p14, c5, [<Rn>], <option>

### Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then UNDEFINED;
n = UInt(Rn); cp = 14;
imm32 = ZeroExtend(imm8:'00', 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15 on page K1-6097](#).

### Assembler symbols

<c> See [Standard assembler syntax fields on page F2-2848](#).

<q> See [Standard assembler syntax fields on page F2-2848](#).

<Rn> For the offset or unindexed variant: is the general-purpose base register, encoded in the "Rn" field. The PC can be used, but this is deprecated.  
For the offset, post-indexed or pre-indexed variant: is the general-purpose base register, encoded in the "Rn" field.

<option> Is an 8-bit immediate, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.

+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
-	when U = 0
+	when U = 1
<imm>	Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

### Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.CheckSystemAccess(cp, ThisInstr());
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];

    // System register read from DBGDTRRXint.
    MemA[address,4] = DBGDTR_EL0[];

    if wback then R[n] = offset_addr;

```

## F5.1.211 STL

Store-Release Word stores a word from a register to memory. The instruction also has memory ordering semantics as described in [Load-Acquire, Store-Release](#) on page E2-2770.

For more information about support for shared memory see [Synchronization and semaphores](#) on page E2-2795. For information about memory accesses see [Memory accesses](#) on page F2-2854.

<q>	See <a href="#">Standard assembler syntax fields</a> on page F2-2848.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    MemO[address, 1] = R[t]<7:0>;
```

## F5.1.213 STLEX

Store-Release Exclusive Word stores a word from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in [Load-Acquire, Store-Release](#) on page E2-2770.

For more information about support for shared memory see [Synchronization and semaphores](#) on page E2-2795. For information about memory accesses see [Memory accesses](#) on page F2-2854.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	0	0	0	1	1	0	0	0	Rn	Rd	(1)	(1)	1	0	1	0	0	1	Rt
cond																							

#### A1 variant

STLEX{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

#### Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If d == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If d == n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	0	0	1	1	0	0	Rn	Rt	(1)	(1)	(1)	(1)	1	1	1	0	Rd			

#### T1 variant

STLEX{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

#### Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $d == t$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If  $d == n$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is: <ul style="list-style-type: none"> <li>0 If the operation updates memory.</li> <li>1 If the operation fails to update memory.</li> </ul>
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

### Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,4) then
        Mem0[address, 4] = R[t];
```

```
        R[d] = ZeroExtend('0');  
else  
        R[d] = ZeroExtend('1');
```

## F5.1.214 STLEXB

Store-Release Exclusive Byte stores a byte from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in [Load-Acquire, Store-Release](#) on page E2-2770.

For more information about support for shared memory see [Synchronization and semaphores](#) on page E2-2795. For information about memory accesses see [Memory accesses](#) on page F2-2854.

### A1

1	1	1	1	1	0	0	1	1	1	0	0	Rn	Rd	(1)	(1)	1	0	1	0	0	1	Rt	
cond																							

#### A1 variant

STLEXB{<C>}{<q>} <Rd>, <Rt>, [<Rn>]

#### Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If d == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If d == n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

### T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	0	0	1	1	0	0	Rn		Rt		(1)	(1)	(1)	(1)	1	1	0	0	Rd	

#### T1 variant

STLEXB{<C>}{<q>} <Rd>, <Rt>, [<Rn>]

#### Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $d == t$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If  $d == n$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is: <ul style="list-style-type: none"> <li>0 If the operation updates memory.</li> <li>1 If the operation fails to update memory.</li> </ul>
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

### Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

### Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,1) then
        Mem0[address, 1] = R[t]<7:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

## F5.1.215 STLEXD

Store-Release Exclusive Doubleword stores a doubleword from two registers to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in [Load-Acquire, Store-Release](#) on page E2-2770.

For more information about support for shared memory see [Synchronization and semaphores](#) on page E2-2795. For information about memory accesses see [Memory accesses](#) on page F2-2854.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	0	1	1	0	1	0	Rn	Rd	(1)	(1)	1	0	1	0	0	1	Rt	
cond																							

### A1 variant

STLEXD{<C>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]

### Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); t2 = t+1; n = UInt(Rn);
if d == 15 || Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If d == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If d == n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

If Rt<0> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: Rt<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction executes as described, with no change to its behavior and no additional side effects.

If Rt == '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction is handled as described in [Using R15](#) on page K1-6097.

## T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	0
1	1	1	0	1	0	0	0	1	1	0	0	Rn	Rt	Rt2	1	1	1	1	Rd				

### T1 variant

STLEXD{<C>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]

### Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn);
if d == 15 || t == 15 || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If  $d == t$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If  $d == n$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rd>	Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is: 0 If the operation updates memory. 1 If the operation fails to update memory.
<Rt>	For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14. For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be $R(t+1)$ . For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

### Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

### Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian() then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address, 8) then
        Mem0[address, 8] = value;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

## F5.1.216 STLEXH

Store-Release Exclusive Halfword stores a halfword from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in [Load-Acquire, Store-Release](#) on page E2-2770.

For more information about support for shared memory see [Synchronization and semaphores](#) on page E2-2795. For information about memory accesses see [Memory accesses](#) on page F2-2854.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

```

## F5.1.218 STM, STMIA, STMEA

Store Multiple (Increment After, Empty Ascending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2855](#).

ARMv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see [ARMv8.2-LSMAOC](#). For details of related system instructions see [STM \(User registers\)](#).

### A1

### A1 variant

STM{IA}{<C>}{<q>} <Rn>{!}, <registers> // Preferred syntax  
STMEA{<C>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack

### Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If n == 15 && wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15 on page K1-6097](#).

### T1

### T1 variant

STM{IA}{<C>}{<q>} <Rn>!, <registers> // Preferred syntax

STMEA{<C>}{<q>} <Rn>!, <registers> // Alternate syntax, Empty Ascending stack

#### Decode for this encoding

```
n = UInt(Rn); registers = '00000000':register_list; wback = TRUE;
if BitCount(registers) < 1 then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If n == 15 && wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15 on page K1-6097](#).

## T2

#### T2 variant

STM{IA}{<C>}.W <Rn>{!}, <registers> // Preferred syntax, if <Rn>, '!' and <registers> can be represented in T1

STMEA{<C>}.W <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack, if <Rn>, '!' and <registers> can be represented in T1

STM{IA}{<C>}{<q>} <Rn>{!}, <registers> // Preferred syntax

STMEA{<C>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack

#### Decode for this encoding

```
n = UInt(Rn); registers = P:M:register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 2 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<13> == '1' then UNPREDICTABLE;
if registers<15> == '1' then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If `BitCount(registers) == 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If `wback && registers<n> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored for the base register is UNKNOWN.

If `registers<13> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs all of the stores using the specified addressing mode but the value of R13 is UNKNOWN.

If `registers<15> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

If `n == 15 && wback`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15 on page K1-6097](#).

## Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Assembler symbols

IA	Is an optional suffix for the Increment After form.
<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers> For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.

The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list.

If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register\_list" field. If the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T2: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.

The registers in the list must be in the range R0-R12, encoded in the "register\_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN; // Only possible for encodings T1 and A1
            else
                MemA[address,4] = R[i];
            address = address + 4;
    if registers<15> == '1' then // Only possible for encoding A1
        MemA[address,4] = PCStoreValue();
    if wback then R[n] = R[n] + 4*BitCount(registers);

```

## F5.1.219 STM (User registers)

In an EL1 mode other than System mode, Store Multiple (User registers) stores multiple User mode registers to consecutive memory locations using an address from a base register. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Store Multiple (User registers) is UNDEFINED in Hyp mode, and CONSTRAINED UNPREDICTABLE in User or System modes.

ARMv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see [ARMv8.2-LSMAOC](#).

### A1

### A1 variant

STM{<amode>}{<C>}{<q>} <Rn>, <registers>^

### Decode for this encoding

```
n = UInt(Rn); registers = register_list; increment = (U == '1'); wordhigher = (P == U);
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<amode> is one of:

DA	Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
ED	Empty Descending. For this instruction, a synonym for DA.
DB	Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.
FD	Full Descending. For this instruction, a synonym for DB.
IA	Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
EA	Empty Ascending. For this instruction, a synonym for IA.
IB	Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.

FA	Full Ascending. For this instruction, a synonym for IB.
<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
<registers>	Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be stored by the STM instruction. The registers are stored with the lowest-numbered register to the lowest memory address, through to the highest-numbered register to the highest memory address. See also <a href="#">Encoding of lists of general-purpose registers and the PC on page F2-2855</a> .

## Operation

```

if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elsif PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;
    else
        length = 4*BitCount(registers);
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;
        for i = 0 to 14
            if registers<i> == '1' then // Store User mode register
                MemA[address,4] = Rmode[i, M32_User];
                address = address + 4;
            if registers<15> == '1' then
                MemA[address,4] = PCStoreValue();

```

## CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32\_User,M32\_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

## F5.1.220 STMDA, STMED

Store Multiple Decrement After (Empty Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end at this address, and the address just below the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2855](#).

ARMv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see [ARMv8.2-LSMAOC](#). For details of related system instructions see [STM \(User registers\)](#).

### A1

### A1 variant

STMDA{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax  
STMED{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Descending stack

### Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If n == 15 && wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

- <c> See [Standard assembler syntax fields on page F2-2848](#).
- <q> See [Standard assembler syntax fields on page F2-2848](#).

- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> Is a list of one or more registers to be stored, separated by commas and surrounded by { and }.  
The PC can be in the list. However, ARM deprecates the use of instructions that include the PC in the list.  
If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

## Operation

```

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers) + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;
            else
                MemA[address,4] = R[i];
            address = address + 4;
    if registers<15> == '1' then
        MemA[address,4] = PCStoreValue();
    if wback then R[n] = R[n] - 4*BitCount(registers);

```

## F5.1.221 STMDB, STMFD

Store Multiple Decrement Before (Full Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end just below this address, and the address of the first of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F2-2855](#).

ARMv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see [ARMv8.2-LSMAOC](#). For details of related system instructions see [STM \(User registers\)](#).

This instruction is used by the alias [PUSH \(multiple registers\)](#). See [Alias conditions on page F5-3505](#) for details of when each alias is preferred.

### A1

### Decode for this encoding

```
n = UInt(Rn); registers = P:M:register_list; wback = (W == '1');  
if n == 15 || BitCount(registers) < 2 then UNPREDICTABLE;  
if wback && registers<n> == '1' then UNPREDICTABLE;  
if registers<13> == '1' then UNPREDICTABLE;  
if registers<15> == '1' then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If `BitCount(registers) < 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If `wback && registers<n> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored for the base register is UNKNOWN.

If `BitCount(registers) == 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If `registers<13> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The store instruction performs all of the stores using the specified addressing mode but the value of R13 is UNKNOWN.

If `registers<15> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

## Alias conditions

Alias	of variant	is preferred when
<a href="#">PUSH (multiple registers)</a>	T1	W == '1' && Rn == '1101' && BitCount(M:register_list) > 1
<a href="#">PUSH (multiple registers)</a>	A1	W == '1' && Rn == '1101' && BitCount(register_list) > 1

## Assembler symbols

<C>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
<registers>	<p>For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.</p> <p>The PC can be in the list. ### Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

## T2

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	1	0	0	0	0	1	0	0	!=1111	Rt	0	0
												Rn	0	0	0
												imm2	Rm		

### T2 variant

STR{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1  
STR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

### Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.  For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:  -           when U = 0 +           when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see <a href="#">Shifts applied to a register on page F2-2852</a> .
<imm>	If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

## Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    if t == 15 then // Only possible for encoding A1
        data = PCStoreValue();
    else
        data = R[t];
    MemU[address,4] = data;
    if wback then R[n] = offset_addr;

```

## F5.1.225 STRB (immediate)

Store Register Byte (immediate) calculates an address from a base register value and an immediate offset, and stores a byte from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F2-2854](#).

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11			0
!=1111	0	1	0	P	U	1	W	0		Rn		Rt					imm12
cond																	

#### Offset variant

Applies when P == 1 && W == 0.

STRB{<C>}{<Q>} <Rt>, [<Rn> {, #<+/-><imm>}]

#### Post-indexed variant

Applies when P == 0 && W == 0.

STRB{<C>}{<Q>} <Rt>, [<Rn>], #<+/-><imm>

#### Pre-indexed variant

Applies when P == 1 && W == 1.

STRB{<C>}{<Q>} <Rt>, [<Rn>, #<+/-><imm>]!

#### Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE STRBT;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

#### CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If wback && n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

## T1

index = (P == '1'); add = (U == '1'); wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE; // ARMv8-A removes UNPREDICTABLE for R13
```

### CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If wback && n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE behaviors](#).

### Assembler symbols

<c>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<q>	See <a href="#">Standard assembler syntax fields on page F2-2848</a> .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding T1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field.

+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: <div style="margin-left: 20px;">-           when U = 0  +           when U = 1</div>
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 5-bit unsigned immediate byte offset, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field. For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

### Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        MemU[address,1] = R[t]<7:0>;
        if wback then R[n] = offset_addr;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        MemU[address,1] = R[t]<7:0>;
        if wback then R[n] = offset_addr;

```

## F5.1.226 STRB (register)

Store Register Byte (register) calculates an address from a base register value and an offset register value, and stores a byte from a register to memory. The offset register value can optionally be shifted. For information about memory accesses see [Memory accesses](#) on page F2-2854.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	7	6	5	4	3	0

    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    MemU[address,1] = R[t]<7:0>;
    if wback then R[n] = offset_addr;

```

## F5.1.227 STRBT

Store Register Byte Unprivileged stores a byte from a register to memory. For information about memory accesses see [Memory accesses on page F2-2854](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

### A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11			0
1	1	1	1	0	0	U	1	1	0	Rn	Rt						imm12
cond																	

### A1 variant

STRBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}

### Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

### CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

## A2

```

#### CONSTRAINED UNPREDICTABLE behavior

If t == 15 || t2 == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If wback && (n == t || n == t2), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If wback && n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

If  $Rt < 0 > == '1'$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode:  $t < 0 > = '0'$ .
- The instruction executes with the additional decode:  $t2 = t$ .
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when  $Rt == '1111'$ .

If  $P == '0'$  &  $W == '1'$ , then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

## T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	0
1	1	1	0	1	0	0	P	U	1	W	0	! $1111$	Rt		Rt2		imm8		

Rn

### Offset variant

Applies when  $P == 1$  &  $W == 0$ .

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #<+/->imm}]

### Post-indexed variant

Applies when  $P == 0$  &  $W == 1$ .
